The power of the bill is such that wood may be torn to pieces, and crossbills in confinement seem to take a mischievous pleasure in destroying the cage. An apple is cut to pieces almost in an instant, in order that its seeds may be reached, and flocks of these birds sometimes do great mischief in orchards. Three or four species are known, two of which are found in America, although only one, the common red crossbill (*Loxia curvirostris*), is numerous, and even this in most years is scarcely to be seen in the United States. It is a native of Europe, Asia, and North America, dwelling chiefly in evergreen forests and extending as far north as they do, not dreading the coldest climates. The American bird is regarded as a subspecies, and a second subspecies is found from the southern Rocky Mountain region to central Mexico. The white-winged crossbill (*Loxia leucoptera*) is the other American species, but is not so common as the preceding. Both species are red in the males and olive brown in the females, the former species with blackish wings and the latter having wings crossed by two conspicuous white bars. They go about in small, chattering flocks and are resident in the most northern parts of the

United States and in Canada. They breed in the late winter or early spring, sometimes during very severe weather.

**CROSS BILL**. In chancery or equity, a bill, or petition, filed by the defendant in an equity proceeding against the plaintiff or against other defendants, or both, in the same suit, either to obtain a discovery of facts in aid of the defense, or to bring the matters in dispute more completely before the court than could be done by a mere answer to the original bill. The cross bill must not introduce new parties nor new matter not embraced in the original suit, and is considered as an auxiliary suit in the nature of a defense to the original bill, the two proceeding together as one cause. However, the persons made defendants in it must answer, plead, or demur to it, or the relief demanded will be granted by default. Cross bills are used in the equity practice of the United States and many of the State courts and in the English chancery courts. See **BILL**; **DISCOVERY**, **BILL OF**, **EQUITY**; also **PLEADING**; and consult the authorities there referred to.

**CROSSBOW**. See **ARBALEST**; **ARCHERY**.

**CROSS BREEDING**. See **BREEDING**.

**CROSS BREEDING IN MAN**. Interbreeding in animals, as among plants, may, within due limits, be beneficial. These limits are confined to the same variety, race, or stock. If individuals of widely different races or breeds intermix, the result is degeneracy and sterility, the outcome of such unions being of the same nature as hybrids between different though allied species. As Darwin states: "After plants have been propagated by self-fertilization for several generations, a single cross with a fresh stock restores their pristine vigor; and we have a strictly analogous result with our domestic animals." This will apply to man also. When the French aristocracy was, as the result of the Revolution, broken up and forced to intermarry with the *bourgeoisie*, the result was an increase in the population and additional vigor in the race. An old family in its decline may be rejuvenated and restored by intermarriage with a more vigorous, even if a coarser, stock or strain. The population of our cities is maintained by the constant influx of fresh blood from the rural districts.

The mixture of the European races, now so marked, has been going on from early prehistoric (Neolithic) times. The French population is highly composite. The Anglo-Saxon race is equally or still more so, and the American people so in a still more marked degree; the intermixture being the result of emigration from the countries of northern and central Europe. It is not only that the old mixes with new stock, but the latter comes from regions differing in soil, climate, etc. Inter marriages between the stocks or breeds or strains of the white race are happy in their effects, resulting in increased vigor and fertility; and so with the stocks of the yellow, brown, or black races. The same law prevails throughout the animal world; everywhere Nature abhors too close inbreeding.

**Interracial Marriage**. Miscegenation, or "métissage," is marriage between individuals of widely different races, i.e., a high and a low race or variety. Its effects are bad physically and morally, since the product, like mules or hybrids between species, is inferior to the higher though superior to the lower race; the result is that, when general, the higher race is pulled down, or

tends to degeneracy, while the lower is in a degree elevated. Hybrids, or half-castes, are notoriously inferior to either pure race, though so partly from social causes. The results, so apparent in human history, show that crosses are injurious between races too far removed in physical characters and constitution, or where living under remote climatic conditions. While marriages between black or other backward races and white races are markedly evil in their effects, unions between those nearer allied, such as those between the white race and the Japanese or the Polynesian or Malay or North American Indian, also tend to result in sterility; on the other hand, crosses between the yellow and brown races, and the brown and black, are apparently fertile, and the results not harmful.

**In-and-in Breeding.** The deleterious effects of self-fertilization, or of marriage between blood relatives, are recognized both by Darwin and by Wallace. Darwin found that certain plants which had been naturally cross-fertilized for many or all previous generations suffered to an extreme degree from a single act of self-fertilization. "Nothing of the kind," he adds, "has been observed in our domestic animals; but then one must remember that the closest possible interbreeding with such animals—that is, between brothers and sisters—cannot be considered as nearly so close a union as that between the pollen and ovules of the same flower."

**Consanguineous Marriages.** The bearings of the previous statements on this important subject are obvious. Yet the matter is involved in doubt, authorities differing. The popular notion is that marriages between first cousins result in disease, idiocy, insanity, sterility, etc. That the results are not, however, always deleterious is a matter of frequent observation. Darwin refers to his son's (G. H. Darwin) attempt to discover by a statistical investigation whether the marriages of first cousins are at all injurious, "although this is a degree of relationship which would not be objected to in our domestic animals." It appears from these and other researches that "the evidence as to any evil thus caused is conflicting, but on the whole points to its being very small." He concludes "that with mankind the marriages of nearly related persons, some of whose parents or ancestors had lived under very different conditions, would be much less injurious than that of persons who had always lived in the same place and followed the same habits of life. Nor can I see reason to doubt that the widely different habits of life of men and women in civilized nations, especially among the upper classes, would tend to counterbalance any evil from marriages between healthy and somewhat closely related persons."

Finally, to sum up the results thus far obtained, it appears, as concluded by Wallace, that a slight amount of crossing, attended by slight changes of the conditions of life, is beneficial; while extreme changes and crosses between individuals too far removed in structure or constitution are injurious. For the literature, consult many of the volumes under **EVOLUTION**.

**CROSS-BUN.** A small cake specially prepared for Good Friday and in many English towns cried about the streets on Good-Friday morning as "hot cross-buns." Good-Friday buns were appropriately marked with the cross; hence the name. The origin of the practice is obscure. Most probably it is a relic of some

heathen observance, to which the early Church gave a Christian significance.

**CROSSCUT.** A horizontal, or nearly horizontal passageway driven between two levels, drifts, or underground workings in a mine. In coal mining crosscuts are often driven in the coal for ventilation, whereas in metal mines they are usually driven across the formation, at right angles to the strike, to prospect for or connect parallel veins.

**CROSSE, ANDREW** (1784-1855). An English physicist. He was born at Fyne Court, in the Quantock Hills, Somersetshire, and was educated at Bristol and Brasenose College, Oxford. He early devoted himself to the study of electricity and in 1807 he commenced experiments with the view of forming artificial crystals. These discoveries and investigations in electricity were described at the meeting of the British Association for the Advancement of Science, at Bristol, in 1836. A few months later, while experimenting with some highly caustic solution, out of contact with atmospheric air, there appeared, as if gradually growing from specks between the poles of the voltaic circuit, certain animals of the genus *Acarus*. Crosse never affirmed that he had developed animal life out of inorganic elements, but simply that under physical conditions he could make *Acarus* appear, and not otherwise. This discovery aroused such violent criticism that Crosse retired from the world and for some time neglected his researches; but later he published papers on *Mode of Extracting Metals from their Ores; On the Perforation of Non-conducting Substances by the Mechanical Action of the Electric Fluid; and On the Apparent Mechanical Action Accompanying Electric Transfer*.

**CROSS-EXAMINATION.** The examination of a witness on behalf of the party against whose interest he has been called and against whom he has given testimony. The object is to test the correctness of the testimony given, to disclose any prejudice, lack of intelligence, weakness of memory, or untruthfulness that may exist, and to break in any proper way the force of the direct examination. Greater latitude is allowed to counsel in cross-examination of an adverse witness than in adducing direct testimony for his own client. Thus, "leading questions"—i.e., those which in their form suggest or indicate the answer desired—are allowed in cross but not in direct examination. In the United States generally it is held that cross-examination should be limited to inquire into matters drawn out on the direct examination, and if counsel asks questions as to new matter he thereby makes the witness his own and cannot thereafter impeach his credibility.

Counsel are required to confine the questions on cross-examination to material and relevant matters, but the determination of the question whether the facts sought to be shown are material and relevant rests in the discretion of the court, and, when occasion seems to demand it, this discretion is liberally exercised, especially in cases of cross-examination of expert witnesses, where it is necessary to show the standing and ability of the expert. Previous mistakes in collateral matters not connected with the cause in issue have been allowed to be shown on this point.

The right to cross-examination should be exercised immediately after the examination in chief; but it is in the discretion of the court,

upon good reason shown, to allow the privilege at a later stage of the trial. Consult Wellman, *Art of Cross-Examination* (New York, 1904). See EVIDENCE; EXAMINATION; TESTIMONY; and authorities there cited.

**CROSS-FERTILIZATION, IN PLANTS:** See POLLINATION.

**CROSS-FOX.** A valuable variety of the American red fox, marked by a dark line along the back, crossed by one upon the withers, whence the name. See FOX.

**CROSS KEYS.** A post village in Rockingham Co., Va., about 20 miles northeast of Staunton. Here, on June 8, 1862, during the Civil War, an indecisive engagement occurred between 18,000 Federals, under General Frémont, and a part of Jackson's retreating army, numbering about 8000, under General Ewell, the latter withdrawing during the night to effect a junction with Jackson. Each side lost about 500. The engagement was a strategic success for the Confederates, in that it checked the pursuit by Frémont and prevented his joining with General Shields for a combined attack.

**CROSSLEY, SIR FRANCIS** (1817-72). An English philanthropist, born at Halifax, Yorkshire. He succeeded to the proprietorship of the Dean Clough carpet mills and accumulated a vast fortune. His many benefactions included the gift to Halifax of 21 almshouses in 1855 and an endowed public park, and to the London Missionary Society of £20,000. He was created a baronet in 1863 and published a lecture, *Canada and the United States*, in 1856.

**CROSSOPTERYGII**, *krōs-sōp'tēr-i-jī* (Neo-Lat. nom. pl., from Gk. *krōssos*, *krōssos*, fringed + *pterygion*, dim. of *πτέρυξ*, *pteryx*, wing). An order of ganoid fishes, numerous in former ages, but surviving only in the ganoid-like genera *Polypterus* (see BICHR) and *Calmacichthys*. They are described as "Teleostomi, in which the pectoral fin consists of a rounded basal lobe, supported by endoskeletal structures and fringed by dermal rays. There are no branchiostegal rays. The vertebral column is well ossified, and the caudal fin is diphyccercal. The pelvic fins are abdominal. A spiral valve and a conus arteriosus are present, and the optic nerves form a chiasma."

**CROSS RIVER.** See CALABAR.

**CROSS STONE.** See MACLE.

**CROSSWELL, KRŌZ'wēl, EDWIN** (1797-1871). An American journalist and leader in Democratic politics as a member of the Albany Regency (q.v.). He was born at Catskill, N. Y., began his journalistic career on the *Catskill Recorder*, a journal established by his father, and in 1824 became editor of the *Albany Argus*, which he made the official organ of his party in the State. He was also State printer from 1824 to 1840 and from 1844 to 1847. In 1854 he gave up journalism and went into business in New York City. Crosswell was the great antagonist of Thurlow Weed and exerted powerful influence by his editorial utterances in both State and national politics.

**CROSSWELL, HARRY** (1778-1858). An American journalist and clergyman, born at West Hartford, Conn. In 1802 he became editor of the *Balance*, a Federalist newspaper, at Hudson, N. Y., and later of the *Wasp*. In the latter he charged Jefferson with paying Callender to defame Washington. He was sued for libel and defended by Alexander Hamilton, whose plea in this case Kent called "the greatest forensic effort

Hamilton ever made." In 1814 Crosswell took orders and in 1815 became rector of Trinity Church, New Haven, Conn. He was the author of *The Young Churchman's Guide*; *Manual of Family Prayers* (1857); *Guide to the Holy Sacrament* (1807).

**CROT'AL'ARIA** (Neo-Lat. nom. pl., from Gk. *κρόταλον*, *krotalon*, rattle). A genus of plants of the family Leguminosae, deriving its name from the inflated pods in which the seeds rattle when ripe. The species, about 250 in number, are annual, perennial, and shrubby plants, natives of the temperate and tropical parts of the world. (See Plate of CHANBERRY.) Many of them have long, straight, slender stems and branches, and some of these yield valuable fibre, particularly the Sunn (q.v.), or Sunn hemp of India, *Crotalaria juncea*, an annual species, the fibre of which is now an important article of commerce. Jubbulpore hemp, also an important fibre, and regarded as stronger than Sunn, is the produce of *Crotalaria tenuifolia*, usually considered a variety of *Crotalaria juncea*, a perennial species about 9 feet high, a native of the south of India, which, when growing in abundant space, throws out many branches, but, when sown thick, grows with little branching. *Crotalaria burhia*, which naturally grows in very arid places, is also cultivated in Sindh for its fibre. There are a dozen species native of the United States, one of which, *Crotalaria sagittalis*, and perhaps others, are reputed to be injurious to horses, causing what is termed "crotalism," a disease something like loco (q.v.).

**CROTALIDÆ** (Neo-Lat. nom. pl., from Gk. *κρόταλον*, *krotalon*, rattle). A family of venomous serpents, the pit vipers, viper-like in form, but distinctively characterized by the presence of a deep pit on each side of the face between the nostril and the eye. It includes the American rattlesnakes, moccasins, and copperheads and some Asiatic species. See RATTLE-SNAKE.

**CROTALISM.** See CROTALARIA.

**CROTAPH'YTUS.** See COLLARED LIZARD.

**CROTCH, WILLIAM** (1775-1847). A distinguished English composer, born at Norwich. He was quite as precocious as Mozart. When little more than three years old he could play "God Save the King" almost throughout with chords, and could detect in a moment what note was struck and in what key music was composed. When only 22, Crotch was appointed professor of music in Oxford University, and the degree of doctor of music was conferred upon him. In 1822 he obtained the principalship of the Royal Academy of Music. He composed much for the organ and piano, as well as many glees. Among several oratorios which he wrote, two, *Palestine* (1812) and *The Captivity of Judah* (1834), are especially noteworthy. He died at Taunton, England.

**CROTCH'ET.** A musical term used in England to denote the quarter note (♩). In France the *crochet* denotes the eighth note (♪). The semiminima of the older notation (see MENSURABLE MUSIC) was called in Italy *crocheta* and was written as an open note with one hook (♩). When later on the larger values of notes were abandoned and all notes of lesser value were written black, the French applied the old name to the *shape*, the English to the *value*, of the note.

**CROTHERS**, KRÜTH'ERZ, SAMUEL MCCORD (1857- ). An American clergyman and essayist, born at Oswego, Ill. He graduated from Princeton in 1874 and from the Union Theological Seminary. After holding several charges in the West, he entered the Unitarian ministry, and was settled in Brattleboro, Vt. He was called in 1894 to the First Parish of Cambridge, Mass., where he became also one of the preachers to Harvard University. His essays are of the familiar type, humorous, shrewd, and discreetly communicative, yet proceeding from a ripe and cultured mind, stored with literary lore, and of a scholarly type. They are happiest, perhaps, in dealing with the intellectual weaknesses and frailties of the time and are often pleased to treat with refreshing irony European conditions, which, from the American standpoint, do not fail in humorous appeal. His works include: *The Gentle Reader* (1903); *The Pardoner's Wallet* (1905); *The Endless Life* (1905); *By the Christmas Fire* (1908); *Among Friends* (1910); *Humanly Speaking* (1912); *Three Lords of Destiny* (1913).

**CROTON** (Neo-Lat., from Gk. κροτόν, or κρότων, *krotón*, tick, shrub bearing the castor berry, which was thought to resemble a tick). A genus of plants of the family Euphorbiaceae. The species, about 700 in number, are mostly tropical or subtropical trees or shrubs, a few herbaceous. Some of them possess in a very high degree the acrid properties so characteristic of the family to which they belong. Among these the most important is the purging croton (*Croton tiglium*), a small tree, a native of India and the more easterly tropical parts of Asia. The leaves are extremely acrid; the wood in a fresh state is a drastic, and in a dried state a more mild purgative; and the seeds (*croton seeds*, or *tilly seeds*) are an extremely powerful drastic purgative, formerly much employed in Europe, but latterly disused on account of violence and uncertainty of action, although still valuable as yielding croton oil (q.v.). They are oval, or oval oblong, about the size of field beans. The oil is obtained mostly by expression, and partly by treating the cake with alcohol. Very different properties are found in the species which yield cascarrilla (q.v.) and copalche (q.v.) barks, to which a great resemblance exists in the barks of a number of species, natives chiefly of South America. Other species are still more aromatic, and some delightfully fragrant, containing in great abundance a thickish balsamic sap. The sap of *Croton gratissimus* is much employed as a perfume and cosmetic at the Cape of Good Hope; that of *Croton organifolius* is used in the West Indies as a substitute for balsam of copaiba; that of *Croton flaccens*, also West Indian, furnishes *cau de Mantes* by distillation; and the balsamic sap of some South American species is dried and used as incense. *Croton aromaticus*, which grows abundantly in Ceylon, is an important lac tree. The plants cultivated by florists in hothouses as crotons belong to the genus *Codiaeum*. See Plate of CYPRUS.

**CROTONA**, or **CROTON** (Lat., from Gk. Κρότων, *Krotón*). A Greek colony in south Italy, on the east coast of Bruttium, founded probably about 710 B.C. by Achæans. Situated near a good harbor and in a fertile territory, Crotona rapidly became wealthy and was famous for its Olympian victors, especially the

great athlete Milo (q.v.). About 530 B.C. the city became the home of Pythagoras (q.v.). But soon after the destruction of Sybaris (510 B.C.) a reaction set in, and the Pythagoreans were expelled. The power of Crotona sank rapidly during the fifth and the fourth centuries B.C. It was captured by Dionysius the Elder of Syracuse, and later by Agathocles, and in the war between Pyrrhus and the Romans was plundered and nearly destroyed. It recovered somewhat, but suffered severely in the Second Punic War, when it was for three years the winter quarters of Hannibal. Though made the seat of a Roman colony in 194 B.C., it was never after a place of importance. The modern name is Cotrona (q.v.). Pop. (commune), about 9000.

**CROTON AQUEDUCT**. See AQUEDUCT for descriptions of both the old and the new Croton Aqueduct. See Plate of DAMS.

**CROTON BUG**. See COCKROACH.

**CROTON EL'EUTE'RIA**. See CASCARILLA.

**CROTON OIL**. The fixed oil obtained by expressing the seeds of the *Croton tiglium*, cultivated in India and the Philippine Islands. It is a viscid liquid, varying in color from a pale yellow to a reddish brown or deep sherry. It is insoluble in water and but sparingly soluble in alcohol, ether, carbon disulphide, and many other organic solvents. It has an acrid taste and an unpleasant fatty odor. It contains *tiglic acid*,  $C_5H_9O_2$ , *crotonol*,  $C_3H_5O_2$ , and the glycerides of several fatty acids. Croton oil is a powerful irritant. When rubbed upon the skin, it produces rubefaction and pustular eruption. It is now rarely used in medicine, being prescribed for the purpose of stimulating the skin in alopecia, and internally to relieve very obstinate constipation.

**CROTON RIVER**. A river of New York, about 60 miles long, and formed by the confluence of three branches, the East, the Middle, and the West, which rise in the southern part of Dutchess County, flow in a southerly direction, and unite near the southern boundary of that county, whence the main stream follows a southwesterly course through Westchester County, and empties into the Hudson River at Croton Point, 30 miles north of New York. Its principal tributaries are the Titicus, Cross, Kisco, and Muscoot rivers. Its catchment area is about 33 miles north and south by 11 miles east and west, lying almost entirely in New York, and involving about 360 square miles above the new Croton dam. Within this area are about 30 lakes and ponds, many of which are utilized as natural storage basins. For many years New York City (i.e., the present Borough of Manhattan) was dependent chiefly upon this source for its water supply. For an account of the city's enlarged water-supply system, see AQUEDUCT.

**CROUCH**, FREDERICK NICHOLLS (1808-96). An Anglo-American musician, born in London. He came of a musical family and was himself remarkably precocious. He studied at the Royal Academy of Music and with Boehsa, and when only nine years old was a 'cellist in the Royal Coburg Theatre. Subsequently he was in the orchestras of Queen Adelaide and at Drury Lane Theatre, after which he became a teacher and singer in Plymouth. In 1849 he came to the United States, acting in various capacities as musical director, teacher, and chorister in New York, Boston, Philadelphia, Washington, and

Baltimore. He died in Portland, Me. His compositions were almost exclusively songs and comprise "Kathleen Mavourneen," "The Soldier's Grave," "The Emigrant's Lament." He also wrote two operas, *Sir Roger de Coverley* and *The Fifth of November*.

**CROUP** (Scotch *croupe*, *crope*, to croak, make a harsh noise). Since the discovery of the cause of diphtheria, it has been found that there are two forms of disease formerly known as croup: (1) spasmodic, or false croup, and (2) membranous croup, which is diphtheria of the larynx. False croup is caused in feeble or ill-fed children, or in those who have a catarrhal tendency, by exposure to cold and wet, digestive disturbances, or, in some cases, the gripe (q.v.). The child has a running from the nose and a cough; he awakens coughing hoarsely, with noisy and labored breathing or gasping, with every appearance of suffocation, the face becoming red or purplish, and tears starting from the eyes. The attack lasts from a half hour to five or six hours, and then relief comes in a loose cough, abatement of the fever, and free perspiration. The attack may be repeated on succeeding nights. No membrane is coughed up. The treatment consists of inhalation of warm moist air from a teakettle placed under a sheet thrown over the child's bed; frequent draughts of warm milk; and a dose of a half teaspoonful of syrup of ipecac, repeated every 15 minutes till vomiting occurs.

Membranous croup is caused by the bacillus of diphtheria (q.v.), and is very dangerously contagious as well as largely fatal. The symptoms are much the same as in false croup, except that they are steadily progressive; the child is generally drowsy for a few hours before the difficulty in breathing and the cough begin, and after a time becomes exceedingly restless, the lips and face become blue, pieces of membrane are coughed up, coma and possibly convulsions follow, and death occurs unless relief is obtained. Relief from suffocation may be obtained in desperate cases by the use of the tracheotomy tube. This is a metal or hard rubber tube inserted into the windpipe below the larynx by a surgeon, through an incision in the neck. More generally relief is afforded by the use of the intubation tube invented by Dr. Joseph O'Dwyer, of New York, which is passed down the throat and between the vocal cords. These procedures do not, however, check the disease, for which antitoxin (q.v.) is the only effective remedy. See DIPHTHERIA.

**CROUTH.** See CROW.

**CROW** (AS. *crauc*, OHG. *chrawa*, *chraja*, Ger. *krahe*, crow, from AS. *craucan*, OHG. *chrajan*, Ger. *krahen*, to crow; probably onomatopoeic in origin). A bird of the genus *Corvus*, the type of the family Corvidæ. The crows are a widely distributed group of birds, found in nearly all parts of the world, but especially in the Northern Hemisphere. The largest species of the genus is the raven; the rook and the jackdaw of England also belong to it. Crows are always more or less black, frequently wholly so, but differ from each other not only in color, but especially in size and in the amount of space at the base of the bill, which is bare of feathers. All are smaller than the raven, but most of them are more than 15 inches in length. They are omnivorous, eating almost anything edible, and some species live largely on fish. All are intelligent to a high degree, and many stories are cur-

rent regarding their avoiding danger and communicating with each other. They are easily domesticated. Most of the species are more or less gregarious, at least at certain seasons of the year, and frequently resort in incredible numbers to certain favorite places of woodland to roost at night.

Three species of crow occur in the United States, besides the two ravens. The common crow (*Corvus brachyrhynchos*, or *americanus*) is generally distributed over North America, but is most abundant in the East and is apparently wanting from certain parts of the Rocky Mountain region, where ravens are common. Although it formerly had a bad reputation as a corn thief, and is known to be guilty not only of stealing corn, but even of stealing eggs and killing birds (including poultry), it is now recognized as a really beneficial bird and a true friend of the farmer, because of the vast number of injurious insects which it destroys. It was primitively confined mainly to the Eastern coast belt, but has steadily progressed westward with the advance of civilization, as the raven has correspondingly disappeared.

The fish crow (*Corvus ossifragus*) frequents the coast and the southern rivers of the United States (See FISH CROW.) The "jabbering" crow (*Corvus jamaicensis*) of the Blue Mountains of Jamaica is remarkable for the resemblance of its voice to human speech, which some of the other species of this genus may be taught to imitate. The small, glossy crow of India and Ceylon (*Corvus splendens*) frequents the towns, feeding on offal, and boldly entering rooms through open windows to snatch some morsel from the dinner table, these birds, called "hooded crows" in English India, are a nuisance by their boldness and thievish ways about camps and villages.

**CROW** (translation of the Hidatsa name of the tribe *absaroka*, hawk). A warlike nomadic tribe of Siouan stock, formerly roaming over the upper Yellowstone region of Wyoming and Montana and now gathered upon a reservation in the southeastern part of the latter State to the number of about 1750. They were formerly almost constantly at war with all their neighbors, particularly the Sioux, but have uniformly remained at peace with the whites, frequently furnishing a contingent of scouts against the hostile tribes.

In language the Crow are most closely related to the Hidatsa, with whom they also share certain cultural features, notably a clan system with maternal descent, which is, however, combined in both tribes with social usages dependent on the father's clan. The Crow had a series of ungraded military societies, and still engage in the ceremonial planting of a sacred tobacco plant under the auspices of esoteric organizations.

Consult: Curtis, *The North American Indian*, vol. iv (Cambridge, 1909); Lowie, *Social Life of the Crow Indians* (New York, 1912); id., *Societies of the Crow, Hidatsa and Mandan Indians* (ib., 1913).

**CROWBERRY, or CRAKEBERRY** (so called from its black color) (*Empetrum nigrum*). A small procumbent shrub, of the family Empetraceæ, a native of northern latitudes, abundant in moors and highlands. The family consists of a few heathlike shrubs. The berries of the crowberry are nearly black, surround the branches in crowded clusters, and each contains six to nine bony seeds and a watery,

acidulous juice, which is sometimes thought to be refreshing; but they are generally little esteemed. A fermented or vinous liquor is prepared from them in some northern countries. They are a favorite food of game. A second species, *Empetrum rubrum*, of southern South America, differs little from the northern plant, except in having red berries.

**CROW BLACKBIRD.** See GRACKLE.

**CROWD** (AS. *croda*, *gecrod*, throng; of unknown origin), or MOB. In the popular sense, an aggregation of individuals, regardless of their character or the purposes which brought them together. The psychological signification of a crowd is different. The aggregation becomes a crowd only "when the sentiments and ideas of all the persons in the gathering take one and the same direction, and their conscious personality vanishes." A half dozen individuals gathered together may become a crowd more easily than hundreds assembled accidentally.

The most distinctive characteristic of a crowd is that the individuals composing it do not think and act as each one would think and act independently. Back of the avowed causes of our acts are unconscious motives or forces that defy investigation, and these are the mainsprings of crowd activity. They are the common characteristics of the race, and it is in these points that people are more alike than in the acquired characteristics which result from education. It is owing to the fact that these forces which are requisite for crowd or mob activity are the primitive ones, that crowds are incapable of rising above very mediocre intellectual attainments. This also explains why the crowd descends in the scale of civilization below the average individuals composing it. If this were not true, it would be impossible to explain the conduct of otherwise respectable persons at lynchings and the degrading forms of torture imposed by them.

The causes which determine the appearance of the characteristics of the crowd are: (1) a sentiment of invincible power; (2) suggestion; and (3) contagion. Through the mere force of numbers, and also through the irresponsibility of the individual of the crowd, a feeling of invincible power takes possession of him. Nothing is permitted to stand between him and the realization of his aims. On this account the soldier in battle, acting under a common impulse, is braver and stronger than he would be otherwise. By means of suggestion contagion in the crowd is produced; the individuals are more or less in a hypnotic state; and the individual will and personality disappear in a common purpose or aim.

Crowds are not premeditative; they are impulsive and mobile. Aroused one minute to acts of generosity and heroism, they may descend the next to acts of extreme violence and torture. They are credulous, believing things wholly incomprehensible to those outside of crowd influence.

Much difference of opinion prevails concerning the rôle which mob action is to play in the civilization of the future. Gustave Le Bon, *The Crowd* (Eng. trans., London, 1900), asserts that "while all our ancient beliefs are tottering and disappearing, while the old pillars of society are giving way one by one, the power of the crowd is the only thing that nothing menaces, and of which the prestige is on the increase. The age we are about to enter will in truth be the era

of crowds." Professor Baldwin, *Social and Ethical Interpretations* (New York, 1897), differs widely from this point of view, claiming that "the attempt to build a fruitful conception of society upon the actions of the crowd under the influence of these imitative suggestions, seems to be crude and unphilosophical in the extreme." Consult Lee, *Crowds: A Moving Picture of Democracy* (New York, 1913). See SOCIOLOGY; SOCIAL PSYCHOLOGY.

**CROWD**, kroud, dial. kroöd, **CROUTH**, or, Welsh, **CRWTH**, kroöth (from Welsh *crwth*, Gael. *crut*, OIr. *croit*, violin; ultimately identical with Welsh *crwth*, bulge, on account of the rounded shape of the instrument). A musical bow instrument, of Welsh or Irish origin, and probably the oldest European instrument of that class. It is mentioned as a *chrotta* by Venantius Fortunatus in 609, and from then till the beginning of the nineteenth century, when it was still in use in Ireland, Wales, and Brittany, it seems to have preserved its form. But on the Continent the instrument underwent radical changes. Originally its body was square and was prolonged by two parallel arms, connected at the end by a crossbar. From this bar a narrow finger board extended to the middle of the sound box. The strings—originally three, later six in number—were stretched from the top of the parallel arms to the bottom of the sound box and were supported by a bridge placed between two sound holes. For illustration, see **MUSICAL INSTRUMENTS**. Consult F. W. Galpin, *Old English Instruments of Music* (London, 1911).

**CROW DUCK**, or SEA CROW. A coot.

**CROWE**, CATHERINE STEVENS (c1800-76). An English author. She was born at Borough Green, Kent, and lived chiefly in Edinburgh. Her principal work, entitled *The Night Side of Nature* (1848; new ed., 1904), has perhaps never been surpassed for weirdness of conception. In her novels, among which are *Adventures of Susan Hopley* (1841), *Lilly Dawson* (1847), and *Lanny Lockwood* (1854), she showed much skill and ingenuity in the development of the plot.

**CROWE**, EYRE (1824-1910). An English painter, born in London. He was a pupil of William Darley and later of Paul Delaroche in Paris. He traveled in the United States as amanuensis to Thackeray in 1852 and remained until 1857. In 1876 he was elected an associate of the Royal Academy. His painting is somewhat dry and hard and his color poor, but he treats his subjects with great care and feeling. His pictures include "Goldsmith's Mourners" (1863); "Nelson Leaving England" (1888); "The Brigs of Ayr" (1894); "The Gipsy's Rest" (1897); "James II at the Battle of La Hogue" (1898); "Napoleon's Abdication" (1902). He published *With Thackeray in America* (1893).

**CROWE**, SIR JOSEPH ARCHER (1825-96). An English journalist. He was born in London and began his journalistic career as foreign editor of the *Daily News*. During the Crimean War he was the correspondent of the *Illustrated London News*, and he acted in the same capacity for the *Times* during the Indian Mutiny. While in India he was also director of the Art School at Bombay from 1857 to 1859. He was Consul General at Leipzig in 1860-72 and at Düsseldorf in 1872-80. In the latter year he became commercial attaché in Berlin, and two years later attaché in Paris; and was secretary and protocolist to the Danubian Conference, London (1883), and British Plenipotentiary to the Sa-

moan Conference, Berlin (1889). He wrote, with G. B. Cavalcaselle, *The Early Flemish Painters* (1857) and *History of Painting in Italy* (5 vols., 1864-71).

**CROWELL**, KRŏ'el, EDWARD PAYSON (1830-1911). An American scholar and educator, born at Essex, Mass. He graduated at Amherst College in 1853, at Andover Theological Seminary in 1858, and in 1859 was licensed to preach by the Congregational church. From 1858 to 1864 he was instructor in German and professor of Latin at Amherst. In 1864 he was appointed to the chair of Latin languages and literature and in 1880-94 was dean. His publications include editions of Latin classics, such as those of the *De Senectute* and *De Amicitia* of Cicero (1871), the *De Officiis* of Cicero (1873), the *Andria* and *Adelphoe* of Terence (1874), and the *De Oratore* of Cicero (1879). He also translated and edited Bender's *Grundriss der römischen Literaturgeschichte* (1876) under the title, *A Brief History of Roman Literature* (1880), jointly with H. B. Richardson prepared a useful volume of *Selections from Latin Poets*, with notes (1882), and wrote *A Clue to the Prose Writings of the Silver Age* (1897).

**CROWELL**, JOHN FRANKLIN (1857- ). An American economist, born in York, Pa., and educated at Yale, Columbia, and Berlin universities. He was principal of Schuylkill Seminary, Fredericksburg, Pa., for several years; president of Trinity College, N. C. (1887-94), head of the department of economics and sociology at Smith College (1895-97); and in 1900-04 an expert of the United States Industrial Commission and also expert on internal commerce for the Bureau of Statistics in the Treasury Department. In 1906 he became editor of the *Wall Street Journal*, New York City, and in 1910-11 was president of the American Civic Alliance. His publications include: *The Logical Process of Social Development* (1898); *Internal Commerce of the United States* (1902); *Report to War Department on Deepening the Mississippi River* (1903); *Trunk Line Differentials* (1904); *Competition, Fair and Unfair* (1913).

**CROWFIELD**, KRŏ'feld, CHRISTOPHER. A name which Mrs. Harriet Beecher Stowe sometimes used as a pseudonym.

**CROWFOOT**. See RANUNCULUS.

**CROWFOOT FAMILY**. See RANUNCULACEAE.

**CROW GARLIC**. See ALLIUM.

**CROWLEY**, KRŏ'li. A city and the county seat of Acadia Parish, La., 135 miles west by north of New Orleans, on the Louisiana Western, the New Orleans, Texas and Mexico, and the Opelousas, Gulf, and North Western railroads (Map: Louisiana, C 3). Its principal industries are the cultivation of rice and rice milling. A rice-growing experiment station has been established here under State and Federal control. Petroleum in large quantities is produced in the vicinity. Settled about 1887, Crowley was incorporated two years later and grew rapidly. The government is administered by a mayor, elected biennially, and a council. The city contains an Odd Fellows Home and owns and operates its water works, electric-light plant, and sewerage system. Pop., 1890, 420; 1900, 4214; 1910, 5099.

**CROWN** (MDutch *krune*, *krone*, IceL. *krúna*, Ger. *Krone*, OHG. *corōne*, *corōna*, OF. *corone*, Fr. *couronne*, from Lat. *corona*, crown, Gk. *korōnē*, *korōnē*, curved end of a bow; connected

with Gael. *crúinn*, Welsh *crwn*, round, Lat. *curvus*, curved). The crown, as we understand it to-day, resembles in some degree the fillets, wreaths, and garlands which were worn among the Greeks as an emblem of office (in the case of the archons), as a distinction for the victors in the public games, or for citizens who had rendered exceptional service to their country. The Romans used them chiefly as rewards for valor. The most highly prized was the *corona obsidionalis*, made of grass or wild flowers, bestowed by a beleaguered garrison on the general who rescued them. Next came the *corona civica*, of oak leaves and acorns, as a reward to any soldier who had saved the life of a Roman citizen in battle; a place next to the senators was reserved for the wearer at public spectacles, and the whole assembly rose at his entrance. The *corona muralis*, a golden ring surmounted with turrets or battlements, was bestowed on the man who first scaled the wall of a besieged city; and the *corona triumphalis*, of three kinds, upon a general who obtained a triumph. There were other crowns not honorary, but emblematical, and regulated not by law, as were the former ones, but by custom. Of these the most important were the *corona sacerdotalis*, worn by priests and others engaged in sacrifice; *corona funebria*, or *sepulchralis*, with which the dead were crowned; *corona convivalis*, worn on festive occasions by banqueters; *corona nuptialis*, or bridal wreath; and *corona natalitia*, a chaplet suspended over the door of a house in which a child was born.

As the emblem of sovereignty in modern Europe, the crown was borrowed rather from the diadem than from the above-mentioned crowns. The Roman emperors are represented as wearing either the diadem, the laurel crown (a simple emblem of glory), or the radiating crown, probably of Eastern origin, which symbolized among the Romans the deification of the emperors. From the time of Constantine the Great (306-337) the diadem was the established emblem of Imperial power; but it was supplanted under Justinian (527-565) by the crown, called *stemma*, a slight elaboration upon the golden fillet; and this in turn was replaced by still more elaborate crowns, until the crown with arches became the accepted form. The ordinary type of the Imperial crown of the Middle Ages, as assumed in imitation of the Greek emperors by Charles the Bald (840-877), is found in an illuminated manuscript at Munich representing the Emperor Henry II (1002-24) crowned by Christ. The crown actually used at the coronation of many subsequent emperors, and now preserved in the Imperial treasury in Vienna, is a round cap surrounded by eight small shields with semicircular tops alternately adorned with precious stones and with pictures. It is surmounted by a small cross resting on an arch inscribed "Conradus Dei gratia Romanorum imperator augustus" (Conrad II, 1024-39). The present Austrian Imperial crown is of the style adopted by the Emperor Maximilian II in 1570. It is cleft in the centre so as partly to resemble a mitre; the golden circlet is jeweled and adorned with fleurs-de-lis and surmounted by a cap, above which rises a single arch surmounted by a cross. The new German Imperial crown resembles the old crown of Charlemagne and consists of eight shields ornamented with precious stones; the larger shields show a cross made of precious stones, the smaller the Imperial

eagle set with diamonds; above it rise four arches surmounted by a cross. The royal crown of Great Britain is a circle of gold enriched with precious stones and pearls and heightened by four crosses patée and four fleurs-de-lis alternately; from these rise four arches which close under a mound ensigned with a cross patée. See *TIARA*; *CORONET*.

So entirely was the crown regarded as the symbol of sovereignty that the word came to be used as synonymous with the monarchy, the state, and matters under the control of the executive authority. Thus we speak of crown lawyers, crown lands, etc., the term having no connection with the sovereign personally.

**CROWN and HALF CROWN** (so called from the crown which generally appears on the reverse). English silver coins since 1551, before which date they were made of gold. The crown, which is the five-shilling piece, is worth approximately \$1.20 in United States currency.

**CROWN, ORATION ON THE.** See *DE CORONA*.

**CROWN DEBTS.** In English law, all debts due to the crown, which are on record, or evidenced by a bond or other specialty, and also those due from accountants to the crown on account of moneys received for the use and benefit of the crown. Formerly the lands of the debtor were subject to a lien for the amount due, even in the hands of an innocent purchaser for value without notice of the lien, if they were conveyed after the debt became due. At present the lien is not binding on a *bona fide* purchaser or mortgagee for value, unless a writ of execution has been issued and registered before the execution of the mortgage or conveyance.

Simple contract debts have no such lien; but the crown has in all cases preference over private creditors in the distribution of the estates of bankrupts and deceased persons. See *ADMINISTRATION*; *DEBT*; *PREROGATIVE*; *EXCHEQUER*. Consult *Prideaux, Law of Judgments and Crown Debts, as they Affect Real Property* (4th ed., London, 1854).

**CROWNE, JOHN** (c.1640-c.1703). An English dramatist. He began his literary career with *Pandion and Amphigenia* (1665), interesting as one of the very few English heroic romances in imitation of Scudéry. His contemporary reputation as dramatist was gained by *The Destruction of Jerusalem*, in two parts (produced in 1677). His comedy *Sir Courtly Nice* (produced in 1685) held the stage through the eighteenth century. His numerous other plays have only slight interest. Consult *Dramatic Works* (4 vols., Edinburgh, 1873).

**CROWN GALL.** A very destructive disease that attacks nearly all kinds of fruit trees, grapes, almonds, walnuts, blackberries, raspberries, poplars, and chestnuts, frequently killing them. It exists in two forms—crown gall proper, which is described below, and hairy root, characterized by numerous thin fibrous roots. The exact relation between the two forms has not been positively determined. The point of attack is at the crown of the roots where the roots and stem join, the galls formed on young trees being half an inch or more in diameter. When young, they have the color of the young roots, but later they are considerably darker. They increase with the age of the tree, becoming as large as a man's fist or even larger. When small, they are soft masses of irregular fibres, and when older they exhibit concentric rings in cross section. On account of the deep wounds

and the attack made upon the vitality of its host the tree is frequently killed, and whole orchards are reported in which every tree has succumbed to this cause. The disease is widely distributed, being known in Europe, in many parts of the United States, and recently reported from New Zealand. The more common cause of crown gall is the bacterium, *Bacterium tumefaciens*. This organism has been repeatedly isolated from galls on many kinds of plants and galls produced by the inoculation of sound plants. Annual inspection of the trees, cutting off all galls and coating the cut surfaces with a paste made of copper sulphate and lime, is the most efficient protection known.

A crown gall of alfalfa that is rather common in parts of Europe and has been reported in this country is due to the fungus *Urophlyctis alfalfa*.

**CROWN GLASS.** The method of blowing soda-lime glass in which the original balloon is flattened, crown-shaped. A steel rod tipped with molten glass is now attached opposite to the blowpipe, which latter is then removed. By rapidly revolving the rod on a horizontal axis opposite the large opening of the glass furnace, the mass of glass softens and spreads out into a disk, thick at the centre and thinning towards the edges. The limit of the diameter of these disks is about 4 feet. On cooling and annealing, small windowpanes may be cut from the disk, leaving the irregular centre or "bull's-eye." This type of glass is no longer made in quantity except for art work, where it retains its place on account of its peculiar brilliant surface.

**CROWN IMPERIAL.** See *FRITILLARY*.

**CROWNINSHIELD, ARENT SCHUYLER** (1843-1908). A United States naval officer, born at Seneca Falls, N. Y. He graduated at the United States Naval Academy in 1863, was a participant in both of the attacks on Fort Fisher (December, 1864, and January, 1865), and in 1868 attained the rank of lieutenant commander. His further promotions were to the rank of commander (1880) and captain (1894). He became chief of the Bureau of Navigation of the Navy Department in 1902, during the Spanish-American War was a member of the Board of Naval Strategy, and was retired in 1903. He immediately preceded Capt. C. D. Sigbee in the command of the battleship *Maine*.

**CROWNINSHIELD, FREDERIC** (1845- ). An American decorative painter and writer. He was born in Boston, graduated at Harvard College in 1866, and studied abroad 11 years, under Rowbotham in London, Couture in Italy, and Cabanel in Paris. From 1879 to 1885 he was an instructor in the Boston Art School, after which he removed to New York, where he was president of the Fine Arts Federation from 1900 to 1909. In 1911 he was appointed director of the American Academy in Rome. He devoted himself principally to mural decoration, excelling particularly in the difficult work of harmonizing color, planning arrangement, and designing borders and arabesques, and contributed very materially to the development of this branch of art in America. His stained-glass windows and landscapes also deserve mention. His writings include: *Mural Painting* (1887); *Pictoris Carmina* (1900); *A Painter's Moods* (1902); *Tales in Metre* (1903).

**CROWNLANDS.** The English sovereign was at one time not only the nominal owner,

as lord paramount, of all the lands in England, but was also in his royal capacity one of the great landowners in the kingdom. He was the lord of many manors, and in him were vested most of the wastes, forests, and common lands throughout the realm. The ancient demesne lands of the crown are now contracted within narrow limits, having been almost entirely granted away to subjects. King William III so impoverished the crown in this manner that an act was passed (1 Anne, c. 7, § 5), the effect of which and of subsequent statutes is that all grants or leases from the crown of royal manors, or other possessions connected with land, for a period exceeding 31 years, are void. At a much earlier period (1455, c. 41) a Scottish statute had rendered the consent of Parliament necessary to the alienation of the property of the crown; but neither it nor the subsequent statutes which were passed with a similar object succeeded in checking the practice. Since the beginning of the reign of George III the English sovereign surrenders during his life the hereditary revenues derived from the crownlands in exchange for a fixed civil list granted by Parliament. The control of crownlands is now vested in commissioners appointed for that purpose, called the commissioners of woods, forests, and land revenues. These restrictions do not apply to estates purchased by the sovereigns out of the privy purse, or coming to the sovereign, his heirs, or successors, by descent or otherwise, from persons not beings kings or queens of the realm; for, although there is no marked line drawn between the proprietary rights which the King has as King and those which he has in his private capacity, and there are no lands which belong to the nation or state as a personified body, yet a distinction is made between the lands of ancient demesne and those coming by modern title, by which the alienation of the former is restricted and that of the latter left free. Consult Cox, *Institutions of the English Government*, etc. (London, 1863), and Stephen, *New Commentaries on the Laws of England* (14th ed., London, 1903). See CIVIL LIST, DEMESNE; FEUDALISM.

In Austria the term "crownland" is applied to the various territorial divisions into which that country is divided.

**CROWN POINT.** A city and the county seat of Lake Co., Ind., 39 miles south-southeast of Chicago, Ill., on the Chicago and Erie, and the Pittsburgh, Cincinnati, Chicago, and St. Louis railroads (Map: Indiana, B 1). Among the noteworthy features are the county jail and almshouse, the juvenile home for delinquents, and the Carnegie library. It has grain elevators, machine shops, wagon works, and a shirt and overall factory. Pop., 1900, 2336; 1910, 2526.

**CROWN POINT.** A town in Essex Co., N. Y., on the west shore of Lake Champlain, on the Barge Canal, and on the Delaware and Hudson Railroad, 110 miles north by east of Albany (Map: New York, G 2). It contains the Hammond library and chapel, Congo Park, and a memorial lighthouse erected to the memory of Samuel de Champlain. The town manufactures building material and staves and has sash and door factories, grain elevators, spar mills, and a creamery. In the vicinity are deposits of graphite and iron. Pop., 1900, 2112; 1910, 1690. Crown Point was first visited by Champlain, who, on July 5, 1609, fought and defeated the Iroquois Indians here. In 1714 it became an

important English trading station. About 1731 the French built upon the site Fort St. Frederic, which, in spite of hostile English expeditions directed against it in 1755 and 1756, they held until 1759, when it was partly destroyed after being abandoned by Montcalm and Dieskau, who returned to the defense of Quebec. Lord Jeffrey Amherst then took possession and during the winter of 1759-60 began the erection of Fortress Crown Point, the ruins of which still remain, and which, though never completed, ultimately cost fully \$10,000,000. On May 11, 1775, Seth Warner, at the head of a company of "Green Mountain Boys," captured the fort, then garrisoned by only 12 men. In 1777, on the approach of General Burgoyne, it was temporarily abandoned by the Americans. The grounds containing the ruins of Forts St. Frederic and Crown Point were presented to New York State in 1910 for a public park and reservation.

**CROWN SOLICITOR.** The solicitor to the Treasury, who, in state prosecutions in England, acts as solicitor for the crown in preparing the prosecution. In Ireland there are crown solicitors attached to each circuit, whose duties correspond in some degree to those of the procurator fiscal and crown agent in Scotland. In England there are no analogous local officers, such prosecutions being conducted by solicitors representing the parish or by private parties.

**CROW PHEASANT**, *fézant*. See COUCAL.

**CROWQUILL**, ALFRED. See FORRESTER, ALFRED HENRY.

**CROW SHRIKE.** See PIPING CROW.

**CROW'S NEST.** A perch for the lookout man of a vessel. It is placed on the foremast at its great height above the deck as is found desirable; protection from the weather is afforded by a platform surrounded by canvas.

**CROW STEP.** See CORRIE STEPS.

**CROWTHER**, *krou'thër*, SAMUEL ADJAI (c.1810-91). The first native Bishop of Africa, born in the Yoruba country. He was captured in a slave raid when a lad and was several times sold; was rescued by a British man-of-war from a Portuguese slaver, and placed in the mission school at Bathurst, and was the first student enrolled in the Fourah Bay College, where he subsequently served as an assistant instructor. Ordained in 1843, he became a missionary at Akassa. In 1864 he was consecrated Bishop of the Niger country. Crowther accompanied both of the British Niger expeditions, a journal of which he published (1859; 1872). His other works include a dictionary and grammar (1852) of the Yoruba language, a primer (1860), and a grammar (1864) of Nupe, and a translation of part of the New Testament into the Yoruba. Consult *Good out of Evil* (London, 1852) and *The Slave Boy Who Became Bishop of the Niger* (1888), and a biography (New York, 1889) by Page.

**CROYDON** (OEng. *Croidene*, from Fr. *crâie*, It. *creta*, OHG. *krida*, Ger. *Kreide*, chalk, from Lat. *creta*, chalk, AS., OHG. *dûn*, hill, Eng. *dune*, from Ir. *dûn*, Gael. *dûnon*, Welsh *dûn*, hill, fort; connected with AS. *tûn*, Eng. *town*, OHG. *zûn*, Ger. *Zaun*, hedge). A parliamentary and municipal borough and market town of Surrey, England, 10½ miles south of London Bridge (Map: England, F 5). Its parish church of John the Baptist dates from the fourteenth or fifteenth century and has been rebuilt three times. It lies on the edge of the chalk and plastic clay,

near the Banstead Downs, at the source of the Wandle, and is an important railway centre. Among its public buildings are the former palace of the archbishops of Canterbury (now used as a girls' school), Whitgift's Hospital, a handsome Elizabethan structure with which is connected a grammar school, and the municipal buildings containing the law courts and central public library. Owing to its proximity to London, a healthful climate, and the absence of factories, Croydon is a favorite residence place of London business men. This accounts for its great progress in municipal improvements and ownership of public utilities, libraries, water supply, artisans' dwellings and lodging houses, parks and recreation grounds, hospitals, baths, electric lighting, and street railways. It is governed by a mayor, 12 aldermen, and 36 councillors. Its death rate in 1914 was a little over 10 per 1000, the smallest in England for a city of its size. Pop., 1851, 10,000; 1901, 133,895; 1911, 169,559. Consult Steinman, *History of Croydon* (London, 1836).

**CROZAT**, krô'zâ'. A prominent French family of financiers and art collectors.—PIERRE (1661-1740) was treasurer to the King, and his various acquisitions included 19,000 original drawings, 2000 engravings, 400 paintings, 1382 intaglios and cameos, and a library of 20,000 volumes. Two series of engravings of the drawings and paintings in his and other collections were published in 1729-42 under the title of *Le cabinet de Crozat*. His nephews LOUIS FRANÇOIS (d. 1750), JOSEPH ANTOINE (d. 1750), and LOUIS ANTOINE (d. 1770), inherited the greater part of his collection, to which they added. After their deaths it was dispersed, and the treasures of Louis Antoine ultimately came into the possession of the Russian crown.

**CROZET** (krô'zâ') ISLANDS (in honor of the second in command of the French expedition under Marion-Dufresne which discovered the islands in 1772). A volcanic group in the Indian Ocean, between Kerguelen and Prince Edward Islands (Map: World, O 26). The larger islands are Possession (15 miles long, 8 miles wide, fair anchorage at Navire Bay), East, Apostle, and Hog. The total area is about 200 square miles. They have no permanent population, but are visited by seal-lion hunters and war vessels. They were recently annexed by France. Consult Roth, *Crozet's Voyage to Tasmania* (London, 1891).

**CROZIER**, krô'zhër, JOHN BEATTIE (1849-). An English writer on philosophy and history. He was born of Scottish parents, at Galt, Ontario, and was educated at the Galt Grammar School and at the University of Toronto. Graduating M.D. in 1872, he at once settled as physician in London. His *Religion of the Future* (1880) was followed by *Civilization and Progress* (1885). To aid him in carrying out his studies, he received in 1894 a civil-list pension of £50, which was doubled four years later. In 1897 appeared the first volume of *The History of Intellectual Development on the Lines of Modern Evolution*. Dr. Crozier has also published: *My Inner Life, Being a Chapter in Personal Evolution and Autobiography* (1898); *Lord Randolph Churchill: A Study of English Democracy* (1887); *Sociology as Applied to Practical Politics* (1911). In 1890 he received from the University of Toronto the degree of LL.D.

**CROZIER**, WILLIAM (1855-). A United States artillery officer and inventor of ordnance.

He was born in Carrollton, Ohio, and on his graduation from West Point in 1876 was assigned to the Fourth Artillery, in which he served three years, taking part in campaigns against the Sioux and Bannock Indians while at Western posts. From 1879 to 1884 he was instructor in mathematics at West Point, and in 1881 won by competitive examination an assignment to the Ordnance Department. In 1898 he was major and inspector general of volunteers. With General Buffington he invented the Buffington-Crozier disappearing gun carriage (see illustration and description under ORDNANCE), which ranks high among modern military inventions, and which has been installed in all the important coast-defense works of the United States. He is also the inventor of a wire-wound cannon. In 1899 he was appointed by President McKinley one of the American delegates to The Hague Peace Conference. In the Peking relief expedition in 1900 he served under General Chaffee as chief ordnance officer, and in November, 1901, was appointed chief of ordnance, with rank of brigadier general, and reappointed in 1905, 1909, and 1913, the detail being for four years. In 1912-13 he was detailed as president of the Army War College, Washington, D. C. Many of the notes and pamphlets on the construction of ordnance published by the War Department are from his pen. He is of international reputation regarding all matters connected with his department of military science.

**CRUCE**, LEE (1863-). An American public official, born in Crittenden Co., Ky. He was educated at Marion Academy and Vanderbilt University. In 1891 he removed to Ardmore, then in Indian Territory, where he continued to practice law until 1901. From 1903 to 1910 he was president of the Ardmore National Bank. In the latter year he was elected Governor of Oklahoma on the Democratic ticket for the term 1911-15.

**CRUCIAN**, krô'shan (Dutch *karuts*, Ger. *Karassius*, older *Karas*, *Karutze*, *Karutsch*, from Fr. *carassin*, It. *coracino*, crucian, from Lat. *coracinus*, Gk. *kopakivros*, *korakinos*, fish like a perch, from *kôpaî*, *korax*, raven, so called on account of its color). A species of carp (*Carassius vulgaris*), differing from the common German carp (*Cyprinus*) in the larger scales, in the absence of barbules at the mouth, and in the pharyngeal teeth. It may attain a large size and inhabits lakes, ponds, and slowly flowing rivers in northern Europe and Asia.

**CRUCIBLE** (ML. *crucibulum*, *crusibulum*, melting pot, from OF. *cruche*, Portug. *crugo*, crock, from OHG. *chrug*, Ger. *Krug*, AS. *crôg*, jar, or Ir. *crogan*, Gael. *crog*, Welsh *crochan*, pitcher; confused by popular etymology with Lat. *cruz*, cross). A highly refractory vessel in which metals, glass, or other material requiring a high temperature may be fused, melted, or treated. Crucibles are made in all sizes, from that of a lady's thimble to one which will hold 400 pounds of molten zinc. The essentials in their construction are that they be made to endure extreme heat without fusing and sudden changes of temperature without breaking. A great variety of materials are used for making crucibles, as clay, porcelain, graphite, lime, aluminum, silver, and platinum. The most common form is the *Hessian crucible*, made of equal parts of fire clay and coarse sand. It will stand extreme heat, but not very sudden changes in temperature. This is the cheapest variety and is

adequate for all ordinary processes of assaying ores and refining metals or alloys. They come in nests, in sizes varying from 2 to 8 inches in diameter. *Porcelain crucibles* are largely used for special fusions in chemical analyses. *Coke crucibles* are of value in the fusion of certain metals. *Graphite crucibles* meet all temperature conditions, but are slowly acted on by metallic oxides or gases. They are largely used in making crucible steel and various alloys and in refineries for the melting of gold-silver bullion. *Lime crucibles* are absolutely infusible. *Aluminum crucibles* possess the advantage of not being readily acted on by the materials fused, even sodium having no effect on them. The *Berlin crucibles* are made of a composition of fire clay, black lead, powdered coke, and old crucibles. *Silver crucibles* are of use for special analyses. *Platinum crucibles* are of utmost importance in chemical laboratories on account of the infusibility and noncorrosive character of the metal. Compounds of lead, mercury, and other metals which will combine with platinum when heated cannot be treated in these crucibles.

**CRUCIFERÆ** (Neo-Lat. nom. pl., from Lat. *cruz*, cross + *ferre*, to carry, bear), the mustard family. One of the most characteristic families of dicotyledons, including about 200 genera and 1800 species of very wide geographic distribution. It is a very well-marked and therefore easily distinguished family. There are four conspicuous characters by which it may be recognized: (1) the plants are more or less pungent, as the name "mustard family" would suggest; (2) there are four petals that spread in such a way as to form a Greek cross, from which the family name was taken, (3) there are six stamens, four of which are longer and stronger than the other two (*tetradynamous*); and (4) the fruit is the characteristic pod called a *silique*, which means that it is divided into two compartments by a false partition and that each half usually opens from below, leaving the seeds attached to the partition. The amount of variation in the family is indicated by the fact that 10 distinct tribes are recognized, the differences being based largely on the characters of the pods. Among the useful plants included in the family are mustard, radish, turnip, cabbage, cauliflower, cress, etc. Some of the ornamental plants are sweet alyssum, wallflower, the various stocks, etc. The family also contains many common weeds, such as shepherd's purse, wild mustard, pepper grass, etc. Sulphur compounds are common in many, as may be recognized from the odor given off when cooking. The pungence and acidity of the *Cruciferæ* seem to depend on a volatile oil, or on different volatile oils of a very similar character, present in various degrees in different species, or in the same species under different circumstances, and in different parts of the same plant. This diversity is very well illustrated in the common turnip, in the different qualities of the root as to sweetness and acidity in different soils or seasons, and in the difference between the flesh and the rind. The seeds of the *Cruciferæ* contain a fixed oil, which is extracted from some (rape, colza, in Europe; *Camelina sativa* and *Erysimum perfoliatum* in Japan), to be used as a lamp oil and in the arts, and the oil cake of which is valuable for feeding cattle.

**CRUCIFIX** (Lat. *cruci fixus*, fastened to the cross, from *cruz*, cross + *figere*, to fasten). A cross with the effigy of Christ affixed to it. It

must be distinguished, as an instrument of devotion and liturgical use, from the pictorial or other representations of the scene of the Crucifixion (q.v.). The cross (q.v.), at first used for devotional and symbolic purposes in its simplest form, came first to be decorated with the symbolic sacrificial lamb (see **CHRIST IN ART**), with the addition sometimes of the medallion bust of Christ, as in the Vatican cross. Perhaps the earliest crucifixes were small devotional objects which contained portions of the supposed true cross, such as that of Mount Athos, or were pictorial crosses, like that of Queen Theodolinda at Monza (sixth century). During the Carolingian age the crucifix came into somewhat more general use in the West, but, having been opposed in the East shortly after its introduction by the image-hating iconoclasts (eighth century), it obtained a foothold there, not as a plastic image, but in the form of a pictured Crucifixion. The manner in which the figure of Christ was represented on the crucifix is the same as that in pictures of the Crucifixion. During the Romanesque and Gothic periods there was an increasing number of large crucifixes, in some of which the figure was almost or wholly life-size. These were mainly of four classes—the stationary *altar crucifix*, that stood in the centre of the altar or at the entrance to the choir, sometimes with accompanying statues of the Virgin and St. John (e.g., at Weeselsburg, Saxony, thirteenth century); the *road crucifix*, at crossroads, or to mark certain spots for devotion; the *station crucifix*, which often crowns a hall at the end of a line of devotional stations (q.v.) known as the Way of the Cross; the *processional crucifix*, usually smaller and of metal, carried in religious processions. All such crucifixes became very numerous from the thirteenth to the sixteenth century and were sometimes carved by the greatest sculptors, as in the case of Brunelleschi's crucifix in Santa Maria Novella and Donatello's in Santa Croce, Florence.

A curious compromise between a picture of the Crucifixion and a crucifix is a class of representations in which the figure of Christ is painted on a panel cut in the shape of a cross. A very early instance is in the cathedral of Spoleto. Others by the Berlinghieri, Margaritone, and other early painters (thirteenth century) exist at Lucca, Pisa, and Florence. The plastic crucifix was more popular in northern Europe than in Italy before the fifteenth century and was often executed in wood, while for smaller examples ivory and metals were most used. The realistic schools of North Italy, however, during the fifteenth and sixteenth centuries, especially the artists of Modena, gloried in realistic crucifixes of painted wood and terra cotta. The most impressive are the large station crucifixes, such as that of the Sacro Monte at Varallo. Consult: Stockbauer, *Kunstgeschichte des Kreuzes* (Schaffhausen, 1820); Lazar, *Die beiden Wurzeln der Kreuzfigural Darstellung* (Strassburg, 1912); Schönemark, *Der Kreuzfixus in der bildenden Kunst* (ib., 1908). See also the bibliographies under **CROSS** and **JESUS CHRIST IN ART**.

**CRUCIFIXION**, THE. A favorite subject in Christian art since the sixth century, before which time effigies of Christ were unusual. The treatment of the subject may be divided into two periods: in the first, which lasts until about the twelfth century, Christ is represented adhering to the cross without signs of suffering, in-

stead of hanging upon it, the figure generally robed and wearing a royal crown—Christ living and triumphant. After the eighth century the two thieves, the centurion, the soldier with the sponge, the Virgin and St. John are usually introduced, together with symbolical figures. One of the earliest representations is the Crucifixion carved on the wooden door of the Santa Sabina, Rome, dating from the sixth century. In the tenth century the subject is treated more realistically, and after the twelfth the Christ Triumphant is replaced by the humiliated, dead, or dying Christ; the sufferings are accentuated, the crown of thorns appears. The Magdalene and sometimes the other Marys are associated with the Virgin and St. John, and often many other figures are introduced. This treatment, rendered popular by the schools of Cimabue and Giotto, was followed by the great masters of the Renaissance, almost all of whom painted the Crucifixion. Among the most famous are those by the Italian masters: Antonello da Messina (Antwerp Gallery); Fra Angelico (San Marco, Florence); Perugino (Santa Maria dei Pazzi, Florence); Andrea Mantegna (Louvre); Luca Signorelli (Florence Academy); Guido Reni (Bologna Gallery and San Lorenzo in Lucina, Rome); and Tintoretto (Scuola di San Rocco, Santi Giovanni e Paolo, and San Cassiano, Venice). Other famous examples are by the German masters Lucas Cranach (Stadtkirche, Weimar), and Albrecht Dürer (Dresden Museum); by the Flemish masters Rubens (Antwerp Museum) and Van Dyck (cathedral of Malines); by Murillo (Hermitage, St. Petersburg). Consult the bibliography of JESUS CHRIST IN ART.

**CRUDEN**, krōd'en, ALEXANDER (1701-70). An English scholar, maker of a well-known Bible concordance. He was born at Aberdeen and educated at Marischal College in that city, with a view to the church, but, having exhibited decided symptoms of insanity, he was for some time placed in confinement. On his release he left Aberdeen and, after spending several years as a tutor in and about London, settled in London in 1732 as a bookseller. In 1735 he received the title of "bookseller to the Queen." In 1737 he published his *Complete Concordance of the Holy Scriptures of the Old and New Testaments*. Soon afterward he relapsed into insanity, and his friends were obliged to remove him to a private asylum, where he appears to have been harshly treated. On his recovery he published an account of his sufferings (1738). He then acted as a corrector for the press. Cruden now believed himself divinely commissioned to reform the manners of the world, styled himself Alexander the Corrector, and went about exhorting the people to refrain from Sabbath breaking and profanity. He also petitioned the King for the honor of knighthood, and Parliament to constitute him by act "the corrector of the people," hoping by such honors to influence the people more effectually. He was mentally unbalanced during the rest of his life, and died at Islington, London, Nov. 1, 1770. The second edition of his concordance appeared in 1761 and the third in 1769; since then it has been repeatedly reprinted in full, with his definitions, which make it a Bible dictionary, or in abridgment, and has been made the basis of other concordances. Perhaps the best edition of the complete work is by Alexander Chalmers (London, 1812; 10th ed., 1824), with his life. See CONCORDANCE.

**CRUELTY** (OF. *cruauté, cruelté*, Fr. *cruauté*, from Lat. *crudelitas*, cruelty, from *crudelis*, cruel, *crudus*, raw). The intentional infliction of unnecessary pain. As a legal term, it is used chiefly in connection with divorce, with the treatment of children, and the treatment of animals.

As a ground for divorce, cruelty is not limited to physical violence, although formerly it was thought to be thus restricted. It is now held to include any unjustifiable conduct on the part of either husband or wife which so grievously wounds the feelings or destroys the peace of mind of the other as seriously to impair bodily health or endanger life, or which utterly destroys the legitimate ends and objects of matrimony. See DIVORCE.

While the common law does not permit a child to sue a parent in tort for injuries inflicted by cruel treatment, it does provide for the criminal punishment of parents guilty of such cruelty, and courts of equity have not hesitated to take children away from a parent who abuses their persons or corrupts their morals. Cruel treatment of animals by their owners is not a criminal offense at common law unless it is of such an aggravated kind as to amount to a nuisance. See CRUELTY TO ANIMALS; CRUELTY TO CHILDREN; HUSBAND AND WIFE; PARENT AND CHILD.

**CRUELTY TO ANIMALS**, PREVENTION OF. The earlier laws on this subject were not so much the outcome of humane principles as for the protection of animals considered as property. At the common law cruel treatment of animals by their owner was a criminal offense only when it was so aggravated as to be a nuisance. But the general tendency of the nineteenth century towards the organization of philanthropy was not slow to operate in this direction. England was the first country to organize (in 1824) a society for the purpose. Legislative enactments followed, and the Statute of 1849 provides a penalty not exceeding £5 (in addition to a further sum recoverable as damages by the owner) for any person who "shall cruelly beat, ill-treat, overdrive, abuse, or torture" a variety of domestic animals. The movement spread to Germany, France, and the United States. The first American society was chartered by the Legislature of New York in 1866, chiefly through the efforts of Henry Bergh, who was its president for 22 years. Cruelty to domestic animals is now punishable in most of the United States by fines ranging from \$5 to \$100, or imprisonment from 30 to 60 days, or both. The Ohio law, as amended in 1898, specifies cruelty by beating, mutilating, lack of good food and water, carrying in an inhuman manner, overwork, and crowded transportation. The New Hampshire Law of 1897 gives the officer making an arrest the right to seize the animal, notifying the owner, and to kill it if disabled, or to hold it as security for proper damages.

The Pennsylvania Society for the Prevention of Cruelty to Animals (founded 1867, incorporated 1868) is generally accepted as a model. It endeavors to prevent cruelty by moral suasion and well-considered advice rather than by coercion. It tries to educate where cruelty is due to ignorance and thus attempts to secure the use of proper harness and bits for horses and the abolition of the checkrein. A similar movement in England against the checkrein, excessive curbing, and the docking of horses' tails received great impetus from the hearty support of King

Edward VII, then Prince of Wales. The Pennsylvania society was the first to provide (1874) an ambulance for the removal of disabled animals and a derrick with chain pulley and sling for hoisting animals out of holes. In several States the weight of a load which may be drawn uphill is carefully regulated by the work of such societies; and homes are very generally established for stray dogs and cats, where the animals are painlessly put to death in case of need. Similar societies now exist in nearly every European country, in Algeria and South Africa, in Australia, and in Mexico, Brazil, and the Argentine Republic. See VIVISECTION; CRUELTY TO CHILDREN, PREVENTION OF; ORNITHOLOGICAL SOCIETIES.

#### CRUELTY TO CHILDREN, PREVENTION OF.

Owing to the long survival of the Roman idea of parental power (see CRUELTY), and the comparatively late growth of a tendency towards social legislation, it was not until very recent times that organized effort in this direction became common. Curiously enough, the movement in the direction of organization, in the United States at least, did not take definite shape until eight years after that for the prevention of cruelty to animals. The New York Society for the Prevention of Cruelty to Children was organized in January, 1875, and within five years 10 other societies followed, from Boston to San Francisco. As the movement grew, some societies originally intended for the protection of animals added the care of children to their purpose. In other cases "humane societies" were organized to cover both purposes. The total number of societies in the United States in 1913 for the protection of children, or children and animals, was 354. They were brought into close relations by the Humane Association (qv), which has included societies for the protection of children since 1887. As in the case of animals, their work is twofold—the promotion of better legislation in their field and the diligent enforcement of existing laws. They also investigate cases of alleged cruelty or neglect and present to the courts such facts as they learn. The New York society exceptionally includes the investigation of cases of destitution. By the work of the agents whom it stations in all the magistrates' courts it has come to have a powerful advisory influence on the commitment of destitute, neglected, and wayward children in New York City, thus affecting the lives, on an average, of about 15,000 children. These societies in general are private corporations, supported by subscriptions, although in New York, Philadelphia, and a few other places, some aid has been given from public funds. In the State of Indiana since 1889 boards of children's guardians have been organized by law, which not only investigate cases of cruelty and neglect and secure the punishment of the offenders, but also undertake subsequent oversight of the children. The Colorado Humane Society was made by the Legislature of 1901 a "State bureau of child and animal protection," with an appropriation of \$3000 per annum for two years; this, however, remains under private control, though three State officers are made ex officio members of its board of directors. Consult: Folks, *The Care of Destitute, Neglected, and Delinquent Children* (New York, 1902); Hart, *Preventive Treatment of Neglected Children* (ib., 1910); *Annual Reports of the American Humane Association* (1876—); *The National Humane Re-*

view (Albany, 1913—). See DEPENDENT CHILDREN.

**CRÜGER**, kry'g'er, JOHANNES (1598–1602). A German choral composer and musical author. He was born at Grossbresen, Province of Brandenburg, and was educated at the Jesuit College in Olmütz, under Hamburger at Ratibson, and at the University of Wittenberg. He was cantor of the Nikolaikirche, Berlin, from 1622 until his death. As a composer of Lutheran chorals, he has never been excelled, and many of his melodies, such as *Nun danket alle Gott: Jesus, meine Zuversicht; Schmücke dich, o liebe Seele*, have survived to the present day. His sacred compositions were published under the title *Praxis Pietatis Melica, oder Kirchenmelodien über Luthers und anderer Gesänge*, for four voices and two instruments (45th ed., 1736).

**CRUIKSHANK**, kryk'sh'ank, ERNEST ALEXANDER (1854—). A Canadian historical and military writer. He was born in Welland Co., Ontario, and was educated at Upper Canada College, early acquiring an extensive acquaintance with several modern languages. For a few years he was engaged in newspaper work in the United States, but he returned to Fort Erie, Ontario, became warden of Welland County (1886), police magistrate at Niagara Falls, Ontario (1903), and was in 1908 military archivist at Ottawa. In 1899–1904 he was lieutenant colonel commanding the Forty-fourth Regiment of militia, and afterward he was appointed a district officer commanding. In 1907 he was elected a fellow of the Royal Society of Canada. His principal publications are: *Battle of Lundy's Lane* (1889, 3d ed., 1894); *Battle of Queenston Heights* (1891); *Battlefields of the Niagara Peninsula* (1891). *A Century of Municipal History* (1892–93); *Battle of Fort George* (1896); *Documentary History of the Campaigns on the Niagara Frontier in 1812–13* (9 vols., 1896–1910).

**CRUIKSHANK**, kryk'sh'ank, GEORGE (1702–1788). An English caricaturist, etcher, and painter. He was born in London, Sept. 27, 1702, the younger son of Isaac Cruikshank, himself a caricaturist. His early wish to follow the sea was opposed by his mother, who desired that his father should instruct him in art; but his father refused, and George, failing to secure entrance into the Royal Academy schools, was almost entirely self-taught. His apprentice work as caricaturist appeared in the monthly periodicals called, respectively, *The Scourge* and *The Meteor*; and about the same period he made the sketches referring to the trial of Queen Caroline. Indeed, a great deal of his work, which at that time reflected the political situations of the day, may be looked upon now as being fairly historical in its bearing. By his "Bank-Note not to be Imitated" (1818) he contributed largely to the abolishment of hanging for minor offenses. As early as 1825 he began the illustrations for Grimm's *Fairy Tales*. In 1835 he published the first number of the famous *Comic Almanac*, which flourished under various managements until 1853. In 1847 he made a series of woodcuts on "The Bottle," and his "Sunday in London," "The Gin Trap," and "The Gin Juggernaut," published at this time, had a wide circulation. It is said that the unfortunate life of a personal friend influenced him to exercise his gifts in a crusade against intemperance. A strong moral was enforced in these drawings. His best-known illustrations were those made

for Dickens's *Oliver Twist* and the *Sketches by Boz*, those for the Waverley novels, and for the *Memoirs of Grimaldi*. In 1833 he designed and etched 15 plates for illustration of *Don Quixote*. After 1830 he essayed to paint, and, though he had little skill in manipulating pigments, his efforts in that direction show his keen insight into human nature and his unique genius in portraying the grotesquely humorous. His "Cinderella," painted in 1854, is in the South Kensington Museum. In 1862 he painted for the National Temperance League "The Worship of Bacchus," which is now in the National Gallery. Rossetti wrote, in reference to this picture, that "the man who in his old age occupies himself for nearly three years in painting this homily upon canvas, to the most negative results in point of art, deserves respect." George Cruikshank died in London, Feb. 1, 1878, and was buried in St. Paul's Cathedral. Consult: Stephens, *A Memoir of George Cruikshank* (London, 1891); Bates, *George Cruikshank* (ib., 1878); Jerrold, *Life of George Cruikshank* (ib., 1897); *Cruikshank's Water-Colors* (ib., 1903); Cohn, *Bibliographical Catalogue of the Printed Works Illustrated by George Cruikshank* (New York, 1914), and a biography by W. H. Chesson (1912).

**CRUIKSHANK, ISAAC** (c.1756-c.1811). An English caricaturist and water-color painter. He was born in Leith, the son of a painter, and, early left an orphan, followed his profession as an illustrator, water-color painter, and political caricaturist. He settled in London and married Miss Mary Macnaughten; excepting this, very little is known of his career. Two of his water colors, "A Child Lost" and "A Child Found," are in the South Kensington Museum. His political drawings were as well known as those of Gillray. His other designs include "The Rage; or 'Shepherds, I Have Lost my Waist,'" a skit on the exaggerated fashions of the times. His oldest son, ISAAC ROBERT (1789-1856), born in London, was a miniature painter and caricaturist. He satirized the political and social customs of the time, but after 1825 seems to have taken more to illustrating. His most popular work was done for *Life in London* (1821), in collaboration with his brother George, the text being supplied by Pierce Egan. It was dramatized and achieved a notable success. Further work of Cruikshank's was 71 illustrations for Charles Molloy Westmacott's *English Spy* (1825); and illustrations for Crichton's *Original Fables* (1834); Colburn's *Kalendar of Amusements* (1840); and *The Orphan*, a translation of Eugène Sue's *Mathilde*. While neither as gifted nor as imaginative as his celebrated brother George, Robert Cruikshank was a good draftsman and a clever artist. Consult biographies of George Cruikshank by Jerrold (1897) and W. H. Chesson (1912).

**CRUIKSHANK, WILLIAM CUMBERLAND** (1745-1800). A Scottish anatomist, author of a number of medical works, the most valuable of which is one on *Insensible Perspiration*, showing that carbonic acid is constantly given off by the skin. His work, *The Anatomy of the Absorbing Vessels of the Human Body* (1786, 2d ed., 1790), was translated into French, German, and Italian.

**CRUISER** (from *cruise*, from Dutch *kruisen*, to cruise, to cross, from *kruis*, OHG. *cruc*, Ger. *Kreuz*, AS. *crāc*, Eng. cross, from Lat. *crux*, cross). A war vessel built for cruising. The principal features of a cruiser are: (1) sea-

worthiness; (2) ability to keep at sea for long periods (this requires large capacity for coal and stores, and habitability); (3) speed; (4) offensive and defensive powers. Cruisers are of many kinds, but they may be divided into three general classes—*armored cruisers*, *protected cruisers*, and *unprotected cruisers*. The dividing line between the classes is not very distinct, as some cruisers partake of the character of two classes. *Armored cruisers* carry armor for the protection of the ship, or battery, which is applied vertically, or nearly so. *Protected cruisers* have no vertical armor, but the vitals are protected by a thick steel deck, which is nearly horizontal, placed about the level of the surface of the water, but having the edges of the deck near the ship's sides inclined downward, so as to meet the side several feet below water. This part of the deck (the slope) is thicker than the middle part, called the *flat*. *Unprotected cruisers* have no protective deck. Some of them have a watertight deck in the same region, but of insufficient thickness to admit of styling it a *protective* deck. Cruisers are frequently divided into first-class cruisers, second-class cruisers, etc. These distinctions are purely arbitrary and differ in the various navies. In the United States navy small cruisers are called "gunboats." This is a term properly applicable to craft so small as to approximate to large boats. In the British navy the terms "gunboat" and "gun vessel" are used almost as loosely. In addition to the regular cruisers a most important addition to the naval force in time of war is found in fast merchant steamers, which are frequently armed as *auxiliary cruisers* and used as ocean scouts or fleet scouts; in the former case they are bound on distant missions, in the latter they accompany the fleet. See SHIPS, ARMORED.

**CRUITHNIGH**, *kruth'ni*, or **CRUITHNIANS**, *kruth'ni-anz*. The name given by the Irish to invading tribes of Picts, from whom the kings of Ulster were supposed to have descended. The appellation was subsequently applied to some of the inhabitants of the counties of Antrim and Down. They were also called Dalaradians, and their country Dalaradia (q.v.). The name "Cruithnigh" is sometimes derived from the custom of painting and tattooing practiced by the people. The Irish called the Picts of Britain Cruithnigh, and it is probable that the Irish Cruithnigh were related to those of Britain, as a Pictish colony came from Scotland and settled in Dalaradia a century before the Christian era. Consult Skene, *Celtic Scotland* (3 vols., Edinburgh, 1876-80).

**CRUIVE**, *krv*, or **ZAIRE**, *zâr* (probably from Gael. *crò*, sheep cote, hovel). A contrivance erected upon rivers in Scotland for the purpose of catching salmon. These weirs are of great antiquity and consist of a kind of hedge formed by stakes driven into the ground, the interstices being filled with brush, and the mode of capturing salmon being similar to those employed with bag and stake nets. See NET.

**CRUMMELL, ALEXANDER** (1818-98). A negro clergyman of the Protestant Episcopal church. He was born in New York of a slave father and free mother, was educated at the Oneida Institute, N. Y., and graduated from Queens' College, Cambridge, England. He held a professorship in the Liberian College, at Liberia, West Africa, and then returned to the United States, and was rector for 22 years of St. Luke's Church, Washington, D. C. He was

one of the first negro clergymen to enter the Episcopal church. His works comprise: *The Future of Africa* (1862); *The Greatness of Christ, and Other Sermons* (1882); *Africa and America* (1891).

**CRUMMLES**, krum'lz, VINCENT. The head of a theatrical family, in Dickens's *Nickolay Nickleby*.

**CRUNCH'ER**, JERRY. In Dickens's *Tale of Two Cities*, a general-utility man in Tellson's banking house by day and a "resurrection man" at night.

**CRUPPI**, kru'pé', JEAN (1855- ). A French public official, born at Toulouse, France. He was general advocate in the Court of Appeals at Paris, advocate at the Court of Cassation, and, being elected a deputy for Haute-Garonne, served as Vice President of the Chamber. Later he was Minister of Commerce, and, in 1911, Minister of Foreign Affairs in the Monis cabinet. He was made a chevalier of the Legion of Honor. His publications include. *Un avocat journaliste au XVIIIe siècle, La cour d'assises: Pour l'expansion économique de la France* (1910). *Femmes écrivains d'aujourd'hui* (1912).

**CRUQUIUS**, krou'ki-ús. The Latinized name of a renowned Flemish scholar of the sixteenth century, Jacques de Crusque. He was professor at Bruges, and his studies in Horace have had a most important influence on our knowledge of that poet. In his commentary on Horace (Antwerp, 1578) Cruquius gives readings from the four valuable "Blandinian" manuscripts, since destroyed, one of which is very ancient, and also quotes the marginal notes of an early commentator, whose name is lost, but who is now cited as "Commentator Cruquianus." Consult Palmer, edition of Horace's *Satires*, xxix-xxxii (4th ed, London, 1891), and Endt, *Studien zum Commentator Cruquianus* (Leipzig, 1906).

**CRUSADE** (Fr. *croisade*, It. *crociata*, from MI. *cruciata*, crusade, from *cruciare*, to mark with the cross, from Lat. *crux*, cross.) A war undertaken for a religious purpose; specifically one of the wars waged by the Christians for the recovery of the Holy Land. Towards the close of the eleventh century, when the Byzantine Empire was in great danger of being conquered by the Seljukian Turks, the Emperor Alexis Comnenus appealed for help. At the Council of Clermont, in November, 1095, Pope Urban II made his memorable speech, in which he exhorted his hearers to bear aid to the Eastern Empire and to reconquer Jerusalem. His fiery eloquence evoked an enthusiastic response; for he appealed to all the motives which were then influential—to the spirit of religious enthusiasm, to the love of fighting and adventure, and to the desire, in many, of bettering their fortunes. After the conclusion of Urban's speech many pressed forward to take the Crusader's vow and the cross, which was the symbol of this vow and gave its name to the movement. The agitation spread rapidly to all the countries of western Europe and embraced all ranks of society. The nobles made deliberate preparations for an expedition which was expected to last three years; but the common people, among whom Peter the Hermit (q.v.) and others had been busily preaching the Crusade, were too impatient, and many of them too poor, to wait. In the spring of 1096 thousands of men, women, and children started in different bands under the leadership of Walter the Penniless, Peter, and others. They marched from Cologne and the Rhineland, across Ger-

many, through Hungary, along the Danube, and southward to Constantinople. Later bands were very disorderly; their course was marked by persecution of the Jews, robbery, and plunder, and many of them were slaughtered by the infuriated inhabitants of the countries through which they passed. Those who reached Constantinople were received graciously by the Emperor. Their disorderly conduct, however, soon caused him to transport them to Asia Minor, where almost all were slain by the Turks. The march of these disorderly bands is generally styled the Peasants' Crusade.

**The First Crusade**, 1096-99. In the summer and fall of 1096 the real armies, led by the nobles, began their march. Among the leaders were Godfrey of Bouillon, Bohemond, Prince of Tarentum, Robert of Normandy, Robert of Flanders, and Raymond, Count of Toulouse, who was the latest of all to start. They proceeded by different routes to Constantinople, where they were delayed by the Emperor, who was alarmed by their numbers and lack of discipline, but wished to make use of their strength. An agreement was finally made, by which almost all of the leaders were induced to become his vassals, but in the campaign which followed neither party kept its promises, and the long negotiations resulted only in a mutual feeling of antagonism, which proved disastrous to the Christian cause. All of the Crusaders met at the siege of Nicaea, in May, 1097, when the army may have numbered 100,000, besides the women and noncombatants. Six millions were said to have taken the cross, but undoubtedly the number was greatly exaggerated; many, besides, who had taken the vow had turned back or were dead. Nicaea was taken, the Sultan of Iconium was defeated at Doryleum, and in a few months the Crusaders accomplished the arduous march to Antioch, which was captured after a siege lasting from Oct. 21, 1097, to June 2, 1098. In the meantime Baldwin, brother of Godfrey, had taken possession of Edessa for himself, and Bohemond now established himself as Prince of Antioch. The leaders became so intent on making conquests for their own profit that the advance to Jerusalem was delayed for months. Finally, on June 7, 1099, the remnants of the army, about 20,000 in number, reached Jerusalem. After a siege of five weeks the city was captured, by reckless daring, on July 15. The Crusaders vented their wrath in an indiscriminate massacre, in which neither youth nor age was spared, and men and women were slaughtered in the holy places. The leaders wrote home exultingly, "In Solomon's Porch and in his temple our men rode in the blood of the Saracens up to the knees of their horses." Godfrey was elected "Baron and Defender of the Holy Sepulchre," and after the battle of Ascalon, in which the Egyptian army was defeated with great slaughter, almost all of the Crusaders returned home, leaving Godfrey with a small band of followers to defend Jerusalem. Bohemond held Antioch with his Norman followers. Baldwin was in the distant Edessa. A large part of Asia Minor was restored to the Greek Emperor. The news of the victories gained by the Crusaders set into motion three great armies from France, Germany, and Italy (1101-02), but, owing to their own excesses and folly, they fell an easy prey to the Mussulmans in Asia Minor.

**The Second Crusade**, 1147-49. In 1144 Edessa was captured by the Mohammedans. The news

of its loss aroused great alarm in the West, and a new Crusade was initiated, in which special privileges were offered to all participants. Bernard of Clairvaux was the great preacher of this movement. Conrad III of Germany and Louis VII of France took the cross and led great armies to the relief of the Holy Land, Conrad and Frederick Barbarossa starting from Ratisbon, in April, 1147. The march was very disorderly, and when the Crusaders entered the Byzantine Empire they came to blows with the Greeks. After much trouble the Bosphorus was crossed, and the army advanced into Asia Minor, led by Greek guides. The guides proved unsatisfactory, the troops were harassed by the Turks, and finally, threatened with famine and death, they retreated, closely pursued by the enemy, only a very few getting back to Nicea. Louis had better fortune, his army was more orderly, and he was well received by the Greek Emperor, although, when the French King crossed to Asia Minor, the Emperor refused to furnish guides until Louis and his barons had taken the oath of homage. Near Nicea they met the German fugitives, with whom they joined forces and marched along the coast. Conrad soon turned back and spent the winter in Constantinople, but Louis went on, and, after meeting with a terrible defeat, in which the loss was very great, he and his knights went by ships to Antioch, while the common people were left behind to be slaughtered. From Antioch Louis proceeded to Jerusalem, where he was joined by Conrad. Together they planned the renewal of hostilities on a grand scale, but their schemes miscarried, and the kings went home in disgust.

**The Third Crusade, 1189-91.** The capture of Jerusalem by Saladin, in 1187, caused Frederick Barbarossa, Philip Augustus of France, and Richard the Lion-Hearted of England to take the cross. Frederick was drowned soon after he reached Syria. Richard and Philip captured Acre after a long siege, but the two kings quarreled so bitterly that Philip went home soon after the capture. Richard, thwarted at every turn by Saladin (q.v.), was compelled to make a truce without accomplishing anything more.

**The Fourth Crusade, 1201-04.** Innocent III (q.v.) made every effort to bring about a new Crusade. A great number of Latin nobles and knights were induced to take the cross, and the enthusiasm of the people was unbounded. Among the leaders in this Crusade were Baldwin of Flanders, Boniface of Montferrat, Geoffroy de Villehardouin, Louis of Blois, and Simon de Montfort. Arrangements were made with Venice that the Republic should supply the vessels and provisions for the journey; but, when the Crusaders reached Venice, they could not raise the amount agreed upon for payment. After a long delay they made a new bargain with Venice by undertaking to capture for her the city of Zara, in Dalmatia. The common soldiers were kept in ignorance of the infamous plan until it was too late for effectual protest. Zara was sacked, and the army spent the winter there. In the meantime a new plot was hatched by which, under pretense of reinstating the rightful Byzantine Emperor, Isaac Angelus, the Crusade was diverted to Constantinople. Isaac Angelus was restored to his throne, but, as he was not able to fulfill the conditions to which he had been compelled to agree, the Crusaders

turned against him. Constantinople was captured a second time and sacked (1204). Much of the city was burned, precious works of art were destroyed, and enormous quantities of booty were secured. The Crusaders and the Venetians divided their conquests, and the Latin Empire (q.v.) was established.

The last three Crusades effected little permanent good for the Christian cause. *The Fifth Crusade* took place in 1228-29. The German Emperor, Frederick II (q.v.), who had taken the vow, went to the Holy Land and, by a treaty with the Mohammedan powers, secured Jerusalem. In 1244 the Holy City fell into the hands of the Kharezmians. *The Sixth Crusade* (1248-54) was led by Louis IX of France (St. Louis). He invaded Egypt and, although at first successful, was soon defeated, captured, and compelled to pay an enormous ransom. He then went to the Holy Land, rebuilt some fortresses, but accomplished little of importance. In 1270 he started on the *Seventh Crusade*, but was induced to turn aside to Tunis, where he died. Edward Plantagenet associated himself with Louis IX in that Crusade. He abandoned the Holy Land in 1272, and this year is generally considered to mark the end of the Crusades.

In addition to the seven principal Crusades, there were countless other expeditions. In some of these large armies took part, as in the Crusade of 1101, of which mention has been made; the German Crusade of 1197, the Children's Crusade (q.v.) in 1212, and the Crusade of John of Brienne and Andrew II of Hungary in 1217-21, which achieved the conquest of Damietta, in Egypt, in 1219. The last is often called the Fifth Crusade, and in fact the first four Crusades are the only ones to which the same numbers are assigned by unanimous consent. In addition, almost every year, from 1100 to 1270, small bands of Crusaders went to the Holy Land, and after 1270 many attempts were made to reconquer Jerusalem. There were also Crusades in the West against the Moors in Spain and against the heathen Prussians. (See TEUTONIC KNIGHTS.) Besides these Crusades against pagans many Crusades were preached against the Albigenses (q.v.), the Hohenstaufen (q.v.), and other opponents of the popes, the name being used for all kinds of expeditions in which the Church was interested.

**The Results of the Crusades.** The Crusades were of very great importance in the history of Europe in that they accelerated many movements which without them would probably have advanced much more gradually. They contributed to the growth of the great Italian seaports by establishing closer commercial communications between Europe and the East; they enriched the Church and increased its powers, and they helped to develop the strength of the French monarchy by killing off large numbers of the turbulent nobility, or removing them to a more grateful field of activity in Asia, and Africa. For Europe at large the most important results were these: 1. They checked the advance of the Mohammedans for a considerable period of time; for, by carrying the war into the enemy's country, they prevented his advance into Europe. It is true that too much stress may be laid on this fact, for the Crusades undoubtedly weakened the Byzantine Empire and made it an easier prey for the Turks in the fifteenth century; but in

the twelfth and thirteenth centuries the Crusading states in the East served as outposts to guard against the invasion of Europe. 2. The Crusades enriched Europe greatly by promoting the growth of commerce. In order to transfer the Crusading armies and to supply their various needs, large ships had to be built. These brought back to the West the products of the Orient. In Asia and Africa the Crusaders acquired new tastes and desires, which had to be gratified by a more extensive commerce—witness the remarkable growth in the use of sugar and spices in the twelfth century. Money, which previously had been hoarded, was put into circulation to equip the crusading hosts. All of these causes led to a remarkable growth in wealth and prosperity, which benefited especially the inhabitants of the cities in western Europe. This is regarded by many as the most important result of the Crusades. 3. The Crusades caused a broadening of the intellectual horizon and originated a tendency towards skepticism. "On its Oriental *Studienreisen* young Europe studied industriously and with great results." The constant contact for two centuries with the more advanced Byzantine and Arabic culture taught the Crusaders many lessons in civilization. The admiration which they learned to feel for heretics and Mohammedans dispelled many of their prejudices. Some Crusaders became Mohammedans, others became freethinkers. There was a rapid spread of heresies. "The roots of the Renaissance are to be found in the civilization of the Crusades." There have been three periods of great advance in the history of Europe—the Crusades, the Reformation, and the French Revolution; and of these three the Crusades were not the least important and influential.

**Bibliography.** The literature of the Crusades is very extensive, and only a few of the principal titles can be given. The most important collection of sources is the *Recueil des historiens des croisades*, of which 15 folio volumes have been published (Paris, 1841 et seq.). Consult also Bongars, *Gesta Dei per Francos* (Hanover, 1611); the publications of the Société de l'Orient (Paris, 1878-84), Villehardouin and De Joinville, *Chronicles of the Crusades* ("Everyman's Library," 1908). Of general histories the best are: Wilken, *Geschichte der Kreuzzüge* (7 vols., Leipzig, 1807-32); Michaud, *L'Histoire des croisades* (Paris, 1825-29, many later editions), and also an English translation by Robson, *History of the Crusades* (London, 1881); Kugler, *Geschichte der Kreuzzüge* (Berlin, 1891); Archer and Kingsford, *The Crusades* (New York, 1895); Bréhier, *L'Eglise et l'Orient au Moyen Age* (Paris, 1907); Prutz, *Kulturgeschichte der Kreuzzüge* (Berlin, 1883); Von Sybel, *Geschichte des ersten Kreuzzuges* (Leipzig, 1900); Röhrich, *Geschichte des Königreichs Jerusalem* (Berlin, 1898). See ANTIOCH, PRINCIPALITY OF; DANDOLO, LATIN KINGDOM OF JERUSALEM.

**CRUSADE**, CHILDREN'S. See CHILDREN'S CRUSADE.

**CRUSCA**, krō'sakā, ACCADEMIA DELLA. See ACADEMY.

**CRUSENSTOLPE**, krō'sen-stōl'pe, MAGNUS JAKOB VON (1795-1865). A Swedish publicist and author, born in Jönköping. He became editor of *Ställningar och förhållanden* in 1838 and for publishing therein certain expressions against the government was imprisoned from 1838 to 1841. He is best known for his his-

torical fiction, such as *Morianen* ('The Moor,' 1840-44) and *Carl Johan och Svenskarne* ('Carl Johan and the Swedes,' 1845-46). Consult Ahnfelt, *Magnus Jakob C.* (2 vols., 1880-81).

**CRUSHING MACHINERY.** See GRINDING AND PULVERIZING MACHINERY.

**CRUSIUS**, krō'sē-us, OTTO (1857 - ). A German classical scholar, born at Hanover. He became professor at the University of Heidelberg in 1898 and at Munich in 1903. His works include: *Zur griechischen Religionsgeschichte* (1886); *Untersuchungen zu Herondas* (1892); etc. He edited *Philologus*; *Herondas* (1901); *Fabeln des Babrius* (1897); and *Griechische Lyriker* (1897 et seq.). Since 1910 he has, with others, published several volumes of *Das Erbe der Alter Schriften über Wesen und Wirkung der Antike* (Leipzig).

**CRUSOE**, krō'sō, ROBINSON. See ROBINSON CRUSOE.

**CRUSQUE**, JACQUES DE. See Latinized form CRUQUIS.

**CRUSTA'CEA** (Neo-Lat. nom. pl., from Lat. *crusta*, crust). A class of gill-bearing aquatic arthropods, differing from other Branchiata in having five pairs of appendages on the head, the first two of which are antennae, and in having all of the limbs except the first pair of antennae biramous.

**Structure.** The Crustacea derive their name from the hard armor which in most of them covers the whole body, forming a complex exoskeleton, calcareous and intermediate between shell and bone in the higher forms, while in the lower and smaller kinds it consists principally of chitin and corresponds more nearly in its nature with the integuments of insects. It is secreted by the epidermis on its outer side and serves not merely for protection, but also for the attachment of the muscles. Its color is dependent upon the absence or presence and amount of pigment, which is also a product of the epidermis and is formed during the growth of the skeleton. These pigment cells are often very ornamental, especially under the microscope, as their shape is beautifully and very irregularly stellate. Usually, however, the pigment is so abundant as to make the body wall opaque and the individual pigment cells are no longer visible. The mineral matter of the skeleton is chiefly carbonate of lime. The smallest crustaceans have little or none in the skeleton, but in all of the larger forms it is present in greater or less abundance. In the so-called "stone crabs" so much is present that the skeleton is really as hard as a rock. In all cases, however, where the skeleton covers a joint it is thin and free from mineral matter, thus permitting perfect freedom of movement. The bristles and hairs often found on the outside of the skeleton are of the same essential structure as it and have a central core of epidermis. In barnacles (q.v.), ostracods, water fleas (q.v.), and a few other crustaceans, there is, in addition to the external skeleton, and formed as an outgrowth of it, a true shell, whose only function is protection. This shell may consist of several pieces, as in barnacles, or be strictly bivalve, as in water fleas, and it may be wholly chitinous or very firmly calcified. Sometimes it is capable of inclosing the entire animal, but often it only seems to protect certain parts. It is usually hinged along the dorsal side of the animal, where it is attached to the skeleton and is supplied with muscles for closing it.

The crustacean body is composed of segments, some very distinct, while others coalesce or are consolidated, of which the thorax of a crab affords an excellent example. The first five rings are regarded as forming the head, the next eight the thorax, when that part of the body is separable from what follows.

*Epidermis and Molting.*—The crustaceous covering has beneath it a true skin and, like the epidermis, is cast off from time to time and supplied anew, as the growth of the animal requires more room for the internal parts. In this molting or casting of the shell the animal divests itself of its covering, not in separate parts, but in one piece, including the coverings of the limbs and even of the antennæ, although the membranes which connect the hard plates are split and torn. A period of apparent sickness precedes, and agitation accompanies the process; and the thick muscular parts of the limbs of crabs and lobsters become soft and flaccid, so as to be more easily extricated from their hard covering. The loss of a limb, which sometimes takes place in this process and is otherwise a frequent occurrence, is easily repaired, for a new one grows in its stead; but it is a curious circumstance that in order to this reproduction the limb must be broken off at a particular joint, the second from the body, thus leaving only a short stump, and when a limb is broken elsewhere, the animal itself exercises the remarkable power of throwing it off by this joint.

*Locomotive and Other Organs.*—The principal organ of locomotion in many Crustacea, as in the lobster, shrimp, etc., is the abdomen, terminating in fanlike appendages; by bending the abdomen suddenly down under the body, the animal darts backward in the water. The limbs, which are connected with the thoracic rings, are, in some, organs of swimming; those of others are used for walking at the bottom of the water or on dry ground. Some have "swimming feet" or pleopods attached to the abdomen, often very different from the thoracic legs. The legs of some are fitted for burrowing. The first pair of legs is not infrequently transformed into a pair of powerful pincers or "claws," the last joint but one being prolonged so as to oppose the last joint, which becomes attached as to the side of it, and these are used for seizing and tearing food. The first pair of appendages are organs of touch called "antennules"; following these are the antennæ, also sense organs, then come a pair of powerful jaws, the mandibles; and back of these are two pairs of accessory jaws, the maxillæ. The thoracic feet, which follow in regular order, are sometimes modified to function as jaws and are then called "maxillipeds." In some forms the mouth parts are greatly modified to form sucking instead of masticating organs. The digestive organs are very simple: there is a short but capacious gullet, a large stomach, and a straight and simple intestinal tube. A well-developed digestive gland called the "liver" is often present. The pyloric region of the stomach is sometimes furnished with a remarkable apparatus of hard tubercles or sharp teeth for grinding or tearing food. Many of the Crustacea feed on animal food and are very voracious; many, however, feed on vegetable food. The nervous system of crustaceans agrees generally with that of other anthropods and exhibits many gradations of concentration. The

eyes are either simple (ocelli), aggregate (consisting of several ocelli under a common cornea), or compound; and the compound eyes are often elevated on stalks. Besides eyes some crustaceans have ciliated pits or cavities that seem to be sense organs, perhaps for smell or taste. Others have otcysts or positional organs, but it is doubtful whether any have the sense of hearing. In some Schizopoda there are also "accessory eyes" on the basal points of certain thoracic feet and in the middle line of the abdomen. The gills are variously placed, on the sides of the body, or on the thoracic limbs, on the abdominal legs, etc. The heart is always in the middle line of the body on the dorsal side, is of variable form, and distributes the blood by a number of trunks through the system; but the blood returns to venous sinuses, from which, and not from the heart, it is sent into the gills, and it is not until after its aeration in the gills that it comes to the heart again.

*Reproduction and Ecology.* The sexes are distinct in most Crustacea, and all are oviparous. The eggs are almost invariably hatched in water, even those of terrestrial forms, and a sort of incubation often takes place, as the eggs are carried about under the abdomen or thorax of the female, attached to the pleopods or other appendages. Except in a few cases the development takes place by metamorphosis, through a very remarkable series of larval stages. All the lower Crustacea hatch as minute, oval, unsegmented creatures with three pairs of appendages, and this larva is called a "nauplius." Although the higher Crustacea hatch as a more highly organized form called "zoea," and later pass through an intermediate larval form, the "megalops," all pass through a nauplius stage in the egg. See BARNACLE for illustration of nauplius, and see CRAB for illustrations of zoea and megalops.

More than 10,000 species of living Crustacea are known, of which the greater number are marine, some inhabit fresh waters, running or stagnant, comparatively few are terrestrial. Many exhibit a high degree of intelligence. The Crustacea constitute, in an economic sense, perhaps the most important group of invertebrates. The myriads of the smaller forms that drift about the ocean and the great lakes furnish the greater part of the fare of the important food fishes and are thus indirectly of value to mankind. In the economy of the ocean itself Crustacea are also of great importance, for they act as the natural scavengers of the sea.

*Classification and Phylogeny.* Classification of the Crustacea is based upon the number and manner of consolidation of the segments of the body and upon the number and character of the appendages. There are three large groups, (I) Trilobita, (II) Entomostraca, and (III) Malacostraca (qq.v.), which may be considered to constitute subclasses. The principal characters of these subclasses and their component orders, together with some notes of the geological history of the groups, are here briefly given.

I. *TRILOBITA.* This is an extinct group of Crustacea that lived during Paleozoic time only. No near relatives are known, though they exhibit some affinities with the Phyllopoda. The body consists of three regions—head, thorax, and abdomen—and it is further divided by a raised median dorsal ridge into three longitud-

inal lobes from which character the group derives its name. The thorax has a variable number (2 to 19) of segments that are so articulated as to enable the animal to coil itself more or less closely after the manner of an armadillo. The trilobites constitute a very primitive group of Crustacea, and, as their remains are found in the oldest sedimentary rocks, they were among the earliest inhabitants of the earth. They are of great importance to the geologist, as the various species are very characteristic of the particular layers of rock in which they occur, and for this reason they will be more fully described in an article under their own name.

II. ENTOMOSTRACA. The members of this subclass present a great variety of form and habit of life, but they are alike in the variability of the degree of segmentation of the body. They are with few exceptions small, and all are aquatic. They are divided into four orders. 1. In the order *Phyllopoda* the segmentation is distinct, the anterior portion of the body is covered by a cephalic shield, and the thoracic appendages are leaflike, this latter character giving the group its name. In some phyllopods, as *Apus*, and the brine shrimps (*Branchipus* and *Artemia*), the body is elongated, well segmented, partly covered by a single dorsal shield and divided into three regions. In other genera, as *Daphnia* and *Ethemia*, the body is not well segmented and is inclosed in a bivalve shell articulated by a hinge at the dorsal median line. The phyllopods are doubtfully represented in the Cambrian rocks. One genus, *Ethemia*, has enjoyed a remarkably long life period, since it has existed from Devonian to recent times. During the Devonian and Carboniferous periods the Phyllopoda abounded in the brackish waters of the coastal swamps, in the rocks of the Tertiary era the members of this order are less common. A single doubtful representative of the suborder Cladocera, the genus *Lyncetes*, has been found in the Carboniferous rocks. 2. *Ostracoda*.—In this order the animals are all small, mostly microscopic, and with the body inclosed in a hinged bivalve shell that can be tightly shut by a specially developed adductor muscle. These animals occur by myriads in the modern ocean, seas, and lakes, mostly swimming near the surface of the water, and they seem to have lived in equal abundance in the seas of past time, for their fossil shells are common in all the aqueous rocks from those of Cambrian to those of recent time. Their greatest expansion was in the Ordovician and Silurian, and again in the Carboniferous and Cretaceous periods. Examples are *Beurcheia*, *Leperditia*, and *Cypris*. 3. *Copepoda*.—These are all recent forms, with elongated well-segmented bodies in all except the degenerate parasitic members of the order. The limbs of the free-swimming species are biramous; those of the parasites are greatly reduced in size or entirely wanting. Examples: the water flea (*Cyclops*), the fish lice (*Lernæa*), and carp lice (*Argulus*). 4. *Cirripedia*.—In this order, the barnacles, we see perhaps the most aberrant of all crustaceans. Because of the usual sessile habit of life, the body of the animal has suffered so great modification that only the study of the developmental stages shows that the peculiar forms of the adult barnacles are acquired after passing through a series of larval stages exactly parallel to those of other Entomostraca. The

body of the adult is attached by the head. It is inclosed in a leathery integument that develops articulated calcareous plates and is raised upon a peduncle as in the goose barnacle (*Lepas*); or it may be contained in a calcareous box made of a series of stony plates firmly joined to each other and to the foreign object that serves as a support, as in the acorn shell (*Balanus*). The earliest members of the order, *Turrilepas* and *Plumulites*, appeared in Cambrian and Ordovician time, and were ancestors of *Lepas*, while the oldest relative of *Balanus*, viz., *Palæocrassia*, occurs in the Lower Devonian rocks, and the genus *Balanus* itself has been found in the Mesozoic and Tertiary deposits. The Cirripedia afford the largest examples of Entomostraca in some of the goose barnacles that attain a length of 8 or 9 inches, and they furnish also the most degenerate forms in those Rhizocephala that live as parasites in the bodies of crabs. See BARNACLE; COPEPODA; OSTRACODA; PHYLLOPODA; ENTOMOSTRACA; and Plate of BARNACLES.

III. MALACOSTRACA (crabs, lobsters, etc.). The most commonly known, the largest, and the most highly organized Crustacea belong to this division. The body consists of a constant number of segments (20 or 21), distributed between the head (5), the thorax (8), and the abdomen (7). In most of the orders the head and thorax are fused to form a cephalothorax of 13 segments, and each segment bears a pair of appendages, all of which are usually well differentiated to perform special functions. The compound eyes are stalked in all orders except the Cumacea and Arthrostraca. 1. The order *Phyllocarida* was much more fully represented in Paleozoic times than it is now by such genera as *Ceratiocaris*, *Echinocaris*, *Pephracaris*, etc., in which the cephalothorax was covered by a hinged bivalve shell provided with an adductor muscle like that in the bivalve phyllopods and the ostracoda. The order enjoyed a long life period, as it first appeared in the Upper Cambrian, and it lasted to the end of the Paleozoic. Through the Mesozoic and Tertiary eras the order could not have been very abundant, as no fossil remains referable to it have been found in the rocks of those ages, and the modern genera, three in number, show considerable modifications from their early ancestors. This group presents synthetic types which may have given rise on the one hand to the Phyllopoda, and on the other to the higher Crustacea represented by the Schizopoda and Decapoda. (See PHYLLOCARIDA.) 2. *Schizopoda*.—The animals of this order, the opossum shrimps (*Myas*), resemble in their general form the shrimps and prawns among the decapods. They are, however, more loosely built, and the thoracic limbs, of which there are eight pairs, are biramous (whence the name), and all alike. These characters mark the group as of primitive rank. Its relation, as one of lower phylogenetic rank, to the Decapoda, is shown by the fact that certain decapods, such as the prawns, pass in their ontogeny, i.e., in their development from egg to adult, through a "mysis stage," in which schizopod characteristics are strongly marked. The fossil genera *Archæocaris*, *Crangonops*, and *Pygoccephalus* from the Carboniferous, and possibly also *Palæocaris* and *Gamponomys*, the latter from the Permian, are the earliest ancestors of the Schizopoda. These all present very primitive characters and are separated from the

modern descendants by the interval of Mesozoic and Tertiary time, from which we have no traces of the group.

3. *Decapoda*.—The character upon which the order (shrimps, lobsters, and crabs) is based is the prominence of the five posterior pairs of thoracic limbs developed as walking feet; the three anterior pairs being adapted as maxillipedes or accessory mouth parts. The first pair of walking feet is usually provided with strong chela, or nipping claws. The cephalothorax is covered by a single firm carapace, which in many crabs is so shaped as to afford a most efficient protective covering for the entire animal, including the legs. The frontal portion of this carapace is produced into an anterior rostrum that is often of considerable length, and the lateral portions are extended downward to cover the gills, which are borne on the bases of the thoracic limbs. The order is divided into two suborders: the *Macrura*, with long-tailed bodies, as the shrimp, prawn (*Palamon*), and lobster (*Homarus*); and the *Brachyura*, or crabs, with the abdomen reduced and closely applied to the under surface of the cephalothorax. A number of species allied to the hermit crab (*Pagurus*), often distinguished under the subordinal designation *Anomura*, are either *Macrura* or *Brachyura* which, through adaptation to their peculiar habits of life, in occupying the discarded shells of gastropods, have lost the regularity of their thoracic and abdominal segments. The compound eyes of all decapods are raised on stalks, which in many crabs are developed to extraordinary lengths. Some of the largest among Crustacea are found among the decapods. As a rule, the quick-swimming decapods (prawns) may be recognized by the lateral compression of the body, while the bottom crawlers have a more or less flattened form. The crabs are the most highly specialized forms of all Crustacea, and they exhibit many interesting and peculiar adaptations to habit of life. (See CRAB; LOBSTER; PRAWN. ETC.) The early ancestry of the decapods is not well known for those periods previous to Mesozoic time. Some doubtful Paleozoic forms that seem to be transitional between the schizopods and decapods are *Palaeopalamon*, from the Devonian of Ohio, and *Anthrapalamon*, from the coal measures of Illinois, but during this era the order was greatly subordinated to other crustaceans like the trilobites and ostracods, and to the merostomes, represented by *Eurypterus*. In the Mesozoic of Europe the group attained a great development, and thus continued through the early Tertiary period. Fossil decapod remains are peculiarly sparse in the American deposits of these periods. The Jurassic lithographic slates of Bavaria have afforded large numbers of finely preserved specimens of fossil decapods of many genera and species. Some of these, as *Eryon*, have modern representatives, as *Willemaria*, still living in the abyssal depths of the ocean. Other genera, among them the prawn (*Peneus*), began in the Jurassic and Cretaceous periods and have survived without changes of greater than specific rank throughout the succeeding ages, and are now abundant in the Mediterranean Sea and the Atlantic and Indian oceans. The *Macrura* declined towards the end of Cretaceous time and gave way to the *Brachyura*, which attained great expansion during the Eocene or early Tertiary period. In fact, the crabs were the dominant types of invertebrate

life in many parts of the Tertiary seas of Europe, and their fossil remains are now found in abundance in the rocks that are relics of those seas. The Eocene deposits of the London Clay of England, those of Bavaria and Hungary, and especially those of Vicenza, in northeastern Italy, have afforded the finest specimens, nearly all of which belong to modern families.

4. *Stomatopoda*.—This is a small order comprising nine marine genera, of which the best known is the mantis shrimp (*Squilla*). They have the body loosely built, elongated, and flattened, with an incomplete carapace that leaves the three posterior thoracic segments uncovered, and with a disproportionately large abdomen. The five anterior pairs of thoracic limbs function as maxillipedes, the second pair being much the largest and provided with a spiny terminal segment that folds back upon the penultimate segment, like a knife blade into its handle, to form a very efficient clasp organ. A powerful burrowing organ, developed by the union of the sixth pair of abdominal appendages with the terminal plate, or telson, enables the animal to bury itself in the sandy bottoms near shore. Fossil forms of this group are rare. The earliest, *Necrosequilla*, from the coal measures of England, resembles *Squilla*. Another allied genus, *Scudla*, is found in fine preservation in the lithographic slates of the Bavarian Jurassic, and *Squilla* is found in the same horizon and in succeeding horizons of the Cretaceous and Tertiary.

5. *Cumacea*.—Another small order of prawn-like Crustacea, in which the compound eyes are sessile and sometimes fused together or are entirely absent. The carapace is further reduced than in the Stomatopoda, for it leaves the five posterior pairs of thoracic segments uncovered. Only two pairs of thoracic limbs function as maxillipedes, and six pairs are legs, of which two or three anterior pairs are biramous. This group is related to the Schizopoda and Isopoda, no fossil representatives of it are known.

6. *Arthrostraca*.—In this large order the fusion of the segments is still further reduced, only one or two of the anterior being united with the head to form a rudimentary cephalothorax. These fused segments bear maxillipedes, while the remaining free segments bear legs that end in claws or are built for swimming. The two suborders are quite different in outward appearances. The Amphipoda have the body laterally compressed and the legs adapted for swimming and jumping, as in the sand fleas (*Gammarus* and *Orchestia*.) The Isopoda have the body dorsoventrally flattened, the legs adapted for crawling, and the abdominal segments are fused to form a single terminal plate.

#### EXPLANATION OF PLATE OF CRUSTACEA, FOSSIL.

1. *Dromiopis*, a round crab from the Upper Cretaceous of Denmark.
2. *Leperditia*, an ostracod; Silurian, island of Gotland.
3. *Asper*, a prawn, Jurassic lithographic limestones, Bavaria.
4. *Xanthopus*, a cyclopetan crab, Eocene, Bavaria.
5. *Turnicops*, a primitive cirriped, allied to the goose barnacle, Silurian; Dudley, England.
6. *Scudla pennata*, a stomatopod, Upper Jura of Bavaria, A, outline of the fossil, B, dorsal view of head, C, ventral view of entire body, showing thoracic and abdominal appendages.
7. *Cerataceus*, a phyllocard, Ordovician, Lanarkshire, Scotland; showing the bivalve shell, some of the head appendages, and the segmented long abdomen with terminal spines.
8. *Palaeocrusna*, a barnacle, allied to the acorn shell, imbedded in a fossil coral of Lower Devonian age, New York State.
9. *Pephracrus*, a phyllocard with spinose carapace; Chemung; New York State.
10. *Eryon*, a macruran; lithographic limestones of Bavaria; A, ventral aspect; B, dorsal aspect.

# CRUSTACEA

The amphipods (see AMPHIPODA) are wholly aquatic, in both marine and fresh water, and are often also found living in the damp slats and jetsam of the beach between low and high tides. The isopods, while generally aquatic, afford some fine examples of adaptation to terrestrial conditions in the wood louse (*Oniscus*) and pill bug (*Armadillidium*), which are commonly found under the bark of dead trees and in other like situations. Paleontologically the amphipods are of little importance. The earliest indisputable ancestor is *Acanthotelson*, of the Carboniferous, and the genus *Gammarus* itself is found in the Tertiary rocks. The isopods are better known in a fossil state, and the ancestors seem to have been, as a rule, of larger size than the recent forms. *Arthropleura* of the Carboniferous attained a length of about 20 inches. *Praeacturus*, also a large form, from the Old Red Sandstone of the English Devonian, is the earliest isopod known. *Archoniscus*, *Cyclospheroma*, and *Eospheroma* are other genera from the Mesozoic and Tertiary rocks that are closely allied to modern forms.

**Geological Distribution.** The accompanying table indicates in a rough way the larger classi-

HISTORICAL VIEW OF CRUSTACEA.

fication of the Crustacea and the distribution and expansion of the various subdivisions in past geologic times. It shows that certain types, especially the more primitive, played more important rôles in the early ages than they do at present, and that they have been superseded by the more specialized types. The letters at the heads of the vertical columns indicate the geological systems as follows: C, Cambrian; O, Ordovician; S, Silurian; D, Devonian; Cb, Car-

boniferous; P, Permian; T, Triassic; J, Jurassic; Cr, Cretaceous; E, Eocene; M, Miocene; Pl, Pliocene; R, Recent. An interrogation point indicates the doubtful presence of a member of the group, and the width of the black line indicates in a very imperfect way the relative amount of expansion of the group. The articles on the different orders and suborders should be consulted for further information.

**Bibliography.** The best general introduction to the study of the Crustacea is T. H. Huxley, *The Crayfish: An Introduction to the Study of Zoology*, in "International Scientific Series" (New York, 1884), and the most interesting and comprehensive account of the whole group is Calman's *The Life of Crustacea* (ib., 1911). Other works of a general nature on the morphology and classification are: J. S. Kingsley, "The Classification of the Arthropoda," in *American Naturalist*, vol. xxviii (Philadelphia, 1894); K. Grohen, "The Genealogy and Classification of the Crustacea," in *Annals and Magazine of Natural History*, 6th series, vol. xi (London, 1893); T. R. R. Stebbing, *History of the Crustacea* (New York, 1893); R. Rathbun, "Natural History of the Economic Crustaceans," in *Bulletin United States Fish Commission* (Washington, 1889); H. Milne-Edwards, *Histoire naturelle des crustacés* (3 vols., Paris, 1834-40); H. Gerstaecker, "Glüderfüßler," in *Bronn's Klassen und Ordnungen des Thierreichs*, vol. v (Leipzig, 1866-94). Consult also Cornish, *Crustaceans* (London, 1883); Rankin, *The Northrop Collection of Crustacea from the Bahamas* (Lancaster, Pa., 1898); id., "The Crustacea of the Bermuda Islands," in *Annals of New York Academy of Sciences*, vol. xii (New York, 1900); Sharpe, "Report on the Fresh-Water Crustacea of the United States National Museum," in *Proceedings of the United States National Museum*, vol. xxvi (Washington, 1903); Paulmier, "Higher Crustacea of New York City," in *State Education Department* (Albany, 1905); Smith, "Crustacea," in *Cambridge Natural History*, vol. iv (London, 1909); Calman, "Crustacea," in *Lancaster's Treatise on Zoology*, vol. vii (ib., 1909); Stappers, *Crustacés malacostracés* (Brussels, 1911). For description of the fossil forms, consult the various manuals of paleontology, such as those by Zittel-Eastman, Bernard, Nicholson, and Etheridge. A good synopsis of the class, dwelling more especially on the fossil forms, is to be found in Zittel-Eastman, *Text-Book of Paleontology* (New York and London, 1900), where are given very useful bibliographic lists of works on both recent and fossil forms.

**CRUST OF THE EARTH.** It was formerly believed by scientists that the interior of our globe is in a state of fusion due to excessive heat, and they accordingly gave the name "crust of the earth" to the external solid portion of the earth with which we are familiar. Modern investigation has tended to show that the interior of the earth may not be liquid, as this term is ordinarily understood, and the term "crust of the earth," suggesting, as it does, the liquidity of the earth's interior, has fallen somewhat into disfavor among scientists. The term "lithosphere," meaning "rock sphere," has been proposed as a substitute, but in popular usage it has not displaced the earlier term. The crust of the earth is composed of igneous and sedimentary rocks. The rocks occurring deepest below the surface, chiefly of the Archean age,

are igneous. Resting on them, and forming the surface rocks for much of the globe, are sedimentary rocks, which have everywhere the same general geological succession, although varying widely in minor stratigraphy and structure. The basal igneous rocks, owing to erosion, are now exposed at the surface over considerable areas, and later igneous rocks are associated with the sediments which they have invaded by deep-seated or volcanic processes.

The rocks of the earth's crust are fractured and folded, the folding involving an actual plastic deformation or "flowage" of the rock mass. It is probable that fractures are confined to the outer portion of the earth's crust, while at a considerable depth, perhaps 10,000 meters or more, the pressure is so great that fractures cannot be developed, and the rock is deformed by flowage. For convenience in discussing its structure, Van Hise has accordingly proposed a division of the earth's crust into (1) a deep-seated zone of flowage, where rocks are deformed by flowage and where fractures cannot exist; (2) an upper zone of fracture, where the rocks are deformed by fracture alone, and (3) an intermediate zone of fracture and flowage. By surface erosion rocks which have been deformed in the zone of flowage may ultimately reach the surface of the earth, and hence it is that we have, side by side, the effects of deformation in all zones. Consult Van Hise, "Principles of North American Pre-Cambrian Geology," in *Nineteenth Annual Report United States Geological Survey*, part 1 (Washington, 1896). See GEOLOGY: METAMORPHIC ROCKS.

**CRUVEILHIER**, kru'vèl'yè', JEAN (1791-1874). A French anatomist. He was educated in the University of Paris and became professor of pathological anatomy at Montpellier in 1824 and at Paris in 1836. His publications include: *Essai sur l'anatomie pathologique en général* (1816); *Anatomie descriptive* (1834-36); *Anatomie pathologique du corps humain* (2 vols., 1828-42); *Anatomie du système nerveux de l'homme* (1845); *Traité d'anatomie pathologique générale* (5 vols., 1849-64); *Traité d'anatomie descriptive* (3 vols., 1833-38; 5th ed., 1872-79).

**CRUVELLI**, kru'vèl'li, SOPHIE, COUNTESS VIGIER (1826-1907). A German singer. Her real name was Cüßwell. She studied under Bordogni in Paris, made her début in Venice in 1847, and sang with increasing success in various Italian theatres and afterward in London and Paris. Endowed with a contralto voice of great strength and purity, she was one of the most popular vocalists of her time. On marrying Count Vigier, in 1856, she left the stage and thereafter lived at Nice.

**CRUX** (Lat. *crux*, a cross). A southern constellation, commonly known as the Southern Cross. It is situated near the Antarctic circle and therefore never visible in northern latitudes. It consists of four bright stars, to which fancy, aided by Christian associations, gives the cruceiform shape. The two brilliant stars which mark the summit and foot of the Southern Cross have nearly the same right ascension. The constellation, therefore, is almost vertical when passing the meridian, and these two stars act as pointers to the Antarctic Pole.

**CRUYS**, krois, or **KRUYS**, CORNELIS (1657-1727). A Russian rear admiral of Norwegian extraction. He entered the service of Peter the Great in 1698 and rose to be a vice admiral and

vice president of the Russian Admiralty Board. He served Peter faithfully in the wars with Sweden and Turkey, but was hampered by the jealousy of the native Russian officers, and in 1714, after an unsuccessful encounter with some Swedish vessels, he was arrested and tried by court-martial. Sentenced to death, he was reprieved by order of the Czar and exiled to Kazan, but later in the year was recalled and restored to his office. As chief assistant to Count Apraxin (q.v.), Cruys did much to build up the Russian navy. He promoted the building of dockyards, canals, and the drawing up of charts. At the time of his death, in 1727, he owned a large estate at Kexholm and the island of Birken in Finland. In memory of his work, the Russian men-of-war still fly a white flag with a blue cross (*kruis*). Consult "The Russian Fleet under Peter the Great," in *English Navy Records Society* (London, 1899), and Browning, *Peter the Great* (ib., 1898).

**CRUZ**, kros, JOSÉ MARÍA DE LA (1801-75). A Chilean general. He was born at Concepción and became a member of the Republican cadet class when 10 years old. In 1838 he became chief of staff in the Peruvian campaign, was twice appointed Minister of War, and in 1842 was elected Governor of Valparaíso. In 1851, defeated as the candidate of the Liberals for the presidency, he organized a revolution which terminated in the disastrous defeat of Locomilla (Dec. 8, 1851), and was followed by his retirement from public life.

**CRUZ**, JUAN PANTOJA DE LA. See PANTOJA DE LA CRUZ, JUAN.

**CRUZ**, kros, SAN JUAN DE LA (1542-91). A great Spanish mystic, born at Fontiveros. His real name was Juan de Yepes y Alvarez, but upon entering the Order of the Carmelites (1563) he assumed that of de la Cruz ('of the Cross'). St. Theresa was then engaged in the reformation of the Order of Carmel, and San Juan became her ardent disciple. His efforts brought him into constant trouble, and into one imprisonment of seven months, and he was practically in exile at the time of his death. He was canonized in 1726. The many writings of Juan de la Cruz in prose and verse contain some passages of great beauty and others of untranslatable vagueness, but wonderfully harmonious. In his *Obras espirituales* Spanish mysticism finds its loftiest expression. Many of his poems have been translated into English by Arthur Symonds. His best single works are *Yoche ocura del alma* and *Subida del Monte Carmelo*. His works, published first at Barcelona in 1580, were translated into French by P. Maillard in 1694 and have frequently been reprinted. Consult M. Domínguez Berruete, *El misticismo de San Juan de la Cruz en sus poesías* (Madrid, 1894), and R. Encinas y López de Espinosa, *La poesía de San Juan de la Cruz* (Valencia, 1905).

**CRUZADA**, kros-zá'dá or -zà'dá. BULL OF THE. This was one of many special dispensations from the rigors of Lenten abstinence and was originally granted for war against the Moors. Later it was practically forced upon the people for a money consideration and became a regular source of considerable revenue. It was promulgated by Pope Pius II, who reigned from 1458 to 1464. By a brief dated at Rome, Jan. 28, 1555, Pope Julius III conceded to His Catholic Majesty the sale of the Bull of the *Cruzada*. The Cortes

more than once complained of the Bull and claimed the prerogative of deciding for themselves whether the Bull should be published or not. They also claimed that if the Bull were to be sold, the purchase must be purely voluntary and not forced, as has been asserted, on the people by itinerant friars who kept congregations for days in church and refused absolution to all who did not buy. Those who sold the Bull were known as *bulderos*. The abuses practiced in the sale were frequently the subject of witty, satirical works. The sale by the King of Spain was also a stock subject for a quarrel between the King and the Pope. Pius IV withdrew the right, and Pius V renewed it.

**CRUZ CANO Y OLMEDILLA**, krōōth kã'nō ē ōl'mã-dēl'yã, RAMÓN FRANCISCO DE LA (1731-94), commonly known as DON RAMÓN DE LA CRUZ. The most important dramatist produced by Spain during the eighteenth century; also a poet. He essayed nearly every kind of drama—tragedy, tragic-comedy, comedy drama, comedy, farce, comic opera, and, last of all, the *sainete*, a short, witty piece, with little or no plot (since its length, of one act, forbade), that gives a faithful picture of some little scene in everyday life. This *genre* is the further development of the older *pasos* and *entremeses*, and in Cruz's hands forms the natural bridge between rigid classicism and elastic romanticism in things dramaturgic. In his early days Cruz attempted the classic drama along lines strictly classic and even carried his admiration thereof so far as to imitate in some cases, and to translate in others, certain French and Italian plays. But in the *sainete* he was himself, and a Spaniard, with no debts to foreign influences or models. The effect of this lesson in patriotism and independence was later felt even in serious drama, and thus prepared the way for the modern renaissance of the drama in Spain. Before the time of Cruz the *zarzuela* (a kind of Spanish comic opera) had been the pastime almost exclusively of the rich. Not the least of Cruz's achievements was its democratization as we now know it. During 30 years he kept the Madrid theatres supplied with his plays, at a time when long runs were unknown, and runs even of a week practically unheard of. His productivity caused one of his editors to call him the Lope de Vega of the eighteenth century. We know the titles of more than 500 of his plays, of which number nearly two-thirds are still imitated. Although Cruz realized the importance of what he was doing (as shown by his celebrated phrase, "Truth dictates and I write"), posterity long failed to recognize him as a master. Only in relatively recent years have we come to realize that his works are an inexhaustible source of information concerning Spanish life in his period, and that he is entitled to be called, as he has been, "the Goya of the theatre." Consult: Cruz y Cano, *Teatro* (10 vols., Madrid, 1786-91); *Colección de sainetes*, etc., ed. of A. Durán (2 vols., ib., 1843); *Sainetes inéditos*, etc., ed. of C. Cambrónero (ib., 1900); *Sainetes desconocidos* (1st series, ib., 1906); Pérez Galdós, "Ramón de la Cruz y su época," in *Revista de España*, (1870-71); Cotarelo y Mori, *Ramón de la Cruz y sus obras* (ib., 1899); Pérez y González "Cuatro sainetes 'anónimos' de Don Ramón de la Cruz," in *Ilustración Española y Americana*, vol. lxxxiv (1907).

**CRUZ E SILVA**, ANTONIO DINIZ DA. See DINIZ DA CRUZ E SILVA, ANTONIO.

**CRUZ Y GOYENECHÉ**, krōōs ē gō'yã-nã-chã, LOUIS DE LA (1768-1828). A Chilean general. He was born at Concepción, where he held several municipal offices. His exploration of the Andes in 1806 resulted in the discovery of several important mountain passes, which are described in a report published in the *Angelia* collection at Buenos Aires in 1835. Four years after his famous Andean expedition, he became a member of the revolutionary junta of Concepción, but was captured during the ensuing campaign and imprisoned until 1817. He was afterward for a time acting President of Chile and upon the outbreak of the Peruvian campaign joined San Martín's army (1820), advancing to the rank of grand marshal. Shortly before his death he was appointed Minister of Marine.

**CRYING BIRD**. See COURLAN, ILMPEIN

**CRYOHYDRATES**. See FREEZING POINT.

**CRYOLITE** (Gk. κρύος, *kryos*, frost + λίθος, *lithos*, stone). A sodium and aluminum fluoride that crystallizes in the monoclinic system. It is found chiefly in west Greenland, near Arkauk, where it occurs as a large bed in a granite vein, and in El Paso Co., Colo. Cryolite is an important ore of aluminum (q.v.) and is used in the manufacture of alum, sodium hydrate (for making soap), sodium carbonate, and other salts. It is also employed in the making of an opaque white glass, sometimes called hot-cast porcelain, which is said to be prepared by fusing together 100 parts of silica, 35 parts of cryolite, and 15 parts of zinc oxide.

**CRYOPHORUS** (Neo-Lat., from Gk. κρύος, *kryos*, frost + φέρειν, *pherein*, to bear). An instrument consisting of a glass tube with a bulb at both ends, from which the air has been exhausted. A little water is present in one of the bulbs, and when the second bulb, containing only water vapor, is placed in a freezing mix-

CRYOPHORUS

ture, the vapor condenses, thus producing a diminution of pressure, which causes more vapor to rise from the water in the first bulb. The result of this evaporation from the first bulb is the abstraction of much heat, and eventually the remaining water freezes.

**CRYOSCOPY**. See MOLECULES—MOLECULAR WEIGHTS.

**CRYPT**, kript (Lat. *crypta*, Gk. κρύπτη, *kryptē*, crypt, vault, from κρύπτειν, *kryptein*, to hide). In its ancient meaning, a subterranean chapel in the catacombs; hence, in more general usage, a chamber under a church, wholly or partly subterranean. The crypt was the logical enlargement of the confession (q.v.), which became a crypt when so expanded as to provide space for an altar. This expansion progressed, with the development of ecclesiastical architecture, until in many cases the crypt occupied the entire space under the choir and apse. It was reached from the church by a single or a double staircase, usually in the neighborhood of the high altar, in the nave or

side aisles. Although some crypts existed as early as the sixth century, it was not until the Carolingian period (ninth century) that such chambers attained to any size; but from that time until the thirteenth century they formed a very important part of church architecture, especially of the Romanesque style. In rare instances they extend under the entire body of the church, including nave and aisles, as in St. Eutrope at Saintes, the cathedral of Otranto, San Niccolò, Bari, and certain concentric churches of the Holy Sepulchre type, such as St. Bénigne at Dijon. Crypts were invariably and almost of necessity vaulted, usually with groin vaults carried on rows of columns or, in Romanesque and Gothic examples, on heavy round or clustered piers. In a number of important churches great height is secured for the crypt under the choir by raising the floor of the choir considerably above that of the nave, with picturesque effect. Sometimes the change of level is so great that the centre of the crypt opens widely upon the nave by one long central stairway, and two side staircases ascend to the choir. In such cases the crypt is apt to be a very monumental structure. Such are the crypts of San Zeno at Verona, of San Miniato at Florence, of the cathedral of Arezzo, of the abbey church of St. Denis, of the cathedral of Strassburg (the largest in Germany), and many others. Some German churches, having a choir at the west as well as east end, had crypts under both choirs, as in the cathedral of Bamberg. In England the finest crypt is that of Canterbury: next to it, that of Glasgow Cathedral. It is not always easy to draw a clear distinction between such crypts and the lower church or undercroft of two-storied edifices like St. Francis at Assisi, the Sainte-Chapelle (Paris), and the church of Schwarz Rheindorf. Crypts are not only interesting in themselves, and from their great variety of plan and arrangement, but also because, on account of their protected subterranean situation, they have suffered less from vandalism than the more exposed structures aboveground and are often the only remaining part of a mediæval church. The age of cathedral building of the Mendicant orders, in the twelfth and thirteenth centuries, put an end to the building of crypts, because the cardinal idea of this era was to provide immense interiors on a single level for large congregations, instead of interiors divided by a raised choir into two sections.

**CRYPTO-CALVINISTS.** A name given to Melancthon and those who agreed with him in wishing to unite the Lutherans and Calvinists, and especially in his supposed leaning towards the Calvinistic view of the Lord's Supper as shown in the difference between the original and the altered Augsburg Confession (q.v.). The former said "The body and blood of Christ are truly present in the Lord's Supper in the form of bread and wine and are there distributed and received by the communicants: therefore the opposite doctrine is rejected." In the latter the last clause is omitted. Luther did not approve the alteration, but tolerated Melancthon's change of doctrine. Many, however, called him a Crypto-Calvinist. The truth seems to have been that he did not consider that either opinion was a sufficient bar to communion with Christ and therefore thought that both of them ought to be allowed. The con-

troversy was becoming violent before his death, but afterward it broke out with great virulence, and continued with alternate success on each side for 50 years, during which time frequent attempts were made to suppress the Calvinistic opinions by imprisoning their leading advocates and at last, in 1611, by the execution of Chancellor Nicolas Crell. The term has also been applied to the Missouri Lutherans because of their acceptance of the doctrine of unconditional election. Consult Richard, *Philip Melancthon* (New York, 1898).

**CRYPTOGAMS** (from Gk. κρυπτός, *kryptos*, hidden + γάμος, *gamos*, marriage). A general term that includes all plants below the spermatophytes (seed plants), i.e., the pteridophytes (ferns and their allies), bryophytes (mosses and their allies), and thallophytes (algæ and fungi). The name means "hidden sex reproduction," and, in contrast with it, the spermatophytes are often called "phanerogams," which means "evident sex reproduction." The names are not appropriate, since the sex reproduction of cryptogams is "very evident" and that of phanerogams is "very much 'hidden.'" The mistake arose from regarding stamens and pistils as sex organs. The term "cryptogam," however, remains one of great convenience, but the term "phanerogam" is being replaced by the much more significant term "spermatophyte" (seed plant). The old distinction between cryptogams and phanerogams, that the former reproduce by spores and the latter by seeds, is a false one. Both groups produce spores, but the cryptogams do not produce seeds. Since the pteridophytes are distinct from the bryophytes and thallophytes in developing a vascular system, they are very frequently called "vascular cryptogams." For full account, see articles under the different group names.

**CRYPTOGRAPHY** (Gk. κρυπτός, *kryptos*, secret + γράφειν, *graphein*, to write). The art of writing messages and documents in cipher, intended to be read only by those possessing the key. The use of secret methods of correspondence in important matters of state is of considerable antiquity. Plutarch and Gellius tell of a method employed by Spartan ephors in communicating with their generals abroad, which has received the name of *scutale*, from the staff used in deciphering it. A narrow strip of parchment was first wound spirally upon the staff, its edges just meeting, and the message was then written along the line of jointure. When it was unwound, the broken letters could afterward be read only by rolling the parchment upon a duplicate staff in possession of the general to whom it was sent. This is but one of a large number of mechanical devices for reading secret dispatches, such as papers pierced with holes, to be laid over the document, revealing only such words or letters as compose the secret message.

Cryptography, in its stricter sense of a cipher alphabet formed either by changing the value of the different letters or by substituting for them groups of letters, numbers, or arbitrary symbols if not of Semitic origin, was at least already known to and used by the sacred writers, in its simplest form of using the alphabet in its inverted order. By the Jews this form is known by the name of *Athos*, a word formed from *A*, the first letter of the Hebrew alphabet. *T*, the last letter; *B*, the second; and *S*, the last but one. An instance of its use occurs in Jeremiah

xiv, where the prophet, wishing to veil his meaning from all but the initiated, writes "Shehach" instead of "Babel," using the second and twelfth letters from the end of the alphabet instead of from the beginning. Julius Caesar's "quarta elementorum littera," in which D takes the place of A and E of B, is only a variant of this simplest form of cipher. Suetonius states that a similar method was employed by Augustus. In mediæval and modern times many scholars have turned their attention to cryptography. Among them are John Trithemius, Abbot of Sponheim, in his *Poligraphia* (1500); Anastasius Kircher, and his pupil, Kaspar Schott, whose work, *De Magia Universalis* (Würzburg, 1676), contains a cryptographic table that lies at the foundation of the modern cipher telegraph systems. It consists simply of the alphabet repeated 24 times in horizontal rows, each successive row dropping off one or more letters from the beginning and adding it at the end. Thus, in the second row B stands under A, C under B, etc. In the third C represents A, in the fourth D = A, etc. Thus correspondents have a choice of 24 alphabets, it being necessary only to agree between themselves upon the first or key letter. For diplomatic purposes this form is much too simple, since by the simple mechanical task of making at most 24 versions, any one could decipher dispatches made in this way. Accordingly various methods of complicating the cipher have been tried, one simple and effective way being that which is known in France as the method of Saint-Cyr. It consists in using alternately two or more of these 24 alphabets, the order in which they are to be used being determined by a key word previously agreed upon. Thus, if the key word is "Army," four alphabets are to be used, viz., those in the rows beginning respectively with A, R, M, and Y. Various other elaborations have been sometimes employed, such as arbitrarily changing the sequence of the letters of the alphabet, inserting at regular intervals letters or symbols that have no meaning ("nulls and insignificants," Bacon called them), or using groups of letters to represent separate letters. Of the last-named variety is the famous bilateral cipher of Bacon himself, consisting of various combinations of A and B, arranged in groups of five. Thus, *aabab*, *ababa*, *babba* = fly. So used, such a cipher would be but little more difficult to detect than any ordinary set of single symbols. But Bacon went a step further, for the *a*'s and the *b*'s of his groups he substituted two fonts of type, differing so slightly as to present little distinction to the untrained eye. These, called respectively the *a* font and the *b* font, can be used for setting up any ordinary page of printed matter when, by the proper admixture of the two fonts, each successive group of five letters on the page may be made to stand for a single letter in Bacon's bilateral system. The fact that Bacon took a deep interest in cryptograms is probably the origin of Ignatius Donnelly's theory that the Shakespearean plays contain a cipher which, if interpreted, would prove that Bacon wrote them. And recently a still bolder attempt has been made by a certain Mrs. Gallup to apply the bilateral cipher to the early Shakespeare folios, in which, as is generally known, more than one variety of type was used. The general principle involved in Bacon's method—that of representing the whole

alphabet with groups and combinations of two symbols only—lies at the basis of many modern methods of signaling.

It is hardly too much to say that ingenuity and perseverance will solve any code based upon a regular mathematical principle. If the language of the document is known in advance, the relative frequency with which the letters of the alphabet normally occur in that language forms an important initial clue. Thus *e* is the letter of most frequent occurrence, not only in our own language, but in French and German as well. In English the next in order of frequency are *t*, *a*, *o*, *n*, *i*, *r*, *s*, *h*, *d*, *l*, *c*, *v*, *u*, *m*, etc. Single letters must be either *a*, *t*, or *o*. Words of two letters most likely to occur are *of*, *to*, *in*, *it*, *is*, *be*, *he*, *by*, *or*, etc. Double letters are most apt to be *ee*, *oo*, *ff*, *ll*, or *ss*. If there is doubt whether the cipher is in Latin, English, French, or German, the lack of double letters at the end of words suggests that it is Latin; if but few words end with double letters, it is probably French; if double letters are very numerous, it is German. Those who make a science of interpreting cipher documents receive no small assistance from a knowledge of the frequency with which certain symmetrical combinations of letters occur in the vocabulary of a language. Thus, the combination which may be represented for convenience by the formula *abab*, is comparatively rare in English; one may cite *papa*, *dodo*; in French, *tête*, *bêbê*. The form *abba* is found in *l'ère*, *Pr. réver*. In German, the formula *abba* gives only *Anna*, *Elbe*, *Egge*, *Esse*, *Otto*; in French, the formula *abcdab* gives only two words, *cherche* and *quelque*. An interesting example of the relative frequency of letters being used to solve a cryptogram will be found in Poe's tale, *The Gold Bug*.

Consult John Baptist Porta, *De Furtivis Literarum Notis* (1563); Blaise de Vigenère, *Traité des chiffres* (1587); Thicknesse, *A treatise on the Art of Deciphering and of Writing in Cipher* (1772); and among more modern writers, J. L. Klüber, *Kryptographik* (Tübingen, 1809); Romani, *La cryptographie dévoilée* (1875); Fleissner, *Handbuch der Kryptographik* (Vienna, 1881); A. J. Butler's "Elizabethan Cipher-Books," in *Transactions of Bibliographical Society* (London, 1901).

**CRYPTURI** (Neo-Lat. nom. pl., from Gk. κρυπτός, *kryptos*, hidden + οὐρά, *oura*, tail). An order of birds, the tinamous, occupying a singular position and placed by Stejneger near the Apteryx and certain extinct forms. They are now included in the subclass *Carnatæ*, in the order *Tinamiformes*. They differ from all other *Carnatæ* (q.v.) in the character of the palate, which is like that of the ostrich. The order contains only a single family, of eight genera, which include nearly 70 forms, all confined to South America. See **TINAMOU**.

**CRYSTAL**. See **CRYSTALLOGRAPHY**.

**CRYSTAL CLASS AND CRYSTAL SYSTEM**. See **CRYSTALLOGRAPHY**.

**CRYSTAL FALLS**. A city and the county seat of Iron Co., Mich., about 210 miles (direct) north of Milwaukee, Wis., on the Chicago, Milwaukee, and St. Paul, and the Chicago and Northwestern railroads (Map Michigan, A 2). The courthouse and high-school buildings are noteworthy. The city is of considerable importance commercially as the centre of a lumbering and iron-mining region. **Crystal Falls**

was chartered as a city in 1899 and owns its lighting and water plants. It is governed by a mayor and a unicameral council. Pop., 1910, 3775.

**CRYSTAL GAZING.** See CRYSTALLOMANCY.

**CRYSTALLIN.** See GLOBULINS.

**CRYSTALLINE LENS** (Fr. *crystallin*, Lat. *crystallinus*, Gk. *κρυσταλλίνος*, *krystallínos*, from *κρυσταλλος*, *krystallós*, crystal, from *κρυστάινειν*, *krystáinein*, to freeze, from *κρύος*, *kryos*, frost). A biconvex, transparent, solid body, situated immediately behind the pupil of the eye and imbedded in the vitreous humor. Through it the rays of light from any object must pass to reach the retina. The crystalline lens is more convex on its posterior than on the anterior surface, and its shape and consistency vary at different periods of life. In early youth it is nearly spherical and soft; as age advances, it becomes flattened and firm. In the adult human being it measures three-eighths of an inch transversely, and one-sixth of an inch in antero-posterior diameter. The lens is retained in position by a capsule of equal transparency, composed of tissue exactly similar to the elastic layer of the cornea. The lens has no vascular connection with its capsule, but is nourished by means of a very delicate layer of nucleated cells on its surface, which absorb nourishment from the capsule. Opacity of the lens is called "cataract" (q.v.). In rare instances the lens may be entirely absent. It may be dislocated either congenitally or from traumatism.

An increase in the refracting power of the eye for the purpose of near vision is called "accommodation." The mechanism of accommodation is as follows: The ciliary muscle contracts, drawing forward the choroid and ciliary processes and relaxing the zonula. The lens, which had been flattened by the tension of the zonula, assumes, through its own elasticity, a more spherical shape. The posterior surface of the lens alters but little in shape, being fixed rather firmly in place; but the anterior surface becomes more convex, and thus its refracting power is increased. The eye can see objects accurately at every distance between the "far point" (the most distant point of distinct vision for that eye) and the "near point." The near point is situated at that place at which the eye can begin to see clearly the fine print on a page held close to the eye and then moved slowly from it. Between the near point and the eye vision is indistinct, because the ciliary muscle cannot by any effort produce the amount of convexity of the lens requisite for so short a distance.

**CRYSTALLINE ROCKS.** A term used to include the igneous rocks (q.v.) and the metamorphic rocks (q.v.), both of which classes have a more crystalline texture than that of the sedimentary rocks.

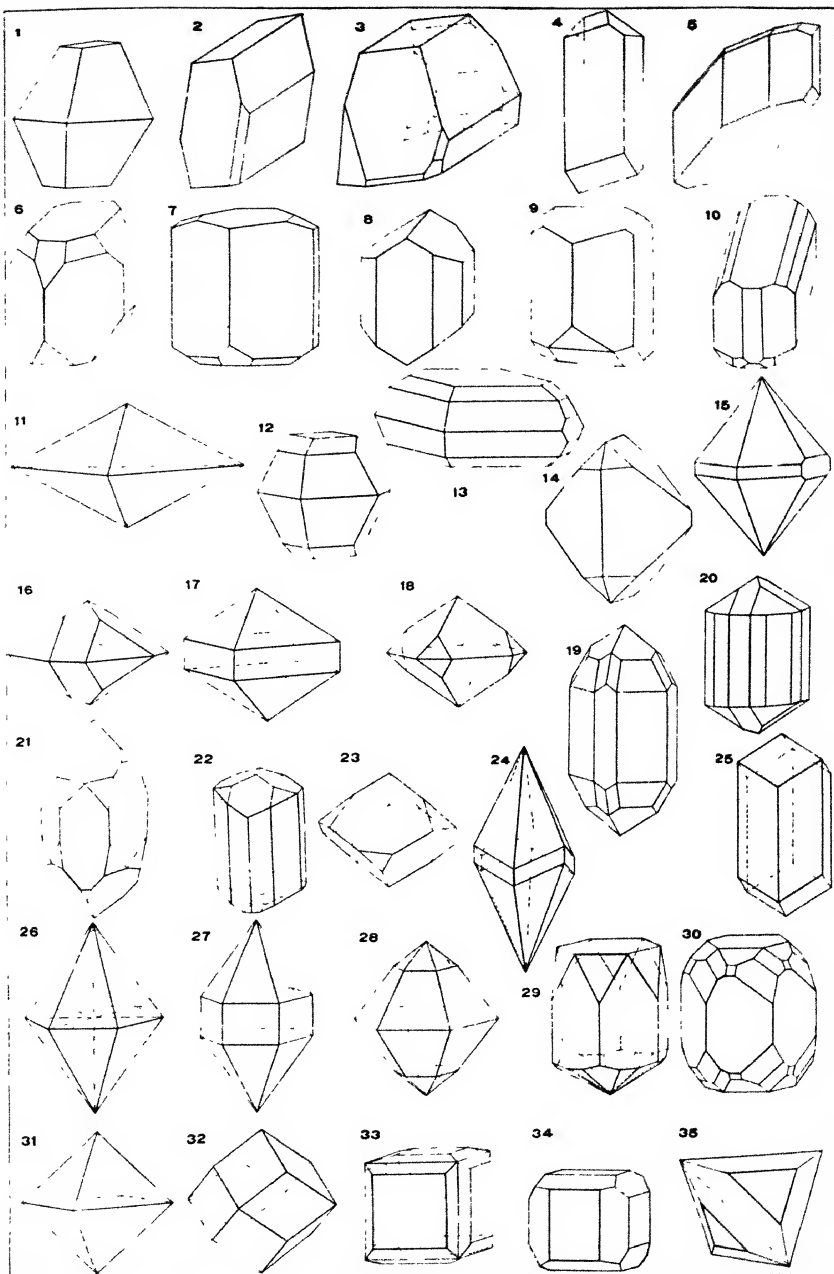

**CRYSTALLINE SCHISTS.** See METAMORPHIC ROCKS.

**CRYSTALLOGENY,** kris'tal-loj'e-ní. See CRYSTALLOGRAPHY.

**CRYSTALLOGRAPHY** (from Gk. *κρυσταλλος*, *krystallós*, crystal + *γράφειν*, *graphein*, to write). The science which treats of crystals. A crystal is a portion of inorganic matter which has a definite molecular structure and an outward form bounded by plane surfaces called "crystal faces." These crystal faces result from the regular arrangement of the particles of the substance which is undergoing solidification,

every addition of matter to the crystal in the process of formation being piled upon the particles already solidified in much the same manner as cannon balls or oranges are built up into a pile. The reason which we assume for this is that every minute particle of a crystallizing substance, which we call a "crystal molecule," has certain lines of attractive force by which it gathers to itself other crystal molecules of the same substance in much the same way that a magnet attaches itself to a piece of iron or to another magnet. Crystal molecules of different substances have, in general, different lines of attraction, some of which are of different intensity; hence it follows that in most cases the solid formed by the piling together of the crystal molecules of a certain chemical compound has an outward shape which is characteristic of that compound. It is also assumed that the directions of attraction of the unit of crystal accretion, i.e., the crystal molecule, is dependent upon the structure of the chemical molecule of the substance crystallizing, being, it is supposed, made up of a number of chemical molecules grouped together. Hence only elementary chemical substances and definite chemical compounds form crystals. In order that the crystal molecules of a substance may come into sufficiently close proximity to admit of their being mutually attracted along their lines of crystallizing force, it is necessary that they should be crowded together by reason of the contraction of the space in which they are confined. This happens where a mass solidified by cooling, or when by evaporation the amount of a substance dissolved in a liquid, such as water, exceeds in quantity the amount which the solvent can retain in solution under the conditions obtaining. Either of these conditions results in the formation of crystals. A condition of formation more rarely met with is that in which crystals form directly from vapors, as in the case of iodine or chloride of ammonia. By far the best means of studying the formation of crystals is afforded by the evaporation of a solution of some soluble compound, such as salt or blue vitriol, until it is supersaturated, when crystals of the dissolved substance will be thrown down. If two substances, such as salt and borax, are dissolved in the same solution, the result of evaporation will be crystals of both substances, each set of molecules building themselves up in distinctive forms. Solutions show considerable inertness, and it is often necessary to start the process of crystallization by introducing some solid substance—best of all, a crystal of the substance—to form a nucleus for the growing crystal. The outward form—i.e., the solid bounded by plane faces—is only an expression of the regular grouping of molecules which takes place when a substance crystallizes, and consequently we may expect other evidences of this molecular arrangement. These evidences become apparent when we consider the physical properties, such as the transmission of light, heat, and electricity through crystals. A sphere cut from a quartz crystal, e.g., does not expand equally in all directions when heated, as does a sphere of an uncrystallized substance, such as glass or amber, neither does a piece of beryl transmit polarized light in the same way as does a piece of glass of the same shape. This latter property of crystals is of great use in the detection of imitation gems. In the case of the

# CRYSTAL FORMS

1-5. TRICLINIC SYSTEM  
6-10. MONOCLINIC SYSTEM  
11-15. ORTHORHOMBIC SYSTEM

31-35. ISOMETRIC SYSTEM

16-20. TETRAGONAL SYSTEM  
21-25. TRIGONAL SYSTEM  
26-30. HEXAGONAL SYSTEM

sphere of quartz we find that the action of heat pulls apart the molecules more in one direction than in all other directions, so that the sphere becomes an ellipsoid. Substances which, like glass, show no evidences of crystallization are said to be *amorphous*. A substance in which the molecules have responded to crystallization but in which crystal faces have not been developed is said to be crystalline. Crystalline masses are often the result of the close crowding of crystals to the exclusion of the development of crystal outlines.

**Symmetry.** Just as in the organic kingdoms we are familiar with unailing regularity of repetition in parts of a flower or of an organism, as the opposite halves of a leaf or the arms of a starfish, so, as the result of the growth by regular accretions in crystals, we find a symmetrical recurrence of crystal faces corresponding to the lines of attraction of the crystal molecules. This is beautifully illustrated in the familiar snow crystals, which throughout their infinite variety of complex forms show a sixfold grouping; i.e., through the centre of every such crystal there passes an axis of sixfold symmetry. Similarly in a cubic crystal of salt there are axes of fourfold, threefold, and twofold symmetry, about which the crystal edges and angles are grouped in fours, threes, and twos respectively. A plane of symmetry is one which divides a crystal into equal halves, each of which is the reflected counterpart of the other—such a plane as would pass through the opposite edges of a cube. The point within a crystal in which the axes and planes of symmetry intersect is known as the centre of the crystal and is a centre of symmetry; i.e., every line through this point intersects the crystal in similar faces, edges, or solid angles. These elements of symmetry form the basis of the mathematical study of crystals, and from them 32 groups of crystals, divided into six systems, have been mathematically deduced. Any substance of which definite crystals are formed produces forms which show the symmetry of a distinct group, and it is impossible to find in nature a crystal whose symmetry would place it in more than one group. Beginning at the lowest degree of symmetry, the six crystallographic systems are:

The *triclinic system*, based on three inclined axes, corresponding to three nonrectangular and noninterchangeable lines of crystallizing force. Crystals referred to this system, which includes two groups, are symmetrical only to a point.

The *monoclinic system*, based on three non-interchangeable axes, two of which are at right angles and the third inclined to the plane of these. This system includes three groups, all crystals of which show one plane of symmetry.

The *orthorhombic system*, based on three non-interchangeable rectangular axes of twofold symmetry, the highest of the three groups under the system having three planes of symmetry.

The *hexagonal system*, based on three interchangeable axes in the same plane equally inclined to each other (i.e.,  $60^\circ$  apart), and one axis at right angles to the other three and noninterchangeable with them. This system includes two subdivisions, (1) the *trigonal*, comprising seven groups, and (2) the *hexagonal*, made up of five groups. The characteristic feature of the system is that the non-interchangeable axis is always an axis of three-

fold symmetry (trigonal division) or of sixfold symmetry (hexagonal division).

The *tetragonal system*, based on three rectangular axes, two of which are interchangeable. Five of the seven groups under this system show fourfold symmetry with respect to the noninterchangeable axis.

The *isometric system*, based on three rectangular interchangeable axes, giving, in the normal group of the five included under the system, the highest symmetry possible.

**Crystal Forms.** From the fact that in five of the six systems enumerated above, at least one axis, or direction of crystallizing force, is different from the others, it follows that this difference may vary in degree between substances crystallizing in the same system; e.g., the fundamental six-sided pyramid of beryl is not as steep as the corresponding pyramid of apatite, although both crystallize in hexagonal forms. This characteristic relation constitutes a means of differentiation between substances crystallizing in the same system, so that with a knowledge of these relations, crystals of any substance, except those of the isometric system may be readily recognized from one another. This is done by measuring the angles between the faces of the crystal, these angles being always constant between the same kind of faces, provided the substance is pure and the temperature constant. Instruments for measuring the angles between crystal faces are known as *goniometers* and are of various forms, the more accurate of which depend on the reflection of a beam of light from the smooth surface of the crystal face.

Although the simple action of the crystallizing forces produces comparatively simple geometrical solids, like the cube of salt or the six-sided prism of quartz, we frequently find them acting in combination, the resultants producing secondary forms, as, e.g., when the resultant of three forces at right angles to the faces of a cube acting together produce faces which cut off the corners of the cube. The crystal in the latter instance would be made up of a combination of two crystal forms, the cube and the octahedron. In the same way a series of faces may be produced which level the edges between the cube and the octahedron, constituting a form of 24 planes. From this it will be readily seen that extremely complicated crystals are possible. The multiplication of crystal forms is, however, subject to the *law of rational indices*, which admits of the usual occurrence of such forms as will intercept the crystallographic axes in proportion to a series of low numbers and simple fractions. It is this law, tracing as it does a direct relation between the simplicity of the axial intercepts of a crystal form and the frequency of its occurrence in nature, which goes far towards proving the theory of regular molecular structure in crystals.

A very significant fact in relation to the connection between the molecular structure of crystals and their chemical molecules is that in many instances substances related chemically crystallize in similar forms of the same crystallographic system. This is known as *isomorphism*. (See MINERALOGY, *Mineral Chemistry*.) Among certain chemical compounds a reversal of the order of molecular grouping often takes place, resulting in the production of *twin crystals*, which are formed by the uniting of two or individual crystals in reversed

juxtaposition. The interrelation of twin crystals is always referable to some simple crystallographic axis or plane.

**Divisions of Crystallography.** The science of crystallography is divided into (1) morphological crystallography, which deals with the external forms of crystals and includes the mathematical relations of crystals; (2) crystallogeny, or chemical crystallography, which treats of the genesis or growth of crystals, and (3) physical crystallography, which discusses the physical properties of crystals, a very important branch of which in its relation to petrography is optical crystallography. Consult Dana, *Treat Book of Mineralogy*, parts 1-3 (New York, 1902), Williams, *Elements of Crystallography* (ib., 1891), Groth, *Physikalische Kristallographie* (Leipzig, 1895), Moses, *Characters of Crystals* (New York, 1899); Phillips, *Mineralogy*, part 1 (ib., 1912). See MINERALOGY.

**CRYSTALLOIDS** (Gk *κρυσταλλοειδής*, *krystalloeidēs*, like crystal, from *κρυσταλλος*, *krystallōs*, crystal + *ειδός*, *eidos*, form). Crystals of reserve proteids in plants. They occur in small proteid granules (see ALBUMEN), in the endosperm (the food bearing tissue surrounding the embryo), and in the embryo of various seeds. Similar crystals are found free in the outer cells of potato tubers and in certain seaweeds. Crystalloids are angular in form, but their faces and angles are inconstant. They are insoluble in water, but absorb it and swell, as ordinary mineral crystals do not. They are insoluble in weak solutions, but dissolve in strong solutions of common salt. The proteid material composing crystalloids belongs to the group of globulins. See also COLLOIDS.

**CRYSTALLOMANCY** (from Gk, *κρυσταλλος*, *krystallōs*, crystal + *μαντεία*, *mantēia*, divination). At one time a popular practice of divination, accomplished by means of transparent bodies. Commonly a transparent jewel would be employed, but a beryl was deemed most effective. The operator first muttered over it certain formulas of prayer and then gave it into the hands of a youth or virgin—none others were pure enough to discern its revelations—who read in it the information required. The desired facts were conveyed by means of written characters on the crystal, but sometimes the spirits invoked were supposed to appear in the crystal to answer the questions asked. This method of divination is still practiced by magicians. Consult Shorthouse, *John Hughesant* (London, 1881), Thomas, *Crystal Gazing: Its History and Practice* (New York, 1905).

**CRYSTAL PALACE** (so called because made of glass). An edifice erected in Hyde Park, London, for the World's Fair held in 1851. Designed by Sir Joseph Paxton, it was built of glass and iron, with floors of wood. Its length was 1608 feet, and its area 21 acres. It cost £1,450,000. Every department of art and science was represented, and the visitors numbered over 6,000,000. Its materials were removed in 1854, and the structure rebuilt at Sydenham, 8 miles from London. There the park and grounds cover nearly 200 acres, and a permanent fair is held. In 1853 a similar but smaller "crystal palace" was erected between Fortieth and Forty-second streets on Sixth Avenue, New York. It was used for exhibitions and grand concerts, but was destroyed by fire in 1858. The locality is now Bryant Park.

**CSABA**, chō'bō, or **BÉKÉS-CSABA**, bā'-kash-chō'bō, a town of Hungary, in the County of Békés, 5 miles from the White Kőrös, with which it is connected by canal, and 105 miles east-southeast of Budapest (Map: Hungary, G 3). Its industries are principally agricultural—cattle raising, wine production, wheat and hemp growing. The women are noted for their skill in making linen and hemp fabrics. Csaba has the largest Protestant community of any town in Hungary, excepting Budapest. It is an important railway centre. Pop. 1890, 32,244, largely Slovaks; 1900, 37,547; 1910, 42,599. The Lutheran religion predominates.

**CSÁNYI**, chā'nyē, LÁSZLÓ (LADISLAUS) (1790-1849). An Hungarian statesman. He was born at Csány (County of Zala), and served in the campaigns of 1809-15. He early manifested an interest in local politics and became intimate with Francis Deák. In 1848 he was appointed commissioner plenipotentiary to various divisions of the revolutionary army, and subsequently received from Kossuth a portfolio in the ministry. After the surrender of the Hungarian army at Világos he refused to avail himself of the opportunity for flight; but as he had previously been one of the most active organizers of the revolution, so he now became a martyr to his convictions, and after a voluntary surrender to the Russians at Sarkad he was delivered by them to the Austrians, and executed on Oct. 10, 1849.

**CSÁRDÁS**, chār'dáš (Hung, from *csárda*, tavern). The national dance of Hungary. It consists of two movements, the first a slow *lassú* in *lúd* form and in four-fourth or two-fourth time. It is mostly in the minor mode. The second movement, *friss* or *frisehka*, is an exceedingly lively dance, also in four-fourth or two-fourth time. This is in the major mode and consists of 8 and 16 bar phrases, which are repeated. Towards the end the time is greatly accelerated, and the rhythm becomes more and more complex, so that the whole piece has a wild, tumultuous, and abrupt character. In both parts of the *csárdás* the accent comes on the weak beat. The alternation from the *lassú* to the *friss* is made at the will of the dancer, who motions to the players when the change is to be made. The figures of the *csárdás* vary greatly in different districts. The usual form opens with a stately promenade, which changes into a rapid whirling motion. The dancers then separate and carry on a sort of pantomime, the girl alternately approaching and retreating from her partner, who follows and finally seizes her. Again they whirl wildly around, then separate and go through much the same performance. The dance may be performed by any number of couples, but, as no two couples are ever dancing identically the same figures at the same time, the whole presents a varied and complex appearance. See HUNGARIAN MUSIC.

**CSENGERY**, chēn'gē-rī, ANTON (1822-80). An Hungarian statesman and publicist. He was born at Grosswardein and early devoted himself to journalism. After editing the *Pesti Hírlap* for three years he was in 1848 appointed ministerial councillor and followed the Hungarian ministry to Debreczin. In 1849 he returned to Budapest and devoted himself to literary pursuits. In 1857 he founded the review entitled *Budapesti Szemle*, which he conducted for 12 years. He was an active promoter of agricultural

and trade societies and was one of the chief founders and afterward the director of the Hungarian Institute of Land Credits. In 1861 he was elected to the Diet, where he became, as the most intimate friend of Deák, a powerful leader of the Deák party. In addition to his excellent translation of Macaulay's *History of England* (latest ed., 1874), he was the author of several important and brilliantly written works in Hungarian, among which may be mentioned: *Historical Studies and Character Sketches* (2 vols., 1870); *History and Historians* (1874); *Memorial Address on Francis Deák* (1877). His collected works were published in Budapest in 1884.

**CSIKY**, ché'k'é, GERGELY, or GREGOR (1842-91). An Hungarian dramatist, born at Pankota (Arad). After studying Catholic theology at Budapest and Vienna he became professor at the Priests' Seminary in Temesvár. After an activity here of several years he became a convert to Protestantism in 1878. Csiky is considered one of the greatest of modern Hungarian dramatists; he was equally effective in tragedy and comedy. He also wrote several successful novels, among them *az Atlaszcsalád* ('The Atlas Family,' 1890), and translated into Hungarian the works of Sophocles, Euripides, and Plautus, as well as standard works of French and English dramatists. Among his numerous plays, most of which have been highly successful, may be mentioned the comedies *A Jósát* ('The Oracle'), *Mulányi*, and *Karai*; the tragedies *Janus*, *Spartacus*, *Nora*, and *Thiodora*; and the popular drama *The Proletarians* (*A Proletariok*).

**CSOKONAI**, ché'kó-nó-é, VITÉZ MINÁY (1773-1805). An Hungarian poet, born at Debreczin. He was appointed professor of poetry in the college at Debreczin in 1794 but resigned the post in 1795, in order to study law, and, with the exception of a brief connection with the gymnasium of Csurgó, he lived thenceforth in private, devoting himself wholly to literature. His acquirements, particularly in linguistics, were notable. In poetry he was to some extent influenced by Földi, but remained essentially independent. He was preeminently a lyricist, in both the narrower domain of the folk song and the larger realm of artistic poetry. His diction is simple and often naive. Some pronounced defects of taste have met with the censure of the critics, but a distinguished place among modern Hungarian poets has been conceded to him. He wrote a most original mock-heroic poem called *Dorottya, or the Triumph of the Ladies at the Carnival* (1804), several comedies, and a number of odes which enjoyed considerable popularity principally because they opposed Napoleon and the French Revolution. A collective edition of his works was published by Toldy in 1846. Two specimen poems rendered into German may be found in Schwicker, *Geschichte der ungarischen Literatur* (Leipzig, 1889). The city of Debreczin erected a statue of him in 1871. For his biography, consult the works of Szana (Pest, 1869) and Haraszti (ib., 1880).

**CSOMA DE KÖRÖS**, ché'mó de ké'rësh, SÁNDOR (1784-1842). An Hungarian traveler and Tibetan scholar. He was born, April 4, 1784, at Körös, in Transylvania, and was educated first at the college of Nagy-Enyed, and subsequently at Göttingen, where he devoted himself especially to the study of Oriental languages. It was the dream of his life to discover the original home

of his race, the Magyars, in Asia. In 1820 he set out on his pilgrimage for that purpose. He went to Egypt, then to Teheran, and, disguised as an Armenian, to Little Bokhara, and finally settled for four years (1827-30) at the Buddhist monastery of Kanam on the confines of Tibet and India, where he studied Tibetan. He found to his disappointment that the Tibetan language had little bearing on the Magyar problem, but it led him to Calcutta to study Sanskrit, as the literature of Tibet is largely translated from the Sanskrit. At Calcutta, where he became the object of general attention on the part of British scholars, he devoted himself to cataloguing the Tibetan books, upward of 1000 volumes, in the library of the Asiatic Society of Bengal. He prepared, likewise, a *Tibetan Grammar* (1834) and a *Dictionary* (1834) which is still a standard work, and he wrote a number of articles on Tibetan literature in the *Asiatic Researches*. Once more he set out on his old-time search to find the early home of the Magyars and bent his way towards the western confines of China, but while on this journey he died at Durrung, north-eastern India, April 11, 1842. Consult *Thi Duka, Life and Works of L. C. de Koros* (London, 1885).

**CSONGRÁD**, chón'grád. A market town of Hungary, in the county of the same name, situated near the confluence of the Theiss and the Körös, 70 miles southeast of Budapest (Map: Hungary, G 3). The inhabitants are chiefly engaged in the raising of cattle, agriculture, the making of wine, and fishing. Pop., 1900, 22,619; 1910, 28,310, mostly Magyars.

**CTENACODON**, ténák'ó-dén. One of the rare primitive fossil mammals found in the Upper Jurassic rocks of Wyoming. It is known only by the lower jaws and a portion of the upper. The former has a length of about one-half inch and indicates an animal of the size of a mouse. The teeth are of the multituberculate type and consist of a prominent chisel-shaped incisor, four longitudinally compressed premolars, which are distinctly cutting teeth with serrated edges and grooved sides, and of which the fourth is much the largest, and two small molars with tubercles surrounding the central cavities on their crowns. This type of dentition indicates relationship to the Monotremata (*Ornithorhynchus* and *Echidna*), which, together with the fossil *Ctenacodon* and its allies, *Plagiaulax* and *Polynastodon* from the Eocene, and other Mesozoic and Tertiary genera, form the order Multituberculata of the subclass Prototheria. Consult Cope, "The Tertiary Marsupialia," in *American Naturalist* (Philadelphia, 1884); Marsh, "American Jurassic Mammals," in *American Journal of Science*, vol. xxviii, 31st series (New Haven, 1887); Osborn, "On the Structure and Classification of the Mesozoic Mammalia," in *Journal of the Academy of Natural Science*, Philadelphia, 2d series, vol. ix (1888); id., "Supplementary Note on the Above," in *Proceedings of the Academy of Natural Science* (ib., 1888).

**CTENOID** (tén'oid) **FISHES** (Gk. κτενοειδής, *ktenoeidēs*, comblike, from *kteis*, *kteis*, comb + *eidos*, *eidos*, form). One of the four orders into which Agassiz classified fishes, the others being *cycloid*, *placoid*, and *ganoid*. The name refers to the scales, which bear teeth or sharp projections on the posterior or free margin. These teeth may be in one or more rows.

farther eastward, a group of many islets, known as the Jardines de la Reina.

The western province of Pinar del Río is hilly, and is traversed by a mountain range, Sierra de los Organos, 2500 feet high. The celebrated tobacco region, Vuelta Abajo, is on its south slope. The central provinces of Havana, Matanzas, Santa Clara, and Camaguey have an undulating surface, broken only here and there by hills, such as the group near Trinidad, on the south coast. The most elevated portion of the island is in the eastern Province of Santiago de Cuba, which consists in the main of an elevated plateau, 1000 to 2000 feet high, deeply scored by streams. Along the south coast of this province, stretching from Cape Cruz eastward, is the Sierra Maestra, the highest land of the island, its highest peak, Turquino, being 8320 feet in height. The south coast, except in the Province of Santiago, is low and marshy. In the provinces of Santa Clara and Matanzas is the great Zapata swamp, having an area of 600 square miles. Just west of the city of Matanzas is the beautiful Yumuri valley, the most attractive scenic feature of the island. The rivers are numerous, but short, and in general unfitted for navigation; the river Cauto, in the southeastern part, is about 150 miles in length, and is navigable for a distance of 50 miles to Cauto Embarradero.

**Climate.** The climate of Cuba on the coast is extremely equable, but less so inland. The average temperatures for January vary from 72° F. at the north, to 75° F. at the south, and the July temperatures average about 82° F.; the coast temperatures seldom exceed 90° F. in summer, nor go below 65° F. in winter. In the mountain regions, however, the temperature often falls below 50° F. The rainfall is excessive in the northeastern section, reaching over 100 inches in some places, at Havana it is over 50 inches; the southern coast region has, however, much less rainfall. The chief rainy season is in summer, but rain falls throughout the year. The prevailing winds are the trades, from the northeast. Cuba lies within the path of the West Indian hurricanes, which are liable to occur during August, September, and October. The unhealthful conditions formerly prevalent were due to the absence of sanitary precautions. Yellow fever was an annual epidemic. The recommendation of sanitary measures by a commission of American scientists, in 1901, and the energetic administration of these measures, first by the United States military authorities and subsequently by the Cuban national government, have resulted in the practically complete extirpation of this disease. See HAVANA: YELLOW FEVER.

**Flora.** The vegetation of Cuba is tropical in its species and luxuriance, although, strangely enough, trees usually found only in colder climates are also found even in the Cuban lowlands. Thus, the pine grows side by side with the mahogany tree. Palms are plentiful, including the magnificent and useful royal palm. The majagua, granadillo, Cuban ebony, lignum vitae, Cuban cedar, Cuban mahogany, the acana, jiqui, cottonwood, logwood, rosewood, and the odd jagüey are all indigenous. The plants of greatest economic value are sugar cane and tobacco; coffee, cacao, and henequén are also cultivated. Among the economic fruit and vegetable products may be mentioned the banana, coconut, pineapple, orange, lemon, lime, fig, date, tamarind,

mango, guava, zapote, pomegranate, custard apple, alligator pear, melon, bean, cassava, and sweet potato.

**Fauna.** The fauna of Cuba includes rabbits, the hutia (q.v.), and bats; the domestic hog, dog, and cat (which have run wild and become very numerous); over 200 species of birds, including scavenger buzzards and vultures, grouse, quail, snipe, and wild turkeys; alligators, chameleons, iguanas, small lizards, and tree toads. Few species of snakes are found, although some, like the majá, grow to large size (16 to 18 feet). The land crabs, which move over the country in countless numbers and grow in size up to 8 inches in diameter, are very annoying, as are also the flying cockroaches. Scorpions, centipedes, and tarantulas are plentiful. Insects are numerous in species and limitless in numbers; among these are ants, beautiful fireflies, and what has been described as the "worst pest on the island," the nigua, or jigger. Nearly 650 species of fish have been found in Cuban waters, among which are large sharks, the giant aguja (weighing sometimes 500 pounds), the snoring ronco, gallego, garfish, and the parego, or red snapper. The porpoise and manatee are also found in numbers in the coast waters. Over 1600 species of mollusks are found in Cuba.

**Geology.** Cuba was largely formed in late Tertiary times. The rocks composing it are mainly recent stratified deposits. There are irregular areas of granite, serpentine, and eruptive rocks near the middle of the island, surrounded by Tertiary beds extending over most of the island to the coast. The Sierra de los Organos is composed mainly of Triassic sandstones, and the Sierra Maestra of Cretaceous and Tertiary beds. The mineral resources consist of iron, asphalt, manganese, coal, and copper.

**Mineral Resources.** The mineral deposits of Cuba are confined chiefly to Oriente, and are exploited almost exclusively by American companies. The chief mineral, iron, was first worked on a large scale in 1884, and the output has since then grown at a steady rate, increasing from 23,977 tons in 1884 to over 600,000 tons annually at present, almost all of it going to the United States. The ore is of good quality and especially adapted for the manufacture of Bessemer steel. Another mineral product of importance is manganese, which is also found in Oriente and exported to the United States. Copper was mined in Cuba as early as the sixteenth century in the Sierra del Cobre, near Santiago de Cuba, Oriente; and prior to the discovery of copper in the United States the latter imported most of the copper for its domestic use from Cuba. Owing to unfavorable circumstances copper mining ceased in 1869, not to be resumed until after the Spanish-American War. In general, the mining industries of the island are little developed.

**Agriculture.** Owing to its climate and soil, Cuba is exceptionally well adapted for agriculture, but long years of political oppression and unfavorable labor conditions, combined somewhat with the indisposition for work inherent in the natives, retarded the agricultural development of the island. Prior to the last war with Spain the number of farms was estimated at over 90,000, valued at nearly \$200,000,000. But the war, with the Spanish reconcentrado policy, caused a great destruction of farms and live stock. In 1905 it was estimated that about 16 per cent was under cultivation. Ownership on

the part of colored inhabitants is confined largely to the smaller farms.

**Sugar.**—Sugar was one of the earliest products of the island. Cane is supposed to have been introduced in 1523, but its cultivation for three centuries was insignificant. The annual output prior to the opening of the nineteenth century averaged about 28,000 tons, which was increased to 70,000 in 1817 and by the end of the first half of the century to about 300,000. During the latter half of the nineteenth century also the tendency was upward, although the industry was greatly handicapped by frequent internal disturbances and by the low price of sugar, brought about largely by the competition of beet sugar. In 1853 the output of the island was 322,000 tons, the average from 1850 to 1878 was about 470,000 tons, and in 1870 the output was 726,000. In 1881 the amount had fallen to 493,000 tons; but in 1894 there were produced 1,054,214 tons, or nearly 50 per cent of the world's output of cane sugar. Even in 1895, the first year of the Cuban war, the output exceeded 1,000,000 tons; but in the following year it fell to 225,221, with a further decrease in 1897 of 13,221 tons. Since the Spanish-American war the figures have rapidly grown, 335,668 tons in 1899, 1,132,482 tons in 1906, 1,459,630 tons in 1911, 1,806,000 tons in 1912, and in 1913 (i.e., the season of 1912-13), 2,285,000 tons. The cultivation of sugar requires a large outlay of capital. The successful *colono*, or sugar estate, generally contains several thousands of acres, several miles of private railway for transporting the cane to the mills, numerous buildings and costly plants of machinery for the manufacture of the sugar, besides buildings for the housing of 1000 or more employees. The cane, which requires replanting but once in seven years, is chiefly grown on elevated land, no fertilizer being required. About one-half the cultivated land is given over to sugar. In 1912 the sugar export was valued at \$102,033,516, most of which (valued at \$94,204,287) went to the United States.

**Tobacco.**—Next to sugar, tobacco is the most important agricultural product of the island. The cultivation of that plant in Cuba dates from about 1580, when it was introduced into the Vuelta Abajo, which has since been famous for the quality of its tobacco. The Vuelta Abajo is generally regarded as that part of Cuba west of the meridian of Havana, and thus includes Pinar del Rio Province and part of La Habana Province, sometimes the term is applied to a restricted area within Pinar del Rio. The output of Pinar del Rio is over 70 per cent of the entire crop of the island. La Habana yields less than 25 per cent, Santa Clara producing the bulk of the remainder. At the outbreak of the war for independence the normal annual output was over 62,000,000 pounds, but in 1896-97 the amount had dwindled to about 41,000,000 pounds; in 1904-05 it reached about 45,700,000 pounds, and in 1911 it was 37,019,640 pounds. In 1912, 23,684,944 pounds of leaf tobacco were exported, of which 16,769,318 pounds went to the United States. Tobacco covers about one-tenth of the cultivated area.

**Other Agricultural Products.**—Corn, or maize, is grown throughout the island and is used extensively for the feeding of domestic animals. Rice is also cultivated, but the harvest goes entirely to satisfy the domestic demand. Wheat, barley, and oats are little cultivated, and it is

doubtful whether the output of wheat will ever meet the home demand. Sweet potatoes are raised almost everywhere and form a very important article of food. The natural conditions are exceedingly favorable for the cultivation of fruit. The banana is grown in enormous quantities and, besides being extensively exported to the United States, figures very prominently in the diet of the poorer classes. Coffee, once an important product, is now in a state of decline, and the output is barely sufficient for home consumption. Pineapples, oranges, coconuts, limes, lemons, and numerous other southern fruits grow in abundance. Their cultivation and exportation have increased notably in recent years. The fruit interests are largely in the hands of foreign (chiefly American) companies.

The forests of Cuba are supposed to occupy about 50 per cent of the total area of the island. Besides the valuable mahogany and cedar woods which find their way to foreign markets, there are about 30 species of the palm, of which the royal palm is probably the most useful tree on the island, every part of it, from the leaves and fibre to the roots, being utilized by the natives. Of the forest area the state owns 1,250,000 acres.

The natural conditions for the raising of live stock are very favorable, and at one time this industry was in a high state of development. During the decades preceding the war for independence, however, the supply was far short of the natural demand, and most of the animals necessary for agricultural purposes and slaughtering had to be imported. In 1894 the live stock of the island numbered 584,725 horses, 2,485,766 cattle, 570,194 hogs, and 78,494 sheep, with a total value of over \$101,000,000. The effect of the late war on the live stock of the island may be seen from the census figures of 1899, which give the number of horses at 88,000, cattle, 376,650, hogs, 358,868; and sheep, 9982. In January, 1902, there were 805,000 cattle, 137,000 horses, and 25,700 mules. In June, 1912, there were 2,829,553 cattle, 560,580 horses, 41,192 mules, and 2298 asses.

**Manufactures.** The manufacturing industries of Cuba are almost wholly confined to the production of sugar and of cigars and cigarettes—both industries closely connected with agriculture. In fact, the first is so intimately connected with the plantations that it is rather to be regarded as an adjunct of agriculture than a separate industry. In the case of tobacco products the line of demarcation is more distinct, and, while some of the large manufacturing companies have their own plantations, most of them prefer to buy the raw material of the planters. The centre of the cigar manufacturing is Havana, and most of the large firms are in the hands of foreigners.

**Labor Conditions.** One of the prominent retarding factors in the agricultural and industrial development of Cuba is the scarcity of labor. The liberation of slaves had a detrimental effect on the economic development of Cuba as well as the West Indies in general. With the supply of black labor cut off, the Chinese coolies became the chief factor in the Cuban labor market, but, owing to real or alleged inhuman treatment, the Chinese government prohibited further emigration to the island. Since then Spain and the Canary Islands have been drawn upon to some extent, but the supply falls short of the demand. The war still further depleted the ranks of labor, and accord-

ing to the census of 1899 only 299,197 persons were engaged in agriculture, fishing, and mining; 93,034 in manufacturing and mechanical pursuits. The 1907 census showed that of all wage earners 48.5 per cent were engaged in agriculture, mining, and fishing, 16.3 in manufacturing, and 17.7 in trade and transportation. To the sugar planter the problem of securing competent laborers is serious. In the tobacco industry the labor question does not offer such difficulties, owing to the fact that the work requires great skill, and white labor can be utilized to a large extent. In the mining industry the problem is also simplified, largely because of more favorable climatic conditions in the mountain districts.

**Transportation.** Existing transportation facilities are inadequate. The roads are mostly unimproved and during the rainy season become almost impassable. Much of even the *Camino Central*, the chief highway of the island running from Havana to Santiago de Cuba, is in poor condition. However, the impetus given to public improvements during the American occupation has been continued to some extent by the Cuban government, which is steadily improving the highways of the country. In the introduction of the railroad Cuba was 12 years in advance of Spain; the first railway in a Spanish country was the line from Havana to Güines, opened in 1837. A system was built up between the city of Pinar del Río in the west and the city of Santa Clara in the middle of the island, and short lines were constructed from several ports into the interior. In 1902 Santa Clara was connected with Santiago de Cuba, through communication being thus established nearly from one end of the island to the other. For the most part the railways are narrow gauge, with light rails and poor roadbeds. Havana is the centre of the railway system. Among the ports connected with the line running from Havana to Santiago de Cuba are Cienfuegos, Cárdenas, Caibarién, Nuevitas (connecting with Camaguey), and Manzanillo. All the railways are owned and operated by private companies. In 1913 the length of railway in operation, including the private lines owned by the great sugar estates, was upward of 2200 miles. At the end of 1910 there were 5848 miles of telegraph line, with 6184 miles of wire and 180 offices, post offices, 496.

**Commerce.** The commerce of Cuba, under the Spanish régime, notwithstanding the restrictions placed upon it, was, relatively speaking, extensive. By a system of heavy protection, which had grown out of the monopoly idea of the seventeenth century, most of the commerce was diverted into Spanish channels, although only a few of the demands of the island could be supplied by Spanish domestic products. But the adoption of a reciprocal treaty between the United States and Spain gave an impetus to commercial relations between the former country and Cuba. The exports of merchandise from the United States to Cuba rose from \$12,224,888 in 1891 to \$24,157,698 in 1893, while the imports of Cuban products into the United States increased during the same period from \$61,714,395 to \$78,706,506. With the expiration of this treaty in 1894 and the beginning of the war for independence in the following year, Cuban commerce began to decline, and the exports and imports in 1899 amounted to \$49,700,000 and \$75,300,000 respectively, as against \$64,000,000 and \$93,000,000 in 1892. Comparing the mean

annual value of imports by countries for 1894-95 (\$67,335,800) with that for the period of 1899-1900 (\$64,965,800), we find that Spain's share fell off from about 44 to less than 16 per cent; that of the United States increased from about 33 to over 45 per cent, while that of the United Kingdom practically remained the same, over 15 per cent. The export trade of Cuba for 1900 was distributed as follows: United States and possessions, 68 per cent; United Kingdom and possessions, 12 per cent; Spain, 2 per cent; and Germany, 11 per cent. In 1903 the imports amounted to \$67,000,000, and the exports to \$78,000,000. The principal imports in that year were: foods and drinks, 36 per cent; textiles, 16 per cent; animals and animal products, 13 per cent; metals, machinery, and chemicals, 15 per cent. The principal exports were: sugar and its products, 54 per cent, tobacco and its products, 20 per cent; the remainder consisting of woods, fruits, minerals, and animals. Imports increased from about \$77,000,000 in 1904 to \$91,447,581 in the fiscal year 1909, and exports from about \$89,000,000 to \$124,711,069. In the fiscal year 1910 imports and exports were \$103,675,581 and \$150,909,020 respectively. In 1911, \$108,097,782 and \$129,178,865, in 1912, \$120,229,317 and \$146,787,295. Principal exports in the fiscal years 1911 and 1912: sugar, \$85,168,933 and \$102,033,516 (of which \$85,081,624 and \$94,264,287 to the United States), unmanufactured tobacco, \$16,888,761 and \$17,399,403 (of which \$14,319,155 and \$14,954,309 to the United States); manufactures of tobacco, \$13,097,982 and \$13,057,484, iron, gold, and copper ores, \$3,874,172 and \$3,910,305, fruits, \$1,835,952 and \$2,264,229. The growth of Cuba's trade with the United States after the reciprocity treaty of December, 1903, may be seen in the following figures: imports from and exports to the United States in 1903, \$26,000,000 and \$60,000,000; in 1904, \$33,000,000 and \$74,000,000, in 1905, \$44,000,000 and \$95,000,000, in 1909, \$46,339,000 and \$109,408,000, in 1910, \$54,569 and \$129,329,000; in 1911, \$57,128,000 and \$113,451,000, in 1912, \$62,826,000 and \$122,969,000. Second to the United States in commercial importance is the United Kingdom, imports from which in 1911 and 1912 amounted to \$12,759,000 and \$14,834,000; exports, \$5,087,000 and \$11,067,000.

**Banks.** Of all the banks founded in Cuba in the course of the last three decades of the past century, only two survived the Spanish-American War, viz., the Spanish Bank of the Island of Cuba and the Bank of Commerce. The former, though owned by private stockholders, was a semiofficial institution under the Spanish régime, being subject to certain official regulations, and its governor appointed by the Spanish government. It acted as fiscal agent of the government, collecting the internal revenue and floating the paper currency. The Bank of Commerce owes its uninterrupted, though by no means entirely prosperous, existence to its valuable railway and other properties, which have helped indirectly to swell its banking business and have yielded a revenue outside of that derived from its purely banking operations.

**Finance.** The history of the currency of Cuba does not differ much from the lamentable record made by nearly all of the Spanish-American countries as well as Spain. It is the story of desperate, but in the end of vain, attempts to make the fiat of government pass for commodi-

ties of intrinsic worth in the monetary transactions of the people. For a time such attempts succeeded, but in the end the government was compelled to refuse its own worthless currency. This is particularly true of the paper currency of the Spanish government, which was worth at the time of American occupation but seven cents on the dollar. Even before that event, when the Spanish government accepted 10 per cent of customs dues in that currency, the price rose only to 15 cents, varying between that value and 12 cents. The last issue of Spanish paper currency took place during the war for independence, when \$20,000,000 of paper money was put in circulation through the Spanish Bank of the Island of Cuba upon the security of \$6,330,000 (silver) deposited with the bank. In spite of having been made legal tender, the paper went at a discount from the start, and as soon as the government had shown by its illegal withdrawal of the silver fund from the bank that it did not mean to depart from its old-time methods, the paper was repudiated throughout the island, until, as stated above, the action of the government in accepting the paper in payment of 10 per cent of customs dues raised it to from 12 to 15 per cent of its par value.

The standard of money in Spanish Cuba was Spanish gold, a 25-peseta piece being the principal coin. In addition to that there was a large amount of silver currency. The principal silver coins in circulation were: the peso (dollar), medio peso (half dollar), peseta (quarter dollar), real (bit), medio real (half dime). Since silver was not exchangeable for gold at its face value it tended, as is always the case, to drive the gold out of circulation. To counteract that tendency the government by a royal decree artificially inflated the value of the gold 25-peseta piece to \$5.30, the real value being only about \$4.80. In 1893 the French louis, a 20-franc piece (real value \$3.86), was similarly and for the same reason inflated to \$4.24.

Upon assuming temporary administration of the island, the government of the United States found itself in a predicament. The only rational course lay in reducing the coin to its face value and putting an end to all inflation and artificial substitutes for currency of intrinsic worth. On the other hand, the people had become accustomed to existing conditions: prices had adjusted themselves to the level of the inflated currency, and all contracts had been concluded on that basis. Nevertheless, by order of the President of the United States, which took effect Jan. 1, 1899, the United States gold dollar was declared the standard in which all customs, taxes, public and postal dues in Cuba should be paid, and foreign gold coins should be current at their real value. At the same time, since retail prices and wages have been usually fixed on the island on the basis of silver money, and in order to prevent a sudden rise of wages to the detriment of the planters who could not expect a corresponding rise in prices of their products in the foreign markets, the Spanish silver money was also declared legal tender. The old inconveniences of a fluctuating currency were done away with by giving the coins a fixed rate in exchange for gold as follows: peso, 60 cents; medio peso, 30; peseta, 12; real, 6; medio real, 3 cents. A fixed value was also given to the bronze and copper coins, which were made legal tender for sums not exceeding one dollar.

During the last 30 years of Spanish sovereignty in Cuba the budget of the island remained almost stationary, at from 26,000,000 to 30,000,000 pesos. Although the entire revenue was derived from the people of the island, only about 15 per cent of the expenditures was incurred for local needs, while about 85 per cent went to defray "sovereignty expenses," i.e., the expenses of the general government. The average annual budget for the period July, 1890, to June, 1895, was as follows:

## REVENUE

Customs	\$11,599,270
Internal revenue	5,882,205
Lotteries	2,919,945
Other sources	2,058,305
<b>Total</b>	<b>\$22,459,725</b>

## EXPENDITURE

Government	\$3,634,439
Justice and instruction	902,449
Finance	664,911
Public works	889,685
<b>Total civil administration</b>	<b>\$6,092,484</b>
Army and navy	\$6,493,281
Service of the debt	10,334,421
<b>Total</b>	<b>\$22,910,186</b>
Deficit ..	450,461

As compared with the foregoing average budget of the Spanish régime, the following budget for the fiscal year 1900-01 (during the American occupation) is of interest:

## REVENUE

Customs	\$15,945,666.42
Postal	367,950.28
Internal	658,535.92
Miscellaneous	182,736.96
<b>Total</b>	<b>\$17,154,889.58</b>

## EXPENDITURE

State and government	\$1,756,689.53
Justice	871,152.52
Public instruction	724,335.78
Finance	2,363,863.61
Agriculture, industry, and commerce	223,588.56
Public works	1,735,231.38
Municipalities	8,226,748.39
Military department	1,732,885.04
<b>Total</b>	<b>\$17,644,494.81</b>

The chief sources of revenue under Spanish rule were (1) taxes and excise duties, yielding less than one-fourth of the total; (2) import and export duties, which furnished about 55 per cent of the entire revenue; (3) stamp taxes, 6 per cent of the revenue; (4) lotteries, over 7 per cent; (5) state property—rent and sale of public lands and rent from docks—producing about 1½ per cent of the total revenue; (6) miscellaneous, over 5 per cent. Thus the great bulk of taxation fell upon the consumer, while the expenditures took little account of the needs of the people. As the above table shows, the army absorbed almost 30 per cent of the entire expenditure; nearly 50 per cent went to pay the debt incurred by the Spanish government, while only about one-fourth of the total went for civil administration, of which the greater part was absorbed by salaries of Spanish officers.

It will be observed that under the new régime the customs duties furnished over 90 per cent of the entire revenue of the island. On the other hand, on the side of expenditures a radical change may be noted. The expenses of the mili-

tary department decreased from nearly one-half of the total expenditure to less than 10 per cent. The service of the debt naturally disappeared from the budget because it was not the business of the United States to pay the debts incurred by the Spanish government, and the Cuban Convention, by repudiating that debt, relieved the people of a great burden. A detailed comparison of expenditures under the two régimes is impossible owing to the different method of classification; however, a comparison of the four leading items common to both budgets shows the following changes:

The expense for state and government decreased from \$3,634,439 to \$1,756,689.53, or 52 per cent, although the latter sum includes the cost of the census. The expense for justice and instruction, on the other hand, increased from \$902,449 to \$1,605,488.30, or 78 per cent. The finance department showed also an increased expenditure of 255 per cent, and that of public works increased from \$880,665 to \$1,735,231.38, or 99 per cent. An unusually large item, \$8,226,748, almost one-half of the total budget, was formed by the supplementary grants to municipalities. These subsidies were occasioned by the poverty-stricken condition of the people, who were unable to raise the necessary local revenue, and the money was advanced largely to defray expenditures affecting the most vital interests of the people, such as instruction, sanitation, hospitals and asylums, public buildings, etc.

Such were the finances of Cuba during the period of American military occupation. The national budget for 1905-06 showed estimated revenue of \$19,899,805 (of which \$17,862,000, customs) and estimated expenditure of \$19,138,104. for 1912-13 estimated revenue and expenditure were \$37,940,000 and \$33,974,147 respectively. Estimated receipts for the latter year were as follows: customs, \$26,434,000, excise, \$3,900,000; lottery, \$3,700,000; direct taxes, \$1,113,000, posts and telegraphs, \$1,076,000, consular dues, \$500,000; other, \$1,217,000; total, \$37,940,000. Estimated disbursements for 1912-13: administration, \$10,117,394, public instruction, \$4,782,653, sanitary service, \$3,784,987, public debt, \$3,710,500; public works, \$3,704,625; finance, \$3,329,504; justice, \$2,038,220, executive, \$1,000,540, foreign affairs, \$717,224; agriculture, industry, and commerce, \$488,400; total, \$33,974,147. The public debt in 1911 was \$62,083,100; charge, \$2,464,585.

**Government.** The constitution of Cuba was adopted by the constitutional convention on Feb. 21, 1901. It provides for a republican form of government and in its main provisions differs but slightly from the Constitution of the United States. The President, who must be either a native Cuban or a naturalized citizen with at least 10 years' service in the Cuban army during the wars for independence, is chosen by an electoral college for a term of four years and is disqualified for more than two consecutive terms. He has the right of appointing and removing the members of his cabinet.

The legislative power is vested in the Congress, which consists of a Senate and a House of Representatives. The former is composed of four senators from each province, chosen by an electoral board composed of the provincial councilmen and electors, the latter being twice the number of the former and chosen by popular vote. Provision is made for the retirement of

one-half of the senators every four years. The House of Representatives consists of one member for every 25,000 inhabitants, or for a fraction of more than 12,500. They are elected directly for four years, one-half retiring every two years. Congress meets twice annually (on the first Monday in April and November) and is endowed with extensive powers, controlling, besides the financial affairs and foreign relations of the republic, also the preparation of electoral laws for the provinces and municipalities. The approval of two-thirds of the members of both legislative bodies is necessary for a change in the constitution.

For administrative purposes the republic is divided into six provinces. The provincial governors and assemblies are elected directly for a period of four years. The provinces are independent in their internal administration, but the President has the right of interference in case of abuses of power on the part of the Governor or the Assembly. The municipalities are administered by mayors and assemblies elected directly by popular vote. The judges of the Supreme Court are appointed by the President with the approval of the Senate. The voting franchise is accorded to every male Cuban over 21 years of age, and not mentally incapacitated, convicted of crime, nor serving in the army or navy, to all Spanish male residents of like age who have been on the island since April 11, 1899, and to all male foreigners of like age who have resided in Cuba since Jan. 1, 1899. For foreigners who have arrived on the island after Jan. 1, 1899, a five years' residence is required for naturalization.

**Education.** Primary education, according to the provisions of the constitution, is free and compulsory, and the expenses are to be paid by the central government in case of inability on the part of a province or a municipality to maintain its primary schools. Secondary and advanced education is under the control of the state. During the Spanish régime education was controlled to a large extent by the church, and the provisions for primary education were very inadequate. According to the census of 1899 the proportion of illiteracy among the voting population was: Cubans, 59 per cent; Spaniards, 12 per cent. In 1894, just before the war for independence, there were about 900 public and about 700 private schools, with an enrollment of not more than 60,000. With the American occupation the school system was entirely reorganized, and the facilities for teaching as well as the enrollment increased with an extraordinary rapidity, so that in 1900 the number of public schools was 3550, with an enrollment of 172,000 and an average attendance of 123,000. In February, 1911, there were 3774 public schools, with an enrollment of 152,658 and an average attendance of 105,774; enrollment in private schools, 24,434. The 1907 census showed that 56.6 per cent of the people above 10 years could read (as compared with 43.3 per cent in 1899). Cuba has a university at Havana. The population is Roman Catholic. The island forms one archiepiscopal diocese.

**Population.** The population of Cuba in 1910 is stated at 2,220,278; the estimate of 1912 is 2,473,600. There have been various censuses, beginning with 1774, but the results of those prior to 1887 are regarded as untrustworthy. The census returns have been as follows: 1774, 173,620; 1792, 272,300; 1817, 572,363; 1827,

704,487; 1841, 1,007,624; 1861, 1,396,530; 1877, 1,509,291; 1887, 1,631,687; 1899, 1,572,797; 1907 (census of September 30), 2,048,980. The decrease of 3.6 per cent shown in 1899 was due to the war. The increase shown in 1907 was 30.3 per cent; the increase was largest in Pinar del Río (41.1 per cent), next largest in Oriente (38.8), and smallest in Matanzas (13.5). The 1907 population was returned by race and sex as follows:

	Male	Female	Total
Native whites	608,597	615,942	1,224,539
Foreign whites	163,014	40,623	203,637
Negroes	133,655	140,617	274,272
Mixed	157,975	176,720	334,695
Yellow	11,641	196	11,837
Total	1,074,882	974,098	2,048,980

The percentage of whites was 69.75, negroes 13.28, mixed 16.40, and yellow 0.57. Among the white population males exceeded females by 115,046; while among the negroes females exceeded males by 6962, and among the mixed inhabitants by 18,745. Of the total population, 1,820,239 were born in Cuba, 185,393 in Spain, 11,217 in China, 7948 in Africa, and 6713 in the United States. The percentage of negroes was largest in Oriente (43.1) and smallest in Camagüey (18.3). The inhabitants dependent upon agriculture, fisheries, or mining were 48.1 per cent of the total, domestic and personal service, 22.8 per cent, manufacturing and mechanical pursuits, 14.9 per cent; trade and transportation, 12.8 per cent; professional service, 1.4 per cent. The larger cities were: Havana (capital of the republic), 297,159; Santiago de Cuba, 45,470; Matanzas, 36,009; Cienfuegos, 30,100; Camagüey, 29,616; Cardenas, 24,280. There were 13 other towns having over 8000. Sancti-Spiritus (17 thousand), Santa Clara (17), Manzanillo (16), Guantánamo (15), Guanabacoa (14), Sagua la Grande (12), Pinar del Río (11), Trinidad (11), San Antonio de los Baños (9), Jovellanos (9), Marianao (9), Caibarién (8), Guines (8).

The area of the Republic of Cuba (i.e., the island of Cuba and the adjacent isles) is officially stated at 44,164 square miles (the provincial areas in the table below are approximations). By provinces the total population and the density per square mile were as follows in 1907:

PROVINCES	Square miles	Population 1907	Density
Pinar del Río	5,000	240,372	48.1
La Habana	2,772	538,010	194.1
Matanzas	3,700	239,812	64.8
Santa Clara	9,560	457,431	47.8
Camagüey	10,300	118,269	11.2
Oriente	12,468	455,086	36.5
Total	44,000	2,048,980	46.5

In 1904 immigrants numbered 28,467 (from Spain, 23,759); in 1905, 34,219 (47,902); in 1910, 32,006 (25,947); in 1911, 38,053 (32,104). In 1911 there were 12,846 marriages, 74,286 births, and 33,194 deaths.

**History.** The "Pearl (or Queen) of the Antilles," the "Ever-Faithful Isle," as the Spaniards

used to term Cuba (from the attitude of the Cubans at the time of the Napoleonic overthrow of the Spanish Bourbons), was discovered by Columbus during his first voyage, on Oct. 28, 1492. He landed, it is supposed, on the north coast, near Nuevitas, by the river Máximo, and believed it to be a part of the mainland, until assured by the natives that it was an island; but in 1494, on his second trip, he reiterated his previous belief and called the land Juana, after Juan, the son of Ferdinand and Isabella. Subsequently he changed the name to Ferdinandina in honor of Ferdinand, and still later to Santiago, the name of the patron saint of Spain, and finally to Ave Maria, in recognition of the kind offices of the Virgin Mary, but the aboriginal name of Cuba clung to the island and was never supplanted. A peaceable race of Indians, calling themselves Cibon-eyes, were its inhabitants, living under nine *caciques*. In 1502 Columbus visited Cuba a third time, and in 1511 his son, Diego Columbus, fitted out a colonizing expedition of 300 men, under Diego Velásquez, who in 1514 founded Santiago and Trinidad, and also a place on the southern coast called San Cristóbal de la Habana, a name soon transferred to another settlement on the northern coast, and in 1519 to the present locality. The natives were so cruelly treated that by 1553 their race was almost extinct, notwithstanding the appeals of Las Casas, the Roman Catholic apostle to the Indians, to the home government in their behalf. This humane missionary having observed in Santo Domingo that the negroes seemed to possess a capacity for endurance superior to that of the Indians, in order to save the latter, went so far as to suggest that negroes should be imported to take their places in the mines and cane fields. The colonists were not slow to act upon this suggestion, and thus negro slavery gained a foothold in the Western world. The Indians of Cuba, however, did not escape extermination, while the negroes were subjected to cruelties that checked their natural increase and made it necessary to recruit their numbers by constant importations. In 1537 Diego Columbus relinquished to the crown his right to appoint a governor for the island, and Hernando de Soto was appointed, under the title of captain general. Havana was destroyed by the French in 1538 and again in 1554, and for a century and a half the people of the island were in almost continual fear of invasion by the French, Dutch, or English, or the pirates infesting the adjacent waters. Many laws were also made in Spain that were exceedingly disastrous to the prosperity of the island—e.g., a law prohibiting all foreigners, even Spaniards not native Castilians, from trading with or settling in the island. This led to smuggling, which was carried on largely, especially after the English captured Jamaica in 1655. Whatever importance and prosperity Cuba has attained seems to date from the Treaty of Paris, 1763, which ended the Seven Years' War during which the English had captured Havana. The island was restored to Spain, and for the rest of the century it enjoyed unusual prosperity. Las Casas, appointed captain general in 1790, was especially indefatigable in his efforts for the public good, removing many restrictions from commerce and promoting many useful public works. During the nineteenth century the island was ruled by a succession of captains general possessing almost absolute power, and, although

some of these in the face of grave racial and social difficulties did excellent work, the majority proved both tyrannical and inefficient, as the great number of rebellions throughout the century indicate. Among them were: a number from 1820 to 1830, a sympathetic reflection of the revolutions in South America; the Black Eagle revolt of 1830, to some extent a servile insurrection; the great Ten Years' War, from 1867 to 1877, which was suppressed with revolting cruelty; and, finally, the insurrection in 1895, which was to end with the independence of Cuba. In the meantime the United States made repeated efforts to purchase the island. The first of these was by John Quincy Adams in 1825. In 1848 President Polk authorized the American Minister at Madrid to offer \$100,000,000, and in 1858 a proposal was made in the Senate to authorize an offer of \$30,000,000, but this was finally withdrawn. In 1854 what is known as the "Ostend Manifesto" (q.v.), drawn up in the interest of the slaveholding South by Buchanan, Mason, and Soule, United States ministers to Great Britain, France, and Spain respectively, claimed the right of this country to annex Cuba if Spain refused to sell. Various attempts were made to secure the independence of the island and the abolition of slavery. The insurrections of 1849-51, under Lopez (q.v.), and of 1854 failed to accomplish anything and were suppressed by the most cruel measures and, finally, under President Grant these efforts were renewed. The constant jeopardizing of American interests, killing of American citizens, and interference with American shipping, as is illustrated in the *Virginius* and *Black Warrior* affair, led to constant friction between the United States and Spain, and, though the rebellion of 1868-78 induced the Spanish government to promise the representation of Cuba in the Cortes by her own deputies, and a Liberal party was formed to secure the fulfillment of this pledge, to encourage white immigration, and to promote free trade, the general discontent remained. In 1895 came the final revolt. The insurgents, under Generals Gomez, Maceo, and Garcia, succeeded in keeping the field in spite of every effort to exterminate them, and became so bold as in February, 1896, to approach so near to Havana that the sound of their firing was heard within the capital. In the same month General Campos was recalled by the home government, and General Weyler, a soldier reputed to be savage in his measures, succeeded him. The revolutionists were able to maintain the semblance of a government, and their conduct, as well as that of Spain, aroused for them much sympathy throughout the United States. Before the close of 1897 General Weyler was recalled and superseded by General Blanco. In the United States the criticism of Spanish methods suddenly developed into widespread and outspoken hostility to Spain upon the mysterious destruction of the American warship *Maine* in the harbor of Havana on Feb. 15, 1898. Diplomatic relations became strained, and in April, 1898, owing to the apparent success of the insurrection and justified by that, President McKinley called the attention of Congress to the situation in such words that Congress, on April 19, declared that the people of Cuba were "of right ought to be free and independent." War followed, and by the Treaty of Dec. 10, 1898, Spain relinquished all right and sovereignty over Cuba,

and the United States took temporary possession of the island and assumed all the international obligations arising from such occupation. For three years thereafter the affairs of the island were administered exclusively by the War Department of the United States, and extensive public improvements were effected. In December, 1901, after the people had adopted a constitution, a president of the republic was elected, in the person of Estrada Palma. On May 20, 1902, the United States formally withdrew from the island, and Governor-General Wood was replaced by President Palma.

The conditions set for the withdrawal of the American occupation, as incorporated in the Cuban constitution and in the permanent treaty with the United States in 1903, were that the Cuban government should enter into no treaty with a foreign power tending to impair the independence of the republic or permitting a military or naval occupation of the island, and that no loans should be issued beyond the limit justified by the public revenue. The acts of the United States military government were recognized as valid, and the United States received the right to intervene for the discharge of its obligations under the Treaty of Paris. Provision was also made for the lease of coaling and naval stations to the United States. The question of the ownership of the Isle of Pines was reserved for future settlement. The first Congress of the Cuban republic met on May 5, 1902. In August a public loan of \$35,000,000 was authorized for the purpose of facilitating the revival of the sugar-cane industry. With the Spanish market closed to Cuban sugar and the United States as the leading available market, a modification of the American tariff laws in so far as they affected Cuban sugar became a matter of vital necessity. A reciprocity treaty between the two countries was ratified by the United States Senate in March, 1903, but the House of Representatives did not enact the necessary legislation until November. A tariff reduction of 20 per cent on Cuban products was granted. In September, 1903, the United States obtained the lease of the naval stations at Bahia Honda, near Havana, and Guantamano, not far from Santiago. In April, 1904, an extradition treaty was concluded with the United States. In the latter part of 1905 the American residents of the Isle of Pines set on foot a movement for the annexation of the island to the United States, but the agitation received its quietus from the American Secretary of State, who announced that the United States government recognized the sovereignty of Cuba over the Isle of Pines, a position affirmed in a formal treaty between the two governments, then under consideration by the United States Senate.

Party politics entered on an ominous course in 1905. At that time the two leading parties were the Liberals, formerly the National party, and the Moderates. The latter comprised the conservative elements, including the great commercial and industrial interests. The Liberal party, embracing probably a great majority of the nation, consisted of the more democratic elements, including the colored population which had supplied the bulk of the forces in the war against Spain. Up to the beginning of 1905 President Palma carried on his administration with Liberal support, but at that time he abruptly went over to the Moderate camp,

actuated probably by the widespread corruption and inefficiency that characterized the municipal governments under Liberal rule. The Liberal cabinet resigned and was replaced by one composed of Moderates, and there followed wholesale removals of Liberal municipal officers throughout the island. Both parties made active preparations for the presidential and congressional elections at the end of 1905, and there is no doubt that the Palma administration had extensive recourse to illegal methods. Thus the register of votes for the primary elections of September, 1905, contained 432,000 names, or "one-half larger than any possible number of voters." Intimidation was also practiced by the government. Convinced of the hopelessness of their cause, the Liberals remained away from the polls. President Palma was reelected, and a unanimously Moderate Lower House was chosen.

There were trivial uprisings in August and December, 1905, but it was not till the third week of August, 1906, that the Liberal outbreak came. The insurrectionary movement was begun by Pino Guerra in the Province of Pinar del Río, the first notable incident occurring on August 20, about 20 miles from Havana, when Gen. Quentin Bandera, a noted veteran of the War of Independence, was captured by a government force and brutally murdered. The government attempted to check the insurrection by arresting some of the Liberal leaders, including Gen. José Gómez, the candidate of the Liberals for the presidency in 1905. On August 27 President Palma issued a proclamation of amnesty in the hope of bringing the Liberals to terms, but it failed signally. How great was the general discontent throughout the island was attested by the helpless condition to which the government was reduced almost at a blow. It had at its command only 3000 rural guards, and it proceeded to organize a machine-gun battery which proved effective in one engagement with Pino Guerra's troops. But as early as September 8 President Palma secretly appealed to the United States government for intervention, professing his inability to cope with the insurrection. In the following week he gave public acknowledgment of the desperate state of affairs by suspending the constitution in the provinces of Havana, Pinar del Río, and Santa Clara. On September 12 the United States cruiser *Des Moines* arrived at Havana. At the request of President Palma a detachment of marines was landed the following day for the protection of the presidential palace, but received orders from Washington to reembark. On September 14 the Congress bestowed on President Palma full powers to deal with the situation, and on the 16th the latter, after a conference with a number of insurrectionary leaders, proclaimed a cessation of hostilities in view of the expected arrival of Mr. Taft, United States Secretary of War, who had been ordered to Cuba by President Roosevelt in the rôle of a mediator and with the hope of obviating the necessity of intervention by the United States. Secretary Taft landed in Havana on September 19, and immediately proceeded to inform himself of the merits of the issues at stake by soliciting testimony from the adherents of both parties. The weakness of the Moderate cause, in fact as well as in law, was speedily made apparent. Havana, as well as other large cities, was at the mercy of the insurgents.

It was decided by Secretary Taft that peace might be reestablished by declaring null the election of all candidates chosen in 1905 with the exception of President Palma, whose retention was necessary to maintain the continuity of constitutional government. But this possible solution was frustrated by the resignation, on September 28, of President Palma, who declared it incompatible with his dignity to remain in office under the specified conditions. A crisis was thus precipitated and intervention made inevitable. On September 29 Mr. Taft assumed the office of provisional Governor, and the dispatch of United States troops was hastened. The disarmament of the Cuban forces was at once begun and rapidly completed. For the next three years the United States occupied Cuba. In 1909, order having been restored, the republic was declared established for the second time, and the American troops left the island. For two years the new government under General Gómez prospered, but in 1911 the discontent of old veterans, who felt insufficiently rewarded for their services to the fatherland, led to trouble. American intervention was threatened, but the Cuban authorities quelled the incipient revolt, and order was restored. In 1912 the Conservative party under Menocal were victorious at the polls. The question of amnesty to those who opposed the government now became the foremost political issue, and it has not yet been settled. The new administration, however, has proven itself wide-awake to the necessity of economic and industrial progress in Cuba, and to further this has succeeded in floating a large loan in the United States in 1914. See SPAIN, UNITED STATES: SPANISH-AMERICAN WAR.

**CUBAN FEVER.** See CALENTURE.

**CUBAN LITERATURE.** "In Cuba everybody versifies," said the eminent critic Menéndez y Pelayo. It is certainly true that in her compositions in verse Cuba has made her most important contribution to literature in the Spanish tongue. The earliest poem known to have been written on the island is the *Especjo de paciencia* (1608) of Silvestre de Balboa, a native of the Canaries, but neither the seventeenth nor the first half of the eighteenth century produced any Cuban poet of great merit. Mention may, however, be made of the names

of José Surf y Águila (1696-1762), who wrote some religious *loas*; Mariano José de Alva and Lorenzo Martínez de Avileira, authors of *glosas* and *coplas*; an unknown poetess of Havana, who indited a little poem on the English invasion of 1762; and the cleric Diego de Campos, who commemorated the same event in his *décimas*. To another cleric of the eighteenth century, Fray José Rodríguez (*Capacho*), who likewise wrote *décimas* on various subjects, has been attributed the earliest dramatic work composed in Cuba, *El príncipe jardinero y fingido Cloridano*, but the bibliophile Barrera ascribes the play to one Santiago de Pita. The University of Havana was established in 1721, and at an early date in the century the first printing press was set up. In 1790 the first newspaper, *El papel periódico*, made its appearance and had among its most active collaborators such men of force as the teacher of philosophy José Agustín Caballero, the physician Tomás Romay, and, above all, the poet Manuel de Zequeira. Quite a number of epigrams are due to the pen of Manuel del Socorro Rodríguez, a journalist who founded several papers elsewhere in Spanish America. The epic was attempted with little success by Count Colombini in his *Glorias de la Habana*. All thus far produced was rather verse than poetry; the first real poets of Cuba are Manuel de Zequeira (1760-1846) and Manuel Justo de Rubalcava (1769-1805). Zequeira, perhaps the most attractive Cuban poet anterior to Heredia, echoed in the colonies the note of patriotic fervor called forth in Spain by the stirring events of 1808: in the heroic strains of his *Batalla naval de Cortés*, of his *Dos de Mayo*, and his *Primer sitio de Zaragoza*, he is as much a Spaniard as Quintana and Gallego in their heroic odes (cf. his *Poesías*, New York, 1829). Rubalcava, who was "bucolic in temperament, translated the *Elogues* of Vergil and composed some original idyls and descriptive poems (cf. the *Poesías de M. J. Rubalcava*, Santiago de Cuba, 1848).

But towering above the countless posterasters of the time, the greatest of all the poets that Cuba has yet produced was José María de Heredia (1803-39). A patriotic poet, who was exiled from Cuba because of his opposition to Spanish government, Heredia is held in high esteem, not only for his political poems like the *Himno del desterrado*, but also for his descriptive poems like the *Niágara*, the *Teocalli de Cholula*, and the *Tempestad* (often called also the *Huracán*), pervaded by a melancholy sentiment and full of most noble imagery. Among Heredia's works are many translations and imitations of the poems of English, French, and Italian writers, such as Young, Campbell, the pseudo-Ossian, Lamartine, Delavigne, Millevoje, Arnault, Foscolo, and Pindemonte (cf. the edition of Heredia's poems and his translations and imitations of foreign dramas, published at New York, 1875: his prose *Lecciones de historia universal*, Toluca, 1831, and other prose works: and consult Vilemain, *Essai sur le génie de Pindare et sur la poésie lyrique*, Paris, 1859; J. Kennedy, *Modern Poets and Poetry of Spain*, London, 1852). Among the lesser lights must be counted Domingo del Monté, a Venezuelan, who, residing in Cuba, there composed pleasing romances, played the part of a generous patron of other poets, and strove energetically to have purity of idiom maintained in the Cuban use of the Castilian

speech; Ignacio Valdés Machuca, who imitated Meléndez Valdés in his *Ocios poéticos* (1819) and also translated and imitated Jean-Jacques Rousseau; Manuel González del Valle, a teacher of philosophy and the author of a *Diccionario de las Musas* (1827), etc. A protégé of Del Monté's was the romantic spirit José Jacinto Milanés (1814-63), a man of superior powers, whose lyrics are now gently sentimental and again madly socialistic. Milanés is also deemed one of the best playwrights that the island has had so far. His pieces include *El Conde Alarcos*, *El poeta en la corte*, *Por el puente ó por el río*, and *A buena hambre no hay pan duro*. Pictures of manners in dialogue form are to be seen in his *Mirón cubano* (cf. the 1st ed. of his *Obras*, Havana, 1840; 2d ed., New York, 1865). Another true poet was Gabriel de la Concepción Valdés, best known by his pseudonym Plácido (1809-44). He was a mulatto and a foundling and had but slight training, yet few Cuban lyrics will live longer than his romance entitled *Nicotenol*, and his sonnets, *La muerte de Gessler*, *Fatalidad*, and *Plegaria* (cf. the editions of his verse, New York, 1856; and Havana, 1886). Of undisputed excellence is the work of the poetess Gertrudis Gómez de Avellaneda (1814-73). She was eminently successful as a lyric poet and as a dramatist, less so as a novelist (cf. an edition of her works, Madrid, 1869). Juan Valera says that as a lyric poet she has no rival of her sex in any literature, unless we go back to Sappho and Corinna, or perhaps to the Italian Renaissance and Vittoria Colonna; and in some respects he prefers the Cuban to the Italian.

Among the countless writers of verse that have arisen in Cuba later than Avellaneda, three are of particular merit: Joaquín Lorenzo Luaces (1826-67), the author of war songs (the *Caida de Missolonghi*, etc.), of odes (see especially the *Oración de Matías* of biblical inspiration and the ode *A Cyrus Field*, on the laying of the Atlantic cable), and of one or another drama (cf. the *Poesías de J. L. Luaces*, Havana, 1857, and the *Noches literarias en casa de N. Azórate*, Havana, 1866); Juan Clemente Zenea (1831-71), whose elegiac verse is full of a tender melancholy (cf. the complete edition of his *Poesías*, New York, 1872); and Rafael María de Mendive (1821-86), noted for his translation of the *Irish Melodies* of Thomas Moore, whose influence is also easily discernible in his original Cuban verse (cf. the *Poesías* of Mendive, Havana, 1883, and the *Melodías irlandesas*, New York, 1875). To the list of the nineteenth-century poets there may further be added the names of Ramón Vélaz y Herrera (born 1808), Miguel Teófilo de Tolón (1820-58), Francisco Orgáz (1815-73), Ramón de Palma y Romay (1812-60), Ramón Zambrana (1817-66), José Fornaris (1827-90), José Giliell y Renté, etc.

As compared with her poets, it is clear that the prose writers of Cuba are distinctly inferior in importance. In the eighteenth century she has the historians Arrati and Urrutia; in the nineteenth, Valdés, José Arrango y Castillo, etc. Among her legal writers have figured Conde, Ayala, Armas, Bermúdez, Cintra, etc., and among her moralists and writers on philosophical matters, Barea, Veranes, José Agustín Caballero, Félix Varcia, José de la Luz Caballero, etc. In the fine arts Vermau and Perouani have earned some recognition, and in

music Villate has gained notice by his operative compositions. A really good critical account of Cuban prose and poetry has yet to be written; more light on the subject may be expected from the publication of the *Biblioteca selecta hispano-cubana de prosistas* and the *Antología de poesía cubana*, which a commission of litterateurs has presented to the Spanish Academy. On Cuban lyric poets an excellent essay has been written by M. Menéndez y Pelayo and now appears as the preface to the second volume of the *Antología de poetas hispano-americanos* (Madrid, 1893), which contains very good selections from the works of the most important Cuban poets. Consult also: the *Parnaso cubano*, *Colección de poesías selectas de autores cubanos desde Zequeira*, etc., by A. López Prieto (Havana, 1881); the *Cuba poética, colección escogida de las composiciones en verso de los poetas cubanos desde Zequeira*, prepared by Fornaris and Luaces (2d ed., ib., 1861). Hills, *Bardos cubanos, antología de las mejores poesías líricas de Heredia, "Plácido," Arvelandea, Milanés, Mendive, Luaces, y Zenea*, with biographical notices of each of the poets and a comprehensive bibliography of their works and of Cuban poetry in general (Boston, 1901); Bachiller y Morales, *Apuntes para la historia de las letras y de la instrucción pública en la isla de Cuba* (Havana, 1859); Mitjans, *Estudio sobre el movimiento científico y literario de Cuba* (ib., 1890); Merchán, *Estudios críticos* (Bogotá, 1886); Callegno, *Diccionario biográfico cubano* (New York, 1878); González del Valle, *La poesía lírica en Cuba* (new ed., Barcelona, 1900); A. del Valle, *Parnaso cubano* (ib., 1912); C. M. Tréles, *Bibliografía cubana del siglo XIX* (2d vol. appeared at Matanzas, 1912, and carries the account from 1826 to 1840).

**CUBE** (Lat. *cubus*, Gr. *kyβos*, *kybos*, cube), or **REGULAR HEXAHEDRON**. A regular solid with six square faces, each of which is parallel to the one opposite to it. It is a form of frequent occurrence in nature, especially among crystals. The cube, or third power, of a number is the product formed by taking the number three times as a factor, e.g., the cube of 4, or  $4^3 = 4 \cdot 4 \cdot 4 = 64$ . This use of the term arises from the circumstance that the solid contents of a cube may be expressed by the third power of the number which expresses the length of one of its edges. Thus, if the edge of a cube is 4 inches, its volume is  $4 \cdot 4 \cdot 4 = 1$  cubic inch, or 64 cubic inches. The cube root of a number is one of the three equal factors of the number; e.g., the cube root of 8 is 2, since  $2 \cdot 2 \cdot 2 = 8$ . The number of which the root is sought is called the power, and if it is a power of a commensurable (q.v.) number, it is called a perfect power. Roots of perfect powers are often readily obtained by factoring, e.g., to find the cube root of 216,  $216 = 6 \cdot 6 \cdot 6$ , therefore 6 is the cube root of 216. If the root is incommensurable, the binomial formula, logarithms, or the equation (q.v.) is available. Every number which satisfies the equation  $x^3 = 1$ , or  $x^3 - 1 = 0$ , is a cube root of 1. But  $x^3 - 1 = 0$  is the same as  $(x - 1)(x^2 + x + 1) = 0$ , and equating each factor to 0 and solving,  $x = 1$ ,  $-\frac{1}{2} + \frac{1}{2}\sqrt{-3}$ ,  $-\frac{1}{2} - \frac{1}{2}\sqrt{-3}$ , the three cube roots of unity. (See **COMPLEX NUMBER**.) The three cube roots of 8 are

$$2, 2(-\frac{1}{2} + \frac{1}{2}\sqrt{-3}), 2(-\frac{1}{2} - \frac{1}{2}\sqrt{-3}).$$

Thus any number has three cube roots—one real and two imaginary. In extensive calculations tables of roots and of logarithms are employed.

Duplication of the cube, or the Delian problem, according to tradition, originated with the oracle of Delos, who declared to the Athenians that a pestilence prevailing among them would cease if they doubled the altar of Apollo, i.e., replaced his cubical altar by another of twice its contents. The problem reduces to the solution of the continued proportion  $a : x = x : y = y : 2a$ , or to the solution of  $x^3 = 2a^3$ . This was effected geometrically by Hippocrates, Plato, Menæchmus, Archytas, and others, but not by elementary geometry. This is one of the three great problems whose appearance has been of wonderful significance in the development of mathematics. Consult Gow, *History of Greek Mathematics* (Cambridge, 1884), and Klein, *Vorlesung über ausgewählte Fragen der Elementargeometrie* (Leipzig, 1895; Eng. trans., Boston, 1897).

**CUBEBES, or CUBE PEPPER** (Fr. *cubébe*, from Ar. *kabāba*). The dried unripe berries of *Piper cubeba*, a species of climbing shrub of the family Piperaceæ, very closely allied to the true peppers. *Piper cubeba* is a native of Penang, Java, New Guinea, etc., and is said to be extensively cultivated in some parts of Java. Its spikes are solitary, opposite to the leaves, and usually produce about 50 berries, which are globular and, when dried, have much resemblance to black pepper, except in their lighter color and the stalk with which they are furnished. *Piper canum*, a native of the Sunda and Molucca islands, is supposed also to yield part of the cubebs of commerce, and the berries of *Piper ribesoides* possess similar properties. Cubebs are less pungent and more pleasantly aromatic than black pepper, they are used in the East as a condiment, but in Europe chiefly for medicinal purposes. They act as a stimulant and are sometimes found useful in cases of indigestion, also in chronic catarrh and in many affections of the mucous membrane, particularly those of the urino-genital system. The chief constituents of cubebs are a volatile oil, resin, cubebic acid, cubebin, and wax. Cubebs are administered in many ways. For illustration, see Plate of CYPRESS, ETC.

**CUBE ROOT**. See **CUBE**, **INVOLUTION**.

**CUBIC EQUATION**. A rational integral equation of the third degree is called a cubic equation. It is called binary, ternary, or quaternary according as it is homogeneous of the third degree in two, three, or four unknowns. The general form of a cubic equation of one unknown is  $ax^3 + bx^2 + cx + d = 0$ . It is shown in algebra that this equation can be reduced to one of the form  $x^3 + px + q = 0$ . Every cubic equation of this form has three roots, of which one is real and the others real or imaginary. The roots will all be real when  $p$  is negative, and  $\frac{p^3}{27} > \frac{q^2}{4}$ . This is known as the irreducible case in solving the equation. Only one root is real when  $p$  is positive, or when it is negative and  $\frac{p^3}{27} < \frac{q^2}{4}$ . If  $p$  is negative and  $\frac{p^3}{27} = \frac{q^2}{4}$ , two of the roots are equal. The cubic equation may be solved by the following formula, due to Tartaglia and Ferro. Italian mathematicians of

# CUCKOOS

1. AMERICAN YELLOW-BILLED CUCKOO (*Coccyzus americanus*).

2. BLUEHEADED KOEL (*Eudynamis cyanocephala*).

3. COMMON EUROPEAN PARASITIC CUCKOO (*Cuculus canorus*).

4. ANI, or RAIN CROW (*Crotophaga ani*).

5. CRESTED CUCKOO (*Lepidogrammus cummingi*).

6. CHANNEL BILL (*Scythrops novæ-hollandiæ*).

7. CHAPARRAL COCK, or ROAD RUNNER (*Geococcyx californianus*).

the sixteenth century, but known as Cardan's formula:

$$x = \sqrt[3]{-\frac{q}{2} + \sqrt{\left(\frac{q^2}{4} + \frac{p^3}{27}\right)}} + \sqrt[3]{-\frac{q}{2} - \sqrt{\left(\frac{q^2}{4} + \frac{p^3}{27}\right)}}$$

Besides Ferro, Tartaglia, and Cardan, there were Vieta, Euler, and various others who contributed to the early theory of cubic equations. In case the roots of a cubic equation are all real their values are more readily calculated by means of trigonometric formulas: e.g., assume  $x = n \cos a$ , and the equation  $x^3 + px$

$+ q = 0$  may be expressed by  $\cos^3 a + \frac{q}{n^3} \cos a + \frac{p}{n^3} = 0$ . But it is shown in trigonometry that  $\cos^3 a - \frac{3}{4} \cos a - \frac{\cos 3a}{4} = 0$ : therefore, equating

corresponding coefficients of  $\cos a$ , and solving the equations,  $n = \sqrt{-\frac{4p}{3}}$  and  $\cos 3a = -4q \left(-\frac{3}{4p}\right)^{\frac{1}{3}}$

Hence  $x$  may now be computed from  $x = n \cdot \cos a$ ,

$n \cdot \cos \left(\frac{2\pi}{3} + a; n \cdot \cos \frac{2\pi}{3} - a\right)$  For history and

methods, consult Matthiesen, *Grundzüge der antiken und modernen Algebra der literalen Gleichungen* (Leipzig, 1896). See also CARDAN, JEROME

**CUBICULUM** (Lat., bedroom, from *cubare*, to lie down). A term used to designate a small room or cell in a Roman house, containing a bed or couch, and opening off the court, also a recess or alcove, a box at the theatre or circus, and lastly, a final resting place or burial recess for one or more bodies in the early Christian catacombs. In England, and less commonly in the United States, the term is applied to the bed alcoves of a common sleeping room or dormitory in a lodging house, school, or other institution, often in the Anglicized form *cubicle*

**CU'BISTS**. A group of post-Impressionist painters, who see and depict natural objects as if composed of innumerable cubes. They are best treated with painters of similar tendencies under POST-IMPRESSIONISM (qv).

**CU'BIT** (Lat. *cubitus*, elbow). A measure employed by the ancients, equal to the length of the arm from the elbow to the tip of the middle finger. The cubit of the Romans was about 17½ inches and that of the Hebrews 22 inches, but its length is now generally given as 18 English inches

**CU'BITT**, SIR WILLIAM (1785-1861). An English civil engineer, born at Dilham, Norfolk. In 1800-04 he was apprenticed to a cabinet-maker at Stalham, and at Swanton was associated with a manufacturer of agricultural machines and devised self-regulating sails for windmills. In 1818 he began the manufacture of his invention known as the "treadmill," which was quickly introduced into the principal jails of Great Britain. From 1826 he was connected as engineer with important works in the improvement of canals and rivers and the construction of bridges and railways. He conducted the improvement of the Severn and the building of the Southeastern Railway. The water works of Berlin were also executed by him. In 1850-51 he was president of the Institution of Civil Engineers

**CUCKOO**, кукла (Fr. *coucou*, Lat. *cululus*,

Gk. *κόκκυς*, *kokkys*, cuckoo, Skt. *kákila*, cuckoo). A name given to many birds of the picarian family Cuculidae, which contains about 175 species, mostly confined to the warmer regions of the globe, although some of them are summer visitors to cool climates. Only 35 of the known species live in the New World. The beak is slightly compressed and somewhat arched; the tail long, rounded, and usually of 10 feathers; the wings rather long; the tarsi short, with two toes directed forward and two backward, the outer hind toe capable of being brought half round to the front. The feet are thus adapted for grasping and moving about upon branches rather than for climbing.

*Cuckoos of the Old World.*—The name "cuckoo" is derived from the note of the male of the common European cuckoo (*Cuculus canorus*), which, although monotonous, is always heard with pleasure, being associated with all that is delightful in returning spring. A similar name is given to the bird in many languages. This common cuckoo is very widely diffused, as it is also found in India, Africa, and, in summer, even in Lapland and Kamchatka. It appears in Great Britain in April, and all except the young birds are believed to migrate southward again before the middle of August. The adult cuckoo is about a foot in length, ashy gray, barred beneath with black, the wings are black, and the tail is black, marked with white. It frequents both cultivated districts and moors. There is no pairing or continued attachment of the male and female; and the female, after having laid an egg on the ground, takes it in her mouth and deposits it, by means of her beak, in the nest of some other smaller bird, leaving the egg to be hatched and the young one to be fed by the proper owners of the nest. This egg is very small for so large a bird, not larger than a skylark's, and the number laid is uncertain. The young one, soon after hatching, acquires size and strength enough to eject from the nest any eggs or young birds—the true offspring of its foster parents—which may remain in it, and it seems restless and uneasy till this is accomplished. It works itself under them and then jerks them out by a motion of its rump. Other species of cuckoo, closely allied to the European cuckoo, inhabit Africa, Asia, and Australia, and have essentially the same habits, one, about the Mediterranean, victimizing pies alone, its eggs having a remarkable resemblance to those of the magpie. Equally parasitic are many Old-World tropical species of various other genera; yet some of them (see COLGAL) do not shirk parental responsibility, but incubate and rear their own offspring. This extraordinary practice of bird parasitism, in respect to its facts and probable origin and development, is thoroughly discussed by A. Newton, *Dictionary of Birds*, article "Cuckoo" (London, 1896), and Baker, *The Ibis* (ib., 1913).

*The American cuckoos* represent three different subfamilies—the anis, the road runners, and the tree cuckoos. The last compose the group Coccyzinae and are characteristic of and confined to America. The best-known species are the black-billed cuckoo (*Coccyzus erythrophthalmus*) and the yellow-billed (*Coccyzus americanus*). Both species occur commonly in summer throughout the United States and eastern Canada, but pass the winter in Central and South America. The black-billed cuckoo does

not occur west of the Rocky Mountains. The two species are of about the same size, a foot long, and are olive brown above, white beneath, but are easily distinguished by the color of the bill and the amount of white on the tail.

YELLOW-BILLED CUCKOO.

Unlike the Old-World cuckoos, they are not parasites, but build their own nests and incubate their own eggs. The nests are flimsy structures of twigs, the eggs large and pale blue. Incubation begins when the first egg is laid, so that no two of the eggs or young are in just the same stage of development. The American cuckoos are insectivorous and are very useful birds. Their note or call is a series of accelerated "chucks," not exactly harsh, but far from musical. In the Middle, Western, and Southern States the yellowbill is known as "rain crow," because its note is supposed to predict rain—an idea prevalent in regard to these birds in other parts of the world. Consult Beal, *Food of Cuckoos* (Department of Agriculture, Washington, 1898). See Plate of CUCKOOS, and Colored Plate of EGGS OF SONG BIRDS.

**CUCKOO AND THE NIGHTINGALE, THE.** A poem attributed in the sixteenth century to Chaucer, but probably not composed by him. The subject is the discussion between a nightingale and a cuckoo on the comparative blessings of love.

**CUCKOO BEE.** A naked, somewhat wasp-like bee of the family Nomadidae, all the many species of which are parasitic in the nests of other bees, after the manner of the European cuckoo. Each genus makes its home with some particular form or forms of wild bee; thus, our common *Nomada imbricata* is found in nests of *Andrena* and *Halictus*; *Stelis* lives on *Osmia*, etc. These inquilines have no means of collecting or carrying pollen and so have been forced to seek the hospitality of forms able to do so. The investigations of J. H. Emerton show that this forced association arouses no quarreling, but that there is frequently enough food for the larva of both the proper owner of the cell and of the guest, whose egg is laid in the same pollen mass. The term "cuckoo bee" is also applied to hymenopterous insects of the family Chrysididae. See BEE; Cuckoo FLY.

**CUCKOO FLOWER.** See CRESS.

**CUCKOO FLY.** One of a family (Chrysididae) of diminutive, beautiful, metallic-green wasps, in which the abdomen has only three, four, or five visible segments, and can be turned under the thorax and closely applied to it. This "fly" seeks out the nest of a solitary wasp or bee, and, when the rightful owner is absent collecting food, the cuckoo fly deposits an egg in each cell. These eggs are walled in by the bee, together with her own eggs. The cuckoo-fly larvæ hatch, eat the food stored up in the cell by the bee, and perchance even the rightful larvæ. The adult fly, when seen by the wasp,

is fought desperately, and during such encounters it rolls itself up in a defensive ball. In Europe, where the Germans call them *Goldwespen*, one of the cuckoo flies is parasitic on the currant worm.

**CUCKOO SPIT.** See FROG SPITTLE.

**CUCUJIDÆ** (Neo-Lat. nom. pl., from *Cucujus*, of South American origin). A large family, chiefly tropical, of oblong, flattened beetles, most of which live under bark. See CORN INSECTS.

**CUCUMBER** (OF. *cocombre*, Fr. *concombre*, from ML. *cucumer*, from Lat. *cucumis*, cucumber), *Cucumis sativus*. A common garden vegetable, native of Asia, and cultivated from the earliest times. The plant is vinelike and somewhat similar in appearance to the muskmelon. The oblong fruit (4 to 30 inches long) is eaten in the green state as a salad and is extensively used for pickling. The smaller sorts of pickling cucumbers are sometimes called "gherkins." The many varieties of cucumber in cultivation differ greatly in size and shape of the fruit. Cucumbers are very sensitive to frost. They are grown during the warm months in nearly all parts of the United States. The seeds are planted in hills 4 by 6 feet apart. The soil should be a fertile, warm loam, and the hills made rich with a few shovelfuls of well-rotted manure. The long English varieties extensively used for forcing in Europe are less used in America, the white-spine varieties being used more extensively for this purpose. To this genus belong other species valued for their edible fruit. *Cucumis anguria* is known as the West Indian gherkin. The snake cucumber (*Cucumis melo*, variety *flexuosus*) grows to a great length and is similar in quality to the common cucumber. *Cucumis serotinus* is cultivated in Turkey; *Cucumis macrocarpos* in Brazil; the conomon (*Cucumis conomon*) is much cultivated in Japan. The dudaim (*Cucumis dudaim*) is very generally cultivated in gardens in the East, for the fragrance of its fruit. The musk cucumber is *Cucumis moschata*.

**CUCUMBER BEETLE.** Of several beetles whose grubs attack cucumbers, the most important ones are described under MELON INSECTS (q.v.). A species of flea beetle found about cucumber vines is *Haltica cucumeris*, which is about the size of a small grain of wheat, black, with clay-colored antennæ and legs. The larvæ mine the seed leaves of the young plants, and both old and young feed upon the mature vine leaves and also upon other garden vegetables.

**CUCUMBER DISEASES.** The cucumber is subject to the attack of a number of fungi, only the more important of which can be mentioned. In the seed bed it is liable to the attack of *Phythium debaryanum*, the disease being called "damping off" (q.v.). In the field one of the worst pests is *Plasmopara cubensis*, producing mildew. It attacks the foliage, causing the leaves to turn yellow, to wilt, and die, the whole vine being involved. Spraying with some fungicide, as Bordeaux mixture or potassium sulphide, will prevent this disease if applied early and often. Care must be taken to spray the mixture upon the under sides of the leaves. In addition to cucumbers, this mildew occurs on muskmelons, squashes, and pumpkins. Another fungus, *Cladosporium cucumerinum*, attacks the fruit of the cucumber and melons, producing upon the young fruits small, sunken areas that later become black, rotten places. Often a sort of gummy exudation is associated

# CUCUMBER ALLIES

1. LUFFA OR DISHRAG GOURD (*Luffa aegyptiaca*).
2. BOTTLE OR CALABASH GOURD (*Lagenaria vulgaris*).
3. SNAKE GOURD (*Trichosanthes Anguinata*).
4. FLOWERS OF MUSK-MELON (*Cucumis melo*).
5. SUMMER SQUASH (*Cucurbita*); *a*, Crookneck; *b*, Custard or Patty-pan; *c*, Vegetable Marrow.

6. *a*, WATERMELON (*Citrullus vulgaris*); *b*, MUSK-MELON (*Cucumis melo*).
7. CUCUMBER (*Cucumis sativus*).
8. *a*, PUMPKIN (*Cucurbita pepo*); *b*, WINTER OR HUBBARD SQUASH (*Cucurbita maxima*).

with this disease. The treatment given above is recommended for this disease. In the greenhouse a serious trouble to cucumber forcing is the powdery mildew (*Erysiphe cichoracearum*). It may be known by the white, flourlike splashes on the leaves. The leaves become yellow, then brown, and dry up, killing the plant. The disease spreads with great rapidity, but may be kept under control as in the above cases. A disease known as the "wilt disease" is often of great destruction to cucumbers, melons, etc. It is caused by a kind of bacteria to which the name *Bacillus tracheiphilus* has been given. The organisms fill the water ducts of the plant, causing it suddenly to collapse. The leaf blades shrivel and dry up, and later the petioles and stem become flaccid, and the whole plant perishes. If a stem be cut across, a sticky, milk-white substance exudes. The disease is readily produced by inoculation and is largely spread through the agency of insects. A somewhat similar disease is caused by a species of *Fusarium*, a fungus. A disease due to *Mycospharella citrullina* has recently become serious on cucumbers and other cucurbits grown under glass. It also attacks tomatoes.

**CUCUMBER INSECTS.** See MELON INSECTS.

**CUCUMBER TREE.** An American forest tree, *Magnolia acuminata*, growing in nearly all the States from New York to Arkansas and southward. The fruit, which looks like a cucumber, when macerated in spirit, makes a useful tonic drink. The timber is light and useful for boat building. See MAGNOLIA.

**CU-CURBITACEÆ** (Neo-Lat. nom. pl., from Lat. *cucurbita*, gourd). A family of dicotyledonous plants (the gourd family), consisting chiefly of herbaceous plants, natives of the warmer parts of the world, having succulent stems which climb by means of lateral tendrils. The epigynous flowers are monœcious or dioecious and sympetalous. The calyx and corolla are five-parted and more or less coherent. The stamens exhibit a number of peculiarities, in some cases having both unilocular and bilocular anthers; in other cases the often tortuous anthers adhere, and sometimes the filaments are united. The fruit, called a "pepo," is peculiar, is more or less succulent, has a fleshy rind, and the seed-bearing placenta either surround a central cavity or send prolongations into it. The seeds are flat and more or less imbedded in the pulp, which may be dry or juicy. The cotyledons are large and leaf like. This family contains 90 genera, with about 700 species, many of which produce edible fruits and are cultivated in temperate regions. To this family belong the cucumber, melon, gourd, pumpkin, squash, vegetable marrow, etc. (qq.v.). In some, important medicinal properties abound, as in bryony, colocynth, momordica, etc. (qq.v.). *Telfairia pedata*, a tropical African species, is cultivated for its seeds, which are used for food and from which oil is expressed.

**CÚCUTA,** koo'koo-tá. See SAN JOSÉ DE CÚCUTA.

**CUDAHY,** kud'á-hí. A city in Milwaukee Co., Wis., 5 miles south of Milwaukee, on the Chicago and Northwestern Railroad and on Lake Michigan (Map: Wisconsin, F 6). The manufactures of the city include rubber goods, machinery, vinegar, and gloves, and there are foundries and a meat-packing establishment. Pop., 1900, 1366; 1910, 3691.

**CUDREAR,** kud'bar'. See ARCHIL.

**CUDDALORE,** kud'dá-lór', or **KUDALUR,** kud'dá-lóor'. The chief town in the southern division of South Arcot, Madras, British India, at the junction of the Pounaiyar and Gadelain rivers, 15 miles south of Pondicherry and 125 south of Madras by rail (Map: India, D 6). It has an ancient Siva temple and a ruined fort. The river, obstructed by a bar, admits only vessels of moderate size; but there is good anchorage 1½ miles off shore, and the port is the largest in South Arcot. The chief manufactures are cotton goods and carpets. There are a number of sugar refineries, oil presses, and paper mills, and an extensive export trade in cotton and grain. Cuddalore was the scene of exciting struggles between the French and the English from 1758 to 1795, when it was finally acquired by the latter. Pop., 1891, 47,400; 1901, 52,216; 1911, 56,574.

**CUDDAPAH,** kud'dá-pá'. See KADAPA.

**CUDILLERO,** koo'dé-lyá'ró. A maritime town in the Province of Oviedo, Spain, 20 miles northwest of the city of Oviedo (Map: Spain, B 1). The harbor, protected by a jetty, has a lighthouse which marks its eastern point. It admits, however, only small craft. The port is engaged largely in fishing, and there are fish-curing establishments and manufactures of linen and chocolate; stock raising and agriculture also are carried on, and in the vicinity are mines of manganese. Pop. (commune), 1900, 10,160, 1910, 10,703.

**CUDRAKA,** shoo'drá-ká. The reputed author of the Sanskrit drama *Mricchakatika* (q.v.). See SÚDRAHA.

**CUD'WORTH,** RALPH (1617-88). An English theologian and philosopher. He was born at Aller, in Somersetshire, and admitted pensioner of Emmanuel College, Cambridge, in 1632, where he took his degree of M.A. and became a prominent tutor. In 1645 he was appointed master of Clare Hall and regius professor of Hebrew, in 1654 he was chosen master of Christ's College, in 1662 appointed to the rectory of Ashwell, and in 1678 installed prebendary of Gloucester. Cudworth's chief work, entitled *The True Intellectual System of the Universe* (1678), advocates a Platonizing doctrine of philosophy, especially emphasizing the necessity of a theological view against the contention of the mechanists of the day, and defending the doctrine of innate ideas. From such views the remarkable group of which he was a leader obtained the name of the Cambridge Platonists (q.v.). His *Treatise Concerning Eternal and Immutable Morality*, which was posthumously published in 1731, champions the innate character of our moral ideas, which are held to cognize the objective reality of good and evil with the same immediateness and certainty which attend our geometrical knowledge. Selections from this treatise appear in Selby-Bigge's *British Moralists* (1897). Consult: Martineau, *Types of Ethical Theory*, vol. ii (Oxford, 1898); Lowrey, *The Philosophy of Ralph Cudworth* (New York, 1885); Birch, *Life*, in the edition of Cudworth's works (1743; reprinted 1820), and the preface to Mosheim's Latin translation of Cudworth's works (1733); Seth, *English Philosophers and Schools of Philosophy* (1912).

**CUENCA,** kwan'ká. The capital of the Province of Azuay, Ecuador, situated on the Rfo Matadero, 8640 feet above sea level, 190 miles south-southwest of Quito (Map: Ecuador, B 41).

It has straight streets and contains, among the chief buildings, the cathedral, the high school (formerly a Jesuit college), the prison, and the government building. It is the centre of a fertile grain, cotton, sugar, and cochineal producing region, and rich metal deposits are worked in the neighborhood. The most important manufactures are pottery, hats, and woollens, and a considerable trade in preserved fruits, cheese, and grain is carried on. It is the third most important city in Ecuador and has a population of about 30,000. Cuenca was founded in 1557, on the site of the old native village Tumibamba, and in 1786 was created an episcopal see. There are numerous interesting Aztec remains in the vicinity. The mountain of Tarqui on the south was chosen in 1742 for determining the meridian line of La Condamine, Bouguer, and Godin. At the base of the mountain occurred the battle of Tarqui in 1828 between the Colombian and Peruvian forces.

**CUENCA.** A city of Spain, the capital of the province of the same name and the seat of a bishopric, about midway between Valencia and Madrid (Map: Spain, D 2). It is picturesquely situated, at an elevation of about 3000 feet, on the river Júcar, at the confluence of the Huécar, and is poorly built, with narrow, crooked streets. The walls are in ruins, and the city, once celebrated for industry and art, but faintly suggests its former prosperity. A fine bridge spans the Júcar, and there are a college and several notable churches, the most pretentious of which is the Gothic cathedral, with the chapel of the Albornoces. The city has some manufacturing interests and a trade in lumber and wine. Pop., 1900, 10,505; 1910, 11,721.

Cuenca first appears in the history of the ninth century, under Saracen power. In 1177, after a long siege, it fell into Christian hands, though earlier in the century it had been captured, but retaken. It was granted the dignity of a municipality in 1257. The city was taken by the English in 1706 after bombardment, and in 1808 and 1810 was sacked and burned by the French—disasters which contributed materially to its decline. In 1874 Cuenca fell into the power of the Carlists, who ravaged the city, infuriated by its stubborn resistance.

**CUERNAVACA,** kwâr'nâ-vâ'kâ. The capital of the State of Morelos, Mexico, magnificently situated in the valley of the Cuernavaca, 47 miles south of Mexico City, 5000 feet above sea level (Map Mexico, J 8). It contains a church built by Cortés, an agricultural academy, a fine government building, a theatre (with a capacity for 2000 spectators), a hospital, and a literary institute. The city is the centre of a fertile district and has extensive sugar refineries and distilleries. Near by are the ruins of an Aztec temple, 400 feet high, composed of five terraces. Cuernavaca, at the advent of the Spaniards, was an old Indian village and became, after its capture, the favorite residence of Cortés, his palace being still extant. In 1863 Maximilian made it his residence. It bears many marks of his royal favor, especially in its public gardens. As a health resort it is frequented by those who cannot stand the excessive altitude of Mexico City. Pop., 1895, 8747; 1900, 9584; 1910, 12,776.

**CUERO,** kwâr'ô. A town and the county seat of Dewitt Co., Tex., 105 miles by rail east-southeast of San Antonio, on the San Antonio

and Aransas Pass and the Southern Pacific railroads, and on the Guadalupe River (Map: Texas, D 5). It is in a rich agricultural belt, producing corn, rice, truck, and cotton, carries on a large trade in turkeys and cattle, and has cotton gins and compresses, a cotton mill, cottonseed-oil mills, machine shops, turkey-dressing plants, and a creamery. The water works and sewerage system are owned by the town. Pop., 1900, 3422; 1910, 3109.

**CUERVO,** kwâr'ô. RUFINO JOSÉ (1844-1911). A Spanish-American humanist and philologist, born at Bogotá, Colombia, the son of Dr. Rufino Cuervo, a distinguished lawyer and statesman. Owing to various revolutionary disturbances Rufino José (Cuervo) was obliged to give up his professorship in Latin and help recoup the family fortunes. With his elder brother Angel he went into the brewing business about 1871. All during the darkest days the brothers held to their ideal of keeping the path as clear as possible for the studies of the younger one; and about 1882 they retired and went to Paris to spend the rest of their lives on the work Rufino José had planned. This work made of Cuervo the greatest Spanish grammarian and lexicographer of the nineteenth century, without dulling his delicate appreciation of literary values, so much so that Juan Valera, the most Attic stylist of them all, called him *el más profundo conocedor de la lengua castellana*. In addition to the work he (in collaboration with his brother) devoted to his father's career, *Vida de Rufino Cuervo y noticias de su época* (2 vols., Paris, 1892), he published five successively revised and enlarged editions of his *Apuntes críticos sobre el lenguaje bogotano* (5th ed., ib., 1907), repeated new editions, thoroughly revised and brought up to date, of the *Bello-Cuervo Gramática castellana*; and his *magnum opus*, the *Diccionario de construcción y régimen de la lengua castellana*. Although the work was completed, Cuervo's bad health after his brother's death prevented him from publishing more than the first two volumes: vol. i (Paris, 1885), letters A and B; vol. ii (ib., 1893), letters C, Ch, and D. The manuscript of the remainder was intrusted, by Cuervo's will, to the Colombian Academy for publication. Consult Fr. Pedro Fáb, *Rufino José Cuervo y la lengua castellana* (3 vols., Bogotá, 1912), and articles in the *Bulletin hispanique*, iii (1901) and xiii (1911) and the *Romanic Review*, iii (1912).

**CUESTAS,** kwâr'stâs, JUAN LINDOLFO (1837-1905). A South American politician and a president of Uruguay, born at Paisandú. In 1879 he became collector of customs, in 1880 Secretary of the Treasury, in 1884 Secretary of Justice, Worship, and Public Instruction, in 1886 Secretary of State, and in 1891 Senator for Paisandú. He was appointed President of the Senate in 1897, in 1898, after the assassination of President Borda, was placed in charge of the provisional government, and from 1899 to 1903 was President of the republic.

**CUEVA,** kwâr'vâ, JUAN DE LA (c.1550-c.1609). A Spanish poet and dramatist, born in Seville. Despite his importance as one of the most influential of Lope de Vega's predecessors, modern scholarship has not yet succeeded in learning much about his life. He is supposed to have been a pupil of Mal Lara and to have spent five years in New Spain (i.e., Mexico) with his brother Claudio, an officer of the Inquisi-

tion. The date of this voyage is uncertain, as is also that of his visit to the Canary Islands. During many years he acknowledges himself as being in love with Felipa de la Paz, whom he celebrates as Felicia. He is also credited with a love affair with Brígida Lucía de Belmonte, whom he is supposed to have met in the home of Argote de Molina; but there seems to be little ground for this second tale. He lived in his native city until 1607, when he went to Cuenca. We do not know exactly the dates of his birth and death. The last certain date we have is 1609, the date of his signature to a new copy of his *Exemplar poético*, which he had written in 1606. He left a quantity of works (plays, poems, letters, epigrams, *romances*, etc.), but he is of interest and importance only as a dramatist and dramaturge. In these respects it is difficult to exaggerate his importance and influence. He expounded his dramaturgic theories in 1606 in the third epistle of his *Exemplar poético*, after he had long been putting them into practice. His fame rests secure on several important innovations: the introduction of the historical drama, the successful use of the old *romances*, the refusal to be bound by the rule of the three unities, the sketching of the main lines of the *comedia de capa y espada*, and the embellishment of the drama by the use of metrical forms hitherto unknown to the drama (unless they had been used, as Walberg conjectures, in the lost plays of Cuesta's master, Mal Lara). He believed, too, that he was the first to reduce the number of acts to four (not knowing that Micael de Carvajal had preceded him), and the first to use a national theme (unaware that Bartolomé Palau had written, c.1524, his *Santa Oria*). But even in these respects Cueva was the first to make a deliberate effort to reform the drama. Only two of his plays have been reprinted: *El Saco de Roma*, which demonstrated the dramatic possibilities of modern history, and *El Infamador*, which is a forerunner of the peculiar form that is later to be taken by the Spanish drama of manners, and gives us in the character of the libertine Leucino a first sketch of the type that was to become immortal under the name of Don Juan. Consult E. de Ochoa, *Tesoro del teatro español*, vol. 1 (Paris, 1838), for the two plays. E. Walberg, *Juan de la Cueva et son "Exemplar poético"* (Lund, 1904). R. Menéndez Pidal, *L'Épopée castillane à travers la littérature espagnole* (Paris, 1910).

**CUEVA, ENRÍQUEZ ARIAS DE SAAVEDRA**, en-rē'kāth ā-rē-ās dā sa-vā'dra, BALTAZAR DE LA (1626-86). A Spanish statesman. He was born in Madrid, and was the second son of the seventh Duke of Alburquerque and his third wife, Ana Enriquez. He was educated at the University of Salamanca and successively became Councilor of State, Councilor of the Indies, Ambassador to Germany, and Viceroy of Peru, Tierra Firme, and Chile, in which capacity he introduced many beneficent reforms and greatly improved the condition of the Indians. He married Teresa María Arias de Saavedra, seventh Countess of Castellar and Marchioness of Malagón, and by courtesy assumed her names and titles.

**CUEVAS DE VERA**, kwā'vās dā vā'rā. A town of Spain, in the Province of Almería, 42 miles northeast of Almería (Map: Spain, D 4). It is situated in a plain on the right bank of the Almanzora, 8 miles from its entrance into

the Mediterranean, and is generally well built, with broad and regular streets. It has two spacious plazas, and among the principal edifices are an old Moorish castle and the parish church of the Incarnation, a handsome Doric structure, dating from 1758. A large number of persons are employed in the silver mines of the vicinity; agriculture and stock raising are also important industries. There are some manufactures, principally of pottery. Pop., 1890, 20,341; 1900, 20,603; 1910, 26,130.

**CUFA**, kō'fā. A ruined city in the Turkish vilayet of Bagdad. It was founded by the Arab conquerors of Persia about a year after the decisive battle of Cadesia, in 637, and speedily became one of the most important centres of Moslem life. After the murder of Uthman, in 656, Ali made it his capital. Even when Muawiya had overthrown the son-in-law of the prophet in 661, established the Umayyad caliphate, and made Damascus the capital, Cufa continued to flourish. At the height of its prosperity it is said to have numbered from 150,000 to 200,000 inhabitants, for the most part of South Arabian stock. Cufa was the stronghold of various revolutionary movements. The schools of Cufa exercised the very greatest influence on the development of Arabian literature and theology. It possessed a famous school of grammarians. (See ARABIC LANGUAGE AND LITERATURE.) The peculiar script affected by its scholars spread far and wide and was for some time generally used by calligraphists in manuscripts of the Koran and inscriptions. (See KUFIC WRITING.) Owing to the unsuccessful political rivalry with Damascus and, after the establishment of the Abbasid caliphate, the growth of Bagdad, the city began to decline already towards the end of the eighth century. Consult: A. Müller, *Der Islam im Morgen- und Abendland* (1885). Wellhausen, *Das arabishe Reich* (1902). C. Huart, *Histoire des Arabes* (1912-13).

**CUFFE**, WILLIAM ULICK O'CONNOR. See DESART, fourth EARL OF.

**CUFTEE**, PAUL (1759-1818). An American sea captain, half Indian, half negro, born near New Bedford, Mass. He was a member of the Society of Friends and used his wealth, acquired at sea, in the effort to encourage the colonization of his people in Sierra Leone. He carried out 38 colonists on his own ship in 1815 and died while waiting for permission from England to make further settlements in the colony.

**CUFTEY**. A name formerly given to negroes in the West Indies and common among the maroons of Jamaica.

**CUFIC WRITING**. See KUFIC WRITING.

**CUI**, kú'e, CÉSAR ANTONOVITCH (1835- ). A Russian composer and military engineer, born at Vilna. He studied at the gymnasium, where his father, a survivor of Napoleon's army of invasion, taught French. After studying music with Moniuszko (q.v.) for some six months at Vilna, he entered the School of Engineering and the Engineering Academy at St. Petersburg, becoming subsequently professor of fortification in several military academies, and gradually rising to the rank of lieutenant general. Among his pupils have been several grand dukes, the famous Skobelev, and Nicholas II. During the Russo-Turkish War he was sent to examine the fortifications on the Danube. His report, *Tour Notes of an Engineering Officer from the Theatre of Military Operations in*

European Turkey, was translated into several languages and attracted considerable attention. Among his textbooks the best known are *A Short Manual of Field Fortification* (7th ed., 1894) and *A Short Historical Sketch of Permanent Fortification* (1889). His musical studies he continued with Balakireff (q.v.), making his debut with a Scherzo in F major for orchestra (1859). His opera *The Prisoner of Caucasus* (1857-58) and the comic opera *The Mandarin's Son* were performed privately and exhibited no departures from established tradition. In 1864 he became musical critic of the *St. Petersburg Gazette*. He championed the theories of the Young Russian school, attacking the conservative attitude of the critics, rejudging established reputations, subjecting everything to a keen and searching analysis. He received the nickname "Musical Nihilist," and his opera *William Ratcliff* (1869), based on Heine's drama and embodying the new theories of "melodic recitative," met with severe criticism. *Angelo* (1876), based on Victor Hugo's drama, carried the theories even further and met with a similar fate. In 1883 he rewrote *The Prisoner of Caucasus*, adding a new act, and the work had considerable success. *Le Flûteur* (1894), words by Richpin, was successful at the Paris Opéra Comique, and *The Saracen* was favorably received in 1899. In the following year *Mamzelle Fifi* was written, in 1908 *Matteo Falconi*, and in 1909 *The Captain's Daughter*. His purely instrumental works include two scherzos and four suites for orchestra and a number of works for piano. But his talent shows to best advantage where inspiration is derived from words. His numerous songs, both to Russian and to French words, are veritable gems, while his pieces for chorus enjoy great vogue. He was never fond of orchestration and is far behind his Russian colleagues in that line, but for this shortcoming he makes amends through the sincerity and passion of his works. As a critic, in Russian periodicals and the French *Revue et Gazette Musicale*, Cui enjoys an enviable reputation. His *La musique en Russie* (Paris, 1880) is the only sketch of Russian music written with authority, even though it is at times marred by the author's aesthetic views. *The Russian Lied* (1896) is a detailed study of all important Russian song writers, with careful reference to both music and text. Consult Countess de Mercy-Argenteau, *Cesar Cui* (Paris, 1888), and Pouzin, *Essai historique sur la musique en Russie* (Turin, 1897).

**CUIABÁ.** See CUYABÁ.

**CUIRASS,** kwé-rás' or kwé'- (Fr. *cuirasse*, from ML. *coratium*, breastplate, from Lat. *coriacus*, leathern, from *corium*, leather). Originally a jerkin, or garment of leather for soldiers, so thick and strong as to be pistol proof and even musket proof. The name was afterward applied to a portion of armor made of metal, consisting of a backplate and a breastplate hooked or buckled together, with a piece joined to the back called a *culet*, or *garde de reins*, and still worn by some European regiments of cavalry. For illustration, see ARMOR.

**CUIRASSIER,** kwé-rás-sér' (Fr., from *cuirasse*, cuirass). In modern armies, the name given to certain soldiers of heavy cavalry. They are survivors of the troopers of the sixteenth and seventeenth centuries, who wore helmet and cuirass. There are four regiments of cuirassiers

in the Russian army, and 12 regiments each in the German and French armies. (For illustration, see Plate of ARMOR.) The Russian cuirass is of iron, coated with copper, and weighs 30 pounds; the German is of white metal with a brass plate, and the French of steel with a brass plate, their respective weights being 13½ and 16 pounds. There are no cuirassiers in the British army, although the Life Guards and Royal Horse Guards wear dress cuirasses of steel, costing £3 6s. each, which are discarded on active service. In the time of Queen Mary there were heavy horsemen known as "cuirassiers," who wore body armor over buff coats. They carried swords and pistols, and their reins were strengthened with iron chains. The bodyguard of Napoleon III, Les Cent-Gardes, wore aluminum cuirasses. No cuirass is bullet proof against a direct shot. See CAVALRY, where an historical sketch of mounted troops is given.

**CUISSART,** kwé-särt' (OF., from *cuisse*, thigh, from Lat. *coxa*, hip). A variety of ancient armor worn by troopers. Cuissearts consisted of small strips of iron plate laid horizontally over each other round the thigh and riveted together.

**CUITLAHUATZIN,** kwé-lá-wát-sén', or **CITLAHUATZIN** (1470-1520). An Aztec prince, younger brother of Montezuma II. When the latter was seized by the Spaniards, Cuitlahuatzin, often mentioned as Quetzlavaca, or Cuitlahuac, was also for some time in their hands, but was ultimately released. As the acknowledged leader of the Aztecs after the capture of Montezuma, he led the famous attacks upon the army of Cortés. He also directed the operations of the Aztecs during the retreat of the Spaniards to the coast. He was afterward elected to succeed Montezuma, but died of a pestilence after his installation and was succeeded by his cousin Guatemotzin, the last of the Aztec rulers.

**CUJACIUS,** ká-já'si-ús or ku-ya'si-ús, properly **JACQUES DE CUJAS**, zhák de kú'-zhás', or **CUJAUS**, kú'zhós' (1522-90). A French jurist of the sixteenth century, born at Toulouse. After studying law he was appointed teacher of the law at Cahors (1554) and in the following year gained the chair of law in the University of Bourges, after which he taught successively at Valence, again at Bourges, at Valence, at Paris, and at Bourges, at which last place he resided from 1577 till his death. He was one of the most eminent jurists of his day and is recognized as the founder of the historical school of jurisprudence. His learning was founded on the most diligent study of original manuscripts of the Roman laws. His treatment of these authorities and of the feudal system was classical and reconstructive, free from scholastic subtleties. He had in his library 500 manuscripts on Roman law and by his emendations contributed greatly to remove the obscurities of jurisprudence. A complete collection of his works was edited by Fabrot (10 vols.), at Paris (1658), and reprinted at Venice (1758-83), and at Prato (1834-43). Uhl has edited separately Cujacius' *Animadversiones et Observationes*. Consult: Spangenberg, *Cujacius und seine Zeitgenossen* (Leipzig, 1882); Berriat Saint-Prix, *Histoire du droit romain; Histoire de Cujas* (1821).

**CULAMAN,** koo-lá'mán. See MANOBO.

**CULASI,** koo-lá'sé, or **COLASI.** A town of

Panay, Philippines, in the Province of Antique, situated on the west coast, about 47 miles north of San José de Buenavista (Map: Philippine Islands, D 5). Rice, cacao, fruits, and pepper are cultivated. Pop., 1903, 10,966.

**CULBERSON**, CHARLES A. (1835- ). An American legislator, born in Dadeville, Ala., but taken as an infant to Texas. He graduated from Virginia Military Institute in 1874 and in 1876-77 studied law under his father and at the University of Virginia. He returned to Texas to engage in the practice of law, in 1890-94 was Attorney-General of the State and was thereafter, until 1898, Governor. He was chosen United States Senator in January, 1899, and was reelected in 1905 and again in 1911 for the term expiring 1917. In the Sixty-third Congress Culberson was chairman of the Judiciary Committee.

**CULDEES** (OIr. *cēledē*, servant of God, from *cēle*, servant + *Dē*, gen. sg. of *Dia*, God). Anchorite monks who came into Scotland from Ireland in the eighth and ninth centuries, and established themselves in many places, but who in the twelfth century had been absorbed by the regular orders, particularly that of St. Augustine. The list of books handed over by the Culdees of Loch Leven to the canons regular under Bishop Robert (c.1144) is the oldest Scottish library catalogue. Their monasteries, which, on the Columban model, were really villages on St. Sori's Island, Loch Leven, at St. Andrews, Monymusk, Abernethy, and at Monfeith, near Dundee, are matters of record. Their abbots were often laymen. The mystery about their origin and fate gave rise to the idea that they were particularly holy and that they retained the primitive Christian faith. So claimed Hector Boece in his Latin history of Scotland (Paris, 1516), as many, especially ardent Presbyterians, have done since. But the facts were established by W. Reeves. *The Culdees of the British Isles* (Dublin, 1864), and W. F. Skene, *Celtic Scotland* (3 vols., Edinburgh, 1876-80). Consult also W. Beveridge, *Makers of the Scottish Church* (New York, 1908).

**CULENBORG**. See KUHENBURG

**CULEX** (Lat., gnat). A short pastoral and mock-heroic poem of 414 hexameter lines. A sleeping goatherd is awakened by the sting of a gnat and kills the insect, but finds that it has saved his life by rousing him in time to escape an approaching serpent. The gnat's shade in the night reproaches him whereupon the goatherd builds a tomb for the gnat and celebrates the usual funeral rites. Ancient writers state that Vergil wrote a *Culex*, with the plot described above. Modern scholars have usually refused to charge the extant poem against Vergil; but consult Mackail, "Vergil and Virgilianism," in *Lectures on Poetry* (London, 1911) and Elizabeth S. Jackson, "The Authorship of the *Culex*," in *The Classical Quarterly*, vol. v (1911).

**CULEX**. See MOSQUITO.

**CULIACAN**, *kū'lyá-kán'*. The capital of the State of Sinaloa, Mexico, on the Culiacan River, 50 miles from the Pacific coast (Map: Mexico, E 5). It is situated in a broad valley and contains several plazas, those of Rosales and La Constitución being notable, an ancient cathedral, a seminary, and a mint. It is an episcopal see. The city has some manufactures, principally of textiles, and a large tobacco warehouse.

VOL VI.—23

It is fast becoming an important commercial centre. Culiacan was founded in 1599, with the name San Miguel. Pop., 1900, 10,380; 1910, 13,527.

**CULICIDÆ**, *kū'lis't-dē* (Neo-Lat. nom. pl., from Lat. *culex*, gnat). A family of nematocercous Diptera, the mosquitoes, with long slender wings, the veins and body bearing flattened scales. See MOSQUITO.

**CULILAWAN** (*kū'le-lá'wán*) **BARK**. The bark of a tree of the Moluccas, *Cinnamomum culilawan*, used like cinnamon (q.v.).

**CULIN**, STEWART (1858- ). An American anthropologist, born in Philadelphia, a descendant of Johan van Culin, one of the earliest Swedish settlers on the Delaware. He was educated at a Friends' school and afterward at Nazareth Hall. Leaving this school at the age of 17, he engaged in business, but soon developed a deep interest in scientific matters and, through contact with Dr. Daniel G. Brinton, was led to take up original work in anthropology. In 1883 he was elected secretary of the Numismatic and Antiquarian Society of Philadelphia, and began a study of the Chinese in America, resulting in a series of papers on Chinese games. In 1889 he became secretary of the Archeological Association of the University of Pennsylvania and a curator in the Museum of Archeology, and in 1892 he was appointed director of the museum. In this capacity he represented the University of Pennsylvania at the Columbian Historical Exposition in Madrid, where he was at the same time secretary of the United States Commission. In 1888 he organized the Oriental Club in Philadelphia, of which he became secretary; in 1890 he was elected a fellow of the American Association for the Advancement of Science. He was president of the American Folklore Society in 1897 and was elected to the vice presidency of anthropology in the American Association in 1901. He is author of: *Chinese Games with Dice* (1889); *Chess and Playing Cards* (1896); *Korean Games* (1896); *American Indian Games* (1905).

**CULION ISLANDS**. See CALAMIANES.

**CULLEN**, PAUL (1803-78). Cardinal and Archbishop of Dublin. He was educated in Rome, where he became rector of the Irish College and, in 1848, of the Propaganda College. During the revolution of that year he saved the college property by appealing to Lewis Cass, Jr., the American Minister. He became Archbishop of Armagh and Primate of All Ireland in 1849, and Archbishop of Dublin in 1852. He had great executive ability and zeal in the restoration and erection of churches, reformatories, and hospitals. He assisted O'Connell, opposed the Fenians, forbade the clergy to take active part in politics, and advocated at the Vatican Council the definition of papal infallibility. He was the main supporter of the Catholic University at Dublin, but his quarrels with Dr. Newman, its head, wrecked the scheme. In 1866 he was made a cardinal, being the first Irishman to receive that dignity since the Reformation. In 1873 he was sued for libel by a parish priest, who received a farthing damages.

**CULLEN**, WILLIAM (1710-90). A celebrated Scottish physician, professor of medicine in the universities of Edinburgh and Glasgow. He was born at Hamilton, Scotland, his father being factor to the Duke of Hamilton. He acquired his medical education between 1727

and 1736 under great difficulties, but fortunately secured the aid of John Paisley, a surgeon apothecary, and Monro the Elder. In 1736 he began to practice his profession in his native town and was rapidly successful. One of his pupils was William Hunter (q.v.). In 1740 he received the degree of M.D. from Glasgow University. In 1744 he removed to Glasgow; in 1746 he began to lecture on the theory and practice of physic, on botany and the materia medica, and finally on chemistry, in Glasgow University. In botany Cullen seems to have lectured in Latin, but in the other departments he adopted the English language as the vehicle of expression—an innovation of great importance, which permitted him to adopt a more familiar style of lecturing than had hitherto been in use. One of his original hearers records that "in the physic class Dr. Cullen never read lectures, but only used notes, in the chemistry he sometimes read, but very seldom." In 1757 he became full professor of chemistry, continuing to teach clinical medicine in the Royal Infirmary. In 1760 he undertook also the lectures on materia medica. In 1766 Cullen was placed in the chair of institutes of medicine, vacant by the death of Dr. Whytt, and Black, the greatest chemical discoverer of the time, took Cullen's place as professor of chemistry. In 1773 Cullen was transferred to the chair of the practice of physic.

His most important works are the *First Lines of the Practice of Physic* (1777), in which he sets forth his system of nosology founded on his theories of nerve influence, and which was translated into many languages. *Synopsis Nosologia Methodica* (1785); *Institutions of Medicine* (1787); *A Treatise of the Materia Medica* (1789). His writings have been collected in two volumes by Dr. John Thomson (Edinburgh, 1827), by whom also a life was commenced, the first volume appearing in 1832. This biography was continued by his son, and finally completed in a second volume by Dr. Craigie in 1859.

**CULLERA**, kul-lə'ra. A fortified town of Spain, in the Province of Valencia, on the Júcar River, near its entrance into the Mediterranean, 23 miles south-southeast of Valencia (Map-Spain, E 3). Its streets are irregular but level, and among the noteworthy features are a ruined castle and the chapel of the Virgen de Cullera. Fishing, agriculture, and stock raising are the principal industries. The city is the centre of a considerable trade in grain, rice, oranges, wine, etc. Cullera was of great military importance under the Moors, by whom it was strongly fortified, and successfully withstood attacks of the Christian armies in 1234 and 1235, though later it was taken by James I of Aragon. Pop., 1900, 11,957; 1910, 13,556.

**CULLODEN**, or DRUMMOSSIE MOOR. A Scottish battlefield in Inverness-shire, near the Moray Firth. The place was formerly a desolate table-land, but is now well cultivated. Here on April 16 (new style, 27), 1746, the Duke of Cumberland, with 12,000 royal troops, overwhelmed an army of 5000 Highlanders, under Prince Charles Edward, the Young Pretender, and extinguished the hopes of the house of Stuart of regaining the English crown. A monumental cairn marks the spot where the battle was fiercest and where many of the slain lie buried. At Culloden House, a mile to the north, the family seat of Duncan Forbes, the valuable historical collection of *Culloden Papers*,

covering the years 1625-1748, was discovered in 1812. They were published in London in 1815. Consult William Augustus, Duke of Cumberland, *Authentic Account of the Battle of Culloden* (London, 1746).

**CULLOM**, SHELBY MOORE (1829-1914). An American politician, born in Wayne Co., Ky. He was admitted to the bar in 1855 and began the practice of the law at Springfield, Ill. Here he soon became a leader in politics, was several times elected to the Illinois Legislature, and was Speaker of the House in 1861 and again in 1873. He was a member of Congress for three terms after 1865 and was Governor of Illinois from 1876 to 1883. He then entered the United States Senate as a Republican, and served continuously until 1913. He was the author of the Interstate Commerce Law, and for many years was chairman of the Senate Committee on Interstate Commerce. In 1898 he was appointed one of the commissioners to establish the government of Hawaii. He wrote *Fifty Years of Public Service* (Chicago, 1911).

**CULUM**, GEORGE WASHINGTON (1809-92). An American soldier and writer. He was born in New York, graduated in 1833 at West Point, and was instructor of engineering there from 1848 to 1855. He was made chief engineer of the Department of the Missouri in 1861, superintended engineering works on the Western rivers, and was chief engineer at the siege of Corinth. He was superintendent of the Military Academy from 1864 to 1866 and was brevetted major general in 1865. He retired from active service in 1874. He published *Systems of Military Bridges* (1863), *Biographical Register of the Officers and Graduates of the United States Military Academy* (1868, 3d ed., 1891-1910), *Campaigns and Engineers of the War of 1812-15* (1879). On his death he left part of his fortune to be used for the erection of the Memorial Hall at West Point and for the continuance of his *Biographical Register*.

**CULM**. See KULM.

**CULM** (ME. *culme*, *colm*, soot, smoke, or perhaps connected with Welsh *culm*, knot, the coal being found in knots in some places in Wales, OIr. *colmenc*, nerve, Bret *koulm*, knot) A term used in the United States for the waste coal thrown out in anthracite mining. Owing to its fine size, much difficulty was experienced for some time in using it. At the present day it is either pressed into bricks or burned on special types of grate, often with forced draught. The name has a similar application in parts of Wales, but in some parts of England it is used in a general sense for anthracite. See ANTHRACITE.

**CULMANN**, kul'män, KARL (1821-81). A German engineer, born at Bergzabern, Bavaria. He studied at the Artillery School of Metz and the Technical School of Karlsruhe and from 1841 to 1849 was active as an engineer in bridge construction. In 1855 he was appointed professor of engineering in the Polytechnic School of Zurich, of which he was director from 1872 to 1875. He was the originator of the method of graphical statics, by which the strength of structures is investigated through diagrams made to scale. In exposition of this he published *Graphische Statik* (1864-66: 2d ed., 1875). Among his further works is *Untersuchungen über die Schweizer Wildbäche* von 1858 bis 1863 (1864), translated into Italian and French.

**CULMBACH.** See KULMBACH.

**CULMBACH,** kũl'mbăk, HANS VON. See KULMBACH, HANS VON.

**CULMINATION** (from ML. *culminare*, to culminate, from Lat. *culmen*, OLat. *columnen*, height, from *collis*, hill, *celsus*, high). An astronomical term, signifying the passage of a star across the meridian. The star is then at the highest or lowest point of its course. The sun culminates at midday, or 12 o'clock, apparent solar time—which seldom agrees exactly with mean time as shown by a watch or clock. The full moon culminates at midnight. The time of culmination of a fixed star is always exactly midway between the times of its rising and setting, in the case of the sun, moon, and planets it is only approximately so.

**CULP, JULIA** (1881- ). A distinguished Dutch contralto. She was born, Oct. 6, 1881, at Groningen, where she received her first musical instruction on the violin. Her progress was so rapid that she soon appeared in various cities of Holland as a violinist. When fourteen years of age it was discovered that she was gifted with an unusual voice. Thereupon she abandoned her career as a violinist and entered the conservatory at Amsterdam. After completing her course she went to Berlin, where she continued her vocal studies with Etelka Gerster. Her debut as a vocalist took place at Magdeburg in 1901, in a concert with Busoni. The following year she was heard in Berlin and won instant recognition as one of the foremost lieder singers. Her fame spread rapidly all over Germany. Her tours of Austria, France, Italy, Belgium, Spain, and Russia were a series of brilliant triumphs, so that her place as the greatest of all lieder singers was established even before she made her first American tour in 1913. This was so successful that she visited America a second time in the following season, appearing in numerous recitals and with almost every symphony orchestra of importance. Aside from the extraordinary beauty of her voice, which she handles with supreme mastery, her preeminence as a lieder singer is due to her fine musicianship, dramatic intensity, soulful delivery, and unlimited versatility. It is due largely to her art that the genius of one of the greatest of song writers, Hugo Wolf, has found wider recognition.

**CULPA.** A term of the Roman law, signifying a fault or breach of a legal duty, but later restricted to denote carelessness or negligence. When damage has been done without right and willfully (*dolo*), the doer is always responsible. When damage is occasioned by a careless act or by failure to act as a careful person would act, the person chargeable with carelessness is not usually responsible unless he be under some special obligation to exercise care (*diligentia*). Such an obligation regularly exists only in contractual and quasi-contractual relations, and here the question what degree of carelessness creates liability depends upon the degree of care which the law requires. The standard, in most cases, is the care commonly exercised in similar matters by a good householder (*diligentia boni patris familiae*). Exceptionally, in some cases, a person who is habitually somewhat careless is held to that degree of care only which he is accustomed to exercise in his own affairs (*diligentia quam in suis*). This is true when the advantage of the contractual relation is wholly on the other side, as in the deposit, or bailment, of goods for safe-keeping without

remuneration, and also when the other party is chargeable with negligence if he enters into relations with a careless person, as in partnership. By reason, however, of the fiduciary character of these relations, the careless depositary or partner who has failed to exercise even that degree of care which he is wont to exercise in his own affairs is regarded as guilty of willful wrong (*dolus*). In contractual relations very gross carelessness (*culpa lata*) is also treated as willful wrong. Whether this is true outside of contractual relations—whether gross carelessness begets an action in tort—is disputed. Regularly, of course, at Roman law as at English law, an action in tort lies only when willful intent can be shown or presumed. Exceptionally, however, and by statutory rule (*lex Aquilia*), the person who has damaged another's property by a careless act is liable, although no contractual relation exists between the parties.

By the modern civil law, as administered on the continent of Europe, most of the rules of the Roman law relating to *culpa* still obtain. Modern legislators, however, have generally discarded the exceptional standard of the *diligentia quam in suis*; and the French civil code (art. 1383) and some of the codes based on the French, e.g. the Spanish civil code (art. 1089), lay down the broad rule that every person of sound mind who has reached the age of discretion is responsible for damage occasioned by his negligence, whether of act or of omission, but these provisions have not been interpreted as creating a general duty to act in the interest of strangers. For the English and American applications of the civil-law doctrine, see BAILMENT, NEGLIGENCE. Consult the authorities referred to under CIVIL LAW.

**CULPEPER, JOHN.** An early English emigrant to the Carolinas, leader of the "Culpeper Insurrection." In 1677 and 1678, with Zechariah Gillham (or Gillam) and others, he led a successful insurrection in the northern or Albemarle Colony of Carolina against Thomas Miller, royal collector of customs, who strictly enforced the unpopular customs regulations, and whose office Culpeper seized. He and his followers gained control of the government, but when he went to London to arrange a compromise with the home authorities he was arrested on a charge of treason. He was finally acquitted, however, on the ground that there had really been no authorized government in the Colony at that time to rebel against. In 1680 Culpeper laid out on paper the plan of the city of Charleston.

**CULPEPER, or COLEPEPER, THOMAS** (?-1719). A grantee (1673) and Colonial Governor of Virginia. In 1673 he received from Charles II for a period of 31 years a grant of the entire territory of Virginia. He was appointed Governor for life in 1675, but did not come to the Colony until 1680. In 1683, having administered the office chiefly for his own gain, being shrewd and unscrupulous to the last degree, he returned to England in spite of his orders, was tried and convicted of corruption, and was deprived of his commission. His daughter Catherine brought his great possessions in dower to Baron Fairfax and his descendants, who were related by marriage to George Washington. Consult Doyle, *English Colonies in America*, vol. i (1882).

**CULPER.** A local name in Africa for a fish

resembling a perch, but of uncertain position, ichthyologically, which inhabits the Zambezi valley. It burrows in the mud and thus survives droughts, and is exhumed both by animals and the native negroes for food, but is not thought palatable by the white colonists.

**CULPRIT FAY, THE.** The title of a poem by Joseph Rodman Drake (1816). Its subject is the love of a fairy for a mortal maiden and his expiation of the offense.

**CULTIVATION.** See TILLAGE.

**CULTIVATOR** (Fr. *cultivateur*, from ML. *cultivare*, to cultivate, from Lat. *cultura*, cultivation, from *colere*, to till). An agricultural implement extensively manufactured and used in the United States. The common name for it in Great Britain is "grubber." Certain forms are called "scarifiers." It is used for a number of purposes, such as preparing soil for planting, loosening soil between rows of plants, destroying weeds, etc. There are many forms, but usually the essential feature is a triangular or rectangular iron frame in which are fixed tines or teeth, somewhat like those of a harrow, but curved, and so placed as to enter the ground obliquely when the implement moves forward. Handles like those of a plow are provided for control of the implement, and the centre beam of the iron framework projects in front for the attachment of wheels and draft clevises. In some forms the implement is mounted on wheels and provided with a seat for the operator and various levers for the control of the implement. These are called *rider* cultivators, while the simpler forms are known as *walker* cultivators. The two forms are sometimes combined. One of the more modern forms of the rider cultivator is the disk cultivator, in which revolving sharp-edged disks take the place of teeth or tines. See also IMPLEMENTS, AGRICULTURAL; TILLAGE.

**CULTURE** (Lat. *cultura*, cultivation). When used by anthropologists and historians, the term signifies the complex of habits and customs peculiar to any group of people. Particular customs are designated as traits of culture. See ANTHROPOLOGY, CIVILIZATION, ETHNOLOGY.

**CULTURKAMPF**, *kul-toor-kämpf*. See KULTURKAMPF.

**CULTUS COD.** A marine fish (*Ophiodon elongatus*) of the family Chiridae, abundant from Lower California to Alaska, and one of the most important food fishes of the Pacific coast, where it is also known as "ling," "buffalo cod," and "blue cod." *Cultus*, in the Chinook jargon, means "common" or "ordinary," and was applied to distinguish this species from the true cod of that coast. It is codlike in form, dark brown above, variously spotted, and bluish green below, the flesh being also bluish; and reaches a length of 5 feet and a weight of 30 to 40 pounds, but much smaller specimens are usually brought to market. It lives about rocky places, sometimes in considerable depths, and spawns in summer; and it feeds upon fishes and crustacea and is excessively voracious, often being taken by seizing a fish upon the angler's hook. Its flesh is regarded as of superior quality.

**CULVERIN** (Fr. *couleuvrine*, ML. *colubrina*, culverine, from Lat. *coluber*, serpent). In early times, any small gun, the name being derived from the serpent-shaped handles cast on the piece. In the sixteenth century and later the name was used with reference to the heavier cannon, like the 18-pounder. Variations of the

name were *culver* or *whole culver*, referring to the heavier guns, *demi-culverin* to the smaller.

**CULVER'S PHYSIC, CULVER'S ROOT.**

See LEPTANDRA.

**CULVERT** (probably from Fr. *couloure*, drain, from *couter*, to flow, from Lat. *colare*, to filter, from *colum*, sieve, influenced in termination by analogy with *covert*). An artificial channel for carrying a small stream underneath a canal or the embankment of a roadway or railway. For very small streams vitrified clay pipe or cast-iron pipe is used for culverts. For streams of larger size stone box culverts are employed, consisting of two parallel masonry walls covered over with stone flagging and having a paved bottom. Where stone is scarce, box culverts are sometimes built of timber, and sometimes, instead of stone flagging, a roof of iron beams imbedded in a concrete slab is employed. Large culverts are usually built with parallel masonry side walls, supporting a stone or brick roof arch. With the increased use of concrete in railway engineering this material is increasingly used, both in the form of plain arches and various forms of reinforced concrete structures. A culvert, besides the passageway for the water, has wing walls at one or both ends to hold the embankment in place and protect it from the rush of the flowing water in times of freshet. A full technical description of culvert construction is given in Baker, *Treatise on Masonry Construction* (10th ed., New York, 1912), and also in *American Railway Engineering and Maintenance of Ways, Bulletin 105* (Chicago, 1908). The various railways have special formulas for the construction of culverts which are referred to with other appropriate matter in Merriman, *American Civil Engineers Pocket-Book* (2d ed., New York, 1913).

**CULVERWEL, NATHANIEL.** See CAMBRIDGE PLATONISTS.

**CUMA/CEA.** See CRUSTACEA.

**CUMÆ** (Lat., from Gk. *Kūmē*, *Kymē*). An ancient city on the coast of Chalcidica, founded conjointly by colonists from Chalcis and Cyme in Eubœa. According to Strabo, it was the earliest of all Greek settlements in either Italy or Sicily, it is probable that it was founded before the middle of the eighth century B.C. (ancient authorities give 1050 B.C.). It soon attained wealth and power, built several harbors or port towns of its own, including Dicearchia (Pozzuoli) and Neapolis (Naples), and carried on an extensive trade with the interior. From the Chalcidian alphabet of Cumæ the Etruscan and the Italian alphabets seem to have been derived. Its property led to wars with the Etruscans and other Italian tribes, and in 524 B.C. a great land army was routed by the Cumans. In 474 B.C. Cumæ, thanks to the aid of Hiero of Syracuse, broke the sea power of the Etruscans in a naval battle near the city. The victory seems to have left Cumæ dependent upon Syracuse. Its power now rapidly waned, and in 421 B.C. it was captured by the Samnites and became an Oscan community. About 340, along with Capua, it passed under the control of the Romans and from this period steadily adhered to the fortunes of Rome. In the Second Punic War Hannibal tried to capture it, but was repulsed by Sempronius Gracchus. Towards the close of the Republic it became the municipal capital of the district in which the Roman nobles had their villas

and seacoast residences. It continued to exist as a "quiet" place (Juvenal, iii, 2) down to the close of the Roman Empire, but reassumed a momentary importance during the wars of Belisarius and Narses. Its strong fortress, garrisoned by the Goths, was the last place in Italy that held out against the Byzantine army. The town was finally destroyed, as an abode of pirates, by the Neapolitans in 1205 A.D. Of the ancient fortifications considerable remains may still be traced, and both on the Acropolis and in the lower city there are fragments of architecture and scanty ruins. Underneath the Acropolis are a number of grottos and subterranean passages of unknown origin and purpose. One of these caverns was the seat of the oracle of the Cumæan Sibyl (q.v.). About the city lay cemeteries, showing Greek, Samnite, and Roman graves. Recent excavations here have led to the view that there was on the site of Cumæ a pre-Hellenic settlement. Consult: Beloch, *Campanien im Alterthum* (Breslau, 1890); Pellegrin, *Monumenti dei Lincei*, xiii (1903); Patroni, *Atti del congresso di scienze storiche*, v (1904).

**CUMÆAN SIBYL.** The most famous of the ancient sibyls. She has been represented pictorially by several of the great masters. The most noted examples are paintings by Michelangelo in the Sistine Chapel, and by Raphael in the church of Santa Maria della Pace in Rome. See **CUMÆ SIBYL**.

**CUMANÁ, kũ-mã-na'** A town in the State of Bermudez, Venezuela, situated on the Manzanares River, near its mouth, on the Gulf of Cariaco (Map, Venezuela, E 1). It has a college and is the seat of a United States consular agent. The town is an important commercial centre, its trade being promoted by an excellent roadstead and harbor, which are dominated by the fort of San Antonio on a hill overlooking the town. It exports cacao, sugar, coconuts, tobacco, pearls, and hides. Pop., 12,225. The suburbs of San Francisco, Guayquerias, and Seritos have an aggregate population which equals that of the mother town. Cumaná, possibly the oldest city in America, was founded by Jácomo Castellón, in 1523, under the name of Nueva Córdoba (not far from the settlement made in 1520 by Gonzalo de Ocampo, under the name of Nueva Toledo), and became in the following year capital of the newly erected Province of Nueva Andalucía. It has suffered considerably from earthquakes, notably in 1766 and 1853.

**CUMARIN, or COUMARIN** (from *cumarou*, the Gallicized form of the native name of the Tonka bean),

The anhydride of cumaric (ortho-oxy-cinnamic) acid. It is a colorless, crystalline substance, melting at 67° C. and boiling at 201° C. It has an exceedingly agreeable odor. It is found in various plants, including the Tonka bean (the seeds of the *Dipteryx odorata* and *oppositifolia*); the woodruff (*Asperula odorata*); the melilot (*Melilotus officinalis*); a number of grasses, such as the sweet-scented vernal grass (*Anthoxanthum odoratum*); the faam or faham leaves (*Angrecum fragrans*), much prized among Asiatics for their vanilla-like scent. The Indian sarsaparilla (the root of *Hemidesmus indicus*), etc. Cumarin is soluble in hot water and in

alcohol and ether. It may be obtained from Tonka beans by extracting with alcohol. It has also been prepared synthetically by heating salicylic aldehyde with sodium acetate and acetic anhydride. Tonka beans have been used to impart the odor of cumarin to snuff. Cumarin is also employed in perfumery and in preparing the beverage well known in Germany as *Mastrank* ('May drink'), which is made by adding a small quantity of pure cumarin to wine.

**CUMBERLAND.** A peninsula of Baffin Land, forming the west coast of Davis Strait (Map: Canada, S 3). It cuts off the gulf known as Cumberland Sound.

**CUMBERLAND** (AS. *Cumbria*). The extreme northwest county of England (Map: England, D 2). It has 75 miles of coast and an area of 1520 square miles. A little more than half of the county is cultivated, the rest is covered by mountain and lake. The highest peaks of the Cumbrian Mountains (q.v.) are in the lake region, whence valleys radiate in all directions, gradually ending in a flat coastal belt. The chief rivers are the Eden and Derwent. Mineral wealth abounds, chiefly coal, iron, and lead. Dairy farming and domestic manufactures are carried on. The chief towns are Carlisle, the capital, Whitehaven, Brampton, Workington, Maryport, and Millom. Pop., 1901, 266,933; 1911, 265,780. Consult Ferguson, *History of Cumberland* (London, 1890), and Wilson (ed.), *The Victoria History of Cumberland* (Westminster, 1901).

**CUMBERLAND.** A city and the county seat of Allegany Co., Md., 152 miles by rail west-northwest of Washington, D. C., on the Chesapeake and Ohio Canal, and on the Pennsylvania, the Baltimore and Ohio, the Cumberland and Pennsylvania, and the Western Maryland railroads (Map: Maryland, C 2). It is in a remarkably picturesque locality on the Potomac River, some 650 feet above tide, on the outer edge of the Cumberland-George's Creek coal region, and ships vast quantities of semibituminous coal. There are extensive rolling mills for the manufacture of railroad materials, iron foundries, steel-shafting works, railroad shops, tanneries, brickworks, dyeing and cleaning works, flour mills, glassworks, distilleries, silk and tinplate mills, and cement works. Cumberland was laid out in 1785 on the site of Fort Cumberland, which was erected in the winter of 1754-55 at the outbreak of the French and Indian War. The town was incorporated in 1815, becoming a city in 1850. It adopted the commission form of government in 1909. A new half-million-dollar water-works system and the electric-light plant are owned by the city. Pop., 1900, 17,128; 1910, 21,839. Consult Lowdermilk, *History of Cumberland* (Washington, 1878).

**CUMBERLAND.** A town in Providence Co., R. I., 6 miles (direct) north of Providence, on the Blackstone River, and on the New York, New Haven, and Hartford Railroad (Map: Rhode Island, C 2). Cumberland contains the only Cistercian Trappist Monastery in New England; Nine Men's Misery, a cairn under which are buried nine men who were killed in one of the early Indian wars; the Catholic Institute Association (nonsectarian); the Elder Ballou Meeting House, built about 1740; and the grave of William Blackstone, the first white settler in Rhode Island. It has granite quarries, some deposits of copper, gold, coal, and iron, and extensive manufactures of horseshoes, cotton,

silk, worsted goods, and women's clothes, etc. Cumberland was incorporated in 1747. The government is administered by a council, elected by the people, a police commission is appointed by the governor of the State. Pop., 1900, 8925; 1910, 10,107.

**CUMBERLAND, THE.** A Federal war vessel under the command of Lieut. George U. Morris, sunk by the Confederate ram *Merrimac* in Hampton Roads, March 8, 1862. She went down firing and with colors flying and carried with her a hundred of her crew.

**CUMBERLAND, DUKE OF.** See WILLIAM AUGUSTUS, DUKE OF CUMBERLAND, and ERNST AUGUST, KING OF HANOVER.

**CUMBERLAND, EARL OF.** See CLIFFORD, GEORGE.

**CUMBERLAND, RICHARD (1631-1718).** An English moralist. He was born in London, educated at St. Paul's School and at Cambridge, where he became a friend of Pepys; appointed in 1658 to the rectory of Brampton, Northamptonshire, and in 1667 to the living of All Hallows, Stamford. In 1691 he was made Bishop of Peterborough. His work, *De Legibus Naturæ Disquisitio Philosophica* (1672), translated into English by John Maxwell in 1727 and into French (1744), was one of the first protests against the egoism of Hobbes's ethics. He maintained therein that "the common good of all" is the chief end and ultimate standard of morality, and he is thus one of the forerunners of the well-known English Utilitarians. Consult: Spaulding, *Richard Cumberland als Begründer der englischen Ethik* (Leipzig, 1894); Albee, "The Ethical System of Richard Cumberland," in the *Philosophical Review* (Boston, 1895); likewise id., *History of English Utilitarianism* (1902).

**CUMBERLAND, RICHARD (1732-1811).** An English dramatic writer and essayist, born in Cambridge. He was the great-grandson of the Bishop of Peterborough and was the grandson, on his mother's side, of Dr. Richard Bentley. He graduated at Trinity College, Cambridge, in 1750, and two years afterward was elected fellow. Having been appointed private secretary to the Earl of Halifax, he gave up his intention of entering the Church, and became Ulster Secretary during Halifax's term as Lord Lieutenant of Ireland. In 1775 he obtained a sinecure in the Board of Trade and retired to Tunbridge Wells, where he devoted himself to literature and wrote some 54 farces, tragedies, and comedies; pamphlets; essays; novels; and translations from the Greek poets. Many of his comedies were well received, but have not survived. They include *The Brothers* (1769) and *West Indian* (1770), his best play. Goldsmith describes Cumberland with gentle satire in *The Retaliation*, as "The Terence of England, the mender of hearts." His *Memoirs* appeared in 1807, but are considered untrustworthy. Consult George Paston's *Little Memoirs of the Eighteenth Century* (London, 1901).

**CUMBERLAND AND TEVIOTDALE, tē-vi-ot-dāl, DUKE OF.** English titles borne by the first cousin of Queen Victoria, George V of Hanover (q.v.), and perpetuated by his eldest son, Prince Ernest Augustus, born Sept. 21, 1845.

**CUMBERLAND GAP.** A pass through the Cumberland Mountains on the State line between Kentucky and Tennessee at the southwestern end of Virginia (Map: Kentucky, H 4). It is a notch about 500 feet deep and in some places so

narrow as merely to allow room for a roadway. The road between Virginia and Kentucky laid out by Daniel Boone in 1769 passed through Cumberland Gap, and over this road journeyed most of the early emigrants to Kentucky. During the Civil War the Gap was of great strategic importance, constituting as it did a kind of passageway between central Kentucky and eastern and central Tennessee. It was occupied by the Confederate General Zollicoffer on Nov. 13, 1861, but on June 17, 1862, the Confederates withdrew on the approach of a superior Federal force under Gen. G. W. Morgan, who took possession on the following day and immediately began to strengthen the fortifications. Various minor skirmishes occurred in the vicinity, in the most important of which, that of August 7, the Confederates lost 125 men in killed and wounded, the Federals 68 in killed, wounded, and missing. On the night of September 17 Morgan secretly evacuated the place, destroyed the fortifications and the war material, and by a skillful retreat saved his command from capture at the hands of the superior Confederate forces in the vicinity. On October 22 General Bragg occupied the Gap. On Sept. 8, 1863, the place again passed into the hands of the Federals under General Shackleford, the Confederate General Frazer surrendering, without resistance, 2000 men and 14 pieces of artillery; and here on April 28, 1865, 900 Confederates surrendered and were paroled.

**CUMBERLAND MOUNTAINS, or PLATEAU.** The westernmost division of the southern Appalachian physiographic province. The belt of country occupied by the plateau extends through eastern Kentucky and Tennessee and northern Georgia and Alabama nearly to the Mississippi line. The highest (2500 feet) elevations are attained in Kentucky, the descent towards the south and west being gradual. In central Alabama the plateau merges into the Gulf coastal plain. The plateau has a general elevation of 1000 feet. It rises occasionally to 2000 feet (Map: Virginia, A 5). Its eastern edge is defined by a strong escarpment, while on the west the slope is abrupt in Tennessee but less so in Kentucky. The rocks at the surface of the region are of carboniferous age. They include sandstones, limestones, and slates, which inclose valuable deposits of coal. They are usually well timbered with ash, hickory, chestnut, and other hard woods, but the soil is not sufficiently fertile to support a large agricultural population. The slopes of the Cumberland Mountains are drained mostly into the Ohio River by the Cumberland and the Tennessee, the latter river crossing the southern portion of the range after flowing along the greater part of its eastern edge.

**CUMBERLAND PRESBYTERIAN CHURCH.** See PRESBYTERIANISM.

**CUMBERLAND RIVER.** A river of Kentucky and Tennessee, rising in the Cumberland plateau, in eastern Kentucky, near the Virginia line. It flows at first generally northwest and then southwest through southern Kentucky and enters Tennessee in long. 85° 30' W. (Map: Kentucky, C 4). It then runs, in a very tortuous course, southwest, west, and then generally northwest, through northern Tennessee, reentering Kentucky nearly at 88°. From this point it approximately parallels the Tennessee River, to its confluence with the Ohio River at Smithland, about 12 miles east of Paducah, Ky. The total length of the river is 688 miles, and its

basin area is about 18,000 square miles. It is navigable for steamboats to Nashville, 193 miles, and for vessels of three-foot draft 325 miles farther, to Burnside, Ky., which is commonly considered the head of navigation.

**CUMBERLAND ROAD, THE.** A road 800 miles long, which extended from Cumberland, Md., to Vandalia, Ill., and which had an important part in opening up the West and Southwest to settlement from the East. It was begun about 1806, was constructed in sections, and was finished about 1840. It was to have been built by the Federal government out of funds derived from sales of public lands in the States to be traversed; but additional appropriations soon became necessary, and, largely owing to the influence of Henry Clay, the national government advanced the sum of \$6,821,246 for this purpose between 1806 and 1838. For many years the road was under Federal control and was called the Great National Pike, but by 1856 the government had turned over to the various States through which it passed the portions included within each. For many years it was perhaps the chief avenue for Western emigration, and thousands of prospective settlers passed over it from the various Eastern States. Consult. Hulbert, *The Cumberland Road* (Cleveland, 1903); Sparks, *The Expansion of the American People* (Chicago, 1901); and an article "The Old National Pike," in vol. lix of *Harper's Monthly Magazine* (New York, 1879).

**CUMBRIA** (Lat., the land of the Cymry, or Welsh). An ancient British principality, including Cumberland in England, and most of Scotland as far north as the Clyde. In Scotland, however, the boundaries were indefinite and depended upon the strength of the ruler. Cumbria had a mixed population of Britons, Goidels, and Piets, who, on account of common danger from the Saxons, united and took the name of Cymry. During the sixth century Cumbria ceased to be governed by one ruler and was united only in times of war. The country, however, was hilly and easily defended. Edmund conquered Cumbria in 946, with the help of the King of South Wales, and gave it to Malcolm of Scotland. William I of England annexed Cumbria early in his reign. In 1107 David I of Scotland became Prince of Cumbria, holding it from the English crown.

**CUMBRIAN MOUNTAINS.** A group of mountains, 37 by 35 miles in length and breadth, in the northwest of England, occupying part of Cumberland, Westmoreland, and Lancashire. This tract, embracing the English lake district, is of great picturesqueness and beauty and much frequented by tourists. There are 25 mountain tops upward of 1500 feet high, including Scafell Pike (3210 feet, the highest mountain in England), Scafell (3162), Helvellyn (3118), and Skiddaw (3054). The deep valleys between the mountains contain 14 lakes, 1 to 10 miles long. The largest of the lakes are Windermere, Ullawater, Coniston Lake, Bassenthwaite Lake, and Derwentwater. Many eminent persons have resided among the lakes, the beauty of which has inspired some of the finest writings of Wordsworth, Coleridge, Southey, Professor Wilson ("Christopher North"), De Quincey, Arnold, and Harriet Martineau. The heavy rainfall of the region is utilized by the conversion of one of the lakes, Thirlmere, into a reservoir for the water supply of Manchester, and some of the streams are used for producing electrical energy.

**CUM'MING, ALFRED** (1802-73). An American official born in Augusta, Ga. In 1857 he was appointed by President Buchanan Governor of the Territory of Utah, whither he was sent with a protective force of 2500, under the command of Gen. A. S. Johnston, later famous in the Confederate service. He issued, on November 27, a proclamation which declared the Territory to be in a state of rebellion, a copy of which was forwarded to Salt Lake City. Brigham Young, the Mormon president, retaliated by announcing that the region was under martial law and forbidding the expedition to enter. A compromise was subsequently effected, and Governor Cumming assumed office on April 12, 1858. The troops were retained at Camp Floyd until Feb. 29, 1860. In 1861 Cumming was succeeded by Stephen S. Harding.

**CUMMING, JOHN** (1807-81). A Scottish preacher and author, born in Aberdeenshire. He was educated at King's College, Aberdeen, and in 1833 was ordained to the Scotch Church, Crown Court, Covent Garden, London, where he officiated till 1879. He was very popular as a preacher and lecturer, but is remembered chiefly for his controversies with the Roman Catholic dignitaries and for his interpretation of the apocalyptic writings. The most important of his voluminous publications are: *Apocalyptic Sketches* (1849); *The Great Tribulation* (1859); *Destiny of the Nations* (1864); *Bee-Keeping* (1864); *The Seventh Vial* (1870).

**CUMMINGS, AMOS JAY** (1841-1902). An American editor and politician, born at Conkling, N. Y. A journeyman printer at 15, he set type in nearly every State of the Union. He was with William Walker in the last "invasion" of Nicaragua (1857), and during the Civil War served as sergeant major of the Twenty-sixth New Jersey Infantry and received the congressional medal of honor. Subsequently he became editor of the *New York Weekly Tribune* and in 1869 joined the staff of the *Sun*, of whose weekly and evening editions he was afterward editor. From 1887 he was a Democratic member of Congress from New York. He was the author of a series of letters, which attracted much attention, written from Florida and California to the *Sun*, over the signature "Ziska."

**CUMMINGS, JOSEPH** (1817-90). An American educator, born in Falmouth, Me. He was ordained a minister in the Methodist Episcopal church in 1846 and was president of Genesee College (later Genesee Wesleyan Seminary), Lima, N. Y. (1854-57); president of Wesleyan University, Middletown, Conn. (1857-75), and professor of mental philosophy and political economy there (1875-77), and president of Northwestern University from 1881 until his death. He edited *Butler's Analogy of Religion* in 1875.

**CUMMINGS, THOMAS SEIR** (1804-94). An American miniature painter and author, born at Bath, England. He came to New York early in life and studied there with Henry Inman. He painted miniatures in water color, and many of his sitters were well-known contemporaries of the artist. In 1826 he helped to found the National Academy of Design, was its treasurer for many years and one of its early vice presidents. He also wrote an account of its history, entitled *Historic Annals of the National Academy from its Foundation to 1865* (Philadelphia, 1865). His later life was spent in Connecticut, and Hackensack, N. J., where he died.

**CUM'INS, ALBERT BAIRD** (1850- ). An

American legislator, born at Carmichaels, Pa. He was educated at Waynesburg College, was admitted to the bar in Illinois in 1875, and from that year until 1878 practiced in Chicago. Removing to Des Moines, Iowa, he was in 1898 a member of the State House of Representatives, from 1902 to 1908 Republican Governor of the State, and after filling out the unexpired term in the United States Senate of Senator Allison, was reelected in 1909 for the term expiring 1915. During his period of service in the Senate Senator Cummins came to be recognized as one of its most able and conspicuous members. While Governor of Iowa he had made a thorough study of matters relating to the regulation of railroad and other corporations, and to him was largely due the passage by the Senate of various important measures relating to trusts and railroads. Although not actively affiliated with the Progressive party in 1912, he was in favor of many of the principles advocated by the leaders of that party. After the Republican Convention in 1912 (in which he himself had been mentioned for the presidential nomination), Cummins denounced the action of the majority of the delegates in renominating President Taft and declared that he would not vote for the latter on account of the means used to assure his nomination.

**CUMMINS, GEORGE DAVID** (1822-76). An American clergyman. He was born in Delaware, graduated at Dickinson College in 1841, and entered the Methodist ministry. In 1845 he took orders in the Episcopal church and was rector of several Episcopal churches in Virginia, Washington, and Chicago. He was chosen Assistant Bishop of Kentucky in 1866, but in 1873 resigned, after being criticized for taking communion with ministers outside the Protestant Episcopal church, and founded the Reformed Episcopal church (q.v.), of which he was the first bishop. Consult the *Memoir* by his wife (New York, 1878).

**CUMMINS, MARIA SUSANNA** (1827-66). An American novelist, born at Salem, Mass. After receiving a good education she began writing for contemporary magazines. In 1854 she scored an immense success with her story *The Lamplighter*—more than 100,000 copies in all being sold, a surprising sale for ante-bellum fiction. Her later books are negligible, and her reputation has not been maintained, although *The Lamplighter* is still read.

**CUMNOR HALL.** 1. An old manor house, near Oxford, of which only a few ruins remain—the place where Amy Robsart was imprisoned, as mentioned in Scott's *Kenilworth*. 2. A ballad of that name by W. J. Meikle, supposed to have suggested to Scott the idea of *Kenilworth*.

**CUMONT, ku'mōn', FRANZ VALÉRY MARIE** (1868- ). A Belgian writer on Oriental religions. He was born at Alost, eastern Flanders, and studied at the universities of Ghent, Bonn, Berlin, Vienna, and Paris; from 1892 to 1910 he was professor in the University of Ghent, and from 1899 to 1912 curator of the Royal Museum at Brussels. In 1913 he was made an associate member of the French Academy of Inscriptions. His principal works are on the Eastern cults that took root in Rome about the beginning of the Christian era: they include *Textes et monuments relatifs aux mystères de Mithra* (1894-1901), partly translated by McCormack in 1903 as *The Mysteries of Mithras: Catalogus Codicum Astrologorum Graecorum* (1898 et seq.); *Studia Pontica* (1901-11, with Anderson); *Les reli-*

*gions orientales dans le paganisme romain* (1906; 2d ed., 1909; Eng. trans., 1911); *Recherches sur le manichéisme* (1908-12); *Astrology and Religion in Antiquity* (1912).

**CUMULATIVE VOTING.** A method of voting at elections for office and in representative assemblies, intended to obviate the inconveniences of the majority system by giving proportional weight to the minority vote. As commonly practiced, each voter is permitted to cast as many votes as there are candidates for a given office, and he may distribute his votes or give them all to one candidate, as he may choose. It has been advocated for many years, both in England and the United States, as an important measure of electoral reform, but has made headway slowly. The system has been employed to some extent in Illinois and Michigan and in parliamentary elections in England. Its constitutionality was established by a decision of the Supreme Court at Michigan in 1891. See ELECTION; ELECTORAL REFORM.

**CUMULUS.** See CLOUD.

**CUNA, kō'nā.** A linguistic stock of American Indians at one time occupying the Isthmus of Panama, in Colombia, from the Chagres River to the Atrato, in Colombia. They are also known as Darien or San Blas Indians, likewise Tules, etc. They are extremely jealous of the whites, and have lately withdrawn farther into the interior. They are of small stature, but athletic and of light complexion, some of them even approaching the blonde type. They formerly lived in villages of communal houses, cultivated corn and cotton, and worked gold obtained from the streams and mountains. The women wore clothed, but the men usually went naked. They used poisoned arrows. They have never been entirely subdued and still retain their love for freedom and wild life. Ravet attaches the Cuna language to the Talamanca-Barbacoa group of his Chibchan stock. For recent literature on the Cunas, consult Mrs. Bell, in *Smithsonian Report* for 1900; Pittier de Fabrega, in *National Geographical Magazine* for 1913; and several articles of an ethnological and linguistic nature by Dr. J. Dyneley Prince in the *American Anthropologist* for 1912 and 1913.

**CUNARD, SIR SAMUEL** (1787-1865). An English shipowner, born in Nova Scotia. He was the founder (1839) of the Cunard line of ocean steamers plying between England and America. He was a member of the Royal Geographical Society and was made a baronet in 1859.

**CUNAX'A** (Lat., from Gk. Κούναξ, *Kounaxa*). A place in Mesopotamia, on the eastern bank of the Euphrates, probably about 60 miles north of Babylon. It was the scene of the battle fought (401 B.C.) between Cyrus the Younger (q.v.) and his brother, Artaxerxes Mnemon, in which Cyrus was killed. See ANABASIS; XENOPHON.

**CUNDINAMARCA, kōon'dē-nā-mār'kā.** A department of the Republic of Colombia (Map: Colombia, C 3). Its area was estimated at over 79,691 square miles, but in 1909, in the new territorial division, it was reduced to 8046 square miles (*Statesman's Year Book*, 1913). This description applies to the old department, as the new boundaries are not defined. The western portion belongs to the Eastern Cordillera, and the basin of the Magdalena, while the remainder forms a part of the Orinoco basin. Numerous rivers flow across it, the largest of which are the

Guahibos and the Guayabero. All the eastern streams are tributary to the Orinoco. The soil, with the exception of the mountain regions, is very fertile, but only a small portion is cultivated. The chief crops are corn, wheat, coffee, tobacco, cacao, and sugar. The chief exports are cinchona and tobacco. Bogotá, the capital of the State of Cundinamarca, is also the capital of Colombia. Cundinamarca derives its name from an old American goddess and before the conquest of the land by the Spaniards was one of the chief regions of native civilization, as is proved by numerous remains found in the state. The population of the new department in 1912 was 715,610.

**CUNDURANGO**, kûn'dû-râŋ'gô (Quichua, eagle vine). A vine growing in northern South America. It contains a strong bitter principle and was at one time claimed to be valuable in the cure of cancer, as a remedy for which it was sold in the United States at enormous prices. Subsequently it was found to be worthless for the cure of that disease, although it is still claimed to be valuable as a blood purifier. It is not recognized in the American pharmacopœias, although it is still given in the German.

**CUNEIFORM INSCRIPTIONS.** The term "cuneiform" (derived from Lat. *cuneus*, wedge, and *forma*, shape) appears to have been employed for the first time by Thomas Hyde (died 1703), and is now commonly used as a designation for the script most prevalent in western Asia before the adoption of some form of the alphabet (q.v.). It is generally held that this writing was invented by the Sumerians (q.v.). Whether they brought it with them into Babylonia, or developed it after their settlement in that country, cannot yet be determined. While the arguments formerly relied upon to prove a non-Babylonian origin have lost some of their force, new considerations have been urged that are not without cogency, but a decision is at present impossible. The earliest texts are more than 6000 years old, and the latest inscriptions come from the first century B.C. The script is composed of wedge-shaped characters consisting of combinations of the five elements—

which often become exceedingly complex. Many of them are polyphonous, so that one cuneiform group may represent a large number of entirely different combinations of sounds. As a rule, the writing is syllabic, each character representing not a letter, but an entire syllable. There are also ideograms, standing for whole words, or serving as determinatives to indicate the class to which an object belongs. In some of the systems, however, as in the Mitanian, Assyrian, Chaldean, Susian, and notably the Persian, there is a tendency to simplify the script by assigning one value only to each sign, to use signs for single vowels, and to eliminate the majority of the ideograms.

Originally the cuneiform signs, like the Egyptian, Hittite, Cretan, Chinese, and Mexican, were pictographs. This was already suggested by Oppert in 1863, and the theory was accepted by Ménant, Sayce, Hommel, Hilprecht, and others. But before the discovery of early linear inscriptions no definite proof could be adduced. A new direction was given to the investigations as to the origin of the cuneiform characters by

Delitzsch, who in 1896 propounded, with much learning and ingenuity, a peculiar view concerning a class of signs to which the Babylonians gave the name of *gunu*. These 11 signs he regarded as compounds of simpler forms and additional wedges prefixed, added, or inserted to heighten or intensify the meaning. In spite of the opposition of Jensen (*Deutsche Literaturzeitung*, July 31, 1897) and Peiser (*Mitteilungen der Vorderasiatischen Gesellschaft*, 1897, pp. 316 ff.), this view won very general acceptance. Other scholars added 21 signs that seemed to them to be of the same nature as the *gunus*. An important contribution was made by Thureau-Dangin in 1898-99, who examined 563 signs, presented the linear forms then known, indicated the modifications of many signs, lucidly explained the change in the *ductus* of the script, and strengthened the conviction of its pictorial origin. Serious doubt was cast upon Delitzsch's theory by Ogden in 1911. She showed that in the case of the 11 *gunu* signs some were originally pictures of wholly dissimilar objects, some were pictures of different, though related, objects, and none revealed a heightening of the meaning through the additional wedges. Her conclusions in regard to the 21 signs supposed to be of the same character were equally subversive of the theory. Finally, Barton, in 1913, published a work on the origin of Babylonian writing in which he presented a collection of the actual pictographs, found in early inscriptions, traced their development, identified and registered in an index 288 different pictographs, indicated the signs formed by doubling, tripling, or quadrupling, noted 209 compounds of dissimilar signs, and furnished explanations of 619 out of a total of 719 characters. According to Barton, the signs are drawn from the human body and its parts, mammals, birds, insects, fishes, trees, stars and clouds, earth and water, buildings, boats, household furniture and utensils, fire, weapons, clothing, implements of worship, nets, traps, pottery, musical instruments, lines and circles. All the meanings of each sign, so far as known, have been considered by him. In a very large number of instances his identifications can be accepted without difficulty. Many may indeed be questioned, but the principle seems to have been established without peradventure. As characteristic examples, the following pictographs actually occurring in early inscriptions and some of their later modifications

may be given: 1. archaic, by Gudea, later, 'star,' also meaning 'heaven,' 'god,' 'lord,' 'king,' etc.; 2. archaic, by Hammurapi, later, 'rising sun,' 'sun'; 3. archaic, by Gudea, later, 'bird'; 4. archaic, by Manishtusu, later, 'fish'; 5. archaic, by Hammurapi, later, 'hand'; 6. archaic, later,

'foot,' 'go,' 'lead,' etc. In his *Grundzüge der sumerischen Grammatik* (Leipzig, 1914) Delitzsch recognizes fully the pictographic origin

of the cuneiform characters, but does not refer to the criticism of his *gunu* theory.

To the period of linear writing the peculiar arrangement of the signs goes back which is characteristic of the early inscriptions down to the time of Gudra. The surface on which the inscription was placed was divided into horizontal bands or strips, and each of these into squares or sections. So far as the long bands were concerned the text ran from the top down on the obverse and from the bottom up on the reverse. Within the squares of which they were composed the signs were arranged vertically, but within each band the text was read from the right to the left. This was later changed: the signs within each square fell into horizontal lines, the one at the top becoming the first on the left-hand side, so that the writing assumed a direction from left to right, while the bands became columns. Thureau-Dangin has suggested, as an explanation of this change, that the tablet was held in such a manner that it was possible to maintain in theory that the writing was vertical, though in reality the effect was to make it horizontal.

The transition from the linear to the cuneiform signs was no doubt influenced by the writing material and the implement used. As the Germanic runes, which were carved on wood, are angular in shape and avoid curves, while the Singhalese, which was written on palm leaves, has almost no straight lines, which would split the leaf, so the cuneiform received its shape from the soft clay that was substituted for stone and the stylus that took the place of the chisel. On the clay tablet the straight line was the easiest stroke, and the triangularly prismatic stylus formed the peculiar arrow-shaped head of the wedge. The clay bricks, after the writing was finished, were carefully baked or dried in the sun. A chisel was of course employed for longer inscriptions carved in the rock or on stone slabs and cylinders.

**History of Decipherment.** Although allusions are made to cuneiform texts by Herodotus, Diodorus, Strabo, Plutarch, Arrian, and the epistles ascribed to Themistocles, on the age of which consult Bentley, *Dissertation upon the Epistles of Phalaris* (1690), all remembrance of them seems later to have been lost. But European travelers were at length attracted by the signs on the mountain wall at Behistun. Josafat Barbaro, in 1472, noticed them; Pietro della Valle, in 1621, copied some of the signs; Carsten Niebuhr brought back to Europe and published the first complete and accurate copies in 1777. Upon these copies of the great trilingual inscription of Darius I in Persian, Susian, and Babylonian a number of scholars worked with varying success. The Persian was the first to be deciphered. Tychsen identified the wedge marking the division of words and four other signs; Münter found the true value of another sign and conjectured that an Achaemenian king was the writer; Grotefend read the name of Darius; Rask found the plural ending; Eugene Burnouf recovered all the signs of this cuneiform system; and Henry Rawlinson independently discovered the interpretation of the text he had himself copied afresh from the Behistun rock. Westergaard began the decipherment of the Susian text in 1844. Of the Babylonian text Löwenstern made out the sign for "king." But it was through the efforts of Rawlinson, Hincks, De Sauley, and Oppert that the Semitic version

yielded up its secret. The knowledge of modern Persian, and especially of Pahlavi (q.v.), was of much value in the deciphering of the ancient Persian text; and the similarity of the Babylonian version to well-known Semitic dialects assisted greatly in the deciphering of the third text. The fact that the same text is repeated word for word in the three languages was of great importance for the translation of the Susian, where no modern or hitherto known language gave any help. (On the recently found Aramaic version, see BEHISTUN.) The decipherment of the Chaldian and the peculiar form of the Assyrian found in Cappadocia is largely the work of Sayce; the Mitanian and Arzawian have been deciphered by Sayce, Jensen, Peiser, and Winckler chiefly; the Anzanian by Schei and Weissbach, and the Elamitic by Frank.

**Sumerian.** There are a number of distinct systems of cuneiform writing. Among these may be mentioned Sumerian, Akkadian (adopted for the Assyrian, the Lulubian, and the Gutian as well as in Egypt, Syria, and Asia Minor), Elamitic, Anzanian, Susian, Mitanian, Arzawian, Hittite, Chaldian, and Persian. The Sumerian was first written in linear form, but even after the introduction of the wedge-shaped characters the pictographic origin was for a long time quite apparent. The bulk of the signs consists of ideograms. The real pronunciation of many of these signs is doubtful. It is customary to transliterate the Sumerian signs with capital letters. Especially is this the rule when they occur in Akkadian texts, and the pronunciation or equivalent on the lips of the Semites is uncertain. While the syllabaries and bilingual texts were of great value, the discovery in recent years of numerous Sumerian texts not accompanied by a Semitic translation has greatly increased our knowledge both of the language itself and the Sumerian form of writing. The Sumerians failed to single out the individual consonantal sound which the Egyptians did; but they added to their ideograms phonetic syllable signs, thus preserving the vowel, so often lost to us in the Egyptian hieroglyphics. The numerical system, as in all cuneiform writing,

consists of simple wedges, , for units, and angles, , for tens. After 60, which, like the

first digit, is represented by the same vertical wedge, the system becomes sexagesimal, differing in this respect from the Elamitic. Consult Delitzsch, *Grundzüge der sumerischen Grammatik* (1914) and *Sumerisches Glossar* (1914); and see SUMERIAN LANGUAGE.

**Akkadian.** Probably already before Sargon I of Agade the Semitic Akkadians had taken over from the Sumerians the art of writing. They had to adapt, however, the cuneiform system to the needs of their own language. The script became more distinctly syllabic. Sometimes the syllables were open, sometimes closed: sometimes a syllable was divided so as to consist of only a consonant and a vowel, as *par* or *pa-ar*. But there are not only ideograms taken over from the Sumerian, but also such created by the Semitic Akkadians. In reading, these ideograms were not pronounced according to their phonetic value, but the corresponding Semitic word was used. With the homophones, or different signs for the same sound, the polyphones, or signs with various values, and the ideograms, there are over

700 characters. To simplify the reading determinatives are used, as in Egyptian, by which the noun is shown to denote a class of objects, being a god, a man, an animal, a country, or the like. The clay tablets that form the largest part of the inscribed objects are of various sizes, some being as large as 9 by 6 inches, while others are little more than an inch square. The character of the writing also varies, so that the later Assyrian or Chaldaean letters are different from those of earlier times. Seals, cylinders, stone obelisks, statues of bulls and lions, and the walls of palaces were favorite places for texts to be inscribed. The writing is often exceedingly minute, some tablets having six lines to the inch, so that the complex characters must be read with the help of a magnifying glass. It is probable that the letters were cut with such assistance, as lenses of considerable power have been found among the ruins of Babylonian cities. From the Akkadians the Assyrians adopted the cuneiform writing, though there were slight differences in the pronunciation of some signs. The Lulubians and Gutians at an early time likewise adopted it. With the language itself it went to conquered Elam, to Asia Minor, where it is found in the so-called Cappadocian tablets as well as centuries later in the Boghaz-keui tablets, and to Egypt and Syria, as the Tell el-Amarna tablets and those found at Lachish, Gezer, Taanach, Megiddo, Zenzirli, and elsewhere show. Thus far, however, no tablet has been found in Syria on which Hebrew or Aramaic is written in cuneiform characters. The theory that a large part of the Old Testament was written originally in cuneiform letters, and possibly in the Babylonian language in earlier days and in Aramaic later, as the *lingua franca* of the time, presented recently by Naville, *Archæology of the Old Testament* (1912), can scarcely be regarded as plausible.

The ancient Akkadian scholars designated the cuneiform signs by names. A systematic presentation of these names was given by Brünnow in his *Classified List of All Simple and Compound Ideographs* (Leyden, 1887). Since then it has been briefly treated by Weber in 1907, and most fully by Viktor Christian, *Die Namen der assyrisch-babylonischen Keilschriftzeichen* (Leipzig, 1913).

**Elamitish.** In Elam, as in Babylonia, the cuneiform system developed from pictographs. But the combinations of lines and wedges are entirely different from those of the Sumerians or Akkadians. It is indeed a syllabic writing, with a few determinatives, and this has been regarded as indicating dependence upon Babylonia; but in view of the great age of Elamitish civilization, and the uncertainty as to the origin of the Sumerian, the question must be left open. It is significant that the numerical system and the signs used in it are decimal, and not sexagesimal as in Babylonia. The decipherment by Frank ("Zur Entzifferung der elamischen Inschriften," in *Abhandlungen der Berliner Akademie*, 1912), with the aid of the bilingual inscriptions of Basha-shushinak, has shown that the language is substantially the same as that in the Anzanian inscriptions. The script seems to have disappeared after the middle of the third millennium B.C.

**Anzanian.** This system, used for the native language of the Hatamti or Anzanian tribes, is found in inscriptions of kings from the twelfth century to Achaemenian times. It shows already

strong tendencies in the direction of the later Susian, and has sometimes been called Middle Susian, though Scheil, to whose investigations we owe our knowledge of it, prefers the term "Anzanian."

**Susian.** The third variety of the cuneiform inscriptions in Elam is very much simpler. Mordtmann suggested the name "Susian," which has now taken the place of many other names that have been proposed by scholars at different times. It is also termed the "language of the second form," in allusion to the fact that it is found in the second of the three versions of the Achaemenian inscriptions. This system contains 96 syllabic signs, which at times, however, show a distinct approach to alphabetic values. Like the other cuneiform systems, the Susian possesses ideograms and determinatives, having 16 of the former and 5 of the latter. It is noteworthy that each ideogram, excepting for *sunk*, 'king,' which already has one determina-

tive, is followed by the determinative , *id.*

The readings of the Susian characters are in general fairly clear, although there is still uncertainty about some words.

**Mitanian.** The Tell el-Amarna tablets acquaint us with the language and script of the Mitanians, a people living in Mesopotamia in the fourteenth century B.C. The language seems to be akin to the Hittite; the script is a development of the Akkadian.

**Arzawian.** The Tell el-Amarna tablets also contain a letter from the King of Egypt to the King of Arzawa, a country that is probably to be sought east of Cappadocia and north of Mesopotamia in the territory afterward occupied by the Chaldeans around Lake Van. It is written in the language and cuneiform characters of Arzawa. The Arzawian language seems to be nearer the Hittite than the Mitanian, it is also found in another letter referring to the "sons of Lapaya."

**Hittite.** Through the discoveries of Winckler it is now known that the Hittites themselves, in addition to their peculiar system of hieroglyphics, also had adapted for their use a system of cuneiform writing based on the Assyrian or Babylonian, and possibly upon the form that had been in vogue among the Babylonian and Assyrian colonies in Cappadocia. At Hatti, the modern Boghaz-keui, numerous tablets and fragments of tablets, evidently written in the native language, but in cuneiform script, were found along with those written in Babylonian. The character of this system is likely to resemble that of the Arzawian, but before publication of these important tablets, which is now eagerly expected, judgment upon all such points must be held in suspense.

**Chaldian.** The cuneiform inscriptions which are found in Armenia, chiefly in the neighborhood of Lake Van, are written in a language which is regarded by some scholars as related to the modern Georgian dialects. The inscriptions, which come from the ninth and eighth centuries B.C., were first noted by Saint-Martin in 1823, and studied by Schulz, who was murdered by the Kurds in 1829, before his researches were completed. Despite the erroneous view held by one of the early investigators that the language of these texts was Armenian, while another more naturally tried to read them as Assyrian, researches into them were at last suc-

cessful largely through the efforts of Sayce. The alphabet of the Chaldian cuneiform inscriptions is an obvious modification of the Assyrian characters. It is relatively extremely simple, since polyphones are discarded, and the number of signs is but 158, including 51 ideograms and 7 determinatives. The type of this script, like the Sorian, forms a kind of transition between the Assyrio-Babylonian and the Persian, since it has partly given up the syllabic system and often approximates the alphabetic form. Some of the determinatives, as those for god and man, and the numerical system, are borrowed from the Assyrian system of writing.

**Persian.** The most simple of all the cuneiform systems, and the one which, as stated above, gave the key to all the others, is the Persian. This is employed from the sixth to the fourth century B.C. in the tablets of the Achaemenians, Darius the Great, Xerxes, Artaxerxes I, II, and III, and Cyrus the Younger, together with a few seals of private persons. By far the most important text is that of Darius at Behistun, which is about 413 lines long. Other inscriptions, some of them of great value, are found at Persepolis, Susa, Naq-i-Rustam, Elvand, Kirman, Hamadan, and Murgab. In addition, there are shorter tablets at Van, where the most important Armenian inscriptions exist, and at Suez. The trilingual inscription of Behistun was known to Diodorus Siculus (q.v.) in the first century B.C., who says that the deeds of Semiramis were carved there "in Syriac letters." The Persian cuneiform characters are almost entirely alphabetic, each sign standing either for a vowel or for a consonant plus a vowel. Traces of the earlier syllabic system may perhaps exist in the case of characters which, like some of those found in the Chaldian inscriptions, have different forms according to the following vowel, as

→K, ja, but →E, ji. The Persian system

possesses 36 letters, in addition to which there are four ideograms, for king, land, earth, and Ahura Mazda. Polyphones and homophones are altogether lacking, and the only possible trace of a determinative is in the oblique wedge, already mentioned as the first cuneiform character to be deciphered, which marks the end of a word. The Achaemenian kings probably derived the use of this system of writing from the Medes, as is suggested by Ed. Meyer (*Geschichte des Altertums*, 3d ed., 1913, i, 2, p. 337). But no Median cuneiform inscription has yet been found.

The difference in the three systems represented in the Behistun inscription may be illustrated by reproducing the name of Darius in Persian, *Dāriyavaush*, Sorian, *Tariyavaush*, and Babylonian, *Dāriyavush*:

in Madagascar, and he was distinguished for his conduct in the East. In 1514 he was made special ambassador to present to Pope Leo X the new possessions of Portugal. Upon his return he was made one of the special council of the crown. Da Cunha was the discoverer of three volcanic islands in the Atlantic, one of which bears his name.

**CUNIBERT**, SAINT (c.590-663). In Latin, *Honobertus*. One of the earliest bishops of Cologne. He was consecrated in 623, was present at the synods of Rheims (625) and of Clichy (626), and soon took a place beside Pepin as one of the most influential men in the kingdom of the Franks. He educated Sigebert III and other Merovingian princes; was prominent in the revision of the Salic and Ripuarian laws, and in drawing up the Alemannian and Bavarian codes, and spread the power of the Church over Saxony, Westphalia, Frisia, and part of France. He died after forty years in the bishopric.

**CUNLIFFE**, JOHN WILLIAM (1865- ) An American educator and literary critic. He was born in Bolton, Lancashire, and was educated at the University of London (Litt.D., 1892) and at Owens College, Manchester. He taught English literature at McGill University, Montreal, from 1899 to 1906, at Columbia University in 1906, and at the University of Wisconsin until 1912. He then became professor of English and associate director of the school of journalism, Columbia University. He wrote *The Influence of Seneca on Elizabethan Drama* (1907), edited Gascoigne's *Supposes* and *Jocasta* (1906), and a complete edition of Gascoigne (1907-10, in *Cambridge English Classics*), and "Eastward Hoe" in vol. II of Gayley's *Representative English Comedies* (1913), and contributed to vols. III and V of the *Cambridge History of English Literature* on "A Mirror for Magistrates," Gascoigne, and early tragedy.

**CUNNER**. A small, brown labroid fish, common in summer about all the eastern shores of the United States, where it affords amusement to hosts of amateur anglers who fish for it from wharves and anchored boats. It is closely allied to the tautog, but less valuable, and is variously known as burgall, chogset, blue perch, sea perch, nipper, etc., and to ichthyologists as *Tautoglabrus adpersus*.

**CUNNINGHAM**, SIR ALEXANDER (1814-93). An English soldier, archaeologist, and author, born at Westminster, son of the poet, Allan Cunningham. He studied at Addiscombe, went to India in 1833 as second lieutenant of Bengal engineers, and in 1836 was appointed an aide-camp to Lord Auckland. From 1836 to 1846 he was in military and engineering service, in 1846-49 was field engineer in the Sikh wars, and in 1856, with rank of lieutenant colonel, was appointed chief engineer of Burma. In 1858 he was appointed to a similar post in the North-west Provinces, and, as a major general, retired in 1861. He was from that time until 1865, and again in 1870-85, director general of the Indian Archaeological Survey, editing its *Reports* (23 vols., 1871-86). He made extensive explorations, excavations, and drawings, gathered the most valuable collection of Indian coins yet made, and conducted important researches in the history of Buddhism as revealed by its architecture. In the Lahore Museum is the collection of Græco-Buddhist sculptures which he made and which was arranged by J. Lockwood Kipling. His publications include: *Essay on the Arian*

*Order of Architecture* (1848); *Bhilsa Topes* (1854); *The Ancient Geography of India* part I, (1871); *Corpus Inscriptionum Indicarum*, vol. I (1877); *The Coins of Ancient India* (1891), and *The Coins of Medieval India* (1894).

**CUNNINGHAM**, ALLAN (1784-1842). A Scottish poet and miscellaneous writer. He was born in the parish of Keir, Dumfriesshire. His father was for a time a neighbor of Burns, and Allan, as a boy, was present at the poet's funeral. At the age of 11 Cunningham was taken from school and apprenticed to his brother, who was a stone mason; but his spare time was given to song and the collection of traditions. In 1810 he contributed largely to R. H. Cromek's *Remains of Nithsdale and Galloway Song*. The ballads in this collection, though purporting to be ancient popular songs, were Cunningham's own compositions. Removing to London just before this publication, Cunningham became one of the best-known writers for the *London Magazine*. He subsequently obtained a situation in Chantry's studio as foreman, or confidential manager, and thus office he held till the sculptor's death. Among Cunningham's many works are *Songs, Chiefly in the Rural Dialect of Scotland* (1813), *Songs of Scotland, Ancient and Modern* (1825), several romances, and a drama, *Traditional Tales of the English and Scottish Peasantry* (1822), *Lucas of the Most Eminent British Painters, Sculptors, etc.* (1829-33), and an admirable life of Burns. Cunningham is the author of a fine sea song, "A Wet Sheet and a Flowing Sea." He died in London. Consult Hogg, *Life*, with selections from works (London, 1875).

**CUNNINGHAM**, JOHN (1819-92). A Scottish divine. He was born at Paisley and was educated at the universities of Glasgow and Edinburgh. He was pastor at Clief for 41 years (1845-86). In 1886 he was moderator of the General Assembly of the Church of Scotland and became professor of divinity at St. Mary's College, St. Andrews. His *Church History of Scotland* (1859) is the best work on this subject. He also wrote: *A New Theory of Knowing and Known, with Some Speculations on the Borderland of Psychology and Physiology* (1874); *The Quakers from their Origin to the Present Time. An International History* (1868).

**CUNNINGHAM**, JOHN F. (1842- ). An American Catholic divine, born in County Kerry, Ireland, educated at St. Benedict's College, Atchison, Kans., and at St. Francis Seminary, Milwaukee, Wis. He took an important part in the development of the Catholic church influence in Kansas, having been the first resident pastor of that church at Fort Scott (1865-68). He was transferred to Lawrence, Kans., in 1868, was pastor at Leavenworth in 1876-82, and rector of the cathedral there in 1882-98, when he was consecrated Bishop of Concordia, Kans.

**CUNNINGHAM**, PETER (1816-69). A British author, born in London, the son of the writer Allan Cunningham. He is best known by his *Hand-Book of London* (1849). He also edited a number of the English classics, wrote *Life of Drummond of Hawthornden* (1833), *Poems upon Several Occasions* (1841), *Life of Inigo Jones* (1848), *The Story of Nell Gwynne* (1852), and was a contributor to English periodicals.

**CUNNINGHAM**, RICHARD (1793-1835). A Scottish botanist, a brother of Allan Cunningham, the poet. He was born at Wimbledon. From 1808 to 1814 he worked on the *Hortus Kew-*

*ensis* at Kensington: from 1814 to 1832 he acted as assistant to the King's gardener at Kew, and in the latter year was made Colonial Botanist and superintendent of the gardens at Sydney, Australia. After spending nearly a year in New Zealand, he returned to Australia in 1834, and in the following year, while out with an exploring party on the banks of the Darling River, he was murdered by the natives. He wrote *Two Years in New South Wales* (London, 1827).

**CUNNINGHAM, WILLIAM** (1805-61). A Scottish theologian. He was born at Hamilton, Lanarkshire, and was educated at Edinburgh University. In 1834 he was appointed pastor of Trinity College Church, Edinburgh, and in 1843 became professor of theology in, and in 1847 principal of, New College. He was a leader in the Free Church movement and in founding the Evangelical Alliance and was a controversialist of exceptional ability. He was moderator of the General Assembly of 1859. Among his principal works are the following: *Historical Theology* (1862); *The Reformers and the Theology of the Reformation* (1862); *Discussions on Church Principles* (1863). Consult Rany and Mackenzie, *Life of Cunningham* (1871).

**CUNNINGHAM COAL CLAIM.** See ALASKA, *History*.

**CUNOBELINUS.** See CYMBELINE.

**CUOCO**, कू-ओ'कू, VINCENTO (1770-1823). An Italian historian, born near Naples. He practiced law for a time at Naples, but was banished for participation in the revolutionary movement of 1799, and until his return in 1806 lived chiefly at Milan, where he edited the *Giornale Italiano* and published his *Saggio storico sulla rivoluzione di Napoli* (1800), a vivid narrative of the facts of 1799, viewed with a philosophical and historical criticism so sound as to make of Cuoco one of the greatest modern historians. From 1806 to 1816 he was director of the Treasury and a member of the Court of Cassation at Naples. The best edition of the *Saggio* is by Nicolini (Bari, 1913); best biography by Romano (Isernia, 1904). For Cuoco's philosophical ideas, where he was a follower of Vico, consult articles by Gentile in *Critica* (Bari, 1905, etc.).

**CUP** (AS. *cuppe*, Icel. *kopp*, OHG. *choph*, cup, from Lat. *cupa*, cask, OChurch Slav. *kupa*, cup, GK. κύπελλον, *kypēlōn*, hollow, Skt. *kupa*, well), DIVINATION BY. A mode of foretelling events practiced by the ancient Egyptians and still prevailing in some of the rural districts of England and Scotland. One of the Eastern methods consisted in throwing small pieces of gold or silver leaf into a cup of water, in which were placed also precious stones with certain characters engraved upon them. The infernal powers were then invoked, and returned answer either in an intelligible voice, by signs on the surface of the water, or by a representation in the cup of the person inquired about. By the modern method a person's fortune is foretold by the disposition of the sediment in his teacup after pouring out the last of the liquid. See DIVINATION.

**CUPAR, KOO'pär**, or **CUPAR FIFE.** A royal and municipal burgh, the county town of Fifeshire, Scotland, on the Eden, 32½ miles north of Edinburgh (Map: Scotland, E 3). It has several schools and a public library. The chief manufactures are linens, brick, leather, flour, building stone, printing, and earthenware. Coal is mined near by. A fortress of the Macduffs, thanes of Fife, once stood on a mound called the Castle Hill, at the east end of the town. Pop.

(royal, parliamentary, and municipal burgh), 1901, 4511; 1911, 4380.

**CUP'EL AND CUP'ELLA'TION.** See AS-SAYING; LEAD.

**CUPID** (Lat. *cupido*, desire, from *cupere*, to desire). In classic mythology, the god of love; called in Greek *Ἔρως*, *Erōs*, and by writers in Latin *Amor*, love. Eros was worshiped at Thespie and Leuctra in Boeotia, and Parion on the Hellespont, as a very ancient god of productivity. He also appears in the poets from the time of Hesiod as a mighty god, the personification of the power of love, which unites the gods and produces all things. In this aspect he is called offspring of Chaos, or of Heaven and Earth; in fact any symbolical genealogy is assigned to him which pleased the fancy of a poet or a philosopher. The prevailing later conception, however, is that Eros is the son and inseparable companion of Aphrodite, though there is considerable confusion as to his father. In the earlier Greek art Eros is a winged youth, holding a flower or very commonly a lyre, or a burning torch, and sometimes a whip, as symbol of his power. The bow and arrows, which were his common attributes in Hellenistic and Roman times, seem to have been introduced in the fourth century B.C., when Praxiteles and Lysippus represented the god in famous statues. The statue of Eros stretching the bow, probably influenced by Lysippus, which is now in the Capitoline Museum at Rome, shows the passage to the type which afterward became universal—the chubby, mischievous boy. The later Alexandrian and Roman literature, with its frequent mention of the love gods, finds a reflection in the contemporary art. The artists of the time are exceedingly fond of genre scenes, in which the actors are Cupids, who appear hunting, driving chariots, making wine, selling their wares, or even playing like children. For such scenes cf. the famous "Cupid Frescoes" at Pompeii; consult Mau-Kelsey, *Pompeii: Its Life and Art*, pp. 331-338 (New York, 1902).

**CUPID, THE LETTER OF.** A poem by Oeclve, which was attributed to Chaucer in the edition of 1532, though bearing a date (1402) two years after the latter's death.

**CUPID AND PSYCHE**, σῑ'κέ. 1. One of the tales narrated in the *Golden Ass* of Apuleius (q.v.). Psyche, a princess, by her beauty incurs the wrath of Venus, who sends Cupid to punish her; but he falls in love with his prospective victim and visits her, cloaked in invisibility. He commands her not to attempt to see him. Curiosity leads her to disobey, and the lovers are separated. The pity of Jupiter, however, finally unites them for eternity. 2. A graceful antique marble in the Capitoline Museum at Rome, a copy of a Greek original. Cupid, undraped, embraces Psyche, who is draped from the hips. The statue was found on the Aventine. See PSYCHE.

**CUPID'S REVENGE.** The title of an inferior comedy by Beaumont and Fletcher, showing strong resemblance to Sidney's *Arcadia*.

**CUP'OLA** (It., dome, from Lat. *cupula*, *cupule*, little cup, *cupola*, dim. of Lat. *cupa*, cask). 1. A spherical vault or ceiling, so called from its resemblance to an inverted cup. The term may be used either of the interior or of the exterior structure, and is thus not to be sharply distinguished from the word "dome" (q.v.). It is, however, more commonly applied to the smaller forms of dome and to those which are

not conspicuous externally. When the outer roof differs materially in form from the inner dome, it is proper to call the latter a cupola, though not the former; as in the Baptistery at Florence or that at Ravenna. The minor domes of Turkish mosques, the domical vaults over the Mihrab at Córdoba, over the side aisles or even over the nave and choir of St. Paul's at London, are cupolas, but the term is hardly applicable to great external domes or lofty domes like those of St. Peter's at Rome or of the Capitol at Washington. The inner vaults of these domes may, however, be called "cupolas." In popular language the term is often misapplied to a small lookout or lantern crowning a roof, without regard to its form. 2. A circular furnace used in iron founding. See FOUNDRY.

**CUPPING.** The application of cups, from which the air has been exhausted, to the skin, with the object of causing congestion or excessive fullness of the cutaneous blood vessels; and if it should be thought desirable to withdraw some blood, the skin may be cut or scarified, and the exhausted cups applied over the incisions, to favor its flow. The two procedures are respectively called "dry" and "wet" cupping. Cups are made of glass, with round mouths, from 2 inches to 1 inch wide. The cup is held near the skin, and the flame of an alcohol lamp is thrust into it till part of the air is driven out by expansion. The flame is then withdrawn, and the cup is quickly inverted on the skin, to which it adheres on account of the partial vacuum formed on cooling. The "French cup" is provided with a rubber bulb connected with its interior. The bulb is grasped as the cup is applied, driving out the air, and when the cup is in position the bulb is allowed to expand and fill, thus exhausting part of the air in the cup. Wet cupping should be done under antiseptic precautions. A series of vacuum cups ingeniously devised to fit every part of the body, and provided with suction bulbs, have been invented in connection with the system of treatment advocated by Bier.

**CUPRES/SUS.** See CYPRESS.

**CUPRITE** (from Lat. *cuprum*, copper). A red cuprous oxide that crystallizes in the isometric system and has an adamantine or submetallic lustre. It sometimes occurs in long thin needles (*chalcotrichite*), as well as in earthy varieties red, reddish brown, or black in color. Cuprite results from the oxidation of the sulphides of copper and is found associated with other copper minerals and with limonite. It occurs in Thuringia and Tuscany, in England, in Chile, Peru, and Bolivia; and with various copper ores in the Lake Superior region, Missouri, and Arizona. It is found occasionally as a furnace product. Cuprite is a useful ore of copper.

**CUPULE** (Neo-Lat. *cupula*, dim. of Lat. *cupa*, cask). A word with at least two distinct applications among plants. Among seed plants it refers to a peculiar involucre of coalesced bracts, such as the acorn "cup," and the husk of beechnuts, hazelnuts, etc. Among liverworts (as *Marchantia*) it refers to a cuplike structure that appears on the plant body and contains the peculiar reproductive bodies called "gemmae." See HEPATICE.

**CUPULIFERÆ** (Neo-Lat. nom. pl. from *cupula*, cupule, little cup, *cupula* + Lat. *ferre*, to bear). An old name applied to the family in which the oak was the most conspicuous representative. This old family has now been divided into two: Betulaceæ (birch family), and Faga-

ceæ (beech family). To the former family hazelnuts, birches, and alders belong; while to the latter family beeches, chestnuts, and oaks belong. A conspicuous difference between the two families is that in the Betulaceæ both staminate and pistillate flowers are in catkins or catkin-like heads, while in the Fagaceæ this is true only of the staminate flowers. These two families, along with the willow family and walnut family, constitute the amentiferous groups—a name referring to the characteristic catkins or aments. In all of them the stamens and pistils are in separate flowers, so that the plants are either monoecious or dioecious. In none of them is there any corolla, except occasionally some minute petals in the walnuts. In all of them except the willows the fruit is a characteristic nut.

The Betulaceæ contain six genera with about 75 species, while the Fagaceæ contain five genera with about 375 species, the large majority of which belong to the genus *Quercus* (oak). In both families the leaves are alternate, simple, and straight-veined. The characteristic nuts of oaks, beeches, and chestnuts are well known. These two families contain some of our most important forest trees and are mostly natives of the Northern Hemisphere.

**CURA**, *kūr'ā*, or **CIUDAD DE CURA**, *syō-nā' dā kūr'ā*. A city of Venezuela, formerly capital of the State of Miranda, situated near Lake Valencia, 1600 feet above sea level (Map: Venezuela, D 1). Owing to its position near the llanos of the Guárico, it has considerable trade as the centre of a cotton-growing, agricultural, and stock-raising region. Cura, founded in 1730, suffered considerably in the War of Independence. In 1900 it was visited by a destructive earthquake. Pop., about 12,000.

**CURACANEAN**, *kūr'ā-ka-nā'kàn*. A minor linguistic stock of South American Indians in the lower Bolivian region. Rivet sees reason, however, to make it a dialect of the Otúquan or Otúké.

**CURAÇAO**, *kūr'ā-sā'ō* or *kūr'ā-sō'.* An island of the Dutch West Indies, lying in the southern part of the Caribbean Sea (Map: West Indies, E 4). It is situated about 41 miles north of Venezuela, in lat. 12° N. and long. 69° W., and covers an area of 212 square miles. Its surface is generally flat, except for the hills in the southwest, whose highest elevation is 1200 feet. Streams are few, and the rainfall light. Sugar, tobacco, corn, and fruits are raised, but a considerable part of the island is arid and uncultivable. The principal minerals worked are salt and phosphate. Curaçao liqueur takes its name from the island. The commerce of Curaçao is chiefly with the adjacent islands and the United States. The imports of the colony in 1911 were valued at 4,325,000 guilders; of the island for 1910 at 3,162,310 guilders (coal, dividend, cigars and cigarettes, sugar, coffee, cheese, tobacco, rum, etc.). The exports of the colony in 1911 were 1,952,000 guilders and in 1900 1,716,886 guilders (Curaçao, 925,385; Bonaire, 164,363; Aruba, 542,260; St. Martin, 59,926; St. Eustatius, 13,823; Saba, 11,120). (Guilder = \$402.) The island of Curaçao, together with the adjacent Dutch islands of Bonaire, Aruba, a part of St. Martin, St. Eustatius, and Saba, form a separate colony (area, 436 square miles) officially called Curaçao, administered by a governor, assisted by a council of four members and a colonial council of eight members. The

smaller islands are administered by subordinate officials. The members of both councils, as well as the minor officials, are nominated by the sovereign. Pop. of the colony, Dec. 31, 1910, 54,409 (of the island of Curaçao, 32,585); 1900, 52,109 (30,636). Aruba, 9357, Bonaire, 6383. The capital of the colony of Curaçao is Willemstad, in Curaçao, a well-built town with a good harbor. Curaçao was occupied by the Spanish in 1527 and fell into the hands of the Dutch in 1634. It was ruled by the English for eight years (1807-15), then returned to the Dutch. There is a United States consul on the island.

**CURAÇAO**, koo'ra-sô' (so called from the peel of the Curaçao orange). A well-known and palatable liqueur, made from orange peel by digesting in sweetened spirits, with certain spices, as cinnamon, mace, or cloves. See LIQUEURS.

**CURANA** (koo'ra-ná) **WOOD**. See PROTIUM.

**CURARI**, koo'ra-ré (South American), CURARE, OURARI, URARI, WOORALI, or WOORABA. A celebrated poison used by some tribes of South American Indians for poisoning their arrows. Its active principle is *curarine* ( $C_{14}H_{19}N$ ), a yellowish-brown, intensely bitter powder. It is by means of this poison that the small arrows shot from the blowpipe become so deadly. The nature and source of this poison remained long unknown, the Indians being very unwilling to reveal the secret, which seems, however, to have been at last obtained from them by Sir Robert Schomburgk, and it is now regarded as pretty certain that the principal ingredient is the juice of the *Strychnos toxifera*, a tree or shrub of the same genus with that which yields nuxvomica (See STRYCHNOS.) It has a climbing stem, thickly covered with long, spreading, reddish hairs, rough, ovate, pointed leaves, and large, round fruit. The poison, when introduced into the blood, acts on the end plates of the muscles, peripheral end organs of the motor nerves, causing complete paralysis without affecting consciousness, sensation, circulation, or respiration except indirectly. Convulsions are due to the asphyxia which results from paralysis of the muscles concerned in respiration. Death finally occurs from this respiratory paralysis. Curari is supposed to be the most powerful sedative known. Artificial respiration is the most efficacious means of preventing its effects. It has been proposed to employ it in the cure of lockjaw and hydrophobia, but it merely stops the convulsions and is itself very dangerous on account of the liability to paralysis of the respiratory muscles. It has been used with success in tetanus.

**CURARINE**. See ALKALOIDS.

**CURAS/SOW** (from Curaçao, an island in the Caribbean Sea) or properly CURACAO BIRD. A large gallinaceous bird of the genus *Craz* of the family Crazidae, having a strong bill surrounded at the base with a skin—sometimes brightly colored—in which the nostrils are pierced, and the head adorned with a crest of feathers curled forward. They are natives of the forests of the warm parts of America. Their habits greatly resemble those of domestic poultry. They make large, clumsy nests in trees and lay white eggs. They are easily domesticated. The best-known species, the Curaçao bird (*Craz alector*), is about the size of a turkey; its plumage is almost entirely black. It is abundant in the forests of Guiana. Its flesh is very good eating. It is kept in poultry yards in South America, and was introduced

into Holland at the close of the last century, where it seemed completely acclimated, but the stock has never become widespread. Consult Dixon, *The Dovecote and the Aviary* (London, 1853), and Sclater's illustrated papers in the *Transactions of the Zoological Society of London*, vol. ix (London, 1877). Cf. CHACHATACA; GUAN; and HOCO; and see Plate of GROUSE, etc.

**CUR'ATE** (ML. *curatus*, from Lat. *cura*, cure, care). One who has the cure of souls. In this sense it is used in the phrase of the English prayer book, "all bishops and curates," and similarly in France the word *curé* denotes the parish priest. In England and America the word is applied, in Catholic and Church of England usage, to assistant clergymen. A few incumbents in England hold what are called "perpetual curacies" and are practically the same as vicarages. See VICAR.

**CURAVECAN**, koo'ra-va-kán. A minor linguistic stock of South American Indians, formerly resident in the forested region of eastern Bolivia. Rivet thinks it may belong to the Otupian or Otuké stock and thus lose its independent character.

**CURB** (from OF. *courber*, *corber*, *curber*. Fr. *courber*, It. *curvare*, from Lat. *currare*, to bend, from *currus*, curved, OChurch Slav. *krivŭ*, Lith. *krevas*, crooked). A bulging or thickening of the ligaments and other tissues of the back part of the hock of horses, following a sprain. Swelling appears on the inner and back part of the joint, generally causing lameness, which is most apparent in trotting and in slight cases usually wears off after the animal has been out for 10 minutes. It may be most readily detected by standing at one side and looking across the joint. Applications of cold, as intermittent or constant irrigation, or an ice poultice, must first be used to allay the irritation and inflammation. When the swelling has assumed defined boundaries, efforts should be directed towards effecting its absorption and reducing its dimensions by means of pressure, blisters of cantharides, and frictions with ointments of bin-iodine of mercury. All work should be suspended.

**CUREBINA**, koo'r-bé'ná. See DRUM, or DRUM-FISH.

**CURCI**, koo'r-ché, CARLO MARIA (1809-91). An Italian priest and author, born in Naples. He was a Jesuit and founded in 1850 *Civiltà Cattolica*, a journal which stood for the rehabilitation of the temporal power of the Pope. But Curci later retracted these opinions and in 1877 published, in *Il moderno dissidio tra la chiesa e l'Italia* (1877), the reasons for his opposition to the policy of Pius IX. This forced him to leave the Society of Jesus, but afterward Leo XIII induced him to recant to some extent, and he continued more favorable to the policy of the Vatican until the publication of his books, *La nuova Italia* (1880), *Il Vaticano regio* (1883), and *Lo scandalo del Vaticano regio* (1884), which were immediately placed upon the Index. Towards the end of his life Curci retracted again and died in the communion of the Church. Consult his *Memorie* (Florence, 1891), extending to 1849.

**CURCU'LIONIDÆ** (Neo-Lat. nom. pl., from Lat. *curculio*, *gurgulio*, weevil). A large family of rhynchophorous beetles; snout beetles. See WEEVIL; PLUM INSECTS.

**CUR'CUMA** (It., Fr. *curcuma*, from Ar.

*kurkum*, saffron). A genus of plants of the family Zingiberaceae, having the tube of the corolla gradually enlarged upward and the limb two-lipped, each lip three-parted. The species are stemless plants, with tuberous roots, natives of the East Indies. The dried roots of *Curcuma zedoaria* are the zedoary (q.v.) of the shops; the roots of *Curcuma longa* yield turmeric (q.v.); and *Curcuma angustifolia* yields a kind of arrowroot (q.v.). The same species often yields both arrowroot and turmeric—the former being obtained from the young roots, the latter from the old. *Curcuma amada* is called "mango ginger." Its root in its qualities resembles ginger. It is a native of Bengal.

**CURD.** See CHEESE.

**CURÉ DE MEUDON**, ku'râ' de mē'dōn', LE (Fr., the curate of Meudon). The name frequently given to Rabelais, whose last charge was at Meudon.

**CURE FOR A CUCKOLD.** The title of a play by Webster and Rowley (1661), also attributed to Middleton and Rowley.

**CUREL**, ku'rēL, FRANÇOIS DE (1854– ). A French dramatist, born at Metz. He studied engineering, but gave himself to the stage and, although he gained no great popularity, made his mark at the Théâtre Libre and the Théâtre Antoine with the critics by his boldness of theme and his originality, treating such serious topics as labor and capital, the genesis of religion, and the modern idolatry of science, and showing the influence of Ibsen. His plays include: *L'Envers d'une sainte* (1892); *L'Intrité* (1893). *Le repos du hon* (1897). *La nouvelle idole* (1899); *Fille sauvage* (1902). *Le coup d'aile* (1906). He wrote two novels, *L'Été des fruits secs* (1885) and *Le sauvetage du grand duc* (1889).

**CURES**, kūr'ez (from Sabine *curis*, *quins*, spear). A town of the Sabines, about 25 miles from Rome, near the Tiber, the birthplace of Titus Tatius (see ROMULUS), and of Numa (q.v.). The town was destroyed by the Lombards near the close of the sixth century. It stood not far from the modern Correse.

**CURETES**, kō-rē'tez (Lat., from Gk. *Kοῦρῆτες*, *Kourētes*). Cretan demigods who protected the infant Zeus from his father Cronus (see SATURN), by drowning his cries with the clanking of their brazen weapons. The Curetes were closely connected with the worship of Cybele (q.v.). (See CORYBANTES.) The priests of the Curetes, clad in armor, danced the Pyrrhic dance (q.v.). On the Corybantes and the Curetes both, consult an article by Kaibel in *Göttinger Nachrichten*, pp 512–514 (1901), and Farnell *The Cults of the Greek States*, vol. v (Oxford, 1909).

**CURETON**, kūr'ton, WILLIAM (1808–64). An English Syriac scholar. He was born at Westbury, became canon of Westminster and rector of St Margaret's, London, in 1849. He died in London, June 17, 1864. His fame rests upon his Syriac studies, which include: *Corpus Ignatianum* (1849); *Four Gospels in Syriac* (1858); *Ancient Syriac Documents Relative to the Earliest Establishment of Christianity in Edessa and the Neighboring Countries* (1864).

**CURETU**, kōō-rā-tōō'. A tribe of Betovan stock occupying the country on the Yapurá above the mouth of the Apaporis. They are a subtribe of the Yupua.

**CURFEW** (OF. *courfeue*, *corfeue*, from *cuevre*—

*feu*, *cocrefeu*, *correfeu*, *courrefeu*, cover fire, from *corrir*, Fr. *courir*, to cover + *feu*, fire). In the Middle Ages, the ringing of a bell as a signal for the fires to be covered up for the night and consequently for the people to go to bed. The custom existed in many countries and was very necessary as a police measure, because the fires were built in the centre of the room and there were no chimneys; the wooden houses caught fire easily, and destructive conflagrations were frequent. Polydore Vergil attributes to William the Conqueror the introduction of the curfew bell into England, but the custom prevailed throughout Europe long before his time. There was so much opposition to the ordinance in England that Henry I modified it. The curfew is mentioned in English laws from more than a century afterward, but Blackstone says it refers to the time of night and not to the ordinance. In parts of the United States and England the curfew bell is now rung; in some towns of the former it is a police regulation to warn children off the streets.

**CURIA** (Lat. *court*). In Roman history, the name of a division of a tribe, dating traditionally from the constitution of Romulus. The tribes being three and the divisions in each tribe 10, there were 30 curie. From the *curia* plebeians were at first excluded; later, plebeians were admitted to them. The assembly of the *curia* was called *Comitia curiata*. The *curia* were at bottom, probably, territorial divisions, including groups of related families. They had political functions, discussed under COMITIA, and religious functions of various sorts. The meeting place of a curia was itself called "curia." Hence curia is also the name given to the Senate house in ancient Rome. Consult Botsford, *The Roman Assemblies* (New York, 1909).

**CURIA MURIA** (kūr'i-á mūr'i-á) ISLANDS. See KIRIA MURIA ISLANDS.

**CURIA REGIS** (Lat.), or KING'S COURT. The ancient supreme court of judicature of England, known also as the *Aula Regia*, or Royal Hall (of Justice). It was instituted by William the Conqueror as the instrument of his judicial and administrative authority as supreme head of the state, and, exercising, as it did, a general and practically unlimited jurisdiction, it rapidly drew to itself all the important litigation of the kingdom. There had been no analogous tribunal under the Saxon kings, the popular county courts being in all ordinary cases supreme within their respective counties (shires), and a centralized administration of justice being foreign to the sentiments and traditions of the English people. Among the Normans, however, it was the duke or king, and not the people, from whom the stream of justice flowed, and the followers of the Conqueror could hardly be expected to subject their causes—their controversies over land titles, their exactions, their claims to tithes and preferments—to the judgment of the popular tribunals. It was in the County Court of the County of Kent, however, that a great case, involving the title to 25 manors, between the Archbishop of Canterbury and Odo, the Bishop of Bayeux and Earl of Kent, the half-brother of the King, was tried and adjudged in the tenth year of the Conqueror, and cases of this kind were not uncommon in the earlier years of William's reign.

But the older tribunals could not long com-

pete with the immediate jurisdiction of the King, at first administered by him in person, and then by the chief justiciar, an officer of almost royal authority and importance. All important causes, public and private, whether civil, criminal, or ecclesiastical, might be brought before the King's Court in the first instance, and judgments of the county courts and other local tribunals were subject to be appealed and brought before it for review. Its learning and disinterestedness contributed as much as its authority to invest it with the function of the principal court in the kingdom for the adjudication of private controversies, and the position of the justiciar, as the chief executive and military officer, as well as the highest judicial officer in the kingdom, added to the weight of its judgments.

The *Curia Regis* early became a peripatetic or circuit court, attending the King, or, in his absence from the realm, the justiciar, in his frequent progresses through the kingdom, and this, in the course of time, became a great abuse, amounting in many cases to a denial of justice. To remedy this, it was provided in *Magna Carta* (1215) that common pleas, i.e., causes between private parties, should not follow the court, but be heard in a fixed place. The establishment, thereupon, of a distinct Court of Common Pleas, in the reign of Henry III, to sit permanently at Westminster, was the beginning of the dissolution of the *Curia Regis*. A separate division of the court, known as the King's Court of the Exchequer, had previously been created for determining questions relating to the royal revenues. When in the same reign a Chancellor of the Exchequer was appointed as the permanent head of this department, it also became a separate and distinct tribunal. Finally, in the fifty-second year of Henry III (1268), a third court, thenceforth known as the Court of King's Bench, was created and took over the remaining jurisdiction of the *Curia Regis*. Thus, the latter, though never formally abolished, lost its importance and became obsolete, after 200 years of greatness. The last justiciar of the King's Court, Robert de Brus, became the first Chief Justice of the King's Bench in 1268, and with him the line of great justiciars became extinct. From that time to the reform of the judicial system of Great Britain in 1873-75, England lacked a single supreme court, but the model of the *Curia Regis* of the Norman kings was followed in the creation of the Supreme Court of Judicature, by which justice is administered in England to-day. See COURT; SUPREME COURT.

**CURIA ROMANA.** See ROMAN CATHOLIC.

**CURIATII**, kŭ'ri-m'ſhi-l. The name of three Alban brothers, the opponents and victims of the three Horatii (q.v.) in the famous con-

test by which Alba Longa became subject to Rome.

**CUBICANCHA**, kŭŏ'rĕ-kān'chā (Quichua, court of gold). A temple of the sun said to have been founded by Manco Capac, in Cuzco, Peru, and to have been first used as a palace by the early Incas.

**CURICÓ**, kŭŏ'rĕ-kŏ'. The capital of the Province of Curicó, Chile (Map: Chile, C 10), situated, at an elevation of 748 feet above sea level, 114 miles south of Santiago. It is connected with Santiago by railroad and has considerable trade with Argentina through the Planchón Pass. Curicó was settled in 1743, though not on its present site. Pop., 1907, 17,573; 1910, 18,313. Pop. of the province, 1910, 108,120.

**CURIE**, kŭ'rĕ', MARIE SKŁODOWSKA (1867- ). A Polish-French physicist and chemist, the wife of Pierre Curie (q.v.). She was born in Warsaw, where her father was professor of physics in the University. She studied the physical sciences at Warsaw and later in Paris with Curie, whom she married in 1895. To the researches on radioactive substances and radioactivity which have made her name and that of her husband famous, she contributed at least an equal share. It was she who carried out the tedious and innumerable fractional crystallizations that finally yielded a minute sample of pure radium salt, enabling her to determine the precise atomic weight of radium. The honors and prizes for the discovery of the radioactive elements (see POLONIUM, RADIUM, RADIOACTIVITY) were awarded jointly to her and her husband, including part of the Nobel prize for physics in 1903. On her husband's death, in 1906, she succeeded him as professor of physics and director of the physical laboratory at the Sorbonne, where she continued her researches. Later she became professor also in the *Ecole Normale Supérieure des jeunes filles* at Sèvres. In 1910 she was awarded the Albert medal of the Royal Society of Arts (England), and in 1911 she received the Nobel prize for chemistry. She wrote *Recherches sur les propriétés magnétiques des aciers trempés* and *Recherches sur les substances radioactives* (Eng. trans., 2d ed., New York, 1904).

**CURIE**, PIERRE (1859-1906). A French physicist. He was born in Paris. He received his general education in Paris and early engaged in independent research, which resulted in a number of valuable contributions to physical science. In 1895 he was made professor of physics at the *Ecole municipale de chimie et de physique*. In 1896 he and his wife (see CURIE, MARIE SKŁODOWSKA) began to study the Becquerel rays, which led them to the discovery of polonium (q.v.) and subsequently of radium (q.v.). In 1901 they received the La Caze prize of the Academy of Science and two years afterward the Davy medal of the Royal Society of London, and part of the Nobel prize. In 1904 Curie was made professor of physics at the Sorbonne and in 1905 a member of the Institute of France. He was run over and instantly killed in Paris by a wagon, April, 1906. His memoirs were published mostly in the *Comptes rendus* of the French Academy. See RADIOACTIVITY.

**CURIŌ** (clipped from *curiosity*). A term still popularly used, though somewhat obsolete, to describe any kind of object of curiosity, especially such as would belong to cabinet (q.v.) collections, on account of antiquity, rarity, or intrinsic interest, in such domains as pottery,

porcelain, enamels, metal work, ivories, wood carvings, arms, clocks, fans, watches, snuff-boxes, musical instruments, and the like.

**CURIO, GAIVS SCRIBONIVS.** 1. A Roman statesman and orator, tribune of the people in 90 B.C. He served under Sulla in Greece against Archelaus (see *ARCHELAUS*, 4) and in Asia. He was consul in 76. As Governor of Macedonia, he defeated the Thracians and the European Dardanians, making his way even to the Danube; for this a triumph was granted to him. He was a friend of Cicero, but a bitter opponent of Cæsar, against whom he wrote a political pamphlet in dialogue form. As an orator, he was known for his brilliant style and his pure Latin. He died in 53. 2. Son of the preceding, best known in connection with the events leading to the outbreak of war between Cæsar and Pompeius. At first he supported Pompeius; later, he went over to Cæsar, persuaded, it was said, by a large bribe. When it was maintained that Cæsar, then in Gaul, in order to be free to stand for office in Rome, should follow the usual procedure and lay down his imperium before entering the city, Curio proposed that Pompeius should do the same, and recommended that, if either refused, he should be declared a public enemy. The proposal was carried, but the consuls nevertheless directed Pompeius to command all troops in Italy. Finding his opposition to this unsuccessful, Curio fled to Cæsar. He served with success in Sicily in the interest of Cæsar and then crossed to Africa and was defeated and slain there by King Juba.

**CURIOSITIES OF LITERATURE.** A work in six volumes by Isaac D'Israeli, which appeared without indication of its authorship, at intervals from 1791 to 1824.

**CURISCHES HAFF,** koo'rish-es häf. See *KURISCHES HAFF*.

**CURITIBA,** koo'ra-tē'ba. The capital of the State of Paraná, Brazil (Map: Argentina, K 3), situated on the Iguazú River, in a fertile plain, 3200 feet above sea level. It is well built and has a high school and a street railway. Railroads run to the interior and to the coast, and the town exports corn, beef, fruit, tobacco, and Paraguay tea. There are gold mines in the vicinity. Curitiba was settled in 1654, and since 1831 has been the capital of the state. Pop., 1890, 22,694, 1912 (est.), 60,000.

**CURLEE,** ARENDT VAN. See *VAN CORLEAR*.

**CURLEW** (OF, *corleu*, It. *chiurlo*; probably onomatopoeitic in origin) A shore bird of the genus *Numenius*, and snipe family, characterized especially by its long, slender, downward-curving bill, and its liking for upland plains

BILL OF ESKIMO CURLEW.

rather than marshy places. In America are the Hudsonian or Jack curlew (*Numenius hudsonicus*), the Eskimo curlew, or doe-bird (*Numenius borealis*), and the long-billed curlew (*Numenius americanus*, or *longirostris*). The first two are found in summer in far Arctic regions and in winter as far south as Pata-

gonia, so that during some part of the year they occur in most portions of the Western Hemisphere. The long-billed, whose beak is sometimes 8 inches long, belongs in the eastern and central United States, especially at the South, and on the Northwestern prairies. Its nest, like that of other curlews, is on the ground and slightly constructed, and the eggs are clay-colored, with various brown markings.

The common curlew of Great Britain (*Numenius argutus*), the "whaup" of the Scotch, has an almost world-wide distribution in the Old World, migrating even to New Zealand. Its flesh and eggs are both eaten. Other Old World species are the whimbrel (*Numenius phaeopus*) and the Otahtu curlew (*Numenius fastuosus*) of the Pacific islands. Consult: Coues, *Birds of the Northwest* (Washington, 1874); Selous, *Bird Watching* (London, 1901); Bent, "The Hudsonian Curlew," *Educational Leaflet No. 62*, National Association of Audubon Societies (New York, 1913); Hornaday, *Our Vanishing Wild Life* (ib., 1913). See Plate of BUSTARDS.

**CURLING** (so called from the twisting motion of the curling stones). A game of Scot-

tish origin. Associated with the parent body to-day, the Royal Curling Club of Scotland, are clubs in England, Ireland, Canada, Newfoundland, New Zealand, Nova Scotia, the United States, Russia, and Switzerland. The first club to be organized in the United States was the Orchard Lake Club, near Pontiac, Mich., in 1842. The Grand National Curling Club was organized in 1867.

There are two curling games—the rink play and "playing for points." The rink game is played on any piece of ice, upon which may be plotted out a rink 42 yards long (occasionally 32 yards) and 10 yards wide. There are four players on each side, each using two stones of circular shape, not heavier than 44 pounds nor lighter than 32 pounds (without handles), and not of greater circumference than 36 inches, nor of less height than one-eighth of the greatest diameter. Each player in turn takes his position on the crampet or iron foothold at one end of the rink and propels his stone as near to the tee, 38 yards off, as he can. The next man of the opposite side then projects one of his stones still nearer, if possible, and so the game proceeds until each has cast his two stones, after which the end, or "head," is counted. A stone is of no use unless it reaches the mark called the "hog score," and of no value if it passes out of the parish,

18 inches FOOT	SCORE

HOG	SCORE
LINE	
MIDDLE	LINE
CENTRAL	
HOG	SCORE
BACK	SCORE
FOOT	SCORE
18 inches	

which is a 7-foot ring drawn round the tee. All the stones that stay within the parish are counted, and that side wins which has the greatest number of stones nearest the tee.

It is permitted during the game for one side to aim at its opponents' stones and to knock them out of the circle if possible. The sweeping of the ice, an important feature of the game, is under the direction of one player of each side called the "skip." The player's party may sweep the ice from the hog score next the player to the tee, but when snow is falling the ice may be swept from tee to tee. In the "point" game there are no sides; each player has two stones to throw, and other stones are placed round the tee for him to make his points by placing his ball, or displacing the other balls from the positions in which they have been placed. Originally the stones were simply rounded stones, taken from the channel of a river; but about the middle of the eighteenth century they were improved by chiseling, and later handles were introduced. Now each stone has usually two sides—one so curved that it runs as on a pivot and highly polished for use on dull ice, and the other less polished, but with a larger concave or hollow, to give it a better catch or hold on keen, clean ice. A set of matches is called a "honspiel." There are international honspiels between the United States and Canada, and interstate matches yearly at Montreal, Winnipeg, Ottawa, Hamilton, Toronto, St. Paul, Minneapolis, Duluth, Chicago, Buffalo, Hoboken, N. J., and several other cities. Numerous trophies are contested for, among which are the International trophy, the Quebec Challenge cup, the Grand Challenge cup of Manitoba, the Caledonian tankard, the Viceroyal tankard, the Merriam trophy, and the Gordon-Mitchell and Smith medals. Consult: Ramsay, *An Account of the Game of Curling* (the earliest history of the game, Edinburgh, 1811); Taylor, *Curling, the Ancient Game* (ib., 1877); and the *Official Curling Guide* of "Spalding's Athletic Library" (New York, published annually).

**CURLL**, EDMUND (1673-1747) An English bookseller, to whom Pope devoted some of the least complimentary lines of the *Dunciad*. He became known for his indecent publications, to describe which the term "Curlicism" was invented. Some of these dubious works got him into trouble, and one cost him an hour in the pillory. Besides his "Curlicisms," he published more than 150 standard works.

**CURRACH**, **COURACH**, kūr'ra or kūr'rak, or **COR'ACLE** (Gael. Ir. *curach*, Welsh *corice*, boat). The name given in the British Islands to a canoe or boat made of a slender frame of wood covered with skins. Skiffs of this sort, as well as canoes hollowed out of the trunks of oaks, were in use among the Britons in the earliest times of which we have record. Julius Cæsar, who built some of them after the British model, tells us that the keel and gunwales were of light wood, and the sides of wicker covered with hides. A long voyage in the North Sea, made in a currach during the sixth century, by one of the companions of St. Columba, is commemorated by Adamnan, who died in 704. In 878 three Irish missionaries sailed in a currach from Ireland to Cornwall: the voyage occupied seven days, and the size of the currach is indicated by the remark that it was one of two skins and a half. An old life of St. Patrick speaks of a currach "of one skin, with neither

helm nor oar." The currach of a larger size had a mast and sail. The currach still continues to be used on the Severn, and on many parts of the Irish coast, especially on the shores of Clare and Donegal. The last one known to have been used in Scotland is in the museum at Elgin. See **CORACLE**.

**CURRAGH OF KILDARE**, kūr'rag or kūr'ra óo kil-dár', THE. A famous race track and the seat of a military camp in County Kildare, Ireland. The plain is about 6 miles long and is the property of the crown, its administration being in the hands of a ranger. The camp was established after the Crimean War and has accommodation for over 12 000 men.

**CUR'BAN**, CHARLES COURTNEY (1861- ). An American figure and landscape painter. He was born at Hartford, Ky., and studied in New York at the Art Students' League, and in Paris under Doucet, Lefèvre, and Benjamin-Constant. He received the Hallgarten, Shaw, and Carnegie prizes in the National Academy, the Corcoran prize, Washington, and medals at the expositions of Paris (1900), Buffalo (1901), and St. Louis (1904). He was elected to the National Academy of Design in 1904. There are pictures by him at Vassar College, in the National Gallery, Washington ("Perfume of the Roses"), the Pennsylvania Academy ("The Breezy Day"), and in the museums of Columbus, Richmond, Ind., Toledo, and Buffalo. He has a wide range of subjects, but prefers to paint beautiful female nudes in idyllic surroundings. His color is delicate, his draftsmanship sure and minute. Among his more recent paintings are "Wild Asters on the Mountain Side," "Victoria," "Huckleberries and Ferns," "Mountain Laurel," all exhibited in 1912, and "June," "In the Garden," "The Lanterns," exhibited in 1913.

**CURRAN**, JOHN PHILPOT (1750-1817). An Irish judge and orator. He was born at Newmarket, County Cork, July 24, 1750, and educated at Trinity College, Dublin, where he was more dissipated than studious. In 1773 he went to London and studied law assiduously at the Middle Temple. He was called to the Irish bar in 1775 and soon won success by his ability and social qualities. He was an expert cross-examiner and possessed a thorough acquaintance with every intricacy of the cunning native mind. In 1782 he became member for Killebeggan in the Irish Parliament and supported a liberal policy. His sarcasm led him into several fortunately harmless duels. In 1788 he favored the formation of an Irish volunteer army corps and eloquently protested against the English policy which led to the rebellion of 1798. His fearless defense of the leaders at the State trials, and Robert Emmet's affection for his daughter, the heroine of Moore's pathetic poem, led to Curran's examination before the Privy Council (in 1803), but he was found guiltless of complicity. He bitterly opposed the Union, as the "annihilation of Ireland", and its consummation, crowding on domestic trouble, seriously impaired his health. After the death of Pitt, Fox appointed him Master of the Rolls with a seat in the Privy Council. He held the office from 1806 to 1813 and retired on a pension. As a distinguished man among the brilliant men of the period, he spent the last three years of his life in London, where he died, Oct. 14, 1817. His memory is preserved by excellent examples of sparkling wit and repartee.

found in various memoirs. Consult: Phillips, *Recollections of Curran and his Contemporaries* (London, 1850); Curran, *Life of Curran* (ib., 1819; New York, 1855); Stephens, *Memoir* (London, 1817); O'Regan, *Memoir* (ib., 1817); *Curran's Speeches*, with a *Life*, edited by Davis (Dublin, 1855).

**CURREANT** (Fr. *corinthe*. It. *corintho*, currant, from Lat. *Corinthus*, Gk. *Kóporos*, *Korinthos*, Corinth, so called as being originally exported from that city). A name used to designate some fruits of the genus *Vitis* as well as both the plant and fruit of the genus *Ribes*. Originally this term seems to have been applied to the small raisins which are now a common commercial article much used in cookery. In general the term "currant" is applied to both the plant and fruit of those species of the genus *Ribes* that have no thorns and bear their fruits in bunches or clusters like grapes. *Ribes rubrum* may be taken as a type. This group is found chiefly in the northern half of the north temperate zone. In Europe it is wild and occurs in England and on the Continent as far north as Kamchatka, although it is not found in the Mediterranean countries. In America it is found in Canada and both eastern and western United States. Having a northern origin, it has proved a most valuable plant in the Northwest, where few cultivated fruits thrive without protection. The currant is found in almost every fruit garden throughout the northern United States and Canada and is cultivated to a considerable extent commercially.

*Ribes rubrum*, from which our red and white varieties are derived, is the most important member of this group, both in America and Europe. (For illustration, see Plate of CY-PRUSS.) It grows best on a strong, moist loam, with a northern exposure or partial shade. For this reason it is often planted in orchards and on the north side of buildings. It is generally propagated by hardwood cuttings, 6 to 10 inches long, taken in the early fall. The plants are set about 4 feet apart in rows 6 feet apart. Frequent and shallow cultivation is given, and good results are often secured by mulching. Not much pruning is required. The old wood should be thinned out each year, none over three years old being allowed to remain. Red varieties are the ones chiefly grown for market. The white sorts are sweeter, but not so popular. Both white and red varieties are extensively used in the preparation of jellies and jams and for wine making. Black currants (*Ribes nigrum*) are little grown in the United States, but are extensively cultivated in Canada and in Europe, especially in Scotland. A kind of liquor (*liqueur de cassis*) is made in large quantities from them in France. The raw fruit has an unpleasant odor and flavor, which becomes agreeable only by scalding. It possesses medicinal properties and is used as a tonic and in throat troubles.

*Ribes americanum*, the Western representative of the black currant, possesses all its good qualities and is more ornamental. Another American species very generally met with in ornamental plantations, under the name of "flowering currant," or "golden currant," is *Ribes aureum*. It has been lately placed upon the market as a fruit plant under the name of "Crandall currant"; its fruit is of good quality, but it is a small bearer. The red-flowered currant (*Ribes sanguineum*), now so common as an

ornamental bush in shrubberies and trained on walls, producing in April a profusion of deep-red flowers in large drooping racemes, is a native of northwestern America and was introduced into Great Britain in 1826. Its bluish-black, mucilaginous, insipid berries are not poisonous, as is popularly believed. Another currant, with beautiful red berries, larger than the largest English red currant, occurs on the Himalayas, at an elevation of 13,000 feet. The name "native currant," or "Australian currant," is given in Australia to the berries of different shrubs, particularly the white berries of *Leucopogon richii*, of the family Epacridaceae. Other fruits bearing the same name are produced by species of *Coprosma* (family Rubiaceae), but they are very inferior.

**Currant Diseases**—Two diseases of the currant are well known in the United States, and they both occur in Europe and elsewhere. The anthracnose, caused by *Pseudopeziza ribis*, attacks the leaves, causing small black spots on the upper side, and later white areas on the under surface. The leaves turn yellow and fall from the bushes. The leaf spot, due to *Septoria ribis*, occurs as whitish spots with black centres, which spread over the leaf, causing it to fall prematurely, the whole bush being bare by late summer. The mildew, *Sphaerotheca mors-uvæ*, also attacks currants. These diseases can be prevented by the proper use of any standard fungicide. A wilt due to *Dothiorella* sp. causes a sudden wilting and death of the canes. This disease is most common in the Hudson River region in New York.

**CURREANT INSECTS.** Currants are most injured by the caterpillar-like larvæ, called "currant worms," of two sawflies (q.v.). One, of foreign origin, is *Vermatus ribesii*, and the other, a native, is *Pristiphora grossulariæ*. Both are fully described and treated of by Professor Riley in his *Ninth Report on the Insects of Missouri*, and hellebore is recommended as a remedy. These defoliate the plant. Its stem and roots are attacked by scale insects and by two borers of note. One is the caterpillar of a small wax-moth agerid moth, or clearwing (*Resia tipuliformis*); the other is a small, black, sparsely spotted, long-horned beetle (*Paruceus supernotatus*). It lays its eggs on the currant stems early in June, where there are soon hatched tiny grubs that begin to bore into the stem until they reach and feed upon the pith. When full grown (before the close of the season), they are half an inch long, have brown heads, and whitish, pubescent bodies. When about to change to a chrysalis, this larva gnaws a tunnel to, but not quite through, the outer bark, and then pupates in this chamber and sleeps through the winter. As soon as it is revived by the spring it makes its final change, and the beetle gnaws its way out. The way to destroy these beetles is to prune and burn all dead twigs on the bushes early in spring. Compare GOOSEBERRY. See (CLEARWING).

**CURREANT WINE.** A wine made of the juice of fresh red or white currants, to which sugar is added before it is set aside to ferment. Fermentation requires several weeks, and the wine is not fit for use for at least some months afterward. Black-currant wine is made in the same way from black currants.

**CURRELLEY**, (CHARLES TRICK (1876- ). A Canadian clergyman and archaeologist. He

was born at Exeter, Ontario, was educated privately, and afterward at the Harbord Collegiate Institute, Toronto, and Toronto University. He entered the Methodist ministry in 1899, but went to London, England, in 1902 and was appointed to the staff of the Egyptian Exploration Fund. In 1903 he joined the British School of Archaeology at Athens. In 1902-03, while excavating at Abydos, he discovered the tomb of Admes, "the Pharaoh that knew not Joseph," and also a stone which revealed the parentage of the founders of the eighteenth Egyptian dynasty. In 1903-04 he was in charge of explorations along the Fayoum and in the northern marshes, Egypt. In 1904-05 he led an exploring party to Sinai, and afterward engaged in excavations in Crete, Asia Minor, and Syria. He discovered the statue of Hathor; also the inscription and portrait of Cheops, for which the Khedive of Egypt conferred on him the Order of the Mejidieh. Later he was elected a fellow of the Royal Geographical Society. In 1907 he was appointed curator of the Museum of Archaeology, Toronto University. He published *Sinai*, an account of his explorations.

**CURRENCY** (ML. *currentia*, current of a stream, from Lat. *currere*, to run). The circulating medium in which debts are paid and the business of the country transacted. This would seem to be also the definition of the term "money," and, indeed, among economic writers there is no hard and fast line to distinguish the use of the respective terms "currency" and "money." In general, however, the term "currency" applies more specifically to those attributes of money which are included under the designation "medium of exchange," as distinguished from those which attach to its function as a standard of value.

While, with few exceptions, the money of civilized states rests upon a metallic basis of gold and silver, the circulating medium is often exceedingly complex. Of this the statement of money in circulation in the United States furnishes an excellent illustration:

#### MONEY IN CIRCULATION IN THE UNITED STATES, OCT. 1, 1913

Gold coin	\$ 610,735,030
Gold certificates	1,029,828,159
Standard silver dollars	73,284,490
Silver certificates	478,735,722
Subsidiary silver	157,787,867
Treasury notes of 1890	2,602,750
United States notes	339,826,454
National bank notes	709,677,098
<b>Total</b>	<b>\$3,402,477,570</b>

The aggregate of these various forms of money constitutes the currency of the nation: but among them we can recognize one only, viz., gold coin, as possessing all the attributes of money. It is in the relation of these other forms to the standard money that the questions touching the currency arise. While a fuller discussion of these questions must be reserved for other articles, a brief survey can be had in examining the list here given. In it we recognize three types—token currency, government paper currency, and bank currency.

The subsidiary silver and minor coinage of the United States (the latter not given in the table) represent in the fullest sense token currency. The metallic value of the coins is in contemplation of the law less than their nominal

value; their legal-tender quality is limited, as is also their amount, while the government undertakes the obligation to redeem them in standard money. The silver dollars approach token currency in the lack of correspondence between their metallic and nominal values and in the limitation of their quantity, but they depart from its principles in possessing full legal tender and in not being directly redeemable in gold.

Two forms of paper currency appear in the circulation of the United States—the certificates and the legal-tender notes. The certificates, whether gold or silver, represent in another form a definite quantity of money deposited in the United States Treasury. They are not themselves endowed with the legal-tender qualities of the money they represent, though receivable by the government as money. The United States notes convertible into gold on demand are secured not by an equivalent holding of gold by the Treasury, but by a "reserve" of \$150,000,000, which is deemed sufficient to meet all ordinary demands for redemption. Experience has taught that all such obligations due on demand will not be presented simultaneously. The Treasury notes of 1890, popularly known as "Sherman notes," were issued in payment for silver bullion bought between 1890 and 1893. They are full legal tender and are redeemable in gold like the United States notes. They are gradually being retired in exchange for silver certificates based on silver dollars coined from the bullion purchased by the notes when first issued.

Banking currency is represented in our circulation by the national-bank notes. These are receivable at par by all national banks and by the government in payment of all dues except customs duties, and are payable for all debts owing by the United States except interest on the public debt and in redemption of United States or Treasury notes, for they rest, not on the credit of the issuing banks, but on government bonds, and their redemption is guaranteed by the government. Viewed in this light, they appear as a form of government paper currency. By Act of Dec. 23, 1913, provision is made for the gradual retirement of the bond-secured banking currency through the conversion of the 2 per cent bonds into 3 per cent bonds without the circulation privilege. A new form of currency, issued through the regional reserve banks, is authorized by the law. This currency is based upon commercial paper deposited with a Federal reserve agent, equal to the notes in face value. As additional security the regional reserve bank is required to hold a reserve of 40 per cent in gold against such notes. The notes are a prior claim on the assets of the bank and are further guaranteed by the government, which redeems them at par at the Treasury. The word "currency" is often used to include such credit instruments as checks and drafts and is usually then designated "deposit currency." Consult: Sumner, *A History of American Currency* (New York, 1878); Bullock, *Lectures on the Monetary History of the United States* (ib., 1900); Hepburn, *History of Coinage and Currency in the United States* (ib., 1903); Academy of Political Science, *The Reform of the Currency* (ib., 1911); Dodd, *History of Money in the British Empire and the United States* (London, 1911). See BANK, BANKING; COINAGE; GREENBACKS; TREASURY NOTE; MONEY.

**CURRENT, ELECTRIC.** See ELECTRICITY.

**CURRENT METER.** An instrument for measuring the velocity of flowing water, as in streams, canals, rivers, etc., consisting of a wheel revolving under the influence of the pressure of the flowing water in connection with an indicating or recording device. Such an apparatus was the float wheel of Borda and Dupuit for measuring velocities at the surface; the first real current meter for use beneath the surface was invented in the year 1790 by Woltmann, the German hydraulic engineer, and later improved by Darcy and others, until finally it reached the present form shown in the sketch.

The current meter used by the United States Geological Survey, which may vary more or less in its detail, consists essentially of a vertical metal rod, to the bottom of which is securely attached a heavy lead weight *B* with a tail which insures the apparatus being maintained in a vertical position and directed upstream. Above the weight and on the rod is the device *A*, consisting of a wheel with cup-shaped vanes and a four-bladed rudder to keep the wheel facing against the current.

The flow of water causes the wheel to revolve, and from the known relation between the number of revolutions and velocity, the velocity of the stream in feet per second may be determined.

By means of an electrical apparatus attached by wires to the spindle these revolutions are recorded as such upon an instrument which may be held either on shore or in the boat from which the work is being done.

To determine the relation between revolutions and the velocity in feet per second, it becomes necessary to rate the meter, and this should be

PRICE CURRENT METER.

done for each meter. This is done by passing the apparatus through a body of still water at uniform speeds varying from 0.2 foot per second to 10 feet per second, and noting the number of revolutions indicated on the dial corresponding to the different speeds. From these observations a rating table is plotted, or a curve, to show the velocity of flow in feet per second corresponding to any number of revolu-

tions. It is found, however, that this relation changes after use, so that it is absolutely essential to rerate the meter at definite periods if accurate results are desired. For this purpose the United States Geological Survey maintains stations at Washington, D. C., Denver, Colo., and Los Angeles, Cal., consisting of a track on which runs a car from which the meter is suspended.

The current meter is perhaps more extensively used and gives more precise results than any other apparatus for determining the velocity of flowing water in streams of average size and under normal conditions.

The object of all measurements of rivers is to determine the quantity of water flowing through a given section in a given time, but, as this depends upon the velocity, it is necessary to measure that. Where the quantity or discharge is small, the more accurate ways of measuring are by orifices or weirs, i.e., up to a discharge of 200 cubic feet per second, but beyond this, either floats or the current meter must be employed. Outside of the first cost the latter is always the more preferable.

The method applied by the current meter in determining the discharge of a stream, which depends upon the mean velocity, is as follows. To get the mean velocity of flow in any vertical, it is assumed that this is represented on the meter by the total number of indicated revolutions divided by the time, when the meter has been uniformly lowered from the surface to the bottom and raised again from the bottom to the surface. Several such readings being taken at various points in a plane at right angles to the axis of the stream, and a mean computed, will give the mean velocity at that section, whose area is computed from soundings. This mean velocity multiplied by the area of the section gives the discharge. By the direction meter invented by Ritchie and Haskell the observer is enabled to determine simultaneously on recording dials the direction and velocity of any current. In addition to the current meter may be mentioned those of Fteley and Ellis. The use of the current meter, as well as its construction, is fully discussed in the following references: Hoyt and Grover, *River Discharge* (2d ed., New York, 1912); Hoyt, "Use and Care of the Current Meter, as Practiced by the United States Geological Survey," *Transactions American Society of Civil Engineers*, vol. lxvi, p. 70. (ib., 1910); Murphy, *Hydrographic Manual United States Geological Survey* (Washington, 1904), and other Water-supply and Irrigation papers of United States Geological Survey.

**CURRENT RIVER.** A stream less than 250 miles in length, rising among the foothills on the east slope of the Ozark Mountains, in Texas Co., southern Missouri. It flows southeast, then south, crossing into Arkansas, where it joins the Black River in Randolph County (Map: Arkansas, E 1).

**CURRENTS.** See OCEAN CURRENTS; TIDES.  
**CURRICULUM** (Lat. *curriculum*, a running, a course, from *currere*, to run). The term applied to a course of study, or collectively to that of any type of educational institutions, as the college curriculum, the high-school curriculum, the common-school curriculum, etc. The historical basis of the modern educational curriculum is found in the Seven Liberal Arts of the Middle Ages, the development of which from Greek philosophical speculation and edu-

cational practices is traced under the title of *ARTS, SEVEN LIBERAL*. As long as the idea of the symbolical perfection of this organization of studies and of human knowledge prevailed, there was no modification of the form of the curriculum, though the content of these terms was modified from time to time. All lower education was included in the subject of the *trivium*, i.e., grammar, rhetoric, and dialectic, which represented so many approaches to the Latin language. This was based, it is true, on the work of the "singing" school, which furnished to the child the school arts (reading and writing), with a modicum of arithmetic. The curriculum of higher education included the subjects of the *quadrivium*, i.e., arithmetic, geometry (mathematics and geography), astronomy (natural sciences), and music (aesthetic, etc.). The elaboration of the curriculum under the influences of the early universities and of the Renaissance consisted chiefly in the addition of the subjects of medicine and law, both common and civil, and in the change in the content of the subjects of the quadrivium. These changes can be followed in the successive papal rules and university regulations which prescribed the books that should be read in the several subjects. From the time of the Renaissance to the close of the eighteenth century there was no modification in the organization of the educational curriculum and little in the content. From that time, however, the changes have been numerous and radical, and the old idea of the historical and logical perfection of the traditional curriculum has largely disappeared. In the United States, where conditions permitted these changes with less opposition than in the more conservative societies, very extensive changes have occurred, and an almost chaotic condition has ensued. These changes have consisted primarily in the addition of new subjects to each of the stages of the curriculum, due to the great development of knowledge, especially scientific, during the nineteenth century. The curriculum of the elementary school has expanded in content from the three fundamental school arts until it now embraces from 12 to 15 subjects in half that many spheres of intellectual interests, and in time, from three or four years to eight and nine, the secondary curriculum has undergone no expansion in time, perhaps a diminution, owing to the encroachment of both the lower and the higher curricula, but has added so great a number of subjects that it deals in a preliminary way with almost all those included within the curriculum of college and university. This multiplication of subjects, with no corresponding increase in time and with but little improvement in methods of teaching, has made the problem of the curriculum of the secondary school peculiarly difficult, and that part of our educational system is most in need of reform.

The problem of the curriculum in each of its stages is twofold—that of content and that of organization. This twofold problem is now and long has been the chief topic of educational discussions in the United States. It cannot be said that any solution has been offered, but a statement of the case will be found in the article *PEDAGOGY*. (See also *ELECTIVE STUDIES*.) The matter has received extended study by American educators and has formed the subject of two important reports by committees appointed by the National Education Association. The first

of these, issued in 1892, is known as the *Report of the Committee of Ten* and relates chiefly to secondary education; the second, known as the *Report of the Committee of Fifteen*, relates chiefly to the elementary school and was issued in 1895. Consult, also: *Reports of the National Education Association* (Washington, 1895 et seq.); *Proceedings of the National Education Association*; Payne, *Public Elementary School Curriculum* (Boston, 1905); Henderson, *Textbook in the Principles of Education* (New York, 1910); Ruediger, *Principles of Education* (Boston, 1910); Cubberley, *Changing Conceptions of Education* (Boston, 1909).

**CURRIE, JAMES** (1756-1805). A Scottish physician. He was born at Kirkpatrick Fleming, Dumfriesshire, held a mercantile position at Cabin Point, Va., from 1771 to 1776, and graduated at Glasgow University in 1780. He settled in Liverpool, where he obtained a considerable practice as a physician, and published *Reports on the Effects of Water in Fever and Febrile Diseases* (1797; 4th ed., 1805). He is best known, perhaps, for his (the first) edition of Burns (1800: 7th ed., 1813), prefaced by a *Life* which was long the basis for studies of the poet. Consult the *Memoir* by his son, W. W. Currie (London, 1831).

**CURRY, JABEZ LAMAR MONROE** (1825-1903). An American lawyer, educator, and clergyman. He was born in Lincoln Co., Ga., but removed to Alabama in 1838, where he was admitted to the bar in 1845, having graduated at the Harvard Law School in this year. He served in the Alabama Legislature from 1847 to 1855 and in Congress from 1857 to 1861 and then became a member of the Confederate Congress. After the war he became a Baptist minister, was president of Howard College, Ala., from 1866 to 1868, and was professor of law at Richmond College from 1868 to 1881. From 1881 to 1885 he was general agent of the Peabody Educational Fund, from 1885 to 1888 was United States Minister to Spain, and subsequently was chairman of the educational committee of the John F. Slater Fund. His publications include: *Constitutional Government in Spain* (1889), *William Ewart Gladstone* (1891), *The Southern States of the American Union* (1894), *Difficulties, Complications, and Limitations Connected with the Education of the Negro* (1895); *Civil History of the Government of the Confederate States, with some Personal Reminiscences* (1901).

**CURRY NORMAL AND INDUSTRIAL INSTITUTE**. An institution for the training of colored youths, founded in 1889 at Urbana, Ohio, by E. W. B. Curry. The institute includes a Bible school and normal, literary, commercial, music, and industrial departments. The institute extension work is conducted through a race conference and a social settlement. Since the foundation of the institute over 2000 students have been assisted in obtaining an education. These students have been instructed chiefly along industrial lines. In 1912-13 there were 10 officers and instructors in the faculty. There is one combination building used for chapel, recitation rooms, trade schools, and dormitories. There are also cottages for boys' and teachers' dormitories. The real estate and equipment are valued at \$50,000 and the annual income to about \$7000. In 1913 the institute received a gift of \$2000 from Martha Fouse, a former slave. This is to be used as the founda-

tion of an endowment. The institute depends for its support upon gifts from the general public. The library contains about 5000 volumes. The president from its foundation has been Dr. E. W. B. Curry.

**CURRY POWDER and CURRY PASTE** (Kanarese *kari, kadī*, Malayalam *kari, curry*). A compound condiment added to cooked dishes of meat and rice to render them piquant and appetizing. So generally is curry powder employed in East Indian cookery that it has been called the "salt of the Orient." The substances that commonly form the basis of these powders are turmeric, fenugreek, and sago. To these ginger, black and Cayenne pepper, coriander, caraway, and many other spices are added in varying quantities, or omitted, according to the locality. Such curry powders as contain the pulverized leaves of *Murraya karnigra* (an East Indian tree of the natural order Rutaceæ) are used not only as aromatic stomachic stimulants, but as remedies for dyspepsia, diarrhoea, and even dysentery. The basis of many curry pastes is tamarind (qv).

**CURSCHMANN**, kursh'mán, HEINRICH (1846- ). A German physician, born at Giessen. He studied at the university there, became a lecturer at the University of Berlin in 1875, and in 1876 was appointed head physician of the hospital connected with the city barracks of Berlin. In 1879 he obtained the post of director of the general hospital at Hamburg, and in 1888 was called to the chair of special pathology and therapy in the University of Leipzig. He became recognized as a prominent authority on hospital administration, and from 1886 to 1892 was an associate editor of the *Fortschritte der Medizin*. His publications include: *Entwicklung der Krankenpflege und des klinischen Unterrichts* (1889); *Klinische Abhandlungen* (1894); *Hungersnote im Mittelalter* (1900); *Typhoid Fever and Typhus Fever* (trans. by Alfred Stengel, 1901); *Die Aelteren Papsturkunden des Erzbistums Hamburg* (1909).

**CURSCHMANN**, KARL FRIEDRICH (1805-41). A German musician, born in Berlin. He studied law at first, then music under Hauptmann and Spohr at Kassel. He became known in Berlin as a singer, made tours in Germany, France, and Italy, and was an exceedingly popular song writer. His works consist of "Roméo," a scena and aria. "Abdul und Erminieh," a one-act opera (1828); and his *Gesammelte Lieder*, comprising 92 selections, published in Berlin in 1871.

**CURSE OF KEHAMA**, kâ-hâ'ma, THE. A poem by Robert Southey (1810), relating to the adventures of an Indian rajah who is cursed with supernatural powers.

**CURSE OF SCOTLAND**, THE. In cards, a term applied to the nine of diamonds. Its origin is unknown. Among the many explanations offered are the following: 1. The nine of diamonds is the "pope" in the game of Pope Joan, and hence the symbol of Antichrist to the Reformers. 2. It is the chief card in comette, which game ruined many families in Scotland. 3. It goes back to the nine lozenges on the Dalrymple arms, the Earl of Stair having been responsible for the massacre of Glencoe. 4. Tradition says that the Duke of Cumberland, while drunk and gambling on the night before the battle of Culloden, wrote across the face of this card the order that no quarter was to be given on the morrow.

**CURSIVE WRITING**. See PALEOGRAPHY. **CURSÖR**, LUCIUS PAPIRIUS. See PAPIRIUS.

**CURSÖR MUNDI** (Lat., courier of the world, but intended to mean the course of the world, *cursus mundi*). A poem dating from the beginning of the fourteenth century, professing to be a history of the world from its creation to its destruction. It was based on the paraphrase of Genesis by Cædmon. It is among the works printed by the Early English Text Society.

**CURTAIN**. A term used in fortification. See BASTION; FORTIFICATION.

**CURTAIN, THE**. An old theatre in London at Shoreditch, called also the "Greene Curtain," mentioned in 1577 and probably established about that year. The name was probably given from its green curtain, used for the first time in this theatre.

**CURTAL FRIAR**. A term used by Sir Walter Scott in *Ivanhoe* to denote an irregular clerk or "hedge priest," and applied by him to Friar Tuck of Copmanhurst. The phrase seems to denote a monk with his gown or frock shortened (curtailed) for convenience of moving about. Consult *Ivanhoe*, chap. xxxii, and "Robin Hood and the Curtall Friar," in *Child's Ballads*, v. 273.

**CURTAÑA** (Neo-Lat., from Lat. *curtus*, short). 1. The name given to the sword of Ogier the Dane. 2. The sword of Roland, the point of which had been broken off in trying it. 3. A pointless sword, also known as "the sword of Edward the Confessor," carried before English kings at coronation and symbolizing mercy.

**CURTESY** (OF, *curtesie, cortaise*, Fr. *courtoise*, courtesy, from OF. *curtes*, *cortois*, Fr. *courtois*, courteous, from ML. *cortis*, court, from Lat. *cors*, *cohors*, place inclosed, connected with Gk. *χῆρος*, *choros*, garden, Ofr. *gart*, sedge, Goth. *gards*, Icel. *garðr*, house, OHG. *gart*, circle, Ger. *Garten*, AS. *geard*, Eng. *yard*). In law, the life interest which the surviving husband has in the inheritable estate of the wife. The origin of the estate is involved in obscurity. Both in England and Scotland this customary right is regarded as a national peculiarity—in England, being known as the *courtesy* of England, and in Scotland as the *courtesy* of Scotland—whereas there is reason to believe that it had found a place, with all the peculiarities which now belong to it, in the *coutume* of Normandy, whence it was transferred to England (*Darriage*, vol. ii, p. 60; *Stephen's Commentary*, vol. i, p. 264; *Fraser's Domestic Relations*, vol. i, p. 635). The four circumstances which are requisite to make a tenancy by *courtesy* in England are lawful marriage, actual seisin of the wife, birth of living issue, and the wife's death. It is not necessary, however, that the child survive: it is enough that it was once in existence, although it may have died immediately after its birth. Not only must the estate of the wife be one of inheritance, i.e., a fee simple or a fee tail, in order that the husband shall be entitled to *courtesy* therein, but the child born must have been one capable of inheriting the estate in question. Thus, if the estate were entailed on male issue, and a daughter were born, the husband's inchoate estate of *courtesy* would not become vested, or "initiate," as the phrase was. As soon as the estate becomes vested in the husband by the birth of appropriate issue, he may alienate his life interest in it, subject of course to the wife's rights

therein during her life. If she die first, the estate, notwithstanding the conveyance, is defeated. Originally curtesy attached, as dower still does in most of the United States, to all estates of inheritance of which the wife was seised at any time during the marriage. But it is now generally, though not invariably, limited to such lands as she is seised of at her death; and she may therefore, in most States, by alienating the land during her lifetime or by last will and testament, defeat her husband's claims as tenant by the curtesy. See Blackstone, *Commentaries on the Laws of England*; Pollock and Maitland, *History of English Law* (Boston, 1899); Tiffany, *Law of Real Property*.

**CURTILAGE** (OF. *cortillage*, *curtilage*, *curtilage*, *courtillage*, from *courtill*, *cortill*, *curtil*, courtyard, from Lat. *cors*, *corsus*, inclosed place). The inclosed space of ground and buildings immediately surrounding or lying near a dwelling and used for its convenient occupation. The term is of feudal origin and originally meant a castle and outbuildings inclosed in a stone wall for defense. There is no exact limit to the area which may be included under the term, and it is a matter of proof in each case as to what is set apart for the use of any particular dwelling. The law has always given the curtilage greater protection than outside property, and this idea prevails to-day, as in most jurisdictions breaking and entering curtilage is burglary, and setting fire to any building in it constitutes arson. See ARSON; BURGLARY; REAL PROPERTY; and consult the authorities there referred to.

**CURTIN, ANDREW GREGG** (1815-94). An American politician, known as the "war Governor" of Pennsylvania. He was born in Bellefonte, Pa., studied law in Dickinson College, was admitted to the bar in 1839, and soon was recognized as a leading Republican in State politics. He was appointed Secretary of State for Pennsylvania in 1854 and from 1860 to 1866 served as Governor of the State. From 1869 to 1872 he was Minister to Russia; after his return he joined the Liberal Republican revolt, and later he served as a Democratic member of Congress from 1881 to 1887. During the Civil War he was always prompt in his response to President Lincoln's calls for troops, and by his minute care for the persons and families of the Pennsylvania soldiers won their esteem and became widely known as "the soldier's friend." Consult W. H. Eggle, *Life and Times of Andrew Gregg Curtin* (Philadelphia, 1896).

**CURTIN, JEREMIAH** (1840-1906). An American linguist and translator, born in Milwaukee, Wis. He prepared for Harvard and by his own efforts graduated there in 1863, as an excellent linguist. In the following year he went to Russia, where he remained until 1870 as Secretary of Legation for the United States at St. Petersburg. While serving in this capacity he made a careful study of the languages of the Slavic group, and it was the knowledge thus acquired which enabled him to make his translations of works by Sienkiewicz, Zagoskin, and Alexei Tolstoy. From 1883 to 1891 he was connected with the Bureau of Ethnology of the Smithsonian Institution and after that time made independent researches in matters pertaining to the North American Indians. Curtin was familiar with more than 60 languages. Besides his translations, he also wrote: *Myths and Folktales of the Russian Western*

*Slaves and Magyars* (1890); *Hero-Tales of Ireland* (1894); *Creation Myths of Primitive America* (1898); *Myths and Folklore of Ireland* (1906); *The Mongols* (1907); *The Mongols in Russia* (1908); *A Journey in Southern Russia* (1909); *Myths of the Modocs* (1912).

**CURTIS, BENJAMIN ROBBINS** (1809-74). A distinguished American jurist, born in Watertown, Mass. He graduated at Harvard in 1829, was admitted to the Massachusetts bar in 1832, and soon became one of the foremost lawyers of the State. In 1851 he was appointed by President Fillmore to the United States Supreme Court, and in 1857 he dissented, in a powerful argument, from the opinion of the majority in the Dred Scott decision (q.v.). In the same year he resigned and resumed his practice in Boston. During the celebrated impeachment trial of 1868 he was one of President Johnson's counsel. He published several valuable collections of law reports, including *Reports of Cases in the Circuit Courts of the United States* (2 vols., 1854); *Decisions of the Supreme Court of the United States* (22 vols.), and *Digest of the Opinions of the Supreme Court of the United States to 1854*. Consult *Memoirs and Writings of Benjamin R. Curtis* (Boston, 1880), the first volume of which is a memoir by his brother, George Ticknor Curtis (q.v.).

**CURTIS, CARLTON CLARENCE** (1864- ). An American botanist, born at Syracuse, N. Y. He was educated at Syracuse and Columbia universities and also studied at the universities of Cambridge and Leipzig. In 1892-94 he was principal of the Fayette Union School (New York City), in 1894-96 instructor in natural science at the Brooklyn Polytechnic Institute, from 1898 to 1908 tutor in botany at Columbia, and thereafter associate professor. Besides his contributions to botanical journals, he is author of *Text-Book of General Botany* (1897) and *Nature and Development of Plants* (1907; 2d ed., 1910).

**CURTIS, CHARLES** (1860- ). An American legislator, born in Topeka, Kans. His mother was a full-blooded member of the Kaw tribe of Indians. He was educated in the common schools, and after studying law was admitted to the bar in 1881. In 1884 and again in 1886 he was county attorney of Shawnee County. From 1893 to 1897 he served in Congress from the Fourth Kansas District and from 1897 to 1907 represented the First District of the State. He resigned from the House of Representatives in 1907 upon his election to the United States Senate to fill the unexpired term of J. R. Burton, resigned, and was the first Indian to hold such office. He was a candidate for reelection in 1912, but a Democratic Legislature in 1913 brought about his defeat.

**CURTIS, CYRUS HERMANN KOTZSCHMAR** (1850- ). An American publisher, born in Portland, Me. He was educated in the public schools and in 1876 removed to Philadelphia, where he became publisher of the *Tribune and Farmer*. He later established the *Ladies' Home Journal* and made it one of the most successful periodicals in the United States. The Curtis Publishing Company, of which he became head, published, in addition to the *Ladies' Home Journal*, the *Country Gentleman* and the *Saturday Evening Post*, the latter established by Benjamin Franklin in 1728. Under Mr. Curtis's management the *Saturday Evening Post*

attained a larger circulation than had hitherto been reached by any American periodical. In 1913 he took over the interest of A. S. Ochs in the Philadelphia *Public Ledger*.

**CURTIS, EDWARD S.** (1868- ). An American author and photographer, born in Madison, Wis., and educated in the public schools of Minnesota. In 1891 he settled in Seattle as a professional photographer. He was official photographer for the Harriman Alaska expedition; and in 1907-11 published the *North American Indian*, edited by F. W. Hodge, with remarkably valuable photographs which he had taken in "field research under the patronage of J. Pierpont Morgan."

**CURTIS, GEORGE CARROLL** (1872- ). An American geographic sculptor, born at Abington, Mass. He was educated at Harvard University, where he was for a time an assistant in the geological department. Later he became assistant field geologist of the United States Geological Survey. He was the first to apply aerial perspective to topographical models; this he did in models of Boston and vicinity, and of the city of Washington as it existed and as it would appear if a proposed development were carried out. A member of the expedition to the West Indian eruptions, he was the first to visit the crater of La Soufrière and discovered the new summit of Mount Pelée. He also spent a year among the coral islands of the South Pacific and in 1910-11 made a special study of the Atlantic coast from Maine to Newfoundland. Besides his special geological and topographical articles, he is author and illustrator of *A Description of the Topographical Model of Metropolitan Boston* (1900).

**CURTIS, GEORGE TICKNOR** (1812-94). An American jurist and writer on the constitutional history of the United States. He was born in Watertown, Mass., graduated at Harvard in 1832, was admitted to the bar in 1836, and began the practice of the law in Worcester, Mass. In the following year he removed to Boston, where he continued with short intermissions to practice law until 1862, and from this time until his death he practiced in New York City and before the United States Supreme Court in Washington, D. C. While in Boston he acted for many years as United States Commissioner, and in this capacity, though his sympathies were strongly against the institution of slavery and the rendition of the fugitive slaves, he ordered the return of the escaped slave, Thomas Sims (q.v.), to his master in accordance with the Fugitive Slave Law in 1852 and for so acting was denounced by the Abolitionists throughout the country. Among the cases in which he appeared as counsel are the Dred Scott case, the legal-tender cases, the Colt revolver suits, and the sewing-machine cases. He was popular as a public speaker and delivered many able addresses dealing for the most part with legal or political subjects. He will best be remembered as a writer, and especially as the author of the *Constitutional History of the United States from their Declaration of Independence to the Close of their Civil War* (2 vols., 1896), a part of which was first published in 1854 as *The History of the Origin, Formation, and Adoption of the Constitution of the United States*; and of the *Life of Daniel Webster* (2 vols., 1870), and the *Life of James Buchanan* (2 vols., 1883). He also published, besides numerous magazine articles:

*Digest of the English and American Admiralty Decisions* (1839); *Rights and Duties of Merchant Seamen* (1841); *American Conveyancer* (1846); *Law of Patents* (1849); *Equity Precedents* (1850); *Commentaries on the Jurisprudence, Practice, and Peculiar Jurisdiction of the Courts of the United States* (1854-58); *Memoir of Benjamin R. Curtis* (1880); *International Arbitrations and Awards* (1885); *Creation or Evolution: A Philosophical Inquiry* (1887); and a novel entitled *John Charaxes: A Tale of the Civil War in America* (1889).

**CURTIS, GEORGE WILLIAM** (1824-92). An American critic, essayist, and publicist, born in Providence, R. I., Feb. 24, 1824. After a few years at school he began life as a clerk in New York, joined the Brook Farm Community at West Roxbury, Mass., in 1842, went thence, after 18 months, to Concord, Mass., and afterward spent some years in Italy, Germany, and the Orient. Returning to America in 1850, he became well known through his books of travel and his editorship of *Putnam's Monthly*. In *Harper's Monthly* he published a series of papers called *The Editor's Easy Chair*, from 1853 onward, which increased his reputation. He was popular also as an antislavery orator and lecturer, was long the chief editor of *Harper's Weekly*, took an active part as Republican (till 1884) in politics, and after 1871 in the agitation for civil-service reform. He declined offers of diplomatic service abroad. Shortly before his death, which occurred at West New Brighton, S. I., Aug. 31, 1892, he became chancellor of the University of New York. He was the master of an attractive style, and his books of travel and light essays paved the way for the more important services rendered by his polished lectures and orations and by his single-hearted, patriotic labors in behalf of a pure civil service. His strictly literary reputation seems hardly so well assured as it did a few years since, but the man and orator are still remembered with pleasure and gratitude. His youthful years spent at Brook Farm are charmingly set forth in his letters exchanged with John S. Dwight, which have been published in a volume (1898). His most important publications are: *Nile Notes of a Howadji* (1851); *The Howadji in Syria* (1852); *Lotus Eating* (1852); *The Potiphar Papers* (1853), a satire on New York social life; *Prue and I* (1856), generally thought the best of his early books; *Trumps: A Novel* (1861); *Eulogy on Wendell Phillips* (1884); three series of essays from the "Easy Chair" (1892, 1893, 1894, etc.). He edited the *Correspondence of Motley* in 1889 (2 vols.). Charles Eliot Norton edited his *Orations and Addresses* in 1893-94 (3 vols.). Edward Cary wrote his biography for the *American Men of Letters Series* (Boston, 1894).

**CURTIS, HENRY** (1860- ). A British surgeon, educated at University College Hospital, London, and in Paris, Berlin, and Vienna. He had charge of the bacteriological department of University College Hospital in 1896-97 and was surgical registrar in 1898-1900. In 1900-03 he was surgeon to the Queen's Hospital for Children and assistant surgeon to the Royal Waterloo Hospital for Children and Women, and in 1904-06 he was resident surgeon of Bulawayo Hospital and director of the Pasteur Institute for Rhodesia. Later he became surgeon to the Metropolitan Hospital, senior assist-

ant surgeon to the Seamen's Hospital Society, and instructor in operative surgery at the London School of Clinical Medicine. In 1912-13 he was president of the Æsculapian Society. His clinical lectures on surgery and abscesses have been published.

**CURTIS, JOHN GREEN** (1844- ). An American physiologist, born in New York City. He graduated from Harvard University in 1866 and received his medical training at the College of Physicians and Surgeons (Columbia University), New York. At Bellevue Hospital he was an assistant in 1869, house surgeon in 1870-76, attending surgeon in 1876-80. In the College of Physicians and Surgeons he was assistant and demonstrator in anatomy in 1870-75, adjunct lecturer in 1875-76, and adjunct professor of physiology in 1876-83. He became professor of physiology in 1883 and emeritus professor in 1909. Besides contributions to medical journals, he is author of *American Text-Book of Physiology* (1896).

**CURTIS, OLIN ALFRED** (1850- ). An American theologian, born at Frankfort, Me., and educated at Lawrence College and Boston University, and at the universities of Leipzig, Erlangen, Marburg, and Edinburgh. He served as pastor of Methodist Episcopal churches in Janesville, Wis (1880-83), Milwaukee (1883-86), and Chicago (1888-89), from 1889 to 1895 was professor of systematic theology at Boston University, and in 1896 accepted the corresponding chair at Drew Theological Seminary. Professor Curtis came to be recognized as perhaps the most distinguished Methodist theologian of his generation. Besides many theological papers, his publications include: *Electric Course of Lectures in Systematic Theology* (1901), and *The Christian Faith Personally Given in a System of Doctrine* (1905), a work of great importance.

**CURTIS, SAMUEL RYAN** (1807-66). An American soldier. He was born near Champlain, N. Y., but when very young removed to Ohio. In 1831 he graduated at West Point and in the following year resigned from the service to become a civil engineer. He afterward studied law, was admitted to the bar, and practiced from 1843 to 1845. In the Mexican War he served as a colonel of volunteers and from 1847 to 1848 was Governor of Saltillo. He was then successively an engineer and a lawyer in the West and for two terms and a part of the third was a member of Congress from Iowa (1857-61). He became a brigadier general of volunteers in 1861, commanded the southwestern district of Missouri from December, 1861, to February, 1862, and the Army of the Southwest from February to August, 1862, and on March 7-8, 1862, defeated the Confederate general Van Dorn in the battle of Pea Ridge (q.v.). Soon afterward he was raised to the rank of major general and subsequently commanded the departments of Missouri (1862-63), of Kansas (1864-65), and of the Northwest (1865), and in 1865, as United States Commissioner, negotiated treaties with several Indian tribes.

**CURTIS, WILLIAM** (1746-99). An English botanist, born at Alton, Hampshire. He studied botany, pharmacuties, and entomology, established botanic gardens at Lambeth Marsh and at Brompton, and published a number of works on subjects of natural history. His writings include: *Flora Londinensis* (1777-87; the same work, edited by Graves and Hooker, was

republished in 5 vols. in 1817-28); *British Grasses* (1790 and several later editions); and *Lectures on Botany* (3 vols., 1803-04; 2d ed., 1807). In 1781 he established, and for many years thereafter edited, the *Botanical Magazine*.

**CURTIS, WILLIAM ELEROY** (1850-1911). An American journalist, born in Akron, Ohio, and graduated at Western Reserve University in 1871. From 1873 to 1887 he was on the staff of the *Chicago Inter-Ocean*, and by securing interviews with the James brothers during their contest with Pinkerton's detectives, and in investigating the Ku-Klux Klan of the South, gained a national reputation. He was Washington correspondent of the *Chicago Record* in 1887-1901, when he became associated with the *Chicago Record-Herald*. He was a commissioner of the United States to the Central and South American republics in 1885, was the executive officer of the International American Conference of 1889-90, and was director of the Bureau of American Republics from 1890 to 1893. He wrote: *The Life of Zachariah Chandler* (1879); *Capitals of Spanish America* (1888); *The Land of the Nihilist* (1887); *The United States and Foreign Powers* (1892, 2d ed., 1899); *The Yankées of the East* (1896); *Between the Andes and the Ocean* (1900); *The True Thomas Jefferson* (1901); *Denmark, Sweden, and Norway* (1902); *The Turk and his Lost Provinces* (1902); *The True Abraham Lincoln* (1903); *To-Day in Syria and Palestine* (1904); *Modern India* (1905); *Egypt, Burma, and British Malaysia* (1905).

**CURTISS, GLENN HAMMOND** (1878- ). An American aviator, born at Hammondsport, N. Y. He began life as a news-boy, but was early interested in mechanics. In 1906 at Ormond Beach, Fla., he established the world's record for the fastest mile ever traveled on a motor cycle, making a mile in 26½ seconds. From 1907 to 1909 he was the director of the Aërial Experiment Association of America. He won the *Scientific American* cup in an aeroplane competition at Hammondsport, N. Y. (1908), obtained the international cup in the aeroplane contest at Rheims (1909), and won a \$10,000 prize offered by the *New York World* in a record-breaking flight from Albany to New York (1910). In 1913 he was awarded a medal by the Smithsonian Institution. Besides making a large number of flights in America and in Europe, Curtiss became actively engaged in the commercial side of aviation, being secretary and treasurer of the Curtiss Exhibition Company of New York and president of the Curtiss Aeroplane Company at Hammondsport, N. Y. With the exception of the Wright brothers, none other has done so much as he for aviation in America. He is part author of *The Curtiss Aviation Book* (1912). See *AEROPLANE* and *AERONAUTICS*.

**CURTISS, SAMUEL IVES** (1844-1904). An American biblical scholar, born at Union, Conn. He was educated at Amherst College, at Union Theological Seminary, and at the universities of Leipzig and Berlin. From 1874 to 1878 he was pastor of the American Chapel at Leipzig, Germany, and then was professor of biblical literature and, after 1879, of Old Testament literature and interpretation at the Chicago Congregational Theological Seminary. In addition to several translations of important works from the German, especially by Delitzsch, his writings include: *A Plea for a More Thorough*

*Study of the Semitic Languages in America* (1879); *Moses and Ingersoll* (1881); "Ezekiel and his Times," in *The Bible as Literature* (1876), and *Primitive Semitic Religions To-Day* (1902), his special study.

**CURTIVS**, kūr'tsē-us, ERNST (1814-96). A distinguished German archaeologist and historian, born at Lübeck. He studied at the universities of Bonn, Göttingen, and Berlin, traveled in Greece and Italy, and in 1844 was appointed a professor at Berlin and preceptor of the Crown Prince Frederick William, afterward Frederick III. From 1856 to 1863 he was professor of classical archaeology and philology at Göttingen, whence he returned to Berlin as professor of ancient history. From 1853 Curtius was a member of the Royal Academy of Sciences, from 1871 to 1893 he was continuously secretary of the philologico-historical section of that institution. Under Imperial commission in 1874 he negotiated with the Greek government in regard to the German excavations at Olympia (qv), begun by him in the following year. With Schöne he edited the *Archaeologische Zeitung*, to which he made many important contributions. He must be reckoned among the great scholars of modern Germany, a thinker of imperious influence alike in his academic instruction and in his published works. These latter include: *Peloponnesos* (2 vols., 1851-52), a study of the Greek peninsula with special reference to its mythology, history, and monuments of art. *Griechische Geschichte* (3 vols., 1857-67; 6th ed., 1889), in which he endeavored to present in popular form the results of expert research. *Attische Studien* (1863-64). *Die Stadtgeschichte von Athen* (1891), three volumes of collected lectures and addresses, entitled *Altatum und Gegenwart*, *Gesammelte Abhandlungen* (1894). Consult Gurlitt *Erinnerungen an Ernst Curtius* (Berlin, 1902). Grimm, "Ernst Curtius: Ein Brief an seine Freunde," in *Die Deutsche Rundschau*, vol. lxxviii (Berlin, 1896), and F. Curtius, *Ernst Curtius: Ein Lebensbild in Briefen* (Berlin, 1903). Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

**CURTIVS**, GEORG (1820-85). An eminent German comparative philologist. He was the brother of Ernst Curtius and was born at Lübeck. He studied at the universities of Bonn and Berlin, in 1849 became professor extraordinary, and in 1851 full professor of philology in Prague. In 1854 he was called to Kiel and in 1862 to Leipzig, where he remained. Curtius was the teacher of many of the most eminent comparative philologists of the present day. His most important works are his *Sprachvergleichung in ihrem Verhältnisse zur klassischen Philologie* (1845); *Sprachvergleichende Beiträge zur griechischen und lateinischen Grammatik* (1846). *Griechische Schulgrammatik* (1852; over 20 eds. since). *Grundzüge der griechischen Etymologie* (5th ed., 1879). *Das Verbum der griechischen Sprache* (2d ed., 1877-80). In his *Studien zur griechischen und lateinischen Grammatik* (1868-78) he published not only his own studies, but those of his pupils and others. In 1878, with Lange, Lipsius, and Ribbeck, he founded the *Leipziger Studien zur klassischen Philologie*. Several of his works were translated into English and stimulated interest in Greek grammar and comparative philology. Consult Sandys, *A History of Classical Scholarship*, vol. iii (Cam-

bridge, 1908), and Platner, *The Topography and Monuments of Ancient Rome* (2d ed., Boston, 1911).

**CURTIVS**, kūr'shi-us, METTUS. In Roman legend, the leader of the Sabines who occupied the Capitoline Hill, in the battle with the Romans of the Palatine, during the reign of Romulus. To escape death he plunged with his horse into a morass, on ground afterward occupied by the Forum, from which he extricated himself with difficulty. The morass was thenceforth called *Lacus Curtius*. For the so-called *Lacus Curtius* in the Forum, consult Hülsen-Carter, *The Roman Forum* (Rome, 1906).

**CURTIVS**, QUINTIVS (QUINTIVS CURTIVS RUFUS). A Roman historian, commonly supposed to have flourished in the time of Claudius. He was the author of the interesting work *Historiae Alexandri Magni*, in 10 books, of which the first two have been lost, and the rest are incomplete. Curtius had a very inaccurate knowledge of geography, chronology, military tactics, astronomy, and historic criticism, hence his work is far from being reliable as a whole. The style, though declamatory, is in general pure and elegant. Modern editions are by Vogel (Leipzig, 1884). Dosson (Paris, 1887). Hedcke (1908). There is a translation into English by Crosby (New York and London, 1858). Consult S. Dosson, *Etude sur Quinte-Curce, sa vie et ses œuvres* (1887). For a fresh presentation of the view that Curtius should be assigned to a much later date, consult Steele, *Proceedings of the American Philological Association*, vol. xlii, li-liiv (1912), and the Introduction to the English edition by Heitland and Raven (Cambridge, 1880).

**CURTIVS**, kūr'tsē-us, THEODOR (1857- ). A German chemist. He studied at several German universities and, after the publication of a series of original researches, became professor of chemistry at Kiel in 1889; in 1897 he went to Bonn, but on the death of Victor Meyer, in the same year, accepted the professorship of chemistry at Heidelberg. Curtius discovered new series of important compounds of nitrogen, including hydrazine and many of its derivatives, and the diazo derivatives of the fatty series of organic compounds.

**CURULE CHAIR** (trans. of Lat. *sella curulis*, from *sella*, seat, and *currus*, chariot, from *currere*, to run). The chair of state, equivalent to a throne, among the early Romans, used by the curule magistrates, dictators, consuls, praetors, and curule aediles, on formal occasions. The chair was usually ornamented with ivory, gold, or other precious work. It had curved legs, but no back: it could be folded up as a camp stool is folded. The right to sit in the presence of others and to ride in a carriage in the city of Rome were precious privileges of certain magistrates. The ancients explained the adjective *curules*, applied to certain magistrates (see above), as given because they rode in a currus, 'chariot.'

**CURULE MAGISTRATES**. See CURULE CHAIR.

**CURUMINACAN**, kūr-rū'mē-nā'kan. A minor linguistic stock of South American Indians, in the region of Lower Peru. Rivet thinks it may turn out to be a dialect of the Otuquian or Otuké.

**CURVATURE**. See CURVE.

**CURVATURE OF FIELD OF A LENS**. See LIGHT.

**CURVATURE OF THE EARTH'S SURFACE.** See CURVE.

**CURVATURE OF THE SPINE.** See POTT'S DISEASE; SPINE.

**CURVE** (OF. *courbe*, *corbe*, Fr. *courbe*, Sp., Portug., It. *curvo*, from Lat. *curvus*, curved, OChurch Slav. *krivŭ*, bent, Lith. *kreivas*, crooked). In common language, a line that constantly departs from a fixed direction. In analytic geometry, however, the word is commonly used to designate the locus of a point moving according to any definite law and hence to include the straight line. If the statement of the law according to which the point moves can be translated into an equation or equations between the coördinates (q.v.) of the moving point, these equations may be used to represent the curve—e.g., the circle is the locus of a point moving in a plane at a constant finite distance from a fixed point in that plane, and its equation is  $x^2 + y^2 = r^2$ . (See COORDINATES.) If the curve possesses the property of continuity (q.v.), it is precisely definable at every point, although it may contain singularities. The form of a curve corresponds to the nature of its equation; hence a curve may be designated as algebraic or transcendental according as its equation consists of algebraic or transcendental functions of the coördinates; e.g., the conic sections are algebraic curves, and the cycloid, the logarithmic spiral, and the catenary are transcendental curves. Algebraic curves are fundamentally grouped into orders and classes, according to Newton's classification. The order of a plane curve is determined by the number of points, real or imaginary, in which it intersects any line in its plane. Curves which cut such lines in two points are called curves of the second order; those which cut the lines in three points curves of the third order, and so on—e.g., the conic sections are all curves of the second order, and cubic curves are of the third order. The straight line is the only line of the first order. Similarly the order of an algebraic curve in space depends upon the number of points in which it cuts any plane. The class of an algebraic plane curve is determined by the number of tangents, real or imaginary, which can be drawn to it from any point in its plane. If two tangents are possible, it is a curve of the second class; if three are possible, a curve of the third class, and so on—e.g., the conic sections are curves of the second class; the cissoid (q.v.) is of the third class. Similarly the class of a space curve is given by the number of tangent planes which can be drawn containing any fixed line. The class of a plane curve depends directly upon its order when no singularities exist. If  $n$  is the order and  $c$  the class,  $c = n(n-1)$ . Thus, a conic with no singular points is of the second class, since  $c = 2(2-1) = 2$ ; the cubic is of the sixth class, since  $c = 3(3-1) = 6$ . But singularities tend to diminish the class. Plücker gave six equations connecting the order, class, number of double points, number of double tangents, number of stationary points, and number of stationary tangents from which, if any three of these numbers are given, the other three may be obtained. The one directly connecting the order and class is  $c = n^2 - n - 2d - 3p$ , in which  $c$  is the class,  $n$  the order,  $d$  the number of double points, and  $p$  the number of stationary points. Thus, a cubic with one double point is a curve of the fourth class, since  $c = 9 - 3 - 2 = 4$ . By the aid of covariants (see FORMS),

the class of a curve can be determined directly.

**Singularities.** 1. An algebraic curve whose equation is  $y = f(x)$  is convex or concave downward, according as  $\frac{d^2y}{dx^2}$  is positive or negative.

2. A point of inflection is one at which the tangent to the curve takes a limiting position—i.e., the point of contact of a stationary tangent, at which  $\frac{d^2y}{dx^2} = 0$  or  $\infty$ . See CURVE

OF SINES.

3. A multiple point is one at which more than one tangent exists—i.e., a point for which  $\frac{dy}{dx}$  has more than one value. Two values determine a double point, three values a triple point, and so on. A multiple point is also called a node or crunode. Multiple points of the third order are divided into classes according to the relative number of cusps and crunodes involved.

4. When two branches of a curve have a common tangent at a point, but do not pass through the point, they are said to form a cusp, called also a spinode or stationary point. See CISSOID, COXCHOID.

5. An isolated point whose coordinates satisfy the equation of the curve is called a conjugate point or acnode. An acnode is a multiple point at which the tangents are imaginary. A node or conjugate point corresponds to a double tangent, and a cusp to a stationary tangent. See also CARDIOID; CARTESIANS, CASSINIAN OVAL; CATENARY, CAUSTIC, CYCLOID; ELLIPSE; FOLIUM, HODOGRAPH, LEMNISCATE; SPIRAL; WITCH.

**Curvature.** The curvature of a plane curve at any point is its tendency to depart from a tangent to the curve at that point. In the circle this deviation is constant, since the curve is perfectly symmetrical round its centre. The curvature of a circle varies, however, inversely as the radius—i.e., it diminishes at the same rate as the radius increases. The reciprocal of the radius is therefore taken as the measure of the curvature of a circle. A straight line may be considered a circle of infinite radius and as having no curvature, since  $\frac{1}{\infty} = 0$ . The constancy of curvature in the circle suggests an absolute measure of curvature at any point in any other curve, for whatever be the curvature at that point a circle can be found of the same curvature. The radius of this circle is called the radius of curvature for that point, and the circle itself is called the osculating circle. By means of this radius we may compare the curvatures at different points of the same curve or of different curves. In simple cases, as in the conic sections, the measure or radius of curvature may be determined geometrically, but it is usually necessary to employ the calculus. The expression for the radius of curvature at any point ( $x, y$ ) of a curve is

$$\rho = \frac{\left[1 + \left(\frac{dy}{dx}\right)^2\right]^{\frac{3}{2}}}{\frac{d^2y}{dx^2}}$$

If the curve, instead of lying in a plane, twists in space, it is sometimes called a *gauche curve* or a curve of double curvature, and its curva-

ture at any point may be measured by the radius of its osculating sphere at that point. The centre of the osculating circle or sphere is called the centre of curvature. The curvature of surfaces is determined similarly to that of curves. Thus, the measure of the curvature of the earth, commonly taken as the deviation of the line of apparent level from the line of true level—i.e., from a line everywhere parallel to the surface of still water—is approximately 8 inches per mile.

**Relations.** The following are some of the more important relations which exist among certain groups of curves:

1. The evolute (q.v.) of a curve is the locus (q.v.) of its centre of curvature. Regarding the evolute as the principal curve, the original curve is called its involute. The normals to any curve are tangents to its evolute.

2. Two curves or surfaces are said to have contact when they touch at two or more consecutive points. A contact (q.v.) of the  $n$ th order exists between two curves  $y_1 = \phi(x)$ ,  $y_2 = \psi(x)$  at the point whose abscissa is  $a$  when  $\phi(a) = \psi(a)$ ,  $\phi'(a) = \psi'(a)$ ,  $\phi''(a) = \psi''(a)$ . If  $n$  is even, the curves cross at the point. No curve which has contact of a lower order can pass between the given curves. Curves which have contact of the first order have a common tangent, and those having contact of the second order have a common radius of curvature at the point of contact.

3. The envelope of a curve is the locus of the ultimate intersections of the individual curves of the same species, obtained by constantly varying a parameter of the curve. That is, the envelope touches all of the intersecting curves thus obtained. e.g., if  $p$  is a variable parameter and  $f = 0$  is the equation of the curve, then the result obtained by eliminating  $p$  between  $f = 0$  and  $\frac{df}{dp} = 0$  is the equation of the envelope.

Every curve may be an envelope, and some curves are evidently so by definition—e.g., evolutes and caustics (qqv.).

4. The process of replacing each radius vector of a curve by its reciprocal is called inversion. The origin is called the centre of inversion and the resulting curve the inverse of the given one. See CIRCLE, *Inversion*.

5. The locus of the feet of the perpendiculars from the origin upon the tangents to a curve is called a pedal curve. The pedal of a pedal is called the second pedal, and so on. Reversing the order, the curves are envelopes and are called negative pedals. The pedal and reciprocal polar are inverse curves (See CIRCLE.) In general, to find the inverse of a curve whose equation is given in rectangular coordinates, substitute for  $x$  and  $y$  the expressions  $\frac{k^2x}{x^2+y^2}$  and  $\frac{k^2y}{x^2+y^2}$  respectively.

6. A roulette is defined as the locus of a point rigidly connected with a curve which rolls upon a fixed line or curve. See CYCLOID.

**Centres.** A point such that every radius vector (see COORDINATES) drawn from it to a point on the curve is matched by another vector of the same length in the opposite direction is called the centre of a curve. See also CIRCLE and the paragraph on *Curvature* above.

When a plane figure moves in any manner in its own plane, the instantaneous centre of rotation is the intersection of two lines drawn

through two points perpendicular to the directions in which the points are moving.

The number of kinds of curves that might be drawn is infinite. A large number are known by specific names and are objects of great interest on account of their beauty, their remarkable properties, or their relation to physical problems. Among those discussed under separate titles are the conic sections, cissoid, conchoid, lemniscate, cycloid, trochoid, witch, cardioid, cartesians, Cassinian ovals, caustic curve, tractrix, curve of pursuit, catenary, curves of circular functions (e.g., curves of sines), logarithmic curves, and spirals.

Though the history of curves is inseparable from that of geometry, it may roughly be divided into four periods: (1) the synthetical geometry of the Greeks, in which the conic sections (q.v.) play an important rôle; (2) the birth of analytic geometry, in which the synthetic geometry of Guldin, Desargues, Kepler, and Roberval merged into the coördinate geometry of Descartes and Fermat; (3) the period 1650 to 1800, characterized by the application of the calculus to geometry and including the names of Newton, Leibnitz, the Bernoullis, Clairaut, Maclaurin, Euler, and Lagrange; (4) the nineteenth century, the renaissance of pure geometry, characterized by the descriptive geometry of Monge, the modern synthetic geometry of Poncelet, Steiner, Von Staudt, Cremona, and Plücker. Descartes's contributions were confined to plane curves, but led to the discovery of many general properties. The scientific foundations of the theory of plane curves may be ascribed to Euler (1748) and Cramer (1750). Euler distinguished algebraic from transcendental curves, and Cramer founded the theory of singularities. Clairaut (1731) attacked the problem of double curvature; Monge introduced the use of differential equations. Möbius (1852) summed up the classification of the cubic curve. Zeuthen (1874) did the same for the quartics, and Borchert (1827) first used trilinear coordinates (q.v.). In 1828 Plücker published the first volume of his *Analytisch-geometrische Entwicklungen*, which introduced abridged notation and marked a new era in analytic geometry. To him is due (1833) the general treatment of foci, a complete classification of cubics (1835), and his celebrated "six equations" (1842). Hesse (1844) gave a complete theory of inflections and introduced the so-called Hessian curve as the first instance of a covariant of a ternary form. To Chasles (q.v.) is due the method of characteristics developed by Halphen (1875) and Schubert (1879), and the general theory of correspondence (1864), completed by Cayley (1866) and Brill (1873). Cayley's influence was also very great. He advanced the work of Plücker, investigated bitangents and osculating conics, extended the properties of covariants and invariants, as well as Salmon's theory of reciprocal surfaces and the theory of double curvature. Mention should also be made of the labors of Jean-Claude Bouquet (1819-85) and Charles-Auguste-Albert Briot (1817-82), two of Cauchy's most eminent pupils, whose labors in the field of geometry and theory of functions are well known. Their *Leçons de géométrie analytique* (Paris, 1847) has been translated into English (Chicago, 1896) and forms an excellent introduction to the subject. Besides the works of those mentioned in connection with

the development of curves, consult, for theory: Salmon, *Treatise on the Higher Plane Curves* (Dublin, 1852); Study, *Vorlesungen über ausgewählte Gegenstände der Geometrie* (Leipzig, 1911); Clebsch, *Vorlesungen über Geometrie* (ib., vol. i, 1875-76; vol. ii, 1891); Staudé, *Analytische Geometrie des Punktepaars, des Kegelschnittes und der Fläche zweiter Ordnung* (ib., 1910); Runge, *Analytische Geometrie der Ebene* (ib., 1908); Hilbert, in the *Mathematische Annalen*, vol. xxxviii: Brill-Noether, in the *Jahresbericht des deutsch Math.-Verem.*, vol. iii; and for history, Merriman and Woodward, *Higher Mathematics*, chap. xi (New York, 1896); Brocard, *Notes de bibliographie des courbes géométriques* (Bar-le-Duc, 1897-99).

**CURVE OF PURSUIT.** The problem of the curve of pursuit first attracted attention in the following form: To find the path of a dog which takes the shortest course to reach his master, while the master is walking in a straight line. This problem, though stated in various forms, resolves itself mathematically into finding the curve traced by a point  $A$  whose movement is always directed towards a point  $B$  moving on a known curve. The curve seems to have been studied first by Pierre Bouguer (1732). The result is, in general, an algebraic curve, in particular cases, logarithmic. For a solution of the problem, consult Salmon, *Treatise on the Higher Plane Curves* (Dublin, 1852).

**CURVE OF SINES.** A curve whose ordinates are equal or proportional to the sines of a variable angle and whose abscissas are equal to the corresponding arcs of the unit circle. This curve is also called an harmonic curve, it being the curve in which a musical string vibrates when sounded.

CURVE OF SINES.

In the figure,  $OA$  represents the length of an arc whose sine is  $y_1$ ,  $OB$  the length of an arc whose sine is  $y_2$ , and so on. The ordinate  $y_3$  is the sine of  $90^\circ$ , and is the maximum ordinate of the curve.  $D$ , which corresponds to an angle of  $180^\circ$ , is a point of inflection, the radius of curvature being infinite. Similarly the curves of the other trigonometric functions (cosine, tangent, etc.) may be represented graphically.

**CURVES, ANTICLINAL AND SYNCLINAL.** See ANTICLINE and SYNCLINE.

**CURWEN, JOHN** (1816-80). An English music reformer and writer. He was born at Heckmondwike, in Yorkshire, and was early influenced by the community music, in those days characteristic of every Yorkshire village. The

influence of Handel, and his oratorios, more than any other single factor, had caused choral and philharmonic societies to spring up throughout the northern counties of England. In order to develop these and the numerous local band organizations, Curwen, then a dissenting minister, resigned his pastorate and, becoming interested in the "tonic sol-fa" system, invented by Miss S. A. Glover, spent his entire time in propagating it. In 1853 he had begun to found associations for spreading the theory and in 1862 established the Tonic Sol-Fa College. He was successful enough to start a publishing house in London, where he published the *Tonic Sol-Fa Reporter*. Nearly all of his many publications are for the system of his choice. He died at Heaton Mersey, near Manchester. Consult J. S. Curwen, *Memorials of John Curwen* (London, 1882).

**CURWENSVILLE.** A borough in Clearfield Co., Pa., 34 miles (direct) northwest of Altoona, on the New York Central and Hudson River, the Buffalo, Rochester, and Pittsburgh, and the Pennsylvania railroads, and on the Susquehanna River (Map: Pennsylvania, D 5). The chief industries are coal mining, tanning, and the manufacture of fire brick. Pop., 1900, 1937; 1910, 2549.

**CURZOLA**, Kōri-dzō/lā (Slav. \*Korcula, ancient *Corcyra Nigra* so called from the sombre color of its pine forests). An island in the Adriatic, off the coast of the Austrian Crownland of Dalmatia, of which it forms administratively a part, and is situated in lat  $43^\circ$  N. and long  $17^\circ$  E. It is about 25 miles long, has an area of 107 square miles, and is hilly, the greatest altitude being 1880 feet. It is well wooded and produces grain, wine, and olives. The inhabitants are engaged chiefly in boatbuilding, seafaring, and fishing. There are several good harbors. Pop. of Curzola administrative district, Dec. 31, 1910, 29,908, almost entirely Roman Catholic. The principal towns are Curzola, the administrative seat, with 2157 inhabitants in 1910 (as a commune, 7144), and Blatta, with 6837 inhabitants (as a commune, 8862). The island came under Austrian rule in 1815.

**CURZON, GEORGE NATHANIEL, EARL CURZON OF KEDLESTON** (1859- ) An English statesman, born at Kedleston. He studied at Balliol College, Oxford, became assistant private secretary to the Marquis of Salisbury in 1885, and from 1886 to 1898 sat as a Conservative for the Southport division of southwest Lancashire. In 1891-92 he was Undersecretary of State for India and in 1895-98 Undersecretary of State for Foreign Affairs. He was appointed, in 1898, Viceroy and Governor-General of India. He gave himself up to the duties of his office with almost unprecedented devotion and energy, making the promotion of the material welfare of the people of India his special concern. Owing, however, to his masterful disposition, he did not escape criticism, and, in particular, the partition of Bengal in 1905 aroused violent resentment among the natives. In the same year he came into conflict with Lord Kitchener, commander in chief of the forces, over the latter's proposals looking to the restriction of the power of the civil government over the army, and when the home government supported Lord Kitchener, the Viceroy resigned, Aug. 12, 1905. He did not, however, retire from public life. In 1908 he became chancellor of

Oxford University and in the same year a peer of Ireland. In the latter capacity, in 1910, he was one of the most influential leaders of the Unionist party in their great struggle with the Liberals, and it was owing considerably to his influence that the House of Lords permitted the Parliament bill to become law. Curzon became known also as an advocate of universal military service and an active opponent of woman's suffrage. In 1895 he married Miss Leiter, of Chicago, who died in 1906. He published: *Russia in Central Asia* (1889); *Persia and the Persian Question* (1892); *Problems of the Far East* (1894). Consult Lipsett, *Lord Curzon in India, 1898-1905* (London, 1906).

**CUSA**, NIKOLAUS OF, or NIKOLAUS CUSANUS (1401-64). A Roman Catholic philosopher and theologian. He was born at Kues, on the Moselle, in the Diocese of Treves; educated at Deventer by the Brethren of the Common Life and at the University of Padua; became Archdeacon of Liège and attended the Council of Basel (1431-49), where he opposed the papal claims but, altering his views, he entered the papal service and was made a cardinal in 1448; Bishop of Brixen in the Tirol, and papal legate for Germany in 1450. He died at Todi, Italy, Aug. 11, 1464. He was interested in promoting reform in the church. As a philosopher, he was one of the first to break with the ruling scholasticism. He taught that God cannot be apprehended by the intellect, but by intuition. As a mathematician and natural philosopher, he first taught the revolution of the earth about the sun and the plurality of worlds, as critic, he declared the so-called "Donation of Constantine" to be a forgery. His most important writings have been translated into German by F. A. Scharpf (Freiburg, 1862), who also published the first part of a biography (Mainz, 1842), and subsequently *Der Cardinal und Bischof Nikolaus von Cusa* (Tubingen, 1871). Consult also Falkenburg, *Grundzüge der Philosophie des Nikolaus von Cusa* (Breslau, 1880); Schanz, *Cardinal Nikolaus von Cusa als Mathematiker* (Rottweil, 1872); id., *Die astronomischen Anschauungen des Nikolaus von Cusa und seine Zeit* (ib., 1873); Höfding, *History of Modern Philosophy*, vol. 1 (New York, 1900).

**CUSACK**, MARY FRANCES (1820-99). An Irish nun, known as the NUN of KENMARE. She was born near Dublin, Ireland, and spent her youth in England, where she joined a Church of England sisterhood. She later became a Catholic and upon her return to Ireland took a deep interest in the Franciscan sisterhoods known as Poor Clares, organized for the purpose of providing poor and friendless girls with a useful education. From 1861 to 1884 she conducted the celebrated convent of Poor Clares, established by her at Kenmare. In 1884 Pope Leo XIII sanctioned the founding of the order known as Sisters of Peace. After the establishment of a house in Nottingham, England, in 1884, she founded a branch of the order at Jersey City, N. J. (1885). Among her works are: *A Student's Manual of Irish History* (1870); a biography of O'Connell (1872); *Woman's Work in Modern Society* (1874); *The Book of the Blessed Ones: The Trias Thaumaturga* (1877), lives of St. Patrick, St. Bridget, St. Columba; and several volumes on the shrine of the Virgin at Knock, County Mayo.

Consult *The Nun of Kenmare: An Autobiography* (Boston, 1888).

**CUSACK-SMITH**, SIR BERRY (1859- ). An English legislator. He was born at Dublin and was educated at the Middle Temple. After acting for one year as Consul at Samoa and Deputy Commissioner for the western Pacific, he was in 1891 sent as Consul General to Valparaiso, whence he was again transferred in 1892 to the Tokelau Islands. As special judicial commissioner to Samoa, he acted, conjointly with the consuls of Germany and the United States, as receiver and custodian of the revenues of the islands and as President of the municipality of Apia. From June, 1900, to December, 1901, he was chargé d'affaires at Santiago, and was Consul General at Valparaiso in 1898-1905.

**CUSCUS**. See PHALANGER, and Plate of PHALANGERS.

**CUSCUS**. See VETIVER.

**CUSCUTA**. See DODDER.

**CUSH** (Heb. *Kūsh*). The eldest son of Ham, according to the genealogical scheme given in the tenth chapter of Genesis. In the Bible he seems to be regarded as the eponymous ancestor of the Cushites, or people of the land of Cush, a country mentioned in a number of passages of the Old Testament. The Babylonian Nimrod is also said (Gen. x. 8) to have been a son of Cush. The "Land of Cush" is rendered "Ethiopia" in the Septuagint, in the Vulgate, and in most modern versions of the Bible, and until comparatively recent times the country has been generally identified with the ancient Ethiopia (i.e. Nubia), called by the Egyptians *Kōsh*, though some scholars have supposed that it also included a portion of Arabia. Some modern critics believe that in Gen. x. Cush (v. 6) the brother of Mizraim (Egypt) and Cush (v. 8) the father of the Babylonian Nimrod are two different persons, and that the name of the second Cush represents *Kashshu*, an old name for Babylonia. They further maintain that the Arabian Cushites (Gen. x. 7) were also of a different stock, and that thus, under the same name, three different peoples are confused in the biblical account. Other scholars, however, adhering to the older view, believe that the dark Ethiopian race once extended across Arabia into, or even beyond, Babylonia.

**CUSHAT**, *kush'at* (AS. *cūcote*, ring dove, from *cucu*, quick + *scotan*, to shoot; so called from the bird's swift flight), or CUSHTE-DOO (Scottish). A dove.

**CUSHING**, *kush'ing*, CALED (1800-79). An American statesman, the first American Minister Plenipotentiary to China. He was born at Salisbury, Mass., and was educated at Harvard, where he graduated when 17 years old. He practiced law at Newburyport and was elected to the State Legislature in 1825 and to the State Senate in 1826. From 1829 to 1831 he traveled in Europe. He was elected to Congress in 1835 and served four terms as a Whig, but afterward joined the Democratic party. President Tyler nominated him as Secretary of the Treasury, but the Senate rejected the nomination. Tyler then appointed him Minister to China, where new ports were to be opened according to the Treaty of Nanking. Here he made good use of his erudition and talents. When he arrived, Feb. 24, 1844, at Canton in the frigate *Bradywine*, he had already made the general outline of the treaty, which greatly

abridged the subsequent negotiations. The Peking government honored the United States by sending as High Treaty Commissioner Ki-Ying, a member of the Imperial family, who, on July 3, 1844, signed the convention, which contained 16 provisions not included either in the English Treaty at Nanking or in the treaty supplementary thereto. Among these was the right of Christian missionaries to follow the openings of commerce and to build dwelling houses, churches, and hospitals and to have cemeteries, while Chinese scholars acting as teachers or assistants were to be protected from injury. The purchase of books was legalized, and American citizens were forbidden to engage in the opium trade, or to use the flag of the United States to cover a violation of the laws of China. In short, this treaty, because of its fullness of detail and clear exhibition of the rights conceded by the Chinese government to foreigners dwelling within its borders, was the leading authority in settling disputes until 1860, when foreigners were admitted to Peking.

After his return to the United States Cushing advocated the Mexican War and furnished the necessary funds to equip a regiment of which he was made colonel. He subsequently rose to be brigadier general. In 1852 he became associate justice of the Supreme Court of Massachusetts and in 1853 entered the cabinet of President Pierce as Attorney-General, serving through the entire administration. He favored the Union cause during the Civil War. When the arbitration of the "Alabama Claims" was to be settled at Geneva in 1871, President Grant chose Mr. Cushing as one of the three men who were to be counsel for the United States. In 1873 he was nominated Chief Justice of the United States, but the nomination was withdrawn. From 1874 to 1877 he was Minister of the United States at the court of Spain. Mr. Cushing was a man of unusual erudition and of rare ability, imposing in person and forcible in argument. He was the author, among other works, of *The Practical Principles of Political Economy* (1826), *The Growth and Territorial Progress of the United States* (1830), *Reminiscences of Spain* (1833), *Historical Review of the Late Revolution in France* (1833), *The Treaty of Washington* (1873).

**CUSHING, FRANK HAMILTON** (1857-1900). An American ethnologist. He was born at Northeast, Pa., spent his boyhood on a farm in New York State, and at the age of 16 began excavations on the sites of Indian camps. He studied for a time at Cornell University in 1875 and in 1876 had charge of a part of the National Museum collection at the Centennial Exposition at Philadelphia. He went to New Mexico in 1879 as assistant ethnologist of the United States Bureau of Ethnology and remained for three years among the Zuñi Indians. He was adopted into the tribe, made a thorough study of the habits, folklore, language, and history of the Pueblo Indians of New Mexico and Arizona, and became the recognized authority in this branch of American ethnology. In 1896 he conducted the Pepper-Hearst expedition to the Gulf coast of Florida and published a *Report on the Ancient Key Dwellers of Florida*. Among his publications are: *Zuñi Fetiches* (1881); *The Relationship between Zuñi Sociologic and Mythic Systems* (1882); *The Nation of the Willows* (1882); *Adventures in Zuñi* (1883); *Studies of Ancient Pueblo Ceramic*

*Art, as Illustrative of Zuñi Culture Growth* (1884); *Zuñi Breadstuff* (1885). A volume entitled *Zuñi Folk-Tales* was published posthumously in 1902.

**CUSHING, HARVEY (WILLIAMS)** (1869-). An American surgeon, born in Cleveland, Ohio. He was educated at Yale and Harvard universities, and in 1895 took up the practice of surgery. From 1902 to 1911 he was associate professor of surgery at Johns Hopkins University, and in the latter year he became professor of surgery at Harvard. With Dr. George W. Crile (q.v.) he made an important contribution to the study of blood pressure in surgery. (See *BLOOD PRESSURE*.) In 1913 he received an honorary fellowship from the Royal College of Surgeons. He is author of *Dr. Garth, the Kit-Kat Poet, 1661-1718* (1906) and *The Pituitary Body and its Disorders* (1912).

**CUSHING, LUTHER STEARNS** (1803-56). An American lawyer and law reporter, best known as the author of a *Manual of Parliamentary Practice*, commonly known as *Cushing's Manual* (1845), a work which is still regarded as an authority. He was a native of Massachusetts and was judge of the Court of Common Pleas in Boston and reporter for the Supreme Court of the State. His publications include: *Treatise on Trustee Process* (1837); *Treatise on Remedial Law* (1837); *Reports of Controverted Election Cases in Massachusetts* (1852), *Introduction to the Study of Roman Civil Law* (1854); *Lex Parliamentaria Americana* (1856; 9th ed., 1874).

**CUSHING, THOMAS** (1725-88). An American statesman, born in Boston. He was a graduate of Harvard, was Speaker in 1766-74 of the Massachusetts Assembly, and in 1774-75 was a member of the First and Second Continental Congresses. In England he had the groundless reputation before the outbreak of the war of being the great leader of the American revolutionary movement, and Dr. Johnson, in some of his pamphlets, accused him of aiming at an American crown. At home, however, he made himself unpopular by opposing the Declaration of Independence. From 1780 to 1788 he was Lieutenant Governor of Massachusetts. In 1788 he was a member of the convention which ratified the Federal Constitution for Massachusetts.

**CUSHING, WILLIAM** (1732-1810). An American jurist, born at Scituate, Mass. He was appointed Chief Justice of the State Superior Court in 1777, became an associate justice of the United States Supreme Court in 1789, and in 1796 declined the Chief Justiceship, for which he had been nominated by Washington. He was a founder of the American Academy of Arts and Sciences.

**CUSHING, WILLIAM BARKER** (1842-74). An American naval officer, born in Delfield, Wis. He studied at the United States Naval Academy from 1857 to 1861, and at the outbreak of the Civil War entered the United States navy as a volunteer. In 1862 he was promoted to be lieutenant. He soon became known for his fearless and successful performance of perilous tasks assigned to him, the most notable of which was the destruction by torpedo of the Confederate ram *Albatross*, on the night of Oct. 27, 1864, at her moorings in Plymouth Harbor, N. C. This exploit won him the thanks of Congress and the rank of lieutenant commander. He also led a land attack on Fort Fisher in 1865, and later he served in the Pacific and Asiatic

squadrons and was commissioned commander in 1872.

**CUSHING, WILLIAM HENRY** (1852- ). A Canadian manufacturer and statesman. He was born near Kenilworth, Ontario, and was educated at the public schools. After working on a farm for some years he went west to Calgary in 1883 and engaged in business, later becoming the head of an important manufacturing concern and the owner of extensive timber limits in British Columbia and elsewhere. In 1905 he was elected Liberal member for Calgary in the Alberta Legislature; and in the same year, when the government of Alberta was organized with Alexander Cameron Rutherford as Premier, Cushing became Minister of Public Works, retaining that position until 1910. He was the first Canadian to make ownership of telephones a part of government policy.

**CUSHMAN, ALBERTON SEWARD** (1867- ). An American chemist, born in Rome, Italy, and educated at the Worcester Polytechnic Institute, at Freiberg, and at Heidelberg, Harvard, and Johns Hopkins universities. He was associate professor of chemistry at Bryn Mawr College in 1900-01, associate director of the Office of Public Roads, United States Department of Agriculture, for eight years, and then (1910) founded and became director of the Institute of Industrial Research. He is author of *The Corrosion and Preservation of Iron and Steel* (1910), and of the following bulletins of the Department of Agriculture: *The Useful Properties of Clay* (1904); *The Decompositions of the Feldspars* (1907); *The Use of Feldspathic Rocks as Fertilizers* (1907); and also a bulletin of the Institute of Industrial Research, *The Preservation of the Exterior of Wooden Buildings* (1911).

**CUSHMAN, kush'màn, CHARLOTTE SAUNDERS** (1816-76). A celebrated American actress, best remembered perhaps for her acting of Meg Merrilies in Scott's *Guy Rannering*. She was born in Boston, July 23, 1816, of Puritan descent, and was the eldest of five children left poor with their mother by the early death of their father, a West India merchant. She had, however, a fine contralto voice, which she cultivated, and in 1835 she made her appearance as an opera singer in the *Marriage of Figaro*. Her prospects were bright, when shortly afterward in New Orleans her voice suddenly failed. She was greatly disheartened, but, at the request of a tragedian (Mr. Barton), she undertook her first dramatic part, Lady Macbeth, which became one of her greatest rôles. Long afterward Lawrence Barrett said of her: "To the last she was the greatest Lady Macbeth of her age." She played for a time in Albany and elsewhere, and then began at the Park Theatre, New York, an engagement which lasted for several years. She took a great variety of parts, both comedy and tragedy, among them Bianca, Helen McGregor, Queen Gertrude, Goneril, Nancy Sikes, her wonderful Meg Merrilies, and later, Queen Katharine, Cardinal Wolsey, Ophelia, Lady Teazle, and many others. In 1844, after a period of successful management in Philadelphia and a tour with Macready, whom she had supported before, she went to England. She met with great success; while there she and her sister Susan made their first appearance in *Romeo and Juliet*, which had, for that period, an exceptionally long run in London. She returned to America in 1849, but revisited Europe several

times. In 1856 she went to Rome, where she had a home for some years. She was honored in the most cultivated society of Europe and America, not only as a great artist, but as a good woman. During the Civil War she showed her patriotic spirit by giving performances for the benefit of the Sanitary Commission, contributing in this way over \$8000. In her later years she was known as a reader, with singular interpretative powers. Her last appearance on the New York stage, Nov. 7, 1874, was a memorable occasion. She played Lady Macbeth. When the curtain fell, a body of eminent citizens, with William Cullen Bryant as spokesman, came upon the stage and presented the actress with a laurel crown, inscribed C. C.—*Palmar qui meruit ferat*. Charlotte Cushman never married. She died in Boston, Feb. 18, 1876. In 1880 her grave in Mount Auburn was marked by an obelisk which in form is a copy of Cleopatra's Needle as it stood in Helopolis. Consult: Stebbins, *Charlotte Cushman Her Letters and Memories of her Life* (Boston, 1878); Clement, *Charlotte Cushman* (ib., 1882); Cook, *Hours with the Players* (London, 1881); W. T. Price, *A Life of Charlotte Cushman* (New York, 1894); H. A. Clapp's *Reminiscences of a Dramatic Critic* (Boston, 1902).

**CUSHMAN, ROBERT** (c.1580-1625). One of the founders of the colony at Plymouth, Mass. He was born in Kent and arranged the emigration of the Pilgrims to Holland, later following them to Leyden. He accompanied Deacon Carver upon his fruitless mission to London (1617), assisted Brewster in obtaining a patent from the King (1619), and, together with Carver, chartered the *Mayflower*. He emigrated to New England with his son Thomas in 1621 in the ship *Fortune* and, leaving him there in the care of Governor Bradford, returned to Europe three weeks later to act as the agent of the colonists in London. The celebrated sermon on "Sin and the Danger of Self-Love," delivered by him before his departure, is memorable as being the first published discourse delivered at Plymouth and is the oldest sermon extant delivered in America. It was printed in London in 1622 and in Boston in 1724 and 1780. The strip of territory on Cape Ann secured by him and Edward Winslow in 1623 afterward became the site of the first successful settlement established within the boundaries of the Massachusetts Bay Colony. Sixty facsimile copies of his famous sermon were published at Boston in 1870.

**CUSINS, kûz'inz, SIR WILLIAM GEORGE** (1833-93). An English composer, born in London. He sang in the chapel royal at the age of 10. Soon afterward he was sent to study under Fétis in Brussels and upon his return obtained the King's scholarship at the Royal Academy of Music. At the age of 16 he was appointed organist to the Queen's private chapel, and in 1867 he succeeded Sterndale Bennett as conductor of the Philharmonic Society, which position he retained until 1883. In 1875 he became examining professor at Queen's College, and in 1876 joint examining professor of scholarships at the National Training School of Music. In recognition of his services in behalf of art, he was knighted in 1892. The few but highly meritorious compositions which he wrote include: *Royal Wedding Serenata* (1863); *Gideon*, an oratorio (Gloucester Festival, 1871); *Masonic Prayers Set to Music*; *Responses to the Commandments*; *Te Deum*; pianoforte con-

certo in A minor, a violin concerto, a symphony, two overtures, a septet for woodwind instruments, some chamber music, and several songs.

**CUSK.** A fish of the cod family (*Brosme brosme*), frequenting rocky ledges in the North Atlantic, especially off the shores of Scandinavia and Newfoundland. It has much the same habits and characteristics as the cod and is more extensively used in northern Europe than in America, where it has never found favor in market. See Plate of ROCKFISH, SUNFISH, ETC.

**CUSP** (from Lat. *cusps*, point, spear). In architecture, the point formed by the meeting of two small arches, or foils, decorating the intrados of an arch. From its simplest form in late Romanesque buildings, it was developed by the Gothic builders into a highly ornate feature of the tracery in windows and on walls. In the earlier forms the cusp was always a solid triangular projection; in the more elaborate form it inclosed a triangular opening (open cusp). The cusp, closed or solid, appears also in Hispano-Moresque and Indo-Moslem architecture. For illustration, see ARCH.

**CUSPARIA BARK.** See ANGOSTURA BARK.

**CUSSET**, kus'sâ'. The capital of a canton in the Department of Allier, France, on the Sichon, 2 miles northeast of Vichy (Map: France, S., II 2). It is an ancient town, dating from a convent founded in 886, which was created an abbey in the thirteenth century. It has interesting fifteenth and sixteenth century houses, and the Grosse Tour, now a prison, is a relic of the mediæval fortifications built by Louis XI, now replaced by boulevards, which surrounded the town. It is noted for its cold mineral springs and has manufactures of linen, chalk, textiles, oil, paper, confections, and baskets. Pop., 1901, 6598; 1911, 6941. Consult Giraudot, *Topographie physique et médicale de Cusset*.

**CUSSO.** See KOOSSO.

**CUST, LIONEL** (1859- ). An English author and art critic. He was born in London and was educated at Eton and Cambridge. In 1882 he entered the War Office and two years later was appointed assistant in the department of prints and drawings in the British Museum. He was director of the National Portrait Gallery from 1895 to 1909, when he became director of the National Gallery, and after 1901 he was also surveyor of the King's pictures and works of art. His publications include: *Index of Artists Represented in Department of Prints and Drawings in British Museum* (part i, 1893; part ii, 1896); *Albrecht Dürer, a Study of his Life and Art* (1897); *The Master "E. S." and the "Ars Moriendi"* (1898); *A History of Eton College* (1899); *Van Dyck's Chatsworth Sketch-Book* (1901); *Anthony Van Dyck* (1903); *Angelo Bastiani: A Story of Modern Venice* (1904); *The Bridgewater House Gallery* (1904); *The Royal Collection of Paintings, Buckingham Palace* (1905); *Eton College Portraits* (1909); *Anthony Van Dyck, a Further Study* (1911); *Notes on Pictures in the Royal Collections* (1911); *History of the Society of Dilettanti* (1898; 1914).

**CUST, ROBERT NEEDHAM** (1821-1909). An English Orientalist. He was born at Cockayne Hatley, Bedfordshire, was educated at Eton, and, entering the East Indian service, took honors in the College of Fort William, Calcutta, for skill in four Oriental languages. For many

years he served with the military in various parts of India, took part in several battles, and was present at the taking of Lahore in 1846. He also took an active part in the pacification of the Punjab after the Sepoy Mutiny in 1858. After his return from the East he filled various local offices and became a member of several societies. He died on Oct. 23, 1909. Among his 60 works are: *Modern Languages of the East Indies* (1878); *Modern Languages of Africa* (1883); *Modern Languages of Oceania* (1887); *Modern Languages of the Caucasian Group* (1887); *Modern Languages of the Turki Branch of the Ural-Altaic Family* (1889); *Linguistic and Oriental Essays* (5), seven series (1880-1904); *Clouds on the Horizon* (1890); *Life Memoir* (1899).

**CUSTANCE.** See CONSTANCE.

**CUSTARD APPLE.** A common name in the West Indies and other tropical countries for several fruits of the genus *Anona* of the family Anonaceæ. Some of the fruits of this genus are among the most delicious produced in tropical countries, as the cherimoyer (q.v.), and even the common custard apple (*Anona reticulata*) of the East and West Indies. The custard apple is a large, dark-brown, roundish fruit, sometimes from its size and appearance called "bullock's heart" in the West Indies; the tree is of considerable size. The custard-apple family is represented in the northern United States by the common pawaw (*Asimina*, now *Uvarea*, *triloba*). There are two or three which are natives of western Africa. To the genus *Anona* also belong the sweetsop, the sour-sop, the pinna, or pinha, all of them tropical American fruits, and the alligator apple of the West Indies (*Anona palustris*), a fruit which in its present unimproved state is probably not worth cultivation. Quite recently plant breeders have been giving increased attention to this group of fruits, with the view of extending their commercial culture to semitropical sections of the United States and elsewhere. A number of species are now being grown to a small extent in southern Florida and California.

**CUSTER, GEORGE ARMSTRONG** (1839-76). An American soldier, born in New Rumley, Harrison Co., Ohio. He graduated at West Point in 1861, was assigned as a second lieutenant to the Fifth United States Cavalry, and arrived at the front on the day of the first battle of Bull Run. He served successively as an aid on the staffs of Generals Phil Kearny, William F. Smith, and McClellan, was promoted to be a captain of volunteers, and served throughout the Peninsular campaign of 1862. In June, 1863, he was made a brigadier general of volunteers, and was placed in command of a brigade of Michigan volunteer cavalry, which under his leadership became one of the most efficient and best-trained bodies of cavalry in the Federal army. At the head of these troops he distinguished himself at the battle of Gettysburg. His brigade was then attached to Sheridan's cavalry corps, with which he served in the campaigns in Virginia in the spring and summer of 1864 and the subsequent operations in the Shenandoah valley. Placed in command of the Third Division of Sheridan's corps, he won a victory at Woodstock and distinguished himself at the second battle of Winchester (Cedar Creek). He was brevetted major general of volunteers on Oct. 19, 1864, for his services, defeated General Early at Waynesboro, and took

part in the battles of Five Forks, Dinwiddie Courthouse, and other engagements of Grant's last campaign. After several months' service in Texas during the winter of 1865-66, he applied for leave of absence, in order to accept the offer which had been made him to take command of the cavalry which Juarez was organizing to drive the Emperor Maximilian out of Mexico. His request being denied, he accepted the position of lieutenant colonel of the Seventh Cavalry. In 1867-68 he gained his first experience as an Indian fighter in Gen. W. S. Hancock's campaign against the Cheyennes, bringing the campaign to a successful conclusion by a decisive defeat of the Indians at Washita, Ind. Ter., in November, 1868. From 1871 to 1873 he was stationed with his regiment in Kentucky. In the spring of the latter year he was ordered to Dakota Territory to protect the surveyors of the Northern Pacific Railway while locating that line through the Indian country west of the Missouri River. The discovery of gold in the Black Hills led to an influx of white gold seekers into land belonging to the Sioux, and during the next three years Custer and his command saw considerable active service in the Black Hills country and along the valley of the Yellowstone. In the spring of 1876 General Sheridan planned a campaign against the Indians which he hoped would be decisive. Three expeditions were set under way, with the expectation that they would meet and act in conjunction against Sitting Bull and his force of about 6000 Indians, who were supposed to be encamped somewhere near the juncture of the Rosebud and the Yellowstone. General Crook, with 1000 troops, was to advance northward from Fort Laramie. General Terry, with a similar force, was to march westward, and General Gibbon, with 450 men, was to come down from the northwest. Custer and his regiment of 624 strong formed part of General Terry's force. On June 17 Custer, feeling his way along the Yellowstone, came upon Crazy Horse and some hundred of his braves on the Rosebud and engaged them in a sharp but indecisive struggle. Terry and Gibbon had meanwhile effected a junction on the Yellowstone, at the mouth of the Big Horn, without encountering Indians in any number. After their engagement with Crook on the Rosebud, Crazy Horse and Sitting Bull led their forces in a southwesterly direction, until they were directly south of Terry and Gibbon, where they set up their tipis on the west bank of the Little Big Horn. This new move of the Indians was discovered by scouts sent out by Terry, who immediately determined to march upon them. Terry, having no intimation of Crook's defeat, sent Custer with the Seventh Cavalry scouting up the Rosebud to locate the enemy. He himself went to the mouth of the Big Horn with steamboats to ferry Gibbon's men across the river and planned to rejoin Custer at the junction of the Big Horn and Little Big Horn. But on June 24, Custer's scouts informed him that the enemy was located on the west bank of the Little Big Horn. He supposed that there would not be serious opposition from one Indian village, and although he did not know the strength of the enemy, prepared to attack. In the hope of trapping the Indians by strategy, he formed his troops into three divisions. He kept with himself five companies, with which he planned to attack that part of the village that lay directly before him, dividing the remaining six companies between Major Reno and Captain Benteen, the

latter being sent two miles to the southward, while Reno advanced midway between Benteen and Custer. Thus fatally divided, the Seventh Cavalry advanced to the attack of an enemy greatly outnumbering them. Benteen's advance took him far south of the village. Reno's rather spiritless attack led him against the south end of the village, where he was repulsed and driven back across the river to the shelter of a protecting bluff. Custer and his five companies dashed almost at the centre of the Indians, were driven back and surrounded, but fought on desperately until the entire command of 208 men were killed. The engagement lasted perhaps not more than twenty minutes. Reno lost 56 officers and men. Neither Sitting Bull nor Rain in the Face were in this battle. The bodies were found the next day, when Terry's troops relieved the reunited forces of Benteen and Reno, who had been holding their position on the bluffs with difficulty. Custer was one of the bravest, most daring, and dashing soldiers America has produced, but he undoubtedly allowed his impetuosity to get the better of his judgment. He was the author of *My Life on the Plains* (1874). Consult Whittaker, *Life of General George A. Custer* (New York, 1876); *Report of the Secretary of War and Accompanying Papers* (Washington, 1876). General Custer's wife, ELIZABETH BACON CUSTER, whom he married in 1864, accompanied him in many campaigns, and published the following books: *Boots and Saddles, or Life with General Custer in Dakota* (1885); *Tenting on the Plains* (1887); *Following the Gideon* (1891).

**CUSTINE**, ku'stèn', ADAM PHILIPPE, COMTE DE (1740-93). A French general, born at Metz. He served with distinction in the Seven Years' War. As colonel of the infantry regiment "Saintonge," and quartermaster-general of the French troops, he took part in the Revolutionary War and was present at the surrender of Yorktown. He was a member of the States-General in 1789. In 1792 he became commander of the Army of the Lower Rhine and conducted the brilliant campaigns against Spieker, Worms, and Mainz. In consequence of his failure, in the campaign of 1793, to relieve Mainz, after it was recaptured by the Allies, he was suspected of negotiations with the enemy and was accused of treason and executed. His soldiers idolized him, calling him "Général Moustache."

**CUSTINE**, ASTOLPHE LOUIS LÉONARD, MARQUIS DE (1790-1857). A French author, grandson of the preceding, born at Niederwiller, Lorraine. He wrote a play and several romances, but is most celebrated for his descriptions of travels in his *Mémoires et voyages* (1820). The most amusing of his books of travels is *La Russie en 1839* (1843). His correspondence with Varnhagen von Ense was published in 1870.

**CUSTIS**, GEORGE WASHINGTON PARKE (1781-1857). An American author, the adopted son of George Washington. He was born at Mount Airy, Md., a grandson of Martha Washington, his father being her son by her first husband. Custis studied at Princeton and St. John's colleges, married Mary Lee Fitzhugh, and in 1802 went to reside on an estate of 1000 acres at Arlington, near Washington. His daughter, Mary Randolph Custis, married Robert E. Lee, the Confederate general. The grand estate was confiscated by the government and is now the

Arlington National Cemetery. Besides orations and plays, he left *Recollections of Washington* (1866).

**CUSTOM** (OF. *costume*, Fr. *coutume*, It. *costuma*, ML. *custuma*, *costuma*, from Lat. *consuetudo*, habit, from *consuere*, to grow accustomed, from *consuere*, to be accustomed, from *con-*, together + *suere*, to be accustomed; probably from *suus*, Gk. *éōs*, *heos*, *ēs*, *hos*, Skt. *sva*, Av. *hva*, one's own). One of the three great departments of social psychology (q.v.), coordinate with language and myth (qq.v.). It may be defined as "any norm of voluntary action which has been developed in a national or tribal community." (Wundt.) Like animal instinct (q.v.), it is the outgrowth of individual habits. But instinct is practically invariable, it expresses the habits of past generations in the form of mechanized, not of consciously motivated, actions, whereas custom, however rigorous its prescriptions, may always be disobeyed or modified; the customary action has not lost its conscious antecedents. Hence we may say that "instinct is habitual conduct that has become mechanical; custom, habitual conduct that has become generic."

The origin of custom appears to have been twofold. In the great majority of cases in which we are able to trace a custom back towards its first beginnings we come upon religious or ceremonial ideas. In certain other cases custom seems to have originated in ancient rules of law, the meaning of which has been forgotten, while the usage which they enjoin still persists; although, when we consider that every action of importance in a primitive society, whatever its special significance, has a religious aspect, we shall probably not be wrong in referring these legal customs also to an ultimately religious source. As an illustration of legal custom we may cite the Greek and Roman marriage ceremony, in which it was an established tradition that the mothers of the contracting families should bring the bride and groom together—a clear indication of that law of mother right which the civilized societies of the ancient world had long outgrown. But the mother right is itself permeated through and through with primitive mythological conceptions, so that we are in this case thrown back with practical certainty upon a religious origin of the custom. As an instance of the transformation by custom of the purpose of a religious ceremonial, we may take the funeral feast. In primitive times the "funeral baked meats" were furnished forth as a sacrificial feast; the mourner seeks in part to obtain the favor of the gods for his dead and in part to offer worship to the dead man himself. Later the feast becomes a meal shared in all piety with the dead, the survivors symbolize their brotherhood with the departed by partaking of the meat which is to sustain him on his pilgrimage to the other world. Nowadays the cake and wine may be offered quite perfunctorily, or may bring so much of comfort to the mourners as springs from the conviction that they have dealt handsomely with the dead, or may serve as an excuse for ill-timed carousals. In any event it has completely lost its primary significance and has persisted only by virtue of that *vis inertiae* which makes custom at large so valuable a mine of information to the anthropologist and social psychologist.

**CUSTOM.** In the legal sense, a usage which has obtained the force of law and which will, accordingly, be enforced by the courts. As is explained in the article on CUSTOMARY LAW, the greater part of the legal rules enforced by society are the expression of customs, and custom continues to be an important, though diminishing, source of law in civilized as well as in primitive society. Indeed, it is only in the progressive communities, where the constantly accelerating progress multiplies social needs faster than they can be supplied by the slow processes of custom, and where the political consciousness has kept pace with this progress, that conscious legal development by legislation and judicial action tends more and more to supplant the unconscious development of customary law. In the nonprogressive societies, which vastly outnumber the progressive, custom is still the principal, if not the only, source of law.

English and American law writers distinguish between *general* and *particular* customs, the former being of general observance and constituting the body of the common law, and the latter being restricted to the inhabitants of a particular district or the members of a certain calling. As an example of the former may be cited the right of the public to use the seashore, between high and low water mark, for landing and other lawful purposes; and, as an example of the latter, the right of persons engaged in the business of towing, on some parts of the river Thames, to go upon the banks of the river for that purpose, though the land is the private property of abutting proprietors. There is, in truth, and from the point of view of jurisprudence, no distinction between the two classes of customs, both depending alike upon immemorial usage, and both, when established, having equally the force of law. In practice, however, the common-law system has made a distinction between them for the purpose of establishing them, the courts taking "judicial notice" (q.v.) of general customs as a part of the common law which it is their business to interpret and declare, but requiring proof of the existence of local or other particular customs. But the line between the two classes is not very accurately drawn, the custom of the County of Kent, known as "gavelkind" (q.v.), whereby lands descend to all of the sons equally instead of to the eldest only, and the still more curious custom of "borough English" (q.v.), under which lands descend to the youngest son in preference to his elder brothers, and which is confined to no particular area, but affects isolated estates or manors in various parts of England, being recognized as parts of the common law, notwithstanding their limited occurrence. Doubtless these exceptional cases are to be explained by the great antiquity of the customs in question and their early recognition by the courts. Of a similar character is the *lex mercatoria*, or custom of merchants, which, though applying only to a limited class in the community, has also become incorporated in the common-law system and is noticed by the courts without special proof of its terms.

In order that a particular or local usage, alleged to be a custom, shall have the force of law, (1) the practice "must have been used so long that the memory of man runneth not to the contrary"—i.e., as the phrase is understood in England, from the accession of Richard I (1189); (2) it must have been continued without interruption; (3) it must have been peaceable and acquiesced in, not subject to contention and dispute; (4) it must be definite and certain; (5) it must be reasonable. The question of the reasonableness of a custom is often one of great difficulty. It has been decided that any usage relating to land which is destructive of the land itself, or which deprives the owner of the beneficial use of it, is unreasonable. Thus, a custom for all the inhabitants of a village to play games or walk for recreation on private property has been held to be reasonable, while a custom for all the inhabitants of a village to pasture cattle on private land is, in its turn, unreasonable. As usually stated, the rule is that a right in the nature of an *easement* may arise by custom, but not a right in the nature of a *profit*.

It is doubtful whether local or particular customs can arise generally in the United States. It has usually been assumed that the common-law rules above set forth are in force in this country, and a few States have so held. It has, on the other hand, been decided in New Jersey and Virginia that no rights in another's land can arise by custom, and the decisions have been put upon the ground that there is in the United States no possibility of a usage having the requisite antiquity (i.e., of dating from the reign of Richard I) to give it the standing of a custom enforceable at law.

The courts sometimes make a further technical distinction between local or particular *custom* and *usage*—the former being of compulsory legal effect, and the latter consisting of current practices, to which parties may or may not conform, and in accordance with which they are supposed to have regulated their conduct or agreements. Thus, in matters of contract, a usage affecting the trade or calling with which the contract has to do may be dealt with as an understood but unexpressed term of the agreement, and in matters of tort, as an allegation of negligence, the usage of the community (as, e.g., the so-called "rule of the road") may be called into play to determine the presence or absence of negligence. Consult: Blackstone, *Commentaries on the Laws of England*; Holland, *Elements of Jurisprudence* (9th ed., London, 1900); Holmes, *The Common Law* (Boston, 1881); Pollock and Matland, *History of English Law* (2d ed., ib., 1899); Gale, *Treatise on the Law of Easements* (7th ed., London, 1899); Jones, *Treatise on the Construction or Interpretation of Commercial and Trade Contracts* (New York, 1886). See COMMON LAW; CONTRACT; EASEMENT; LAW; PROFIT.

**CUSTOMARY FREEHOLD.** In English law, a variety of copyhold tenure, sometimes called "privileged copyhold" which differs from the common form of that tenure in that it is not expressed to be "at the will of the lord." It is not a true freehold, however, the freehold title being actually vested in the lord of the manor. As the title indicates, this form of tenure owes its origin to the local custom of a manor or borough. It is of infrequent oc-

currence in England and has never existed in the United States. See COPYHOLD, and the authorities there referred to.

**CUSTOMARY LAW.** The body of customs recognized as binding in any social group or community and enforced by its authority. As, in the evolution of humanity, social habits or customs precede the definite organization of social groups, such an organization, when it arises, finds a body of customary observances ready to be transformed, and in process of being transformed, into positive law. This body of customs constitutes the entire legal system of primitive society, and the development and recognition of new customs and the modification of old customs are its principal, if not its only, means of expansion and change. Indeed, the primitive codes—as the Mosaic law of the Jews, the laws attributed to Lycurgus among the Greeks, the Twelve Tables of Rome, and the more recent barbaric codes (*leges barbarorum*) of the early Middle Ages—represent little more than a statement, in precise and definite form, of the body of custom which had already gained the force of law in the community. It is only when a community has reached the stage of political consciousness that it undertakes deliberately, by legislation or judicial methods, to effect changes in its laws, and even then custom, though relatively diminishing in importance, continues to be an important source of new law.

Customary law, then, is the foundation and basis of all existing legal systems. Of many, if not most, of those systems it constitutes by far the greater portion of the body of rules of which they are composed, and in all of them it forms an important increment of their growth. Even where the political and legal consciousness of a community has reached the stage of sweeping legal reform—as in the Eastern Empire under Justinian and in France under Napoleon Bonaparte—the resultant code of laws, however comprehensive, must be based upon, and must consist mainly of, the rules of the customary law which it is intended to supersede, and its most radical departures from that law are most swiftly corrected by the judicial organs of the community. Undoubtedly the most complete and widespread transformation which the customary law of mankind has ever undergone was the general reception throughout Europe of the civil-law system of Rome. (For the history of this process, see CIVIL LAW.) Only the common-law system of England, upon which that of the United States is based, was able to withstand that influence; and this is still, for the most part, consciously and avowedly a body of customary law. (See CODE; COMMON LAW.) Under the influence of the spirit of nationality, which has so powerfully affected the nations of Europe during the last quarter of the nineteenth century, there has recently developed a strong sentiment in favor of the revival of the local customary law, as against the more general law of foreign origin. This is particularly noticeable in the recent revision of the German codes.

Consult: Maine, *Ancient Law* (11th ed., London, 1887, or any other edition), and *Lectures on the Early History of Institutions* (6th ed., ib., 1893); Lee, *Historical Jurisprudence* (New York, 1900); Blackstone, *Commentaries on the Laws of England*, book i, pp. 63-84; Bryce, *Studies in History and Jurisprudence* (New

York, 1901); Holmes, *The Common Law* (Boston, 1881); Pollock and Maitland, *History of English Law* (2d ed., ib., 1899).

**CUSTOMHOUSE.** The office in a port of entry (seaport or lake port) where masters of ships are bound to enter and clear their vessels according to the statutes governing the subject, and where importers of merchandise must pay customs duties. In the United States the customhouse of each port is under the direction of a collector of the port, appointed by the President with the advice and consent of the Senate. He is responsible for its proper conduct, subject only to the direction of the Secretary of the Treasury, and it is his duty to carry out the United States statutes and tariff laws governing and restricting the importation of foreign goods. See CUSTOMS DUTIES.

**CUSTOM OF THE COUNTRY, THE.** The title of a play by Fletcher and Massinger (about 1628), in part taken from Cervantes. A play by Mrs. Centlivre, with the same title, was produced in 1715.

**CUSTOMS DUTIES.** Taxes levied upon merchandise which passes a frontier, generally upon goods imported. Such taxes are of very early origin, and in the long conflict between the English King and the Commons over the right of taxation it was claimed that these taxes were ancient customs over which Parliament had no jurisdiction. Hence the name which has since clung to this class of taxes. It appears that in their origin such taxes were largely in the nature of payments for privileges of trading at certain places and for use of the facilities of ports and markets, but that they soon passed beyond the stage of fees into that of imposts. The name "customs duties" was applied indifferently to the taxes levied at ports of entry or at ports of passage or upon goods brought into a city from surrounding parts of the same country. Such internal customs have almost disappeared in modern countries, though remnants of them are found in the "octroi" of Paris and other continental cities. Transit taxes, such as those levied upon the navigation of the Rhine, have also disappeared. Such restrictions upon the freedom of commercial intercourse would no more be tolerated in modern times than the tributes once paid to the Barbary pirates.

Taxes upon exports have become infrequent. They are no longer an element of consequence in the fiscal system of modern states, though a few remnants of them can be found. In South America such taxes are more common. Chile derives considerable revenue from its nitrate exports, and Brazil from its coffee exports. Quite striking, as a return to older forms of taxation supposed to be laid aside, was the imposition in 1901 of a tax of one shilling per ton upon all coal exported from Great Britain.

Customs duties are, therefore, generally synonymous with duties upon imports. Such duties may have no other object than to raise revenue. The most conspicuous case of such a purely fiscal tax is when the imported article is taxed to exactly the same extent as the home product, such a tax aiming to equalize the conditions of competition for the foreign and the home producer. Another distinctly fiscal tax is one imposed upon an article not produced in the home country, as the English duty upon tea. Taxes which weigh more heavily upon the foreign article than the home product, or which

are levied upon imports where the same article is not taxed at home, may be purely fiscal in intent or may be designed as a protection for home industries. It is not the magnitude of the taxation which decides this point, but the effect upon the economic order. It is well understood that any taxation whatever influences consumption and production, but this influence may be deliberately planned or incidental. It is the deliberate planning which characterizes a protective tariff. Whether such a course is to be justified is not to be discussed here. (See FREE TRADE; TARIFF.) It is enough for our purpose to note that the injection into tariff legislation of ulterior economic motives complicates the machinery of customs duties in a high degree. Such a course does not eliminate the fiscal features of a tariff, as there are few states which can afford to handle their customs taxation in such a way as entirely to subordinate fiscal interests to economic policy.

The contrast between a purely revenue tariff and a protective tariff is illustrated most strikingly by comparing the United States and Great Britain. In the latter the general principle is freedom from taxation, duties being laid upon a few articles only, 27 in all. In the United States the general principle is taxation, and all articles not specifically taxed at rates named, or expressly exempt from taxation, are subject to a duty of 10 per cent if unmanufactured and of 15 per cent if manufactured in whole or in part. The articles subject to tax, by the tariff law of 1913, fall under 386 paragraphs, divided into schedules lettered from A to N. The following table indicates the nature of these schedules and the paragraphs under each. The free list embraces 271 paragraphs.

SCHEDULES	Paragraphs fixing rates
A. Chemicals, oils, and paints	70
B. Earthenware, and glassware	41
C. Metals, and manufactures of	66
D. Wood, and manufactures of	9
E. Sugar, molasses, and manufactures of	4
F. Tobacco, and manufactures of	5
G. Agricultural products and provisions	51
H. Spirits, wines, and other beverages	13
I. Cotton manufactures	17
J. Flax, hemp, and jute, and manufactures of	19
K. Wool, and manufactures of	25
L. Silks and silk goods	9
M. Pulp, paper, and books	13
N. Sundries	54

Customs duties are specific and ad valorem—the former being reckoned by the quantity of the goods imported (weight, measure, or number), and the latter by the value. Theoretically, the ad valorem duties are the preferable, as they adjust the amount of the burden to the value of the article. But they offer great practical difficulties in ascertaining the value of the goods. As the statements of the importers, even when made under oath, are not accepted as final evidence as to the value of the goods, a complex machinery for the ascertainment of values is a necessary adjunct to all ad valorem taxes. Hence the preference for specific duties, which can be imposed readily according to the physical characteristics of the objects imported. Such specific duties fall unequally upon objects of high value and low value in the same class. Thus, if all textiles were taxed 15 cents a square yard, such a tax would be prohibitive on print

cloths, but insignificant upon silks. It is the plaint of the protectionist that specific duties protect only the lower grades of goods from foreign competition. The only method of mitigating this is to make a minute division into classes. The greater convenience of administration has produced a general sentiment in favor of specific duties, but nations which pursue an avowedly protectionist policy cannot yield to this sentiment as largely as those whose tariff is for revenue only. Specific duties can best be applied when the product is comparatively uniform in quality and value. In Great Britain, Germany, and Austria, only specific duties prevail, and the tariffs in France and Italy show very few ad valorem rates.

With these countries the United States stands in marked contrast. Here ad valorem rates are abundant, but the provisions of the act are so complex that a separation of rates into two classes only is not practicable, and it has become necessary to add a mixed class. This includes several cases: (1) when two articles are named in the same paragraph, one receiving an ad valorem and the other a specific tax; (2) where one article receives both forms of tax; (3) where an article is classed according to value and then receives a specific tax for each class. Other combinations also occur, as where an article is classed according to value and receives a different ad valorem rate in each class, or again when classed according to specific characteristics and taxed at different ad valorem rates, but these combinations are classed as ad valorem rates. Specific rates predominate in the schedules A, C, F, G, and H, but in the others ad valorem and mixed rates prevail.

Consult: United States Tariff Law of 1913, Annual Reports of Commerce and Navigation; Statistical Abstracts of the United Kingdom and of the principal foreign countries. See FREE TRADE; TARIFF, TAX.

**CUSTOMS OF WAR.** See WAR, HONORS OF WAR, SALUTES, LAWS AND USAGES OF WAR.

**CUSTOS ROTULORUM** (Lat., keeper of the rolls, or records). An office of great antiquity and dignity in England. It is usually held by the first civil officer of the county, as the Lord Lieutenant, though the actual custody of the records of the sessions of the peace and of the commission of the peace, constituting by emittance "the rolls" of the county, is vested by statute in the clerk of the peace. Formerly the office was filled by appointment of the Lord Chancellor, but it has for over 300 years been conferred by the crown. The Keeper of the Rolls is always one of the commission of the peace, though the title of the office points to ministerial rather than to judicial functions.

**CUSTOZZA**, koo-stód'zä. A village in the Province of Verona, North Italy, situated 11 miles southwest of Verona (Map: Italy, F 2). On July 25, 1848, and on June 24, 1866, the Italians were defeated here by the Austrians. (See ITALY, History.) In 1879 a monument was erected to the fallen. Consult Mathes von Bilabruck, *Taktische Studie über die Schlacht von Custoza im Jahre 1866* (Vienna, 1891).

**CUSTRIN**, ku-strén'. See KÜSTRIN.

**CUTANEOUS SENSATIONS** (Fr. *cutané*, Portug., It. *cutaneo*, from Lat. *cutis*, skin). The sensations aroused by stimulation of the skin and of the superficial mucous membrane. The skin has been credited, in one or another psy-

chological system, with a large number of sensations: sensations of contact, pressure, impact, movement, resistance, weight, touch; hardness, roughness, wetness, and their opposites; warmth, heat, cold; pain, tickling, goose flesh, pricking, tingling, creeping. (See COMMON SENSATION.) When, however, the organ is explored, point for point, by mechanical, thermal, and electrical stimuli, it proves to be capable of four sensation qualities, and, as far as investigations have gone, of four only: pressure, warmth, cold, pain. The so-called sensations of dryness, weight, resistance, touch, smoothness, etc., have proved to be perceptions, made up of sensations from the skin and from the underlying tissues. Pricking, tingling, etc., are in all probability circulatory sensations, aroused by change of blood flow or blood supply; their organs and mode of excitation are imperfectly known. We shall return to heat and tickling below; we now take up the cutaneous qualities in order.

1. *Pressure*.—If a small point of cork or soft wood be set down firmly upon the skin surface, e.g., on the back of the hand, one of two things will happen: either it will arouse a dull, vague, diffuse pressure sensation, or it will arouse a sharp, distinct pressure, the kind of sensation that one might suppose to come from the inward pressure of a little hard seed lodged in the cutis. (Goldscheider.) If the point be now applied lightly, we get either no sensation at all, or (at the place where the seed pressure was before produced) a light, fine, rather ticklish pressure sensation. The seed pressure, which, however, probably involves subcutaneous in addition to the cutaneous organs, and the ticklish pressure come from the organs of the pressure sense, the "pressure spots" as they are called. The dull pressure with intensive stimulation is set up by the indirect affection of several pressure spots; the stimulus makes an indentation in the skin, and the dragging down of the tissue squeezes the pressure organs that lie about the point of application. The absence of sensation with light contact means that the experimenter has applied the stimulus at a point of the skin which has no pressure organ. We see then, from this simple experiment, that the skin is not uniformly sensitive to pressure. It may rather be compared to a mosaic of tiny blocks, some of which are sensitive, while the rest are insensative, to mechanical stimulation.

A careful exploration of the cutaneous surface, undertaken with the object of mapping the pressure spots, has led to two definite results. (a) If the portion of the skin explored is hairy, the pressure spot lies always to windward of a hair shaft, immediately above a hair bulb. It follows that the nerve skin which enfolds the bulb is the terminal organ of pressure, and that the hairs are as truly sense apparatus in man as they are, e.g., in the cats. (b) If the region is hairless, pressure spots, arranged in lines and groups, can still be identified. The organs in this case are the corpuscles of Meissner.

2. *Warmth and Cold*.—If the blunt point of an ordinary lead pencil be drawn slowly over the back of the hand, it will give rise, from time to time, to little flashes of cold; over the rest of its course it will arouse nothing but pressure sensations. If the point be warmed, and drawn in the same way over the closed eyelid, it will give rise, from time to time, to little dots of warm sensation; at other points it excites nothing but pressure. There is, then, a mosaic of

temperature organs as there is a mosaic of pressure organs. Moreover, if a small square or circle of skin is accurately marked, and explored twice over, once with a cooled and once with a warmed point of metal, it will be found that the cold and warm organs do not coincide. A cold organ never gives a warm sensation; a warm organ never responds to stimulation by a cold sensation. While, therefore, we are justified, physically, in speaking of "degrees" of temperature, and in arranging "warms" and "colds" upon a single thermometric scale, we must recognize the fact that, psychologically regarded, warmth and cold are distinct things; there are two temperature senses, each with its own distribution and its peculiar terminal organs. The organs of cold are more numerous than those of warmth. They are to be found, perhaps, in the end bulbs of Krause, and the organs of warmth in the cylinders of Ruffini (von Frey). All these cutaneous organs are of extremely simple structure, consisting of little more than a skein or tangle of nerve fibrils, twined about a cluster of connective-tissue cells. All alike are readily fatigued; and all show differences of responsiveness or "attunement"—some answering a given stimulus with an intensive, others with a weak, sensation.

3. *Pain*.—If a small area of skin, say, upon the back of the hand, be shaved, moistened, stretched taut, and explored, point for point, by a fine horsehair or needle, sensations of pain—more closely distributed than any of the three preceding sensations—will be obtained. The pain sensations are the most delicate—the smallest, so to speak, of all the skin sensations. The pain quality is unmistakable, even a novice will have no difficulty, after the first few trials, in distinguishing it from the ticklish quality of fine pressures. Moreover, it can be elicited independently of the pressure sensations. Hence there can be no doubt that pain is a new, fourth sense, endowed with organs of its own.

These organs are, in all probability, the free nerve endings in the epidermis. The epidermis lies, like a layer of stiff leather, upon the elastic cutis. When, then, the skin is lightly touched, the resulting vibration passes through the epidermis to the underlying cutis; the epidermis, with its organs, is not stimulated at all. When, however, the skin is bruised, so that the epidermis is actually broken or crushed; or when the epidermis is itself explored, under experimental conditions that render it accessible to stimulation—then the pain quality is evoked. The mechanical character of cutis and epidermis thus enables us to explain the apparently paradoxical fact that the pain organs are placed more superficially than the organs of pressure, and yet that, under ordinary circumstances, it takes less stimulation to call out pressure than to excite pain.

4. *Heat*.—We have seen that warm spots give only sensations of warmth, and cold spots only sensations of cold. It is remarkable that, while the cold spots do not as a rule respond to warm stimuli—as, indeed, we should not expect them to do—they respond, by a distinct cold sensation, to heated stimuli of some 45° C. or over (von Frey's "paradoxical cold"). On the other hand, warm spots may mediate a faint sensation of warmth in response to stimuli that are slightly cooler than the skin ("paradoxical warmth"); a very cold stimulus does not affect them. If a piece of metal, heated above 45°, be

laid upon a portion of the skin that is furnished with both cold and warm spots, the result of the combined excitations is not warmth, or cold, or pain, but what at first seems to be a new quality, that of heat. A good place for experimentation is the median line of the forehead, close up to the hair. Raise the temperature of the metal from 40° upward, by 1° steps. For the first few trials you get nothing but a mild warmth, from the warm spots. But as soon as you pass the critical temperature (the heat that, if the metal were a point, would evoke from a cold spot the paradoxical cold sensation), you get a distinct sense of heat. Thus psychophysically heat is a fusion, a mixture of the stimulus qualities warm and cold. To introspection it is apt to appear as a simple quality, but may, under repeated observation, yield to analysis.

5. *Tickling*.—The psychophysics of this sensation complex is also obscure. Tickling may be set up, at certain parts of the cutaneous surface, by light intermittent pressure or even by a single light touch. The resulting pressure sensations are (a) in some way diffused, so that the area of sensation presently becomes much larger than the area of original stimulation. Concomitant sensations of pressure (see COMMON SENSATION) may also be aroused in remote regions of the skin. It is possible (b) that the smooth muscle fibres at the roots of the hairs, the muscles that cause the hair to "stand on end" and whose contraction produces goose flesh, may contain sensory nerve endings which function in the tickling complex. (c) The occasional thrills of warmth which are characteristic of tickling are due, apparently, not to mechanical stimulation of the warm spots, but to a change of blood supply in the vessels of the cutis. Weak pressure or blowing upon the skin is known to increase the arterial blood pressure. (d) There is, in general, no reference to the stimulus, nor any definite visualization of the surface affected. (e) The movements of withdrawal have been ascribed to the unpleasantness of the intermittent stimulation; a flickering light, a beating tone, an interrupted pressure, are all disagreeable. While this statement may contain a part of the truth, it seems probable that the movements are referable, in part at least, to reflex connections between the sensory and motor nerves, akin to the connections which, on the purely sensory side, subserve concomitant sensation. Moreover, laughter is the direct motor response to tickling, and unpleasantness does not arise unless the stimulation be long continued. (f) For theories of the connection of laughter with tickling, see LAUGHTER.

For the sensitivity of the internal organs, including the alimentary canal, to pressure, pain, warmth, and cold, see ORGANIC SENSATIONS.

See PAIN.

**CUTCH**, or **KACHH**, *kūch* (Skt. *kaccha*, shore). A native state under the Presidency of Bombay, British India, occupying the peninsula south of Sindh, between the marshy tracts of the Rann, or Rann, of Cutch and the Gulf of Cutch. It covers an area of 7616 square miles, excluding the Rann of Cutch (Map: India, A 4).

Its soil is mostly sterile. The climate and meteorological conditions are extremely unfavorable for vegetation and rainfall is light. Its chief products are minerals and salt. The Rann is a morass of 9000 square miles in area. It is flooded during the monsoon by salt water, but by December 1 it is comparatively dry. Cutch has a feudal system of government, the ruling power being confined to the dynasty of Jharaja Rajput, of which there are about 200 members. Pop., 1891, 558,415; 1901, 488,022; 1911, 513,529. About one-third of the inhabitants are Mohammedans, the rest Hindus of various castes. Chief town, Bhuj.

**CUTCH, or KACHH GUNDAVA**, gūṇḍā'vā. A region in Baluchistan, east of Khelat. The Hala Range of mountains extends along the western frontier. The area is a desert, with an annual rainfall of but 3 inches, but the soil under irrigation yields bountiful crops of grain and cotton. The hot summer winds from the interior are not easily endured.

**CUTCH, GULF OF**. An inlet on the north border of the Arabian Sea, lying between Cutch and the peninsula of Kathiawar, British India (Map: India, A 4). It is about 30 miles wide and 100 miles long and connects at its upper end with the Little Rann (or Runn) of Cutch, and through this with the great western Rann, the remarkable salt marshes lying to the east and north of Cutch.

**CUTHA, or CUTHA**. An ancient city in Babylonia, identified by Rawlinson, Rassam, and Delitzsch with the present Tell Ibrahim, 25 miles N. E. of Babylon. It was connected with Sippara (Abu Habba) by a canal. The city is mentioned already by Sargon and Manishtusu. Its famous Nergal temple was built by Dungi of Ur, the zikkurat, or temple tower, was dedicated to Nannar, the moon god. One of the creation stories (see CREATION) came into Assurbanipal's library from Cutha. It remained an important religious centre until the time of Nabonaid. Men from Cutha were carried away, probably by Assurbanipal after 648, to Samaria (2 Kings xvii. 24) where they continued to worship Nergal (vs. 30). Hence the Samaritans were often spoken of in later times as Cuthaeans. In 1881 Hormuzd Rassam conducted for a few weeks excavations at Tell Ibrahim without noteworthy results. Consult Delitzsch, *Wo lag das Paradies* (Leipzig, 1881); Zehnfund, *Babylonien in seinen wichtigsten Ruinenstätten* (Leipzig, 1910), Ed. Meyer, *Geschichte des Altertums*, 3d ed. (Berlin, 1913).

**CUTHBERT**, kŭth'bĕrt. A city and the county seat of Randolph Co., Ga., 118 miles southwest of Macon, on the Central of Georgia and the Georgia, Florida, and Alabama railroads (Map. Georgia, B 4). It is the seat of Andrew Female College (M. E. So.), opened in 1854, and of Bethel Military College (for men). Fruit growing and farming are the principal industries, and there are fertilizer factories, cotton-compress and grist mills, cotton-oil mill, and gineries. The water works and electric-light plant are owned by the city. Pop., 1900, 2641; 1910, 3210.

**CUTHBERT, SAINT** (c.635-687). Bishop of Lindisfarne and one of the most popular saints in England in the Middle Ages. He was born about 635, probably of Northumbrian parents. In 651, moved by a vision of angels carrying to heaven the soul of St. Aidan, he entered the monastery of Melrose. Ten years later he was

put at the head of this monastery and did noble missionary work in the surrounding country. He left it in 676 for an austere hermit life, from which he was withdrawn in 684 to accept the Bishopric of Hexham, which he exchanged for that of Lindisfarne, holding the latter only two years and returning (687) to his solitary hut on Farne Island. Here he died, March 20, 687.

The influence of St. Cuthbert upon his contemporaries was great, but his fame became even greater after his death. His body remained at Lindisfarne till 875, when the monks, bearing it on their shoulders, fled from the fury of the Danes. After many wanderings through the south of Scotland and the north of England, they found a resting place at Chester-le-Street in 883. In 995 the remains were transferred to Ripon, and then to Durham, where, inclosed in a costly shrine and believed to work frequent miracles, they remained until the Reformation, when the shrine was defaced and the body buried under the pavement of the cathedral. The tomb was opened May 17, 1826, when a coffin ascertained to have been made in 1541 was found to inclose two others. The innermost case contained a skeleton, still entire, wrapped in fine robes of embroidered silk, and also the head of King Oswald, killed in battle (642), which it was known had originally been buried with the saint. His life was twice written by the Venerable Bede and still earlier by a monk of Lindisfarne. Besides these lives, all of which have been printed more than once, and what is told of him in Bede's *Historia Ecclesiastica Gentis Anglorum*, are modern lives: Raine (Durham, 1828), Eyre (London, 1849; 3d ed., 1887), and Fryer (London, 1880).

**CUTHBERT OF CANTERBURY** (†758). An English prelate. He was born in the Kingdom of Mercia, became Bishop of Hereford in 736, and Archbishop of Canterbury in 740. He died on Oct. 26, 758. An instructive letter was addressed to him by St. Boniface, in reply to one from him relating the doings of a council which determined upon closer relations between the English church and that of Rome. This letter has been printed more than once and will be found in the appendix to Hussey's edition of Bede, *Historia Ecclesiastica* (Oxford, 1846).

**CUTHBERT'S BEADS, SAINT**. See BEADS, SAINT CUTHBERT'S.

**CUTICLE**. See SKIN.

**CUTICLE** (Lat. *cuticula*, dim. of *cutis*, skin). In plants, a hyaline film covering the surface of plants, and derived from the outer walls of the epidermal cells. The film consists of "cutin," which is a transparent, elastic substance, only slightly permeable to water. The process of formation of the cuticle is called "cutinization," or "cuticularization." The term "cuticle" is sometimes loosely used instead of "epidermis," and is not to be confused with the same term as used by zoologists. See MORPHOLOGY IN PLANTS.

**CUT'IN** (in plants). See CUTICLE.

**CUT'INIZATION** (in plants). See CUTICLE.

**CUTLASS** (Fr. *couteau*, from OF. *coute*, *cultel*, Fr. *couteau*, knife, from Lat. *cultellus*, dim. of *cultus*, knife). A short curved sword formerly used in men-of-war as a side arm for the men. The blade was usually about 27 inches long, an inch wide, and had a bowl-shaped guard on the hilt. See SWORD.

**CUTLASS FISH**. A remarkable fish (*Trichurus lepturus*), alone representing in this coun-

try a family (Trichiuridae, the hairtails) of pelagic fishes allied to the saifishes and better known elsewhere. Its body is long, bandlike, tapering into a hairlike tail, scaleless, and covered with a glistening white skin, so that its resemblance to a sword or to a silver scabbard justifies the European "scabbard fish," or the names "swordfish," prevalent along the Gulf coast, and "silverfish," heard in Florida. Its length may reach 2 or 3 feet, and it swims mostly at the surface, often leaping above it (whence another local name, "skipjack") in pursuit of its prey; and it is sought by anglers both for sport and food. In Jamaica, indeed, it

CUTLASS FISH MOUTH OPEN AND SHUT.

forms the object of a commercial fishery, and another species is the highly esteemed frostfish (q.v.) of New Zealand.

**CUTLER, ELBRIDGE JEFFERSON** (1831-70). An American scholar and poet, born at Holliston, Mass. He was professor of modern languages at Harvard from 1865 until his death. His works include *War Poems* (1867) and *Stella* (1868). In addition to his creative work, he wrote much criticism.

**CUTLER, MANASSEH** (1742-1823). An American clergyman and botanist. He was born in Killingly, Conn., graduated at Yale in 1765, and in 1767 was admitted to the bar. He then studied theology, was licensed to preach in 1770, and from 1771 until his death was pastor of Hamlet Parish, Ipswich, now the town of Hamilton, Mass. During the latter part of the Revolutionary War he served as chaplain of a Massachusetts regiment. He subsequently studied medicine and botany and was the first to make a systematic study of the plants of New England, 350 species of which he classified in accordance with the Linnæan system. As the representative of a number of old Revolutionary soldiers, he contracted with Congress for 1,500,000 acres of the public lands northwest of the Ohio, and in 1788 materially assisted the party of Connecticut farmers who, under the lead of Rufus Putnam (q.v.), founded Marietta, Ohio (q.v.). He is generally credited, moreover, with having made the first draft of the famous Ordinance of 1787. He himself went to Marietta in 1788, but soon returned to Massachusetts, and from 1801 to 1805 was a member of Congress. He was a frequent contributor on scientific subjects to the *Proceedings of the American Academy*, and wrote the chapter on trees and plants in Belknap's *History of New Hampshire*. Consult William P. and Julia P. Cutler, *The Life, Journals, and Correspondence of Manasseh Cutler* (Cincinnati, 1888).

**CUTLER, TIMOTHY** (1683-1765). An American clergyman. He was born at Charlestown, Mass., graduated at Harvard in 1701, became president of Yale College in 1719, but was forced to resign (1722) on account of his prelatinal tendencies. He went to England and was ordained a minister of the Church of England by the Bishop of Norwich (1723) and received the degree of D.D. from both Oxford and Cambridge; he returned to Boston, became rector of

Christ Church (1723), and died there, August, 1765. Some of his letters appear in Nichols, *Illustrations of the Literary History of the Eighteenth Century* (London, 1817-58).

**CUTLERY** (from *cutler*, AF. *cotelier*, OF. *cotelier*, Fr. *couteiller*, from ML. *cutellarius*, knife maker, from Lat. *cutellus*, little knife). A term broadly applied to cutting instruments in general, but, as more commonly employed, its use is limited to such cutting utensils as pocket, pen, and table knives, razors, shears, and scissors. Shells and sharp-edged stones formed the rudest and most ancient cutting instruments. These were followed by bronze weapons and instruments which were used by the Romans as late as the beginning of the Christian era. In the remains of Pompeii, however, knives, shears, and lancets were found made of iron or steel as well as bronze. During the Middle Ages, when the chivalry of the period sought the best equipment, certain cities of Spain and Italy acquired a high reputation for the manufacture of cutting instruments, especially of swords. The knives used by the Anglo-Saxons resembled in appearance the modern razor blade. Forks were used only for serving, as the custom of eating with forks, which was introduced from Italy, was not known in England until the time of James I. Knives were not placed on the table until about the close of the fifteenth century, and each person carried a knife with him for use whenever the exigencies of dining required other instruments than his fingers. As early as the reign of Richard I Sheffield had gained a reputation for the excellence of its *whittles*, Chaucer referring to a Sheffield "thwytel," or whittle. In 1415 the cutlers of London obtained a charter from Henry V. In the seventeenth century, when England had acquired a reputation throughout Europe for the quality of its cutlery, Birmingham was regarded as the centre of the industry; but during the nineteenth century Sheffield regained its old preeminence.

In America, although some tools were manufactured in Pennsylvania as early as 1810, the first cutlery factory was at Worcester, Mass., and dates from 1829, when a pen and pocket knife factory was established there.

The manufacture of table cutlery in the United States began in 1832, when a factory was built at Saccarappa, Me. With the improvement of the quality and lowering of the price of American steel, the industry steadily developed. The annual product in 1909 of cutlery and edge tools, which includes also shears, axes, swords, joiner's tools other than saws, as reported by the Thirtieth United States Census of 1913, amounted in value to \$22,884,914, produced by 281 establishments, with a maximum number of wage earners of 16,997, showing an increase in value from 1850, when the product was but \$3,813,000 and the number of workers 4275, though there were 401 establishments. In 1913 the United States imported cutlery valued at \$2,026,564 and distributed as follows: pen or pocket knives, \$752,705; razors, and parts of, \$391,303; scissors and shears, \$604,029; all other cutlery, \$278,527. America has excelled in the production of "medium" goods—i.e., goods of tasteful design and good quality at a moderate price, and has developed such specialties as the safety razor; but in the manufacture of other branches of cutlery it has not been so successful. Although it is claimed that an equally good quality is produced at home, still the United States

imports from England large quantities of the finest grades, especially pocket knives. In the very cheap grades, such as vegetable and other kitchen knives which retail in the United States for a few cents apiece, America cannot compete with Germany. Many English workmen, attracted by high prices and steady employment, came over from Sheffield to work in the Connecticut shops. As the industry early became established in that State, some of these afterward migrated to Walden, N. Y., where they built a cooperative factory, and since that time over 50 factories, many of them cooperative, have been established, a number of which have failed, while others have sold out, or have been reorganized as corporations. The piece system of paying the operative still prevails to a large extent in cutlery shops, though the work is done for the most part in large factories. All the early cutlery was hand-forged, and this practice is still general in England and in the United States for the manufacture of some of the best pocket and pen knives. In the latter country to-day, however, large quantities of pocket and pen knives and apparently all table knives and most carving and butcher knives are machine-forged. Machinery is used for driving the various grinding stones, emery and buffing wheels for finishing blades and handles. In some instances, also, the blades are placed in holders and manipulated by automatic machinery for the rough grinding. The evil effects from the grinding dust are now obviated, as far as possible, by wet grinding and by exhaust fans and ducts for removing the dust. The hand and machine processes for making different kinds and grades of cutlery vary greatly in detail. But a fair general idea of the industry may be gained by first describing the actual operations of an American pocket and pen knife factory where hand-forged goods are made, and then indicating in a more general way some points of difference in the manufacture of other kinds of cutlery.

**Pocket and Pen Knives.** Each knife, rough-speaking, consists of two parts, the blade and the handle, but each of these, from the manufacturer's standpoint, is composed of a number of parts. The blade consists of the blade proper, or cutting edge, and its supporting back, and of the tang, or the portion which joins the blade to the handle. The handle, in turn, includes (1) the horn, ivory, or other material which is grasped by the hand, and which portion alone is technically called the handle; (2) the scale, which is the brass or iron lining of the handle, and (3) the spring, which, besides its primary purpose of controlling the blade in opening and shutting, also closes the back of the lining.

The edge-tool steel from which pocket and pen knife blades are made is called "rod steel", it is flat, of proper widths for the different sizes of blades, and of thickness one gauge greater than the finished blade. In the best goods the blades are forged and shaped by hand. In the case of cheap knives the blades are pressed into rough shape by machines, then further shaped or forged by trip hammers in much the same manner as that explained below in describing table knives. Comparatively little machinery is used on the blades in either case, except that the grindstones and finishing wheels are driven by mechanical power. The processes here described relate to high-grade goods.

**Moolding** is the name given to the rough shaping of the blade at the first heat, and the forma-

tion of the tang is called *tangging*. After these two processes are completed the metal is heated for the third time, the blade again worked by hammer, and the nail mark cut, which finishes the third or *smithing* process. All the forging is done by means of special hammers on special anvils. *Choling* is filing the little nick just between the cutting edge and the tang. This removes a weak spot in the metal and serves as a guide in filing the blade flatwise. The blade is now shaped in the rough, but before it leaves the forge it must be hardened and tempered. *Hardening* is effected by bringing it to a red heat and dipping it in water up to the choil. The tang is left soft, so it may be readily filed, drilled, stamped with maker's name, and fitted in the handle. *Tempering* (q.v.) is often accomplished by bringing the blades to a purple heat on a thin copper plate, resting on the fire of the forge. The blades are set on their backs, thus keeping their edges furthest from the heat. The final work of the forger or smith is to straighten crooked blades, if any, by means of light hammer blows on the concave side of the blade.

*Grinding* is next in order. The grinder places the tang in a holder, which he grasps with one hand, while with the other hand, protected by a leather patch, he presses the blade against the rapidly revolving power-driven stone. *Racing irons*, consisting of small rods of Norway iron, are occasionally held against the face of the stone to restore the rough surface and preserve its cylindrical shape. *Material* is the name given to all the separate parts except the blade. The *material maker* presses out, or cuts out with dies, the steel springs and the brass or iron linings, and fastens the tips or bolsters to the outside of the lining, in case the material forming the handle proper does not cover the tip ends of the lining. *Cutler's work*, curiously enough, includes assembling, or putting together, the various parts of the knife, including drilling, filing, fitting, polishing, and buffing the handles. The material for handles embraces ivory, pearl, silver and gold, tortoise shell, buffalo and stag horn, celluloid, rubber, California redwood, cocoa wood, and ebony. *Polishing* the handles is accomplished by power-driven built-up wood wheels, covered first with leather, then with a mixture of glue and emery. *Buffing* is effected on wheels in which the leather, emery, and glue give place to cotton cloth, fastened on edge around a wheel or spindle. *Blade finishing* is done on emery wheels, much like the polishing wheels already described, except that the glue and emery are placed on very hard leather instead of on wood. *Glazing*, on these wheels, removes the dirt and gives a glazed finish. *Crocus finish* is a superior glaze, or polish, requiring special wheels.

*Sharpening* is done by hand, on flat stones. The edges of the blades are held at an angle of 45° with the stone, a point that might well be borne in mind by all who attempt to sharpen old knives. The common practice of holding the knives flat on the stone gives a thin, easily broken edge. Finally, the handles are again buffed and the whole knife wiped, packed, and boxed. The ordinary knife of fair quality has now gone through about 100 operations, while the finest goods receive 200 to 300. It may be added that the processes involved in machine-forged pocket and pen knives resemble those described for table knives in the next paragraph.

**Table Cutlery**, including ordinary and carv-

ing knives, and also forks, is an industry which by the use of machinery and factory organization and method has been brought to a high state of efficiency in America. The product was early standardized and adapted for large scale production as contrasted with England, where for many years manufacture was largely or wholly by hand. Knife blades and tangs are roughly shaped by rolling or by trip or drop hammers—an American innovation which, with its application to striking up the bolster or shoulder, increased the output of two men twentyfold—and are brought to a uniform shape and size by means of dies. The blades are hardened in oil, which is sometimes burned or blazed off. They are sometimes heated in a sand bath to secure the desired color and temper. The holes in the tang are punched and the blades are ground on large power-driven stones, 5 to 7 feet in diameter. Where machinery is used at every possible point, the blades are rough-ground by placing six or more in a brass frame, which is so manipulated as to give them both a side to side and vertical motion on the stone. The finish, however, is done by hand, on wheels similar in general character to those explained in describing pocket knives. The highest grades of steel table knives receive more hand work, but the cheaper ones have even less, and the handle, and in some cases the whole knife, is cast instead of wrought. The same is likewise true of forks, though steel forks, except for carving sets, are gradually decreasing in use with the cheapening and more general availability of plated ware. Wooden handles are generally in two pieces, united to the tang, but ivory, bone, horn, and various other materials are in one piece, with the tang inserted. The curved tines of forks are shaped by means of presses, or dies, and the tines are rough-cut in the same general manner. In some instances more or less forging, either by hand or machine, is employed. Silver-plated (see ELECTROPLATING) table knives and forks are plated on steel or on some softer malleable metal.

**Scissors and Shears** differ principally as to length, the dividing line in the trade being 6 inches, and the shorter instruments being classed as scissors. Some of the cheapest scissors are cast, but the best ones are hand-forged, though die forging with a heavy press is very much used, and a fly press is used to shear off the rim of superfluous metal so that the portion of the scissors is turned out ready for the grinder. English shears are of steel, but some of the best American shears, which are now largely exported, have their inner sides only of steel, "laid on" to shear blades of malleable iron, often cast in outside foundries.

**Razors**, at least those of good quality, are practically all hand-forged from razor steel, in much the same general way as pocketknives, but with greater care. There has been a recent tendency towards molding large quantities of razor blanks in a die or under a heavy stamp or hydraulic press. While this process presents difficulties, it was believed that eventually it would supplant the hand-made article. *Safety razors* of various types are provided with guards designed to make cutting the flesh impossible. The earliest safety razor is said to have been made by Michael Hunter, of Sheffield, England, about 1875. It was merely an ordinary razor with a guard. The later safety razors have detachable blades and adjustable guards. The cutting edge

is generally shorter than in the ordinary razor, in some cases not much over an inch in length. The safety razor not only met a world-wide demand, but as hand forging and hand grinding were eliminated it soon became a commercial triumph. Consult: Lloyd, *The Cutlery Trades* (London, 1913), an excellent summary of the industry from its earliest days, giving a comparison of British and other methods; Landrin, *Die Kunst des Messerschmiedes* . . . (Weimar, 1836); Page, *La coutellerie depuis l'origine jusqu'à nos jours* (4 vols., Chatellerault, 1896-98).

**CUTLIPS.** A curious sucker (*Lagochila lacera*) of the streams of the central Mississippi valley, distinguished at sight by its mouth, where the reduced lower lip is divided into two distinct, elongated lobes; the lower lip, further, is "entirely separated from the upper at the angles by a deep fissure," cloaked by the skin of the cheek. It is olive or brown above, silvery on the sides and belly, and the lower fins are faintly orange. Many names have been given this singular fish, such as harehp, or splitmouth, or rabbitmouth, sucker, and May sucker. See Plate of SUCKERS.

**CUTPURSE, MOLL.** The sobriquet of Mary Frith, a notorious character, born in London about 1584, a thief and prostitute and famous in almost every form of crime. She dressed in male attire and is said to furnish the first recorded instance of the use of tobacco by a woman.

**CUTTACK, küt-täk', or KATAK** (Skt. *Kataka*). The capital of the district of the same name in Bengal, British India, situated on the south bank of the Mahanadi, at its junction with the Katjuri, 220 miles southwest of Calcutta (Map: India, E 4). It contains the ruins of an old fort and many educational institutions, including Ravenshaw College. It is famous for its fine filigree work in gold and silver. Other products are oil, fibre, carpets, and cotton goods, made largely by convict labor. Pop., 1891, 47,186; 1901, 51,364; 1911, 52,528, largely Hindus.

**CUTTER.** The name given to a portion of the equipment of boats on board of a man-of-war. They are double-banked and are fitted either for rowing or sailing. In sailing ships a nest of cutters of varying sizes used to be stowed amidships, one within the other, the launch being the bottom boat of all. At present the boats are either swung at the davits or in cradles resting on frames amidships, clear of the blast of the guns. Modern battleships carry very few cutters on account of lack of room. Instead they have steam launches, sailing launches, and motor launches, mostly of large capacity. (See BOAT.) The name "cutter" is also applied to a small vessel with a single mast, a mainsail, a forestaysail, and a jib set to the bowsprit end. Cutter yachts are sloop-rigged vessels, and the name is now generally applied to sloops of considerable draft and comparatively small beam.

A *revenue cutter* is a light, armed government vessel, commissioned for the prevention of smuggling and the enforcement of the customs regulations. (See REVENUE CUTTER SERVICE, UNITED STATES.) A small, light sleigh with a single seat for one or two persons, usually drawn by one horse, is also called a cutter.

**CUTTER, GEORGE WASHINGTON** (1801-65). An American poet. He was born in Massachusetts and, after studying law, settled in Kentucky. He fought in the Mexican War and later

entered the political field, where he soon became known as a brilliant public speaker. His most celebrated poems are "The Song of Steam," "The Song of the Lightning," and "E Pluribus Unum." His works were published under the respective titles: *Buena Vista and Other Poems* (1848); *Song of Steam and Other Poems* (1857); *Poems, National and Patriotic* (1857).

**CUTTHROAT TROUT.** The Rocky Mountain, or black-spotted, trout (*Salmo clarkii*, or *mykiss*). See **TROUT**.

**CUTTING.** A detached portion of a plant inserted in soil, water, or other media for the purpose of propagation. This process is one of the oldest and most important forms of artificial reproduction. Plants in general lend themselves readily to the process, thus enabling the propagator to secure hundreds of offspring from a single individual. Cuttings are superior to seeds, because, with the exception of bud variations, plants so propagated come true to kind, i.e., varieties of cultivated plants which do not come true to sort by seeds can be perpetuated by cuttings. In the arts of budding and grafting the bud or scion is in reality a cutting inserted in another plant with which it unites and thereby develops much faster than on its own roots. Cuttings are made from such a variety of parts of plants—sometimes even from root, stem, and leaf of the same plant—that a corresponding number of styles of cuttings have been developed. They may be classified, according to the maturity of the part used, as:

Hard-wood cuttings	(1) Simple stem,
	(2) Single eye,
	(3) Root,
	(4) Mallet, etc.
Soft-wood (herbaceous) cuttings	(1) Stem cuttings—slips,
	(2) Leaf cuttings,
	(3) Root, rootstalk, or rhisome,
	(4) Tubers, etc.

Some conception of the importance of this means of increasing plants can be gathered from the fact that, except for the production of new varieties, all commercial varieties of grapes, currants, and gooseberries are increased in this way, while among flowering and ornamental bedding plants millions are annually produced by one or another of these methods in the United States alone. Sugar cane, pineapples, and potatoes are extensively propagated by this process.

The parts used in making cuttings are numerous, but the methods resorted to are as varied as interesting. Some plants root readily from cuttings placed in the open ground, others require special treatment before they will "strike" root, while still others require most careful nursing in the greenhouse and even under a bell jar to induce them to take root. Special devices, carrying a variety of soils and capable of maintaining a given degree of heat and moisture, have been constructed in order to facilitate the work of propagating plants by this means. Consult Bailey, *The Nursery Book*, and article on "Cuttings," in *Cyclopedia of American Horticulture*.

**CUTTING, MARY STEWART (DOUBLEDAY)** (1851- ). An American writer of stories, born in New York City. In 1875 she was married to Charles Weed Cutting. While still a girl, her verses were published in *Lippincott's*, and after 1894 she was busied continuously in literary work, especially as a writer of short stories and serials. Her publications include: *Little Stories of Married Life* (1902; 2d ed., 1909); *Heart of Lynn* (1904); *Little Stories of*

*Courtship* (1905); *More Stories of Married Life* (1906); *The Suburban Whirl* (1907); *The Wayfarers* (1908); *Just for Two* (1909); *The Unforeseen* (1910); *The Lovers of Sanna* (1912); *Refractory Husbands* (1913).

**CUTTING R(ICHARD) FULTON** (1852- ). An American financier and philanthropist, born in New York City. He graduated at Columbia in 1871 and was prominent in many municipal reforms, becoming president of the Association for Improving the Condition of the Poor in 1892 and president of the New York Trade School Association in 1899. Of his influence and wealth he contributed largely to political reform in New York City, especially to the Citizens' Union (founded in 1897) and the Bureau of Municipal Research. He published *The Church and Society* (1912), Kennedy lectures in the New York School of Philanthropy.

**CUTTING, STARR WILLARD** (1858- ). An American educator and Germanic scholar, born in West Brattleboro, Vt. He graduated at Williams College in 1881, was principal of Deerfield Academy, Deerfield, Mass., for five years, studied at Leipzig, Geneva, and Johns Hopkins (Ph.D., 1892), and then taught in Chicago University, becoming head of the department of Germanic languages and literatures in 1906. Besides editions of school texts, he published *Der Konjunktiv bei Hartmann von Aue* (1894), *The Modern German Relatives "Das" and "Was"* (1904); *Robert Weselhoeft, Jena Burschenschaftler, German Revolutionary, and American Citizen* (1911).

**CUTTLE, CAPTAIN.** A rough-looking, good-hearted, retired merchant captain in Dickens's novel *Domby and Son*. His favorite expression, "When found, make a note of," was adopted as the motto of *Notes and Queries*.

**CUTTLEFISH** (cuttle, *As. eudeli*; connected by popular etymology with *cuttle*, knife, on ac-

FOSSIL CUTTLEFISH (BELEMNITES).

1. A belemnite (*Pachyteuthis acutus*) from the Lower Lias, England. 2. A belemnite (*Belemniteuthis antiqua*) from the Oxford Clay, England, partly restored *b*, arms; *ac*, eyes, *m*, mouth, *d*, ink bag; *Ph*, phragmacone, *R*, guard. 3. Restoration of a belemnite's shell *Ph*, phragmacone; *R*, guard. See **BELEMNITE**.

count of the knifelike cuttle bone, + fish). A popular name of certain cephalopods, originally applied to a calamary (*Sepia officinalis*), but

now generally restricted, in the United States at least, to octopoda. (See OCTOPODA.) The European cuttlefish (*Sepia*) furnishes cuttlefish bone and sepia, which are of commercial importance. The former is the calcareous "pen," or brace, which lies along the "back" of the creature beneath the skin; and the sepia is the substance in its "ink bag," by throwing out which it beclouds the water and eludes pursuit.

Fossil cuttlefish bones of *Sepia*, scarcely different from the modern species, are found in various Tertiary deposits. In the Triassic, Jurassic, and Cretaceous rocks are other forms of sepoid shells that are not calcified, but are thin, elongated, and horny, often containing fossilized ink bags and hardened ink, which may still be prepared and used for drawing. *Sepia* and its allies are supposed to have evolved from Belemnite-like forms through such intermediate stages as the genus *Belosepia* of the Tertiary. See CEPHALOPODA; SQUID; and Colored Plate of OCTOPODS AND DECAPODS in article DECAPODA.

**CUTTS, EDWARD LEWES** (1824-1901). An English clergyman. He graduated at Queens' College, Cambridge, and was ordained in 1848. He was curate successively of Ide Hill (Kent), Coggeshall (Essex), Kelvedon (Essex), and in 1859-65 of Billericay (Essex), and after 1871 was vicar of the church of the Holy Trinity, Haverstock Hill, London, N. W. He wrote on English archaeology, especially ecclesiastical, and published a *Dictionary of the Church of England* (1887).

**CUTTYHUNK.** The most southerly island in Buzzard's Bay, Mass., on which the first settlement of white men in any part of New England was made (Map. Massachusetts, F 5). Sailing from Falmouth, England, March 25, 1602, Bartholomew Gosnold, in the ship *Concord*, with "32 persons, whereof 8 were mariners and sailors, 12 proposing upon the discovery to return with the ship for England, the rest to remain there for population," made land off the coast of Maine on May 14. Coasting southwesterly, he discovered and named Cape Cod, and, coming "amongst many fair islands, all lying within a league or two, one of another, and the outermost not above 5 or 7 leagues from the main," landed on Cuttyhunk on the 25th of May. This they called Elizabeth's Isle, after the Queen, and here they built a fort. On account of disagreements the settlement was abandoned on June 18, and the colonists returned to England. Cuttyhunk later became the home of many pilots, when New Bedford had 400 whaling ships. The winter population is 50, and in summer, in the clubhouses and hotels, several hundred. The United States Life-Saving Station was established in 1889, and the house of the Massachusetts Humane Society in 1847. Consult *New England Magazine* (Boston, 1897).

**CUTTY STOOL** (Scot. *cuttie*, short, dim. of *cut* + *stool*). A seat once used in the Scottish church for the exposure of offenders against chastity. The sinner was required to sit on the stool before the whole congregation during the entire service and, at its close, to stand up while severely reprimanded by the minister.

**CUT WORM.** The terrestrial caterpillar of certain noctuid moths, mainly of the genus *Agrotis*, which winter and pupate in the ground and are ready to attack early vegetation. Cutworms are night feeders and cut the plants off at the level of the ground, destroying far more than they can eat. They attack wheat, Indian

corn, oats, and all the cereals, as well as garden vegetables. By day they hide under the surface of the soil, where each patch of withering vegetation marks their hiding places. In vegetable beds these spots should be dug over and the up-turned worms killed; holes made with a hoe or rake handle furnish favorite hiding places by day and thus serve as traps to catch many a worm. Some kinds of cutworms ascend trees by night and cut off tender leaves and buds, descending and hiding in the early morning. A widely distributed example is *Agrotis saucia*, a pest of orchards in both Europe and America.

**CUVIER, ku'vyá', FRÉDÉRIC** (1773-1838). A French naturalist, born at Montbéliard. He was professor of zoology in the Jardin des Plantes, Paris, and keeper of the collection in comparative anatomy at that institution. His published works include *Sur les dents des mammifères comme caractères zoologiques* (1825) and *Histoire naturelle des mammifères* (jointly with Geoffroy de Saint-Hilaire, 1819-29). He was a brother of Baron Georges Léopold de Cuvier.

**CUVIER, GEORGES LÉOPOLD CHRÉTIEN FRÉDÉRIC DAGOBERT, BARON DE** (1769-1832). A French naturalist, founder of the science of comparative anatomy, born at Montbéliard, then in the Duchy of Wurtemberg, to which place his father, formerly an officer in a Swiss mercenary regiment, had retired on a pension. He was educated at home in the strictest tenets of the French Protestant or Calvinistic faith, and at the age of 14 entered the Academy at Stuttgart, where he remained four years. His father intended him for the ministry, but he showed such a love for natural history that he was allowed to spend his time in pursuing such studies in that branch of science as the academy afforded, and supplemented them with reading almost every scientific book in the library. In 1788 he became tutor in the family of the Comte d'Héricy, a Protestant nobleman living near Caen, on the coast of Normandy. Here, during the stormy years of the Reign of Terror, he remained, quietly utilizing the rather unusual facilities the neighborhood offered for the study of marine animal life and fossil remains, thus laying the foundations of his future eminence. A chance acquaintance with the Abbé Tessier, a writer on agricultural subjects, who was struck with young Cuvier's remarkable knowledge of zoology, secured for him an introduction to Geoffroy Saint-Hilaire, who at once recognized in Cuvier a man of genius and urged him to move to Paris. Here, in 1795, he became, through the influence of Lacépède, Lamarck, and others, assistant to Mertrud, the professor of comparative anatomy at the Jardin des Plantes. He immediately took a high position among the scientists in Paris and was chosen one of the original members of the Institute upon its organization in 1795. In 1796 he was chosen professor of natural history at the central school of the Panthéon, and in 1800 he succeeded Daubenton in a similar position at the Collège de France. In 1802 he succeeded Mertrud at the Jardin des Plantes. In 1798 appeared his first separate work, *Tableau élémentaire de l'histoire naturelle des animaux*, in which he introduced tentatively his classification of animals upon which so much of his fame rests. Between 1800 and 1805 were published the five volumes of his *Leçons d'anatomie*, which brought together the hitherto disconnected knowledge of comparative anatomy and gave him the right to be con-

sidered the founder of that branch of science. In 1800 he published his first work on paleontology, *Mémoires sur les espèces d'éléphants vivants et fossiles*. At the opening of the nineteenth century, therefore, Cuvier may be said to have already attracted the attention of the scientific world to the three branches with which his name will always be connected.

Cuvier began his career as an administrator in 1802, when he was appointed an inspector of education under the Consulate and helped establish *lycées* at Marseilles, Bordeaux, and Nice. From 1808 to 1813, as a member of the council of the Imperial University under Napoleon, he spent considerable time in Italy, Holland, and Germany, organizing the academies in the districts recently annexed to the Empire. In 1814 Napoleon made him a Councillor of State, a position which he continued to hold under Louis XVIII. In 1819 he became president of the Committee of the Interior, and chancellor of the University of Paris. He was made a member of the Academy in 1818 and a grand officer of the Legion of Honor in 1826. In 1822 he was appointed grand master of the faculties of Protestant theology, in which position he had supervision of all the civil, political, and religious affairs of Protestant institutions and organizations. In 1831 Louis Philippe made him a peer of France, and in 1832, shortly before his death, was considering him for the office of Minister of the Interior.

With all his administrative duties, Cuvier still found time and opportunity to pursue his scientific investigations. His life work falls naturally into three divisions—paleontology, systematic zoology, and comparative anatomy. In each of these departments he achieved remarkable success and left a lasting impression, in spite of mistakes due largely to personal peculiarities derived from his Calvinistic training, such as his refusal to accept the theory of descent. By means of his knowledge of comparative anatomy, and his theory of the correlation of growth, Cuvier "reconstructed" a large number of extinct animals, proving that every geological epoch is represented by distinct animal forms, having a similarity well defined to animals in preceding or succeeding epochs. Nevertheless, he held to the Linnean doctrine of the constancy of species, and looked upon the similarity of animal forms in successive epochs as a recurrence of types rather than a steady development of the same type. In comparative anatomy his work in special fields was as remarkable as it was valuable. His investigations of the comparative anatomy of fishes and of the osteology of mammals may be mentioned as two of his most valuable contributions to zoology. In systematic zoology his work was of great originality and importance, for to him is due the reclassification of the animal kingdom on a natural basis, in place of the artificial and arbitrary classification of Linnaeus. Cuvier's system was based on the constancy and morphological resemblance of types rather than on outward similarities of structure. It remained the standard arrangement of animals until set aside by modern investigators. Cuvier's great work, *Le règne animal* (1816), became at once the standard reference book in natural history.

Among his works not noted above are: *Les reptiles douteux* (1807); *Recherches sur les ossements fossiles des quadrupèdes* (1812); *Mémoire pour servir à l'histoire et à l'anatomie des mol-*

*lusques* (1816); *Description géologique des environs de Paris* (1822); *Histoire naturelle des poissons* (1828); *Discours sur les révolutions de la surface du globe et sur les changements qu'elles ont produits dans le règne animal* (1851). Consult: Lee, *Memoirs of Baron Cuvier* (New York, 1883; Fr. trans., Paris, 1833); Flourens, *Histoire des travaux de Georges Cuvier* (Paris, 1845); Ducrotay de Blainville, *Cuvier et Geoffroy Saint-Hilaire* (ib., 1890).

**CUVILLIER-FLEURY**, ku've'yá-flé're', ALFRED ARGUSTE (1802-87). A French author, born in Paris. His love of letters brought him to the attention of the Duc d'Orléans, who made him tutor to his son, the Duc d'Aumale (1827). These duties ended, he became a political writer on the *Journal des Débats*. In 1806 he was made a member of the Academy. Among his works are: *Voyages et voyageurs* (1837-54); *Études historiques et littéraires* (1854); *Nouvelles études historiques et littéraires* (1855); *Dernières études historiques et littéraires* (1859); *Historiens, poètes et romanciers* (1863); *Études et portraits* (1865-68); *Posthumes et vivants* (1878). Consult the biography by the Duc d'Aumale, in *Le livre du centenaire des débats*, and Bertin's edition (1900) of his *Journal intime*.

**CUXHA'VEN**, Ger. pron. kyks-há'f'en. A German seaport and watering place on the North Sea, at the mouth of the Elbe, about 57 miles northwest of Hamburg (q.v.), to which it belongs (Map: Germany, C 2). It has a fine harbor, which has been much improved in recent years, and which is now the station of the Hamburg pilots. It is a free port, being outside the Zollverein, and the Hamburg-American Steamship Company have made it the point of arrival and departure of their mail service. It is fortified and has a handsome old castle of the fourteenth century. Pop., 1900, 6906; 1905, 11,145; 1910, 14,888. See HAMBURG.

**CUYABÁ**, kú'yá-bá'. An episcopal city of Brazil, the capital of the State of Matto Grosso, situated on the Cuyabá River (Map: Brazil, F 7). It has broad, well-paved streets and contains barracks, an arsenal, and a military hospital. The town was formerly famous for gold and diamond mines and is now an important commercial centre. It has a steamship service to Montevideo, a trip of over 2500 miles. Pop., 1890, for the city, 14,507; for the municipality, 1912 (est.), 20,000.

**CUYAHOGA** (kí'a-hó'gá) FALLS. A village in Summit Co. Ohio, 33 miles south by east of Cleveland, on the Baltimore and Ohio, and the Cleveland, Akron, and Columbus railroads, and on the Cuyahoga River (Map: Ohio, G 3). It contains a public library and has manufactories of paper bags, wire nails, sewer pipe, machine-shop products, rubber goods, and flour. The water works and electric-light plant are owned by the village. Pop., 1910, 4020.

**CUYLER**, kí'lér, THEODORE LEDYARD (1822-1909). An American Presbyterian clergyman. He was born at Aurora, N. Y., Jan. 10, 1822; graduated at Princeton in 1841 and at Princeton Theological Seminary in 1846. After holding charges in New Jersey, he became pastor of the Market Street Reformed Dutch Church, New York, in 1853, and was pastor of the Lafayette Avenue Presbyterian Church, Brooklyn, from 1860 to 1890. His eightieth birthday was publicly celebrated in Brooklyn. He was prominent in temperance work. He was an influential

preacher and a prolific writer of books and articles. In 1902 he published his *Recollections of a Long Life*.

**CUYO** (kōō'yō) **ISLANDS**. A group of the Philippine Islands, Province of Paragua, in the northern waters of the Sulu, or Mindoro Sea (Map: Philippine Islands, C 5). The larger islands are volcanic, and the smaller are low-lying sandy tracts on a coral foundation. On a bay on the southwest shore of Grand Cuyo, the largest of the group, is the town of Cuyo, the capital. Its chief support is fishing and its population mostly women. It has defensive works and a thriving trade. Total number of islands in the group, 49; total area, 47 square miles; pop., 1903, 10,982.

**CUYP**, koip, **ALBERT** (1620-91). A Dutch landscape and animal painter. He was born at Dort, in October, 1620, and studied with his father, Jakob Gerrits Cuyp, a portrait and animal painter of mediocre ability. The son painted animals, still life, and even portraits, but in landscape he was one of the greatest and most original of his day. He was influenced by Jan van Goyen, but soon developed the fresh daring color and glowing atmospheric effects which constitute the peculiar beauty of his work. He was a close student of nature, though at times overhasty in execution. His landscapes found most appreciation in England, where most of them are still preserved, and he undoubtedly influenced such great English painters as Wilson and Turner. He is best represented in London—the National Gallery, Buckingham Palace, Bridge-water House, Wallace collection, Dulwich College, etc. Good examples of his work are also in the museums of St. Petersburg, Berlin, Paris, and Rotterdam, and a fine cattle piece in the Metropolitan Museum, New York. Consult Witzlach, *Niederländisches Künstler-Lexikon* (Leipzig, 1906), and De Groot, *Beschreibung und Verzeichniss der Werke holländischer Maler* (ib., 1908).

**CUYPERS**, kol'pērs, **PETER** (1827- ). A Dutch architect, born at Roermond. He studied at the Academy of Antwerp. The Royal Museum at Amsterdam is by him. He restored the Mainz Cathedral and built a number of important church edifices, including those of St. Jacob at The Hague, St. Barbara at Breda, St. Catharine at Eindhoven, the Sacred Heart at Amsterdam, and St. Boniface at Leeuwarden. He wrote *Der Dom zu Mainz*, *Baugeschichtliche Skizzen* (1878) and *Le Château de Haar à Haarszuydens* (1910).

**CUZA**, kōō'zā. See ALEXANDER JOHN I.

**CUZCO**, kōō's'kō, *Castilian Sp. pron.* kōōth'kō (Quechua, navel, as being the centre of the ancient Inca Empire). An episcopal city, the capital of the department of the same name, Peru, situated on the eastern end of that section of the Andes known as the Knot of Cuzco, more than 11,000 feet above sea level, and 360 miles east-southeast of Lima (Map: Peru, C 6). It is regularly built in part and contains several handsome buildings, prominent among which are the cathedral, in the Corinthian style, and the convent of Santo Domingo, built in part on the site of the great Inca Temple of the Sun. There are also hospitals, a university founded in 1692, a national college, and a museum. The city is the centre of a fertile agricultural district and has considerable trade and manufactures of cotton and woolen goods, refined sugar, leather, and embroidery. Pop. (est.), 20,000. Cuzco, the

capital of the Incas, is said to have been founded in the eleventh century. It retains evidences of its former splendor, although the ancient city was destroyed by Pizarro in 1535. These remains include the palace of the Incas, a fortress built of massive and irregular stone blocks, the temple of the Sun, and the temple of the virgins of the Sun.

**CUZCO**. The second largest department of Peru, bounded by Loreto on the north, Bolivia on the east, Puno and Arequipa on the south, and Apurimac, Ayacucho, and Junín on the west (Map: Peru, C 6). Area, 156,317 square miles. The southern and western parts are mountainous, and the eastern and northern are low and covered with thick forests. The department is to a large extent unexplored, and only a small portion in the south is inhabited. It is watered by the Urabamba and the head streams of many tributaries of the Amazon. The population is chiefly engaged in agriculture and cattle raising. Pop., officially estimated in 1906 at 328,980. Capital, Cuzco (q.v.).

**CUZZONI**, kōō-dzō'nē, **FRANCESCA** (1700-70). An Italian dramatic contralto, born at Parma. After studying under Lenzi she achieved her first great success at Venice in 1719, and later (1722-26) she added to her fame by singing in London in the operas of Handel, during the composer's own venture as an impresario. (See HANDEL.) In 1727 she was engaged in a bitter rivalry with Faustina Bordoni, who had supplanted her in Handel's company. She was married to Sandoni, the pianist and composer, and thereafter sang in Vienna, in Italy, and in Holland, where she was imprisoned for debt. It is asserted that in her old age she earned a living by covering silk buttons, and that she finally died in miserable poverty.

**CYAN'ELIDE**. See CYANIC ACID.

**CYAN'AMID**. A trade name for an artificial fertilizer containing about 45 per cent of calcium cyanamide and 27 per cent of calcium hydroxide. Calcium cyanamide is the name given by chemists and scientific agriculturists to the commercial cyanamid, though strictly it should apply only to the chemical compound designated by the formula  $CN_2.NCa$ , containing about 20 per cent of nitrogen. Free cyanamide, or acid cyanamide, designated by the formula  $CN.NH_2$ , was first obtained by Bineau in 1838, but was not isolated until 1851, when Cloez and Cannizzaro first described it. This work, however, was long before the commercial manufacture of calcium cyanamide, which is now made in the electric furnace. The calcium carbide, produced in the electric furnace, is removed, cooled, and crushed, and then packed into nitrifying ovens, which are cylindrical, perforated steel cans set in heat-insulated brick ovens. The carbide is heated to a temperature where it will combine with the nitrogen by means of a carbon rod in the centre of the can, through which the electric current passes, and nitrogen, which is obtained either from liquid air or more usually by the copper-oxide process, is admitted. The chemical reaction resulting in calcium cyanamide is as follows:  $CaC_2 + N_2 = CaCN_2 + C$ .

The material, both powdered and granulated, is sold to manufacturers of mixed fertilizers. Its use as a nitrogen fertilizer was proposed in 1901 by A. Frank and H. Freudenthal, while the basic patents for its manufacture were issued to Prof. Adolph Frank and Dr. Nicodem

Caro in 1908. A number of large works in Europe are engaged in the manufacture of the calcium cyanamide under these basic patents, and a large factory at Niagara Falls, Canada, in 1914, had a capacity in excess of 60,000 tons annually.

A number of tests have been made of the commercial cyanamid at various experiment stations in Europe and America, and in Germany it has been used as a weed destroyer in addition to supplying nitrogen to the young plants. It is said to be valuable for inducing a slow, steady growth of plants rather than as a forcing material, and is least efficient when used as a top dressing. It should be well mixed with soil at least a week before the crop is planted, and 250 pounds per acre is said to be the maximum amount that can be economically employed. It is not suited to acid soils, which should be first limed or treated with barnyard manure, as the latter material will supply the bacteria that are deficient in such soils. An even distribution of the material is facilitated by mixing it with two or three times its weight of damp earth. When used mixed with the standard commercial fertilizers, the cyanamid does not require any modification of the usual practice or special instructions. For its chemistry and use, consult: Pranke, *Cyanamid: Its Manufacture, Chemistry, and Use* (Easton, Pa., 1913); Fritsch, "Manufacture of Cyanamide and of Nitrate," in *Manufacture of Chemical Manures* (1911), and special bulletins from the various experiment stations as well as journals dealing with chemical technology. See also MANURES AND MANURING; NITROGEN, FIXATION OF.

**CYANE**, *si'a-nē* (Lat., from Gk. *κυανή*, *Ky-anē*). In Greek legend, the wife of Æolus, the god of the winds. Also a nymph, playmate of Persephone. She was transformed into the spring Cyane near Syracuse because of her grief when Hades carried off Persephone from this neighborhood. See CERES.

**CYANIC ACID** (from Gk. *κυανος*, *kyanos*, dark blue),  $\text{HCNO}$ . An unstable compound of carbon, hydrogen, oxygen, and nitrogen, obtained by heating cyanuric acid (qv.) in a current of carbon dioxide. Under ordinary conditions it is a volatile liquid having a strong pungent odor, but is transformed with explosive rapidity into a white, porcelain-like mass of the same percentage composition as cyanic acid. This polymorphic modification of cyanic acid is known as *cyamelide*. (See WOHLER.) After a long series of unsuccessful attempts, Van't Hoff succeeded in showing that three molecules of cyanic acid come together in the formation of cyamelide; which does not prove, however, that the resulting cyamelide molecule is  $(\text{HCNO})_3$ , and the probability is that the molecule of cyamelide is much more complex. Among the salts of cyanic acid may be mentioned the cyanate of potassium and the cyanate of ammonium. Potassium cyanate may be readily obtained by cautiously heating a mixture of potassium ferrocyanide and potassium bichromate; when pure, it forms a white crystalline powder readily soluble in water, in which, however, it gradually undergoes decomposition. Ammonium cyanate may be obtained from the cyanate of potassium by double decomposition. The transformation of ammonium cyanate into urea, observed by Wöhler in 1828, constituted the first synthesis of an organic compound and formed an event of the

greatest importance in the history of chemistry. See CHEMISTRY.

The careful study to which many derivatives of cyanic acid have been subjected has led to the view that cyanic acid may possess two different constitutional formulas, viz.,  $\text{N} \equiv \text{C} - \text{O} - \text{H}$  and  $\text{O} = \text{C} \equiv \text{N} - \text{H}$ . All efforts to produce two different compounds corresponding to those formulas having failed, chemists have proposed to explain this comparatively rare phenomenon on the following hypotheses: 1. Cyanic acid, like most other organic compounds, has a definite structure—say,  $\text{N} \equiv \text{C} - \text{O} - \text{H}$ ; but while during some of its transformations that structure remains unaltered, other transformations involve an intramolecular change resulting in the formation of derivatives of the compound  $\text{O} = \text{C} \equiv \text{N} - \text{H}$  ("isocyanic acid"), which is, for some unknown reason, less stable than the compound  $\text{N} \equiv \text{C} - \text{O} - \text{H}$  and incapable of existing in the free state. 2. According to another hypothesis, every single molecule of the acid is constantly changing its structure, its hydrogen atom rapidly oscillating between the nitrogen and the oxygen; so that while at a given instant the structure of the molecule might be represented by the formula  $\text{N} \equiv \text{C} - \text{O} - \text{H}$ , we should find its structure to be  $\text{O} = \text{C} \equiv \text{N} - \text{H}$  if we could stop the motion of the hydrogen atom at the very next instant. The substance is thus imagined to be composed, at any instant, of two different kinds of molecules, and as under certain conditions each kind may be capable of transformations which the other kind could not undergo, two series of derivatives should be expected, according to the nature of the transformations necessary to produce those derivatives and to the conditions under which the transformations take place. See also FULMINIC ACID.

**CYANIDE PROCESS.** See GOLD, Metallurgy. **CYANIDES.** See HYDROCYANIC ACID.

**CYANITE** (from Gk. *κυανος*, *kyanos*, dark blue), KYANITE, DISTHENE, or SAPPAHE. An aluminum silicate that crystallizes in the triclinic system. Although sometimes gray or green, it usually has a blue color and a vitreous to pearly lustre. The handsomest specimens are found in the St. Gotthard region in Switzerland, in the United States, Chesterfield, Mass., and Bakersfield, N. C., are well-known localities. Fine specimens have been cut as gems, but, as a rule, the material is too soft for wear.

**CYANOGEN** (Gk. *κυανος*, *kyanos*, dark blue + *γενος*, *genos*, producing, from *γλυκυσθαι*, *gignesthai*, Lat. *gignere*, Skt. *jan*, to be born). An important compound of carbon and nitrogen obtained by heating dry cyanide of mercury in hard glass tubes. It is a poisonous gas, having a peculiar odor and dissolving quite readily in water and in alcohol. If ignited in air, it burns with a purple flame, its carbon combining with the oxygen of the air to form carbon dioxide, while its nitrogen is set free. When dry, cyanogen is an exceedingly stable substance and may be heated as high as  $800^\circ \text{C}$ . without being decomposed; in aqueous solution, however, it gradually undergoes a series of chemical changes resulting in the formation of ammonia, hydrocyanic acid, urea, oxalic acid, and other compounds. The molecular formula of cyanogen is  $\text{C}_2\text{N}_2$ , its molecule being composed of two "cyanogen groups" ( $\text{CN}$ , or, as it is still sometimes written,  $\text{Cy}$ ), which enter into the composition of a large number of other substances known. Some of these interesting substances having a

blue color, the name "cyanogen" has been applied to the gas from which they are derived; but the gas itself is perfectly colorless. During the preparation of cyanogen from the cyanide of mercury an amorphous brown substance forms, which has the same percentage composition as cyanogen, but probably a much higher molecular weight; this compound is called *paracyanogen* and is denoted by the symbol (CN)<sub>x</sub>. Paracyanogen may be readily transformed into cyanogen gas by heating.

The derivatives of cyanogen form a large group of compounds, including hydrocyanic acid and its salts, the ferrocyanides and ferricyanides, cyanic and cyanuric acids and their derivatives, etc. The most important of these compounds are described in special articles.

**CYANOIDEA** (Neo-Lat. nom. pl. from Gk. *κύανος*, *kyanos*, dark blue + *εἶδος*, *eidos*, form). A suborder of the Carnivora (q.v.), composed of the family Canidae (dogs, wolves, jackals, etc.), regarded as forming the most central group of the Carnivora, from which the bears, weasels, and raccoons (Arctoidea) depart on the one hand, and the cats, civets, and hyenas (Ailuroidea) depart on the other. Consult Huxley, *Anatomy of Vertebrated Animals* (New York, 1878), and the books mentioned under MAMMALIA; Dog; Fox; ETC.

**CYANOMETER** (Gk. *κύανος*, *kyanos*, dark blue + *μέτρον*, *metron*, measure). An instrument for determining the color of the sky, invented by Saussure—a disk divided into sections, the several sections being tinted and gradually increasing in intensity from white to deep blue. When used to compare with the color of the sky, some of its sections will appear deeper and some lighter in tint. The section where there is no perceptible difference gives the measure or degree of the blueness of the sky.

**CYANOPHYCEÆ** (Neo-Lat. nom. pl. from Gk. *κύανος*, *kyanos*, dark blue + *φυκος*, *phykos*, seaweed). The lowest of the four great groups of algae. They are called blue-green algae from the prevailing color of the cell contents, which are tinted by a diffused blue pigment named "phycocyan." The cell structure is very simple, agreeing in this respect with the Bacteria (q.v.), with which they are usually associated in a group "Schizophytes," distinct from the true algae. For details of cell structure and classification, see ALGÆ.

Many of the Cyanophyceæ are one-celled, or consist of indefinite aggregations of cells situated in a common gelatinous matrix. Other forms are filamentous, and some are elaborately branched. A well-known unbranched form is *Oscillatoria*, interesting because of the movements of the tip of the filament, which swings in a complex curve. *Nostoc* forms large gelatinous balls filled with convoluted chains of cells. Certain cells in some filamentous forms lose their protoplasmic contents, becoming the so-called heterocysts, whose functions are but partly understood: they are responsible in many cases for the branching of the filaments, because the heterocysts become firmly fastened to the sheaths that inclose the vegetative cells. The growth of the latter causes such pressure between the fixed points, determined by the heterocysts, that the sheath is ruptured and the filament grows out at one side. Such branching is termed "false branching." Branches or portions of filaments that break off and start new plants are called "hormogonia."

The Cyanophyceæ are especially fond of warm shallow water, although many grow in damp situations on land, such as spray-wet rocks, damp timber, and earth. They live among the reeking vegetation of salt marshes and flourish in open sewers and drains. The fouling of shallow reservoirs in warm weather, when they give off the well-known "pigpen odor," is due to growth of Cyanophyceæ. The remedy is to deepen the water or apply copper sulphate. See ALGÆ.

One of the most remarkable displays of Cyanophyceæ is in warm springs, well illustrated in Yellowstone National Park, where the growths are brilliantly colored. Here certain species grow luxuriantly in water at a temperature of 75° C. and above, conditions which no other forms of algae can endure.

Another conspicuous display of blue-green algae is the water bloom or scum that frequently covers the surface of ponds and small lakes.

CYANOPHYCEÆ.

1, a and b, *Oscillatoria*, 2, *Chroococcoides* (a), and its division (b), 3, *Stigonema*, showing false branching and heterocysts.

Most of the water blooms are due to Cyanophyceæ, and the largest of all has given name to the Red Sea, whose tint is due to the presence of a flocculent sediment made up of bundles of short filaments of *Trichodesmium*. This peculiar condition of the ocean is not confined to the Red Sea, but has been reported off the coast of Brazil and South Carolina and in the Indian and Pacific oceans.

Consult Wolle, *Fresh-Water Algae of the United States* (Bethlehem, Pa., 1887).

**CYANOPHYLL** (Gk. *κύανος*, *kyanos*, dark blue + *φύλλον*, *phyllon*, leaf). A collective name for the blue coloring substance of leaves and flowers. See COLOR.

**CYANOSIS** (from Gk. *κύανος*, *kyanos*, dark blue). Lividity of the skin, caused by interruption of the circulation or of the respiration caused by nonoxidation of the blood. It may be temporary, as in a convulsion, when the face or lips are blue, or in croup (q.v.), where the face is bluish during an attack. It may be permanent, as in a "blue baby," or child born with obstructed pulmonary circulation, or with a defect in the heart (patent foramen ovale), by reason of which the arterial and the venous

blood are constantly mixed. These children rarely live long.

**CYANURIC ACID** (from *cyanogen* + *uric*, from Gk. *κύβηρ*, *ouron*, urine),  $C_3H_3O_3N_3$ . An organic chemical compound produced by heating urea. The latter is probably first transformed into biuret and cyanic acid, which then combine to form cyanuric acid, according to the following equation:

The most convenient method of preparing cyanuric acid is by heating the compound of cyanogen and bromine represented by the formula  $C_3N_3Br_3$  with water at about  $125^\circ C$ , the formation of the acid taking place according to the following chemical equation:

Cyanuric acid is a colorless crystalline substance sparingly soluble in water and yielding, when heated, ordinary cyanic acid. Like cyanic acid (q.v.), it is capable of yielding two series of derivatives, the study of which has led to assigning to it two "desmotropic" formulas, corresponding to the two different ways in which the acid may behave chemically, according to the transformations to which it may be subjected and the conditions under which those transformations may take place. These formulas represent the structures of two different cyanuric acids, though only one can be actually prepared:

Normal cyanuric acid

Isocyanuric acid

**CYATHASPIS** (Neo-Lat., from Gk. *κύθος*, *kyathos*, cup + *ἀσπίς*, *aspis*, shield). The name of a genus of Paleozoic fishlike forms, specimens of which are found in the Upper Silurian and Old Red Sandstone of Great Britain and strata of corresponding age in New Brunswick. It has been commonly regarded as an early ancestor of the fishes, but more recent study of the fossils which include only the dorsal and ventral shields has tended to show that the genus belongs to a class by itself, lying between the arthropods and the vertebrates. No evidences of vertebrae or notochord have been found, nor are the jaws of vertebrate type, consisting of a mere opening between the anterior margins of the shields.

**CYATHOPHYLLUM** (Neo-Lat., from Gk. *κύθος*, *kyathos*, cup + *φύλλον*, *phyllon*, leaf). A genus of fossil stony corals common in rocks of Middle Paleozoic age. The characters that distinguish this from other genera are of very obscure nature. The species, of which there are about 100 in number, ranging through Ordovician to Carboniferous rocks, vary greatly in form from small solitary individuals to large masses of closely compacted zooids, and their generic affinity can be determined only by study of thin sections under the microscope. The family of which *Cyathophyllum* is the type is a large one and includes many genera, of which the most important, *Heliophyllum*, *Eridophyllum*, *Lithostro-*

*tion*, *Omphyma*, and *Columnaria*, occur abundantly in the fossil coral reefs of the Silurian, Lower and Middle Devonian and the Carboniferous. A recent reef-building coral, *Moseleya*, from Torres Straits, shows affinities with the ancient *Cyathophylloidea* and serves to link this family with the modern *Astræidae*. See *CORAL*; *CORAL ISLAND*.

**CYAXARES I** (Gk. *Κυαξάρης*, *Kyaxarēs*, OPers. *Uvaxšatara*, having good growth or prosperity, Neo-Elam. *Vakšatara*, Babylon. *Uvaxuštar*). King of the Medes from 625 to 585, or 584 B.C., or, according to other authorities, from 634 to 594 B.C. Herodotus (i, 101-103) says he was the son of Phraortes, and grandson of Deioces, who was the founder of the Median Empire. He describes the pioneer work which Cyaxares did in organizing a powerful and well-trained army, and alludes to an eclipse which took place about 585 B.C. when this monarch was at war with Alyattes, King of Lydia. A large part of Asia was brought under Cyaxares' sway, and he was successfully invading Assyria and besieging Nineveh when his own kingdom of Media was invaded by the Scythians. In the combat which ensued the Scythians gained the day and held dominion over the Medes some 28 years. Media at last threw off the Scythian yoke, and Cyaxares once more successfully engaged the Assyrians and conquered Nineveh and the surrounding provinces with the exception of Babylon. The reign of Cyaxares lasted 40 years, including the Scythian domination, and his name is often mentioned in the Old Persian inscriptions as the one to whom the rebel princes of Media, who revolted against Darius, traced back their lineage in claiming the throne. Consult Messerschmidt, *Die Inschrift der Stele Nabonids in Mittheilungen der Vorderasiatischen Gesellschaft*, vol. i (1896). See *Media*.

**CYAXARES II**. According to Xenophon (*Cyrop.* i, 5, 2), a grandson of Cyaxares I (q.v.) and son of Astyages, and maternal uncle of Cyrus the Great. On the authority of Herodotus, however, it is generally believed that Astyages had no son, and it has been suggested that Cyaxares II may have been the brother of Astyages and son of Cyaxares I. His identity with Ahasuerus of the Bible has likewise, but with uncertainty, been suggested. In this way it has been thought that Cyaxares II may perhaps be the same as Darius the Mede in the Book of Daniel or even be identical with Gobryas. But the whole matter is complicated and uncertain. See *DARIUS THE MEDE*.

**CYBELE**, κύβη-λή (Gk. *Κυβέλη*, *Kybelē*, 'Pia, *Rhea*), or *RHEA* *CYBELE*, or the *GREAT MOTHER OF THE GODS*. A divinity whose worship spread far and wide through the ancient world, though its early seats seem to have been Crete and Asia Minor. According to the myth which belonged to the worship of Zeus on Mount Ida, in Crete, Rhea was the wife of Cronus and mother of Zeus, Poseidon, and Hades, i.e., of the ruling race of gods. (See *JUPITER*; *SATURN*.) In Asia Minor we find widespread worship of a nature goddess, regarded as the mother and source of all life, and honored with orgiastic rites upon the mountains and among the wild woods and caves. The wild beasts attended upon her, especially the lion, by whom her throne was watched and her car drawn. Her priests were called *Corybantes* (q.v.). The Asiatic worship of Cybele had its chief centre at Pessinus in Phrygia, whence it passed into Lydia. United

2. CYCAS REVOLUTA, in New York Botanical Garden.

dance wherever favorable Mesozoic deposits occur, ranging through North America, Europe, Asia, and extending into the Arctic regions, so that Bennettitales were evidently a world-wide type of great prominence. The evidence is clear that the group is directly connected with the extinct Paleozoic group of gymnosperms called Cycadofilicales. It is altogether probable that this Paleozoic group gave rise to a Mesozoic branch, which differentiated into Bennettitales on the one hand, and into Cycadales on the other—the former group dominating during the Mesozoic, and the latter continuing to the present day. In general habit the Bennettitales resemble the Cycads so closely that they were naturally mistaken for them until their internal structure, and especially that of their cones, was understood. Consult: Coulter and Chamberlain, *Morphology of Gymnosperms* (Chicago, 1910); Scott, *Studies in Fossil Botany* (London, 1909); Wieland, *American Fossil Cycads* (Washington, 1906).

**CYCLADES**, sik'la-déz (Lat., from Gk. *Kyklades*, *Kyklades*, from *κύκλος*, *kyklos*, circle). A portion of the archipelago lying southeast of Greece, in the Ægean Sea, comprising, in ancient times, the islands of Ceos (Zea, Kea), Cythnus (Thermia), Seriphus (Serpho), Siphnus (Siphanto), Gyarus, Syros (Syra), Paros, Antiparos, Andros, Tenos, Myconus, Delos, Rhenea, Melos, and Naxos (Map Greece, F 4). This group, arranged in three series, was supposed to form a circle with the sacred island of Delos at its centre, and this belief accounts for the name of the group. The modern nomarchy of the Cyclades includes, as well as the above, the islands of Cimolus, Polycandrus, Sicinus, Ios (Nio), Amorgos, Santorini (Thera), Anaphi, and about 200 smaller islands, some of which were formerly grouped with the Sporades (q.v.). The total area is 1041 square miles. The islands are mountainous, having altitudes of over 3000 feet in some instances. Some are of volcanic formation. With the exception of Naxos they are generally scantily watered and sparsely wooded. The formation of the most northern islands is limestone, slate, gneiss, and marble. In the south, eruptive rocks. They produce southern fruits and large quantities of marble, limestone, cement, fuller's earth, emery, manganese, and sulphur. Wine, brandy, hides, and tobacco are exported. Pop. (province), 1896, 137,747; 1907, 130,378. The chief town and capital is Hermopolis (q.v.), on Syra.

**CYCLAMEN**, sik'la-mén (Neo-Lat., from Gk. *κυκλάμιος*, *kyklaminos*, from *κύκλος*, *kyklos*, circle, referring to its corolla). A genus of plants of the family Primulaceae, having a wheel-shaped corolla with a long reflexed limb, and flower stalks twisted spirally downward after flowering. The species are herbaceous perennials, about 15 in number, and chiefly alpine in the south of Europe. They have turnip-like, partly subterranean stems, which are very acrid, but nevertheless are greedily eaten by swine, and the plants are accordingly often designated "sow bread." They are drastic and emmenagogic. Several of the species are frequent in our flower gardens, on account of the beauty and fragrance of their flowers. The most common species are *Cyclamen europæum* and *Cyclamen latifolium*, the latter being the source from which are obtained many of the forms cultivated as Persian cyclamens. The corolla of *Cyclamen latifolium* is strongly reflexed, giving the flower a curious

appearance. Consult: Candolle, *Sur une monstrosité du Cyclamen neapolitanum* (Geneva, 1887); Wooster, *Alpine Plants* (London, 1885), with color illustrations; Bennett, *Flora of the Alps* (ib., 1897). For illustration, see Plate of GREENHOUSE PLANTS.

**CYCLE** (Lat. *cyclus*, from Gk. *κύκλος*, *kyklos*, circle; connected with Skt. *cakra*, AS. *hucól*, Eng. *wheel*). A term used in chronology to denote an interval of time in which certain phenomena always recur in the same order. Cycles have chiefly arisen from the incommensurability of the periods of revolution of the earth and other celestial bodies. Our unit of time is the day of 24 hours, being the period of revolution of the earth round its axis. But neither the year—the period of the earth round the sun—nor the month—the period of the moon round the earth—can be measured by days, or even by hours, so as not to leave fractions. Cycles have been invented in such a way that after a certain number of revolutions of the body whose period is to be compared with that of the earth on her axis, the body shall at last occupy the same place in the heavens and calendar as it did when the cycle commenced. Of the numerous cycles or periods of this kind that have been invented, the more important are noticed under their specific names. See GOLDEN NUMBER; INDUCTION; METONIC CYCLE; PERIOD; ETC.

**CYCLE CAR**. A name given to a development of the motor cycle which has four wheels (or three) instead of two and is provided with a body within which the passenger and the driver sit. The capacity is usually two persons, and these may sit side by side, or the one in front of the other as in a tandem motor cycle. The driver usually is placed in front of the passenger. When the tandem arrangement is used, the gauge or centre distance between wheels on the same axle is 36 inches, or one meter in metric countries. The wheels are of small diameter (28 or 30 inches) and the construction light in weight (from 350 to 650 pounds), so that two persons can lift and carry the car. With side-by-side passenger seating, the gauge will be greater than 36 inches and the wheel base longitudinally between  $7\frac{1}{2}$  and  $8\frac{1}{2}$  feet. The motor will usually be two-cylindere, arranged either in V-form or parallel side by side, and with the shaft parallel to the axles, moving the latter by two chains at the sides of the body. Friction gearing has been popular as a means to secure the variable speeds and reversal between motor shaft and the driving wheels, and when belts are used from a jackshaft to the driving wheels, no compensating gear seems required to operate on curves. The air cooling of the motor cylinders is popular for the smaller sizes.

The line of separation between the small motor car and the cycle car is not very clearly defined, except so far as the gauge of wheel track and the volume of the motor cylinders determines one. The motor vehicle has a gauge of 56 inches, the same as that of the standard wagon, and will "track" with the latter in road runs.

At a meeting of the Fédération Internationale des Clubs Motor Cyclistes, on Dec. 14, 1912, it was formally decided that there should be an international classification of cycle cars, this classification to hold good in England, Canada, United States, France, Holland, Belgium, Italy, Austria, and Germany. It was also decided to divide

the classification into two classes, large and small cycle cars, as follows.

## LARGE CLASS

Maximum weight	784 pounds
Maximum piston displacement	1100 cubic centimeters (67.1 cubic inches)
Minimum tire size	60 millimeters (2½ inches approx.)

## SMALL CLASS

Minimum weight	330 pounds
Maximum weight	660 pounds
Maximum piston displacement	750 cubic centimeters (45.75 cubic inches)
Minimum tire size	55 millimeters (2¼ inches)

The smallest class of standard motor has a cylinder volume of 160 cubic inches.

The cycle car has been developed to meet the demand for a low-priced, mechanically propelled vehicle, light in weight, using little fuel and small tires, cheap in first cost, in operation, upkeep, and stabling, carrying two persons, and safer against upset on poor roads or trails than the motor cycle. Its small wheels prevent its entering into the class of high-speed vehicles, and it is not so well adapted for long tours with luggage.

**CYCLICAL FORMS** (from *cyclic*, Lat. *cyclicus*, Gk. *κύκλικος*, *kyklos*, circular, from *κύκλος*, *kyklos*, circle). In music, forms that consist of a cycle or series of movements, such as the suite, concerto, sonata, or symphony. The origin of cyclical forms is to be found in the form of the old overture, which consisted of three parts—the first and third being slow, while the middle part was lively. Gradually these three parts were extended and detached. In the older compositions the movements were alternately slow and fast. But soon it became customary to begin and end with a fast movement. In the modern symphony the customary arrangement is: (1) fast, (2) slow; (3) fast, (4) fast. But Beethoven's "Sonata," opus 109, and Tschaiowsky's "Symphonie Pathétique," are two famous examples of cyclical compositions closing with a slow movement. Originally all the movements of a cyclical composition were written in the same key. The development of the sonata (q.v.) wrought a change in this direction, so that different keys (though always related to the fundamental) were assigned to the different movements. The first and last movements, however, are always in the same key, which is considered the fundamental key of the whole work. If the first movement is in minor, the last is generally in the parallel major.

**CYCLIC ANAPÆST.** See VERSIFICATION.

**CYCLIC CHORUS** (Gk. *κυκλικὸς χορὸς*, *kyklos choros*). The chorus of 50 men or boys which danced in a circle around the altar of Dionysus during the dithyramb. See CHORUS.

**CYCLIC DACTYL.** See VERSIFICATION.

**CYCLIC POETS** (Gk. *κυκλικοί ποιηταί*, *kykli-koî poietas*). The name was given by the Greek grammarians of Christian times to a class of minor epic poets, who wrote on subjects dealing with events preceding, as well as during and following, the Trojan War; their works taken together formed a complete cycle of the events covered by the Trojan story. There was also a Theban cycle. The following titles are known to us: *Theogony*, *Titanomachy*, *Cypræ*, *Little Iliad*, *Destruction of Troy*, *The Return*,

*Telegony*, *Edipodea*, *Thebais*, *Epigoni*, and *Ethiopsis*. Our knowledge of the Epic Cycle is due largely to Photius and to Proclus. The scanty fragments with testimonia are best published by Kinkel, *Epicorum Græcorum Fragmenta* (Leipzig, 1877); also as an appendix to Welcker's *Der epische Cyclos* (Bonn, 1835-49). Consult the Appendix to Monro's edition of *Odyssey*, xiii-xxiv (Oxford, 1901), and Allen, "The Epic Cycle," in *The Classical Quarterly*, ii (1908). See ÆTHIOPIS; AGIAS; CYPRIA; LESCHES; PHOTIUS; PROCLUS; STASINUS; TABULA ILIACA, TELEGONUS; THEBAIS; THEBAN CYCLE.

**CYCLING** (from *cycle*). The use or act of riding the cycle, either bicycle or tricycle. Although now a common utility of everyday business life, as well as a means of recreation, it had its origin at the beginning of the latter half of the nineteenth century in what was then an improved velocipede and was used only for sport or recreation. (See BICYCLE.) The progress of cycling as a means of recreation was very rapid, its greatest general popularity occurring between 1890 and 1900. Thereafter for several years it steadily lost ground as a sport, partly if not largely as a result of objectionable features of professionalism which appeared in many race meets. However, apart from the many physical advantages derived from the practice of cycling as an exercise, it has been of inestimable benefit to the community at large, in that it has given to all a capacity of locomotion which formerly none but those of ample means and leisure could enjoy, and, as a natural consequence, has developed a general interest in the many "good roads" movements through the United States and England. Many long-distance tours have been accomplished by its means, notably that of Thomas Stevens, who, between April, 1884, and December, 1886, rode round the world, and Lenz, who (1892-94) rode a wheel carrying all his necessaries, as well as a camera, across America, Samoa, Japan, through China, Burma, India, Baluchistan, Persia, and Armenia. *Road racing* has always been a popular sport, and in the early nineties had attained such proportions that nearly every city and town throughout England and America had its annual road-racing fixtures.

*Track racing* is entirely artificial, and confined usually to professional riders racing under unnatural conditions. Long-distance and relay races, such as have been held at Tattersall's, Chicago, and Madison Square Garden, New York, while financially profitable to their projectors, have been very severely condemned as of no real value to the sport and frequently injurious to the riders themselves. The League of American Wheelmen, which was formed while cycling was at its height, was an excellent institution and did much to improve the roads, but with the decline of the sport the League declined to a shadow. Similar advantages are obtained for tourists in Europe by the Cyclists' Touring Club of England, founded in 1873 with headquarters in London, S. W. With this latter organization is allied the Touring Club of France and the Deutsches Radfahrerbund. The military organizations of all the European countries include corps of specially equipped and drilled cyclists, whose principal duties are the transmission of orders and the securing of information, for which purposes their speed, their noiselessness, and the comparatively good roads

which prevail have made them conspicuously useful. See ARMY ORGANIZATION: TACTICS, MILITARY.

**CYCLOID** (Gk. κύκλῳιδης, *kykloeidēs*, circle-like, from κύκλος, *kyklos*, circle + εἶδος, *eîdos*, form). A plane curve, the locus of a point on the circumference of a circle which rolls along a straight line. If, in Fig. 1, circle *O* rolls on

FIG. 1.

the line  $A_1A_2$ , the point *P* traces the arc of the cycloid  $A_1P_1A_2$ . If the generating point is taken at *Q*, within the circle, the resulting curve is  $B_1QB_2$ , called a "prolate cycloid." If the generating point is taken at *R*, in the plane of the circle, the resulting curve is  $C_1RC_2$ , a "curtate cycloid" or trochoid. If the generating circle roll on a fixed circle, instead of a straight line, curves like those in Fig. 2 are produced. (See

FIG. 2

**CARDIOID**) The curve formed by rolling the generating circle around the outside of the fixed circumference is called an "epicycloid." On the other hand, that produced by rolling the generating circle on the inside of the fixed circle is called a "hypocycloid." These curves belong to a general class called "rouleTTes," of which the cycloid is the simplest member. The construction for the cycloid was known to Bouvelles (1503), but its name is due to Galileo (q.v.), who in a letter to Torricelli (1639) recommends it for bridge arches. The term "trochoid" is due to Roberval (q.v.), and the term "roulette" (1659) to Pascal (q.v.). Roberval also effected (1634) the quadrature of the cycloid, showing that it equals three times the area of the generating circle, and he determined the volume obtained by revolution about its axis. Descartes constructed its tangents, and Pascal (1658) determined the length of its arc and the centre of gravity of its surface and of the corresponding solid of revolution. The length of one branch of the cycloid is four times the diameter of the generating circle, and its area is three times that of the same circle. If

*A*, (Fig. 1) is taken as the origin of coördinates, and *a* is the radius of the generating circle, the equation of the cycloid is

$$x = a \text{ vers } y^{-1} \left( \frac{y}{a} \right) - \sqrt{2ay - y^2}.$$

It is simpler, however, to use the expressions for *x* and *y* separately; viz.,  $x = a(\theta - \sin \theta)$ ,  $y = a(1 - \cos \theta)$ . The equations of the hypocycloid are

$$x = (a - b) \cos \theta + b \cos \frac{(a - b)\theta}{b},$$

$$y = (a - b) \sin \theta - b \sin \frac{(a - b)\theta}{b},$$

where *a* and *b* are the radii of the fixed and rolling circles. If the radius of the fixed circle is four times that of the rolling circle, the equation of the hypocycloid is  $x^2 + y^2 = a^2$ , *a* being the radius of the fixed circle, as in Fig. 2. Because of the elegance of its properties and because of its numerous applications in mechanics, the cycloid is the most important of the transcendental curves. One of its most interesting properties is that the time of descent from rest of a particle from any point on its inverted arc to the lowest point is the same; i.e., the cycloid is an isochronous curve. Thus, on an ideally hard and smooth surface whose sections are cycloids, the particle, having reached the lowest point, will through the momentum received in its fall, ascend the opposite branch to a height equal to that through which it fell, losing velocity at the same rate as it acquired it. The cycloid is also the curve of quickest descent; i.e., an object acted upon by the force of gravity, and setting out from any point of the cycloid, will reach any other point of this curve in shorter time than by following any other path. The cycloid is therefore referred to as the *brachistochrone* (Gr. βραχίστονος, *brachistos*, shortest, and χρόνος, *chronos*, time). The problem of finding the brachistochrone was proposed by Jean (Johann) Bernoulli in 1696 and formed the first important step in the calculus of variations. It was solved by Bernoulli himself, by Leibnitz, Newton, L'Hôpital, and Jacques (Jakob) Bernoulli. For the interesting history of the cycloid, consult any of the leading histories of mathematics, and also: Charles, *Aperçu historique sur l'origine et le développement des méthodes en géométrie* (Paris, 1875); De Groningue, *Histoire de la cycloïde* (Hamburg, 1701); Tannery, "La cycloïde dans l'antiquité," in *Bulletin des sciences mathématiques* (Paris, 1883).

**CYCLOID FISHES.** One of the four orders of fishes proposed by Agassiz, based on the character of the scales. Cycloid scales have the posterior or free margin smooth and not spinous. Cycloid-like ctenoid (q.v.) scales are not covered with enamel and belong to many of the present as well as many fossil fishes. The chub and its allies are examples.

**CYCLOMETER** (Gk. κύκλος, *kyklos*, circle + μέτρον, *metron*, measure). An instrument for recording the revolutions of any rotating object, as of a carriage wheel, bicycle wheel, or certain parts of machinery. One of the most common forms consists of a stud projecting from one of the spokes of a wheel and catching a toothed wheel, turning it one notch at each revolution. A similar instrument for measuring distances traversed is an odometer. This instrument, invented by Hudson, is extensively used by surveyors in collecting data for maps.

It is commonly attached to the wheel of a wagon, or to a light vehicle drawn by hand. The term "cyclometry" is often applied to the method of measuring circumferences or areas of circles (q.v.), but more generally it refers to the theory of circular functions. See FUNCTION.

**CYCLONE.** See STORM.

**CYCLOPÆDIA.** See ENCYCLOPÆDIA.

**CYCLOPEAN ARCHITECTURE**, or **MASONRY**. The name frequently used for an ancient wall of large, irregular stones, rudely hewn or quite unwrought. The term originated in Greece, where structures of this kind were fabled to have been the work of the Cyclopes. The ancients also attributed them to the Pelasgians (q.v.), whence such walls are sometimes called Pelasgian. The walls of Tiryns (q.v.), near Nauplia, are an example of the ruder style of Cyclopean masonry. They are made of huge stones, from 6 to 10 feet long, from 3 to 4 feet wide, and from 2 to 3 feet deep. The stones are either unwrought or roughly dressed with the hammer; some effort at horizontal joining was made. The interstices are filled up by small stones, and clay mortar was employed to bind them, though it has now been washed away to a great extent. The walls of Mycenæ (q.v.) are in part of the same rude construction as at Tiryns, but near the Lion Gate they are faced with huge rectangular blocks, fitted in rudely horizontal courses, and the same style of masonry (but more carefully executed) is employed in the great beehive tombs. A portion of the wall of Mycenæ—of much later date—is built of polygonal stones, carefully fitted so as to leave no interstices. Walls of the same general character are found in Asia Minor and Italy, where they surround many of the old Etruscan towns, though here the walls are more commonly in the rude ashlar masonry also found at Mycenæ. While in Greece these walls belong for the most part to the Mycenaean period, and are probably to be attributed to the Achaean domination, it is not likely that this style of fortification was peculiar to any one race, as similar masonry has been found in China and also in Peru and on a smaller scale in the British Isles. Polygonal masonry, composed of carefully hewn and fitted blocks, is common in Greek works of later times, and the early walls of Troy, as well as the tombs already mentioned, show that the Mycenaean civilization was capable of building walls of hewn and fitted stones, as good as, or better than, those erected in the classical times. The Cyclopean architecture is discussed in histories of architecture (q.v.), or in works dealing with the Mycenaean age (see ARCHÆOLOGY), or Etruria (q.v.). For a description of the remains of Cyclopean architecture in Greece and Italy, consult: Middleton, *Grecian Remains in Italy* (London, 1812), a rare work; Dodwell, *Views and Descriptions of Cyclopean or Pelasgic Remains in Greece and Italy* (ib., 1834), and, for a more general discussion, Petit-Radel, *Recherches sur les monuments cyclopéens* (Paris, 1841).

**CYCLOPES**, αἰ-κλό'πεζ (Lat., from Gk. κύκλωτες, *kyklōtes*, round-eyed, from κύκλος, *kyklos*, circle + ὤψ, *ōps*, eye). In Greek mythology, a race of one-eyed monsters, described as follows: 1. Homeric Cyclopes, a wild, lawless, gigantic race of shepherds, inhabiting an island in the western sea. The most famous is Polyphemus (q.v.). Homer describes him as one-

eyed, and later poets attributed this characteristic to his companions. 2. The Hesiodic Cyclopes, Brontes, Steropes, and Arges (i.e., Thunder, Lightning, and Thunderbolt), each having one eye in the middle of his forehead. They were the sons of Uranus and Gæa. Hurled into Tartarus by their father, but delivered by their mother, they helped Cronus to usurp the government of heaven. Cronus, however, in his turn, threw them back into Tartarus, whence they were again released by Zeus, whose servants they now became. Finally, they were slain by Apollo, because they forged the thunderbolt with which Zeus killed Asclepius. The Alexandrian and the Roman poets represented them as the companions and assistants of Hephestus at his forge, which was situated in a volcano, as at Lipari or Etna. In this capacity they were frequently represented on works of art. 3. The Cyclopes, a people who were said to have come from Thrace or Lycia to Argolis, and to have built the mighty walls of Tiryns, Mycenæ, and Argos for King Proteus. See CYCLOPEAN ARCHITECTURE. Consult Mayer, *Die Giganten und Titanen* (1887).

**CYCLOPS.** A play by Euripides, following the Homeric account of the adventures of Odysseus with the Cyclopes, and remarkable as the only preserved specimen of a satyric drama. (See *Greek Drama*, under *DRAMA*.) It has been translated by Shelley, who omitted a few passages.

**CYCLOPORA** (Gk. κύκλος, *kyklos*, circle + ὄραμα, *horama*, sight). A term applied to a painting placed on the walls of a large cylindrical room representing a landscape, battlefield, or other subject, with true perspective. The spectator stands in the centre, and the effect is extremely realistic, especially in the case of the representation of a battle, the cyclopoma of the battle of Gettysburg being a well-known American example. See PANORAMA.

**CYCLO'SIS** (Neo-Lat., from Gk. κύκλωσις, *kyklōsis*, a surrounding, from κύκλος, *kyklos*, circle). The rotation of the protoplasm within a plant cell. Only the outermost portions remain quiet. The various inclusions of the protoplasm, such as chloroplasts, nucleus, etc., are swept along with it. The mass descends on one side of the cell and ascends on the other. A line of no movement necessarily exists between the portions moving in opposite directions. See PROTOPLASM.

**CYCLOSTOMI** (Neo-Lat. nom. pl., from Gk. κύκλος, *kyklos*, circle + στόμα, *stoma*, mouth). A class of eel-like marine animals, the lampreys and hags, regarded as the lowest existing vertebrates (excluding Amphioxus). They have eel-like bodies of very primitive construction. "The spinal column is represented merely by a thick, persistent notochord, inclosed in a sheath, with, in the lampreys, small cartilaginous processes representing neural and hæmal arches. The skull is cartilaginous and is peculiarly modified. Behind it in the lamprey is a remarkable basket-like apparatus, composed of cartilaginous processes. This branchial basket, as it is termed, supports the gill sacs. The gill sacs, of which there are either six or seven pairs, are the organs of respiration and represent the gills of the true fishes." They are, however, very differently arranged, opening externally in some forms by several gill slits, and in others by only one, and communicating internally with the pharynx in diverse ways. Other organs do not

differ so widely from those of the true fishes, the most remarkable fact being that there is only one nasal sac and nostril instead of a pair. The round mouth, without jaws, suggests that of leeches. The Cyclostomi, which by some ichthyologists are regarded as an order (Marsipobranchii) of fishes, are bottom-keeping, voracious, slimy creatures, occasionally truly parasitic, and are traceable back to Paleozoic times.

**Fossil Forms.** Minute teeth (conodonts), found in Paleozoic rocks, have been by some authors considered to be teeth of cyclostomid fishes, but they are more probably the teeth of carnivorous annelids like the modern *Nereida*. In the Caithness flagstones of the Old Red Sandstone of Devonian age, near Thurso, in Scotland, are found numbers of a small, eel-like fossil, which has, with much probability of correctness, been referred to the cyclostomes. These small fossils, known as *Paleospondylus*, vary in length from 1 to 2 inches and consist of an oblong skull, made of bony plates, armed anteriorly with small calcified cirri, and provided posteriorly with two long prolongations that parallel the vertebral column. From between these prolongations projects the long vertebral column, made up of distinct calcified elements, with neural spines in the abdominal region, and both neural and haemal spines in the caudal region. A long, diphycceral tail fin with very slender rays, of which those of the neural series are bifurcated, must have formed a powerful swimming organ for this small fish. This fossil, if it be a true cyclostome, differs from all others of the group in having a calcified skeleton. Consult Calvet, "Diagnoses de quelques espèces nouvelles de Bryozoaires Cyclostomes," in *Institut Océanographique, Bulletin* No. 217 (Monaco, 1911), and Dean, "The Devonian Lamprey, *Paleospondylus gunni*, Traquair, with Notes on the Systematic Arrangement of the Fish-like Vertebrates," *Memoirs of the New York Academy of Sciences*, vol. 11, part 1 (New York, 1899). This work includes a complete bibliography of fossil cyclostomes. See CONODONT; HAGFISH; LAMPREY; and Plate of LAMPREYS AND DOGFISH.

**CYCLOSMMETRY.** See SYMMETRY.

**CYCLUS** (Lat., circle). A curious fossil crustacean found in the coal measures of North America and Europe. It is of a circular, convex form, with usually a low median ridge on its dorsum, and its surface is either smooth, radially striated, or nodular. A pair of small sessile compound eyes, like those of the horseshoe crab, have been found near the anterior lateral margin of some American examples. These fossils are perhaps the larval stages of other crustaceans, like *Belinurus*, *Euproops*, *Prestwichia*, of which adult specimens are often found in the same beds with *Cyclus*. Consult Woodward, "On the Genus *Cyclus*," *Geological Magazine*, vol. viii (1870), and 4th series, vol. i (London, 1894). See PRESTWICHIA, XIPHOSURA.

**CYDIPE** (Gk. *Κυδίπη*). See ACONTIUS.

**CYDNUS** (Lat., from Gk. *Κύδνος*, *Kydnos*). A river of Cilicia, passing the city of Tarsus and emptying into the Mediterranean. It was on this river that Cleopatra made her voyage to meet Antony.

**CYDONIA.** See QUINCE.

**CYGNÆUS**, FREDRIK (1807-81). A Finnish poet and literary historian. He was born at Tawastehus and was educated at the University

of Åbo, where he lectured from 1839 to 1843, when he began an extensive tour through Europe. In 1854 he became professor of æsthetics and modern literature at the University of Helsingfors. He bequeathed his fortune and valuable art collection to the state. His poetic works were published by him under the title *Skaldestycken* (6 vols., 1851-70).

**CYGNÆUS**, UNO (1810-88). A Finnish educator, born at Tawastehus. From 1837 to 1839 he was a pastor and teacher at Wiborg, from 1839 to 1846 spiritual director of the colony at Sitka, Alaska, and in 1861 was appointed chief inspector of the Finnish public-school system, which he thoroughly reorganized. In 1863 he established the first normal school in Finland and became its director. He was the first to make manual work (*sloyd*, *sloyd*) a part of regular public-school instruction. He published *Föreläsningar för folkskoleläsare* (1861).

**CYGNUS** (Lat., from Gk. *Κύκνος*, *Kyknos*, the swan). A northern constellation situated to the east of Lyra and northwest of Pegasus. Several stars in this constellation have received the particular attention of astronomers.  $\beta$  *Cygni*, first detected as a double star by Bradley, has two beautiful colored components of the third and fifth magnitudes—the former topaz yellow, the latter azure.  $\delta$  *Cygni*, also a double star, was the first star to have its parallax (q.v.) determined, this was done by Bessel in 1838. The parallax, 0.37 sec., indicates a distance of 9 light years, so that, with the exception of  $\alpha$  *Centauri*,  $\delta$  *Cygni* is our nearest stellar neighbor. *Nova Cygni*, discovered as a star of the third magnitude by Schmidt at Athens in 1876, is now, according to Barnard, of the 15th magnitude.

**CYLINDER** (OF, *cylindre*, Fr *cylindre*, from Lat. *cylindrus*, from Gk. *κύλινδρος*, *kylindros*, roller, from *κυλίνδω*, *kylindō*, *κύλειν*, *kylēin*, to roll). A surface generated by a line (the generatrix) which moves parallel to a fixed line and touches a given curve (the directrix) is called a cylindrical surface. The space enclosed by a cylindrical surface is called a cylindrical space. The portion of a cylindrical space limited by two parallel planes cutting all the elements of the cylindrical surface is called a cylinder. If the directrix is a circle, the cylinder is called a circular cylinder; if the directrix is an ellipse, the cylinder is called an elliptic cylinder, and so on. If the elements (positions of the generatrix) are perpendicular to the plane of the directrix, the cylinder is called a right cylinder; otherwise it is called oblique. If a rectangle is revolved about one of its sides, a cylinder of revolution, or a right circular cylinder, is formed. The plane figures which form

A CYLINDER OF REVOLUTION.

The ends of a cylinder are called its bases, and these are always congruent. The perpendicular distance between the bases is called the altitude.

The lateral area of any cylinder, expressed in surface units, is the product of the number of linear units in the perimeter of a section perpendicular to the elements (right section) and the number of linear units in an element. The number of units of volume of a cylinder is equal to the product of the number of square units of the base and the number of linear units in the altitude of the cylinder.

A RIGHT CIRCULAR CYLINDER. AN OBLIQUE CYLINDER.  
B<sub>1</sub>, B<sub>2</sub>, lower and upper bases, E, an element, R, a right section, a, the altitude.

A cylindrical surface may be considered as a conical surface (see CONE) with the vertex at infinity. Hence plane sections of the cylindrical space of a right circular cylinder lead to the so-called conic sections, in particular, to the ellipse. If  $V \equiv$  volume,  $C \equiv$  curved surface,  $B \equiv$  base,  $A \equiv$  total area of surfaces,  $a \equiv$  altitude,  $r \equiv$  radius of the base (or of the inscribed sphere), and  $R \equiv$  the radius of the circumscribed sphere of a right circular cylinder, then  $V = \pi r^2 a$ ,  $C = 2\pi r a$ ,  $A = 2\pi r^2 + 2\pi r a = 2\pi r (r + a)$ ,  $R = \sqrt{\frac{a^2}{4} + r^2} = \frac{1}{2} \sqrt{a^2 + 4r^2}$ . The volume of a sector of a cylinder of arc  $k^\circ$  is  $\frac{k}{360} \pi r^2 a$ ; if the arc is given in radian measure, as  $n$  radians, the volume is  $\frac{1}{2} \pi r^2 a$ . If a plane parallel to the axis cuts off a segment, the corresponding arc cut from the base being  $k^\circ$ , the volume of the cylindrical segment is  $V = \frac{r^2 a}{2} \left( \frac{k}{180} \pi - \sin k^\circ \right)$ , or if  $k^\circ = n$  radians,  $V = \frac{r^2 a}{2} (n - \sin n)$ . The mensuration of the cylinder was well known to the Greeks and was studied specially by Archimedes (q.v.). He showed that the volume and surface of a sphere are equal to two-thirds of the volume and surface, respectively, of the circumscribed cylinder. In consequence of this discovery, as Cicero relates, the sphere and cylinder were sculptured on his tomb.

**CYLINDER SNAKE.** One of a family (Ilysiidae) of small burrowing snakes allied to the Typhlopidae and shield snakes, and retaining vestiges of pelvis and hind limbs, the latter showing in clawlike spurs protruding between the scales on each side of the vent. The form is cylindrical, the scales small, polished, and hardly larger on the belly than elsewhere, and the colors bright. The few species are scattered over the Malay Islands and Indo-China, where the common "red snake" (*Cylindrophis rufus*) reaches a length of 2½ feet, and occur in Ceylon and South America. A beautiful species (*Ilysia scutale*) in tropical South America is one of those called "coral snake," and is coral red with black rings. On account of its beauty, perfectly harmless nature, and "for cooling purposes," this snake is said to be sometimes worn as a necklace by the native women.

**CYLIX.** See VASE.

**CYLLENE**, sîl-lé'né (Lat., from Gk. Κυλλήνη, *Kyllênê*). A mountain in northwest Arcadia, the fabled birthplace of Hermes. (See MERCURY.) Its modern name is Ziria. Height, 7790 feet.

**CYLON** (c.660-c.610 B.C.). An Athenian noble, son-in-law of Theagenes of Megara, who sought to make himself tyrant of Athens. He was victor at Olympia (640 B.C.). In 612 B.C., with the protection of the Delphic oracle, and with outside help from Megara and the aid of a disaffected party in Athens, he seized the Acropolis of Athens. He was blocked there by Megacles, an Alcmaeonid, archon for the year, and surrendered on being promised his life, but was killed with his followers. The immediate result was war with Megara; the more lasting effect was the bloodguiltiness of the Alcmaeonidae (q.v.), of which their opponents so often took advantage to attack them.

**CYMA** (Lat. *cyma*, hollow sphere, from Gk. κύμα, *kyma*, swelling, from κύειν, *kyein*, to swell). In architecture, a molding having a profile of double curvature, part convex and part concave, each part usually a quarter round. When the convex part is next the wall or shaft, it is a *cyma recta*; when it is the outermost part, the molding is a *cyma reversa*. It corresponds practically to the modern ogee molding. See MOLDING.

**CYMATIUM**, st-mā'shî-ûm. See CORNICE.

**CYMBALS** (OF. *cimbale*, Fr. *cymbale*, Lat. *cymbalum*, Gk. κύμβαλον, *kymbalon*, from κύμβος, *kymbos*, cup, Skt. *kumbha*, pot, Ger. *Humppe*, drinking cup). Instruments of percussion in the form of round plates with leather holders. When struck one against the other, they produce a loud, harsh sound of no fixed pitch. The best cymbals are those made in Turkey and China. Attempts to discover and imitate the composition of the metal have all failed. The notes in music for this instrument are written on the same line or space, in rhythmical succession. Although originally military instruments, cymbals are now much used in the orchestra.

**CYMBELINE**, sim'bê-lin or -lin, or CUNOBELINUS. A king of the Britons, who lived in the earlier part of the first century of our era. His capital was Colchester. In 40 A.D. Cymbeline banished his son Adminius, who made his submission to Caligula. The Emperor considered Britain a part of the Roman Empire, but no attempt was made to subdue the island till after the death of Cymbeline. In 43 Aulus Plautius was sent to Britain by Claudius, but was opposed by Togodumnus and Caractacus, the sons of Cymbeline. We have no other authentic information of Cymbeline except what may be derived from the few coins extant. The story of Cymbeline which Shakespeare used in the drama is found in Holinshed's *Chronicle* and is in large measure mythical. Consult Boswell-Stone, *Shakespeare's Holinshed* (2d ed., London, 1907).

**CYME**, sîm (Gk. κύμα, *kyma*, swelling). A flat-topped flower cluster in which the pedicels arise at different levels upon an elongated axis and the innermost flowers bloom first. See INFLORESCENCE.

**CYMOPHANE.** See CHRYSOBERYL.

**CYMRY** or **KYMBRY**, kim'ri. See WALES, *History*.

**CYNANCHE**, sî-nān'ké (Gk. κυνάγχη, *kynanchê*, dog quinsy, from κύων, *kyôn*, dog + ἀγχειν, *anchein*, to swell).

*anchein*, to press tight). An obsolete medical term applied to the severer forms of sore throat.

**CYNANCHUM**, *si-nān'kūm*. Several drugs, including the knotty, acrid emetic roots of *Cynanchum vincetoxicum*, a once reputed counterpoison; the nausea-producing leaves of *Cynanchum oleaeifolium*, an adulterant of Alexandria senna; and *Cynanchum monspeliacum*, formerly considered as the source of Montpellier scammony. See ASCLEPIADACEÆ.

**CYNWULF**, *kin'e-wulf*, or **CYNWOLF**, *kin'wulf* (AS., king wolf) (c.750-c.825). A writer of some of the best Old English or Anglo-Saxon verse: *Juliana*, the story of the martyrdom of St. Juliana; *Elene*, a legend of the discovery of the true cross by the Empress Helena; *Christ*, celebrating the coming of Christ, His ascension, and the day of judgment; the *Fates of the Apostles*; *Andreas*, or the *Legend of St. Andrew*, and probably several other extant Old English poems. There is, however, no good reason for assigning to him (as is sometimes done) the riddles in the Exeter Book. About the poet nothing is positively known beyond what he himself has chosen to tell in his verse. In the first four poems cited above, he wove his name in runes. In the epilogue to *Elene*, he gave a brief sketch of himself, in which he speaks of his sinful youth, his conversion, his old age, and his reflection on poetic themes during the watches of the night. Cook has shown that Cynewulf's life must have been bounded very nearly by the years 750 and 825. It is uncertain whether he lived in Mercia, East Anglia, or Northumbria. Consult. Grein, *Bibliothek der angelsächsischen Poesie*, revised by Wülker (Göttingen, 1883-98), *Christ*, by Gollancz (London, 1892) and by Cook (Boston, 1900); *Juliana* by Strunk (ib., 1905), Root, *The Legend of St. Andrew* (New York, 1899); *The Elene: Trans. into English Prose* by L. H. Hall (ib., 1904); *Legend of St. Juliana* (Princeton, 1906). *The Poems of Cynewulf, Translated into English Prose*, by C. W. Kennedy (New York, 1910).

**CYNICS** (Lat. *cynicus*, Gk. *κυνικός*, *kynikos*, doglike, cynic, from *κῶν*, *kyōn*, dog). The name applied to a school of philosophers founded by Antisthenes, a pupil of Socrates. The main tenet of the extreme Cynics was that civilization is a curse, and true happiness can be obtained only by gratifying the most primary physical appetites which man has in common with the brutes. The general attitude of the Cynics, as distinguished from that of the Stoics, lay in the fact that while the Stoics regarded everything in the external material world with indifference, the Cynics viewed it with contempt. They were not an important philosophical school numerically, but attracted attention largely by their eccentricities and insolence. On account of their contempt for refinement, their name came subsequently to be applied to any one who takes a mean view of human life. The word "cynic" was probably suggested by the Cynosarges gymnasium where Antisthenes taught. See ANTISTHENES; DIOGENES; MENIPPUS.

**CYNOCEPHALUS**. See BAROON; MANDRILL.

**CYNODON**, *si'nō-dōn* (Neo-Lat., from Gk. *κυνόδων*, *kynodōn*, or *κυνόδους*, *kynodous*, dog-tooth, from *κῶν*, *kyōn*, dog + *ὄδους*, *odous*, tooth). A small genus of grasses, having digitate or racemose spikes, with spikelets on one side, glumes nearly equal, boat-shaped, and containing one floret, which has two awnless paleæ,

the fruit coated with the hardened paleæ. The most important species is *Cynodon dactylon*, a grass very widely diffused, which is the principal fodder grass and best pasture grass of India, where it is the principal covering of many thousands of square miles and is known by the names of Dhoob, Doorba, etc. It is also common in the south of Europe. It is introduced throughout the warmer parts of the world. Its creeping roots have medicinal virtues and are sometimes used as a substitute for sarsaparilla. See BERMUDA GRASS.

**CYNOGNATHUS**, *si-nōg'na-thūs* (Neo-Lat., from Gk. *κῶν*, *kyōn*, dog + *γνάθος*, *gnathos*, jaw). A large theriodont reptile found fossil in the Karoo formation, of Jurassic age, of South Africa. It belongs to the group Cynodontia, which probably contains the ancestor of the mammals. The skull, which has a length of 16 inches, is, in respect to its form and dentition, remarkably like that of the carnivorous mammals and recalls that of a wolf. The vertebrae, which are 29 in number, are amphicoelous, and the ribs have double articulations. It is perhaps one of the reptiles which have given rise to some of the early mammals. See THERIODONTIA.

**CYNOIDEA**. See CARNIVORA.

**CYNOSARGES**, *sin'ō-sār'jēz* (Lat. from Gk. *κυνόσαργες*, *kynosarges*, explained in ancient days as from *κῶν*, *kyōn*, dog + *ἀργός*, *argos*, white). A place on the outskirts of ancient Athens, usually regarded as near the present site of the American and British schools of archaeology, northeast of the Acropolis, on the slope of Mount Lycabettos. For a different view, consult Welker, *Athens and its Monuments* (New York, 1913). It contained a number of temples and a gymnasium consecrated to Heracles, at which strangers with but one Athenian parent were obliged to exercise. The philosopher Antisthenes is said to have taught here, and thence his school probably derived the name "Cynic."

**CYNOSCEPHALÆ**, *sin'ōs-sēf'ā-lē* (Lat., from Gk. *Κυνὸς Κεφαλά*, *Kynos Kephalai*, Dogs' Heads). The name of two hills in eastern Thessaly, where the Thebans under Pelopidas defeated Jason, tyrant of Phææ, 364 a.c., and the Romans, commanded by T. Quinctius Flamininus, defeated Philip V of Macedon, 197 a.c.

**CYNOSURE**, *si'nō-shōor* or *sin'ō-shōor* (Lat. *Cynosura*, Gk. *Κυνόσουρα*, *Cynosoura*, constellation of Ursa Minor, from *κῶν*, *kynos*, gen. sing. of *κῶν*, *kyōn*, dog + *οὐρά*, *oura*, tail). The constellation of which the pole star is the principal star. Milton's lines in "L'Allegro"—

"Where perhaps some beauty lies,  
The cynosure of neighboring eyes" —

have made the word popular; the metaphor is grounded on *Ursa Minor* being the constellation towards which the others look, as it were, and round which they wheel.

**CYNOSURUS**. See DOG'S-TAIL GRASS.

**CYNTHIA** (Lat., from Gk. *Κυνθία*, *Kynthia*). A surname of Diana (q.v.), from her birth-place, Mount Cynthus, on the island of Delos; and hence a poetic term for the moon. Queen Elizabeth is referred to under this name in Spenser's *Colin Cloute's Come Home Again*, in Fletcher's *Purple Island*, and in Raleigh's poem "Cynthia." See CYNTHIUS.

**CYNTHIA MOTH**. See AILANTHUS MOTH.

**CYNTHIANA**, *sin'thi-an'ā*. A city and the county seat of Harrison Co., Ky., 33 miles by

rail north-northeast of Lexington, on the South Licking River and on the Louisville and Nashville Railroad (Map: Kentucky, F 2). It is the centre of a fertile agricultural region and contains distilleries, flour mills, and a tobacco market of repute. The government is administered under a charter of 1893, which provides for a mayor, elected every four years, and a municipal council, chosen biennially. The city owns and operates the water works. Pop., 1900, 3267; 1910, 3603. On June 11, 1864, Gen. John Morgan, with 1800 men, captured Cynthia and, later in the day, defeated 500 Union cavalry under General Hobson; but on the 12th he was in turn defeated by General Burbridge with a force of about 5400, the Union army losing, in killed, wounded, and missing, 414 men, the Confederates about one-third of their number.

**CYNTHIA'S REVELS.** A comical satire by Ben Jonson, first acted in 1600.

**CYNTHIUS** (Lat., from Gk. *Kynthios*, *Kynthios*). A surname of Apollo, from his birth-place, Mount Cynthus, in Delos. See **CYNTHIA**.

**CYPERACEÆ**, sip'è-râ'sè-é or sip'è (Neo-Lat. nom. pl., from Lat. *cyperos*, *cyperum*, Gk. *κύπερος*, *kypeiros*, sedge), commonly called the sedge family. It is associated with grasses in the order Glumales, the feature of the order being the absence of a perianth and the protection of the flowers by special bracts called glumes. The sedge family is smaller than the grass family, containing about 3200 species under about 75 genera. They are generally thought of as grasses by those who do not know the distinctions between the two families. The general contrasting features are as follows: the sedges have three-ranked leaves and often triangular stems, closed leaf sheaths, no ligules, and solid stems; while the grasses have two-ranked leaves on round stems, open leaf sheaths, ligules, and hollow stems. The greatest differences, however, occur in the flowers of the two families. In the sedges the flowers occur in spikes, consisting of overlapping glumes, and in the axil of each glume there is a flower consisting of three stamens and a solitary carpel, which becomes an achene. This inflorescence is entirely different from that of the grasses.

There are two great series of sedges. In one series the flowers are perfect, so that there is only one kind of flower and one kind of spike. In the other series the flowers are monosporangiate ("unisexual"), which means two kinds of flowers, staminate and pistillate. These two kinds may be in the same spike or in different spikes, and the two kinds of spikes may be on the same plant or different plants (dicocious).

By far the largest and most difficult genus of Cyperaceæ is *Carex*, the common sedges, with more than 1000 species. The other large genera are *Cyperus*, with 600 species; *Rynchospora* (beak rushes), with 200; *Scleria* (nut rushes), with 200; *Eleocharis* (spike rushes), with 160; and *Scirpus* (bulrushes), with 150.

Although sedges resemble grasses, they are by no means so nutritious, and many of them are so rough that they are not eaten by cattle except when very young. Much of the so-called marsh hay is made from sedges, which mostly frequent marshy grounds. See **CYPERUS**; **SCIRPUS**; **BULRUSH**; **COTTON GRASS**; **PAPYRUS**.

**CYPERUS** (Neo-Lat., from Lat. *cyperos*, *cyperum*, Gk. *κύπερος*, *kypeiros*, sedge). A genus of plants of the family Cyperaceæ which contains about 600 species, chiefly tropical, and

gradually decreasing in number towards the colder parts of the globe. Many of the species have tubers or corms, which in some are mucilaginous and nutritious; others contain a bitter principle and possess medicinal qualities. Of the latter class is *Cyperus longus*, or sweet cyperus, one of the species which is common in ditches and wet meadows in some parts of Europe, the rhizome of which has an odor of violets, and is astringent, tonic, and stomachic. It has been employed in medicine from very ancient times, but is now more used in perfumery. Some of the Indian species are also used medicinally and in perfumery in their native country, as well as species of kindred genera. Of those with esculent tubers, the most important is *Cyperus esculentus*. (See **CHUFA**.) A number of species are frequently grown as house plants, common among which are the umbrella plant, or umbrella palm, *Cyperus alternifolius*, and *Cyperus papyrus*, formerly called *Papyrus antiquorum*, the Egyptian paper plant. See **PAPYRUS**.

**CYPHEL.** See **HOUSELEEK**.

**CY-PRÈS**, sâ'prâ' (OF., as near). In English and American law, a rule of interpretation whereby a testamentary gift which cannot take effect in the precise manner intended by the testator is given an effect as nearly as possible like that which was intended. The doctrine has been applied in two classes of cases.

*In the Creation of Fee-Tail Estates.*—It is an established rule of real-property law that a gift of land by way of remainder to the issue of an unborn person is void if it follow a gift of a life estate in the same property by the same instrument to such unborn person himself. But if the gifts be made by will, the remainder to the issue may be saved by construing the life estate of such unborn person as a fee tail, in which case it is capable of descending to the issue as tenant in tail. See **FEE TAIL**; **ESTATE**.

*In Charitable Gifts.*—Where the object of a charitable gift fails, as by the dying out of the entire class of persons intended as beneficiaries of the charity, or where a charitable gift might be void in consequence of the indefiniteness of the charity or the operation of the rule against perpetuities, the Court of Chancery may direct the application of the property to another or to a specific charity. Thus, in the first case, a testamentary gift for the emancipation of slaves in the United States might, after the abolition of slavery, be devoted under the cy-près doctrine to the education of emancipated slaves; and, in the second case, a charitable gift for the benefit of the American Zionist Society—there being no such society in existence and there being a possibility that it may not come into existence within the period fixed by the rule against perpetuities—may be applied to the purposes which the testator had in mind, through the agency of any other society having similar aims and competent to make a beneficial disposition thereof.

It is in cases of charitable gifts that the cy-près doctrine finds most of its applications in the United States. It has been repudiated in several of the States, but in most of them it exists, and in New York, where it had for many years been in abeyance, it has recently been revived by statute. It is generally considered a salutary doctrine, as tending to preserve to charity a gift clearly intended for benevolent purposes, and as effectuating the general intention of the testator, even though the particular

CYPRESS, ETC.

1. MONTEREY CYPRESS (*Cupressus macrocarpon*).  
2. BROOM (*Cytisus scoparius*).  
3. CUBEBS (*Piper cubeba*).

4. AN ORNAMENTAL CROTON (*Croton Cooperi*).  
5. RED CURRANTS (*Ribes rubrum*).  
6. NUT GRASS (*Cyperus rotundus*).

intention entertained by him cannot be carried into effect. See CHARITABLE TRUSTS; PERPETUITIES; TRUST; INTERPRETATION; WILL; and the authorities referred to under those titles.

**CYPRESS** (Fr. *cyprès*, Lat. *cupressus*, Gk. *κυπάρισσος*, *kyparissos*; connected by some with Heb. *gopher*, a sort of tree, ASSYR. *giprur*, reed, canebrake). Evergreen trees and shrubs of the coniferous genus *Cupressus* and of the tribe Cupressineæ. They have small, often appressed, and imbricate opposite leaves and globular cones of a few thickened scales. There are about a dozen species, natives of Europe, Asia, and the western part of North America. One of the best known is the common cypress of the south of Europe (*Cupressus sempervirens*), and introduced into England and parts of the United States—a tree which attains a height of 80 feet and is famous alike for the great age it reaches and for the durability of its wood. The wood is red or yellowish, hard, compact, and durable. It is not subject to attacks of insects and was once in great demand for cabinetwork. It is believed to be the cedar wood of Scriptures and possibly the gopher wood also. Museum specimens of the wood are known to be several thousand years old, and the old doors of St. Peter's at Rome lasted for more than 1100 years until replaced by doors of bronze. Medicinal virtues were once attributed to the wood, but its present use is for cabinetwork and musical instruments. Perhaps the finest tree of this genus is *Cupressus macrocarpa*, the Monterey cypress of California. It is a beautifully symmetrical tree, attaining a height of 150 feet and a circumference of trunk of 8 to 10 feet. It grows rapidly, even on poor soils, and thrives best near the sea. It is not very hardy; freezing temperatures are fatal to it. A small tree (*Cupressus macnabiana*) of California is much hardier. *Cupressus funebris*, of China, has wide-spreading and often pendulous branches; it attains a height of 60 feet, and has been extensively planted as an ornament in regions adapted to it. *Cupressus glauca* is common ornamentally in the south of Europe, where it is known as cedar of Goa. *Cupressus torulosa* is a valuable species found in the north of India. *Thuja obtusa*, a related species of Japan, is hardy, attains a height of 100 feet, has a hard, close-grained, durable wood, which is considered of great value in Japan, where the tree is abundant in the forests. It is hardy in the latitude of New York, and some of its varieties are of great beauty. Other species occur in Japan, Mexico, and the United States. Among the best-known species are the yellow cedar (*Cupressus nootkatensis*), and Port Orford cedar (*Cupressus lawsoniana*), both of the Pacific coast region. The bald or southern cypress (*Taxodium distichum*) is a tall tree with deciduous leaves which occurs abundantly in the swamps from Maryland to Missouri and south to the Gulf of Mexico. The timber of this tree is valuable for many purposes. It works easily and is commonly used for shingles. In water it is very durable. When growing in wet places curious, conical, hollow upward growths, called "knees," rise from the roots. Their function is to aerate the roots when submerged temporarily by water. Permanent submergence kills the trees. The tree will grow in dry places and is frequently planted as an ornament as well as for its timber. For illustration of a California cypress tree, see Plate of CYCADS AND CYPRESS. For fossil forms

of cypress, see CONIFERÆ. Consult Masters, "A General View of the Genus *Cupressus*," in *Journal of the Linnean Society*, vol. xxxi (1896).

**CYPRESS SWAMPS.** Swamps of the southeastern United States in which the bald cypress (*Taxodium distichum*) is one of the dominant trees. See SWAMP.

**CYPRESS VINE.** See IPOMÆA.

**CYPRIA** (Lat. from Gk. *Κύπρια*, *Kypria*, from *Κύπρος*, *Kypros*, Cyprus). The title of a poem once ascribed to Homer, but declared by Herodotus not to be his, and later attributed to Stasinus. It relates the causes leading to the Trojan War, and so is a sort of preface to the *Iliad*. See CYCLIC POETS.

**CYPRIAN.** A name sometimes given to a courtesan as being a follower of Venus, the Cyprus-born goddess of love.

**CYPRIANUS**, or **CYPRIAN**, THASCUS CÆCILIUS, SAINT (c.200–258). The great leader of the early African church. He was born in North Africa and was of a wealthy family. His training had been in the law, and he had attained prominence as a teacher of rhetoric at Carthage. Up to 246, when in middle life, he had been a pagan. Then he applied for admission to the Christian Church as a catechumen and after instruction was baptized. Such a man was a great gain to the Church. He soon gave evidence of his piety by voluntarily parting with his property and giving the proceeds to the poor. In 247 he was made a presbyter, and in 248 Bishop of Carthage. He owed his rapid elevation to his high character, his noteworthy gifts of administration, and to the promise he gave of being a devoted leader. These hopes he did not belie. No sooner had he become accustomed to the duties of his high office than the peace which the Church had enjoyed for many years was broken by the sudden exhibition of zeal for the old faith on the part of the Emperor Decius. By the Imperial decree of 249 Christianity became a forbidden religion; its profession meant confiscation, torture, exile, even death, and bishops had a price set upon their heads. Not from cowardice, but from the conviction that it was better for him to continue to guide his flock, which he thought he could do as well out of Carthage as in it, in January, 250, he went into retirement—not exactly concealment, because it must have been easy for the authorities to find him if they wished. Thus he lived 14 months and then as calmly returned to Carthage. His time had been well spent, and the fruits of it appear in his preserved correspondence and treatises. But when once more in the city he saw for himself the desolation the persecution had caused. Many had denied the faith or pretended to do so, many had abandoned their homes, many had died. The more pressing question related to the treatment to be accorded the "lapsed," whom he treated sternly and commanded to repent and show contrition; then he would receive them. (See LAPSEN.) He had indeed dealt with the matter while in retirement, but now he must take a more decided stand. In March, 251, he held his first council at Carthage, in which he yielded somewhat to his opponents, who had grown stronger in his absence. The relation between Stephen, the Bishop of Rome, and the Bishop of Carthage is the most interesting point. They differ upon the important matter of the reception into the Church upon their renunciation of heresy of those who had been baptized by heretics.

Stephen—and this was the Roman and ultimately the general position—did not re-baptize such, while Cyprian did. The controversy was sharp and even acrimonious. Stephen called Cyprian a pseudo-Christian; Cyprian called Stephen a schismatic.

The episcopate of Cyprian was indeed a troubled one; heretics, schismatics, feeble, timid Christians, scheming, ambitious leaders, and, to add to the turmoil, the horrors of pestilence—all these must have greatly worried the Bishop. But he did much to strengthen the episcopate as an institution, and make Church councils part of the regular machinery of the Church. He held seven councils, the last in 256. But the end which he had long anticipated was very near. In August, 257, persecution once more broke out, this time under Valerian, the successor of Decius, and Cyprian was apprehended. He was treated with the utmost tenderness, for manifestly the officers were discharging a very disagreeable duty. He was brought before the proconsul (Aug. 30, 257), required to sacrifice to the gods, and on his refusal banished to Curubis, a free town near the sea (modern Xurbo), 50 miles southeast of Carthage. There he lived, attended by many friends and active in his episcopal duties, for 11 months, when he was recalled to Carthage and lived for a while in his own home. On Sept. 13, 258, he was again arrested, brought before the consuls, sternly questioned, and sentenced to death. "Our pleasure is that Thascius Cyprianus be executed by the sword," to which Cyprian only said, "Thanks be to God." On September 14 the sentence was carried out.

The writings of Cyprian are most interesting and handle a great variety of topics. The 82 letters are the most important, but the treatises on the "Unity of the Church," the "Dress of Virgins," the "Lapsed," the "Lord's Prayer," the "Vanity of Idols," "Against the Jews," are very instructive. The best edition of his writings is by G. Hartel (3 vols. Vienna, 1868-71); there is an English translation in *The Ante-Nicene Fathers*, vol. v (Buffalo, 1880-96). Consult A. Harnack, *Drei wenig beachtete cyprische Schriften und die Acta Pauli* (Leipzig, 1899); Von Soden, *Die cyprische Briefsammlung* (1., 1904), and for his life E. W. Benson (London and New York, 1897); Faulkner (Cincinnati and New York, 1906).

**CYPRINE**, *slp'rin* or *-rin* (Lat. *cyprinus*, *cyprinus*, from *cuprum*, copper). A name given to a pale sky-blue or greenish-blue variety of vesuvianite. Its color is said to be caused by a small amount of copper, whence its name.

**CYPRINIDÆ** (Neo-Lat. nom. pl., from Lat. *cyprinus*, Gk. *κυπρίνος*, *kyprinos*, carp). A family of soft-rayed fishes inhabiting the fresh waters of North America, eastern Asia, and Africa. The head is naked, and the body, with a few exceptions, is covered with cycloid scales. The mouth bears no teeth, but the pharyngeal bones bear from one to three series of teeth, with a maximum of seven teeth in the main series. There are about 200 genera and 1000 species. They are usually very numerous in individuals. With exceptions like the gold fish, they are not highly colored. The males often differ from the females during the spawning season, not only in additional colors, but in the growth of tubercles on the head, fins, and other parts of the body. The family includes such familiar fish as the chub, dace, carp, tench, bleak, bream, barbel,

minnow, goldfish, roach, loach, etc. Most of the North American species are small, under 12 inches in length. The Old World forms and some of the Pacific coast species grow to a much larger proportion and are often important as food. All important kinds are described elsewhere under their English names. See CARP.

**CYPRINODONTIDÆ** (Neo-Lat., from Gk. *κυπρίνος*, *kyprinos*, carp + *ὄδους*, *odous*, tooth). A large family of soft-rayed fishes closely related to the Cyprinidæ (q.v.), with which they were formerly placed. The body is elongate, compressed behind and usually depressed at the head, and both are covered with rather large cycloid scales. The mouth is small, extremely protractile, and provided with small teeth; the lower jaw usually projects, and the pharyngeal bones are not armed, as in the Cyprinidæ. The sexes are usually unlike, and some of the species are viviparous. In these the anal fin of the male is modified into an intromittent organ. The species are numerous, but none attains a large size, and some are extremely small. They inhabit the fresh-water streams, brackish waters and bays of America, southern Europe, Africa, and Asia. The family includes the top minnows, mummichog, killifish, etc., and the interesting anableps, or four-eyed fish. Many of the species are extremely resistant and have become adapted to very diverse habitats. See MINNOW; and Plate of KILLIFISHES and TOP MINNOWS.

**CYPRIOTES**, *slp'ri-ōts* (from Lat. *Cyprus*, Cyprian, from *Cyprus*, Gk. *Κύπρος*, *Kypros*, Cyprus; Turk. *Kıbrıs*). Natives or inhabitants of Cyprus. Since there appears to have existed at least as early as 4000 B.C. an indigenous civilization in the island of Cyprus, the creative and stimulative influences of which are discoverable all over the eastern Mediterranean, the relationship of its ancient inhabitants is a question of great importance. The idea that they were simply Semitic Phœnicians is being abandoned, since the civilization of the latter may very well have been derived from Cyprus, and not vice versa. Some of the latest authorities, like Ohnefalsch-Richter and Sergi, regard the autochthonous civilization of Cyprus as belonging, with the prehistoric Egyptian, to the Afro-Mediterranean or "Afro-European" culture centre, and its originators physically to the North African white race. Asiatic influence as such is later.

The literature about the Cypriotes and their culture is listed up to date in Cobham, *Bibliography of Cyprus* (London, 1900). The ethnological questions involved have been discussed by Ohnefalsch-Richter, in his article in the *Verhandlungen der Berliner Gesellschaft für Anthropologie* for 1899 and by Sergi in his *Mediterranean Race* (London, 1901).

**CYPRIPEDIDUM**. See LADY'S-SLIPPER.

**CYPRUS** (Lat., from Gk. *Κύπρος*, *Kypros*). The third largest island in the Mediterranean, in the northeast of that sea, nearly equidistant from Asia Minor on the north and Syria on the east, 40 miles from the former and about 60 miles from the latter (Map: Turkey in Asia, E 5). It is 140 miles long and 60 miles wide. Area, 3584 square miles. Cyprus formerly belonged to the Ottoman Empire, but since July 12, 1878, has been under British control. Two mountain ranges extend from east to west in northern and southern Cyprus respectively. The southern uplift is the more important of the two. Its highest summit is that of Mount Troodos,

about 6400 feet. This range terminates in the isolated peak of Oros Stavro, or Hill of the Holy Cross, a conspicuous landmark from Larnaca, and evidently the peak called Olympus by Strabo, although it is but 2260 feet high. The northern range is an unbroken ridge for 90 miles, inferior in elevation to the other, its highest summits not exceeding 3200 feet. Between these ranges is a broad plain extending across the island from the Bay of Famagusta to that of Morphou on the west, about 60 miles long and from 10 to 20 miles wide. This plain is called Messaria and is watered by two streams, the Pedias and Ialías. It is bare of timber, forests, mostly pine, being confined to the mountainous areas. The climate is generally healthy and dry except along the coast in summer. In the central plain and about Larnaca the heat is excessive, but is tempered by cool sea breezes until about the middle of September, between which time and the end of October is the hottest period. The winter is short and cold, but snow is seldom seen except upon high mountain peaks. Fevers are prevalent during the warm months.

In ancient times Cyprus supplied the Greek monarchs of Egypt with timber for their fleets. It was also celebrated for its copper, a metal which takes its name (*cuprum*) from the name of the island, but little work has been done in modern times. Silver also was produced; Pliny says precious stones were found there. Salt working, an ancient industry, is still carried on near Larnaca and Limassol. Gypsum, terra umbra, and asbestos are the chief minerals found. The majority of the rivers dry up in summer, being only mountain torrents fed by rains and melting snows. The Pedias and the Ialías are the most important. None is navigable.

Agriculture is the main industry; the chief products are cereals, carobs, wine and spirits, fruits and vegetables, linseed, aniseed, and cotton. Cattle, sheep, donkeys, and mules are raised; cheese, wool, and silk are produced for export. The development of the agricultural industries has been hindered by lack of water; but an irrigation scheme carried out by an Indian government engineer, the introduction of special machinery and implements, and compulsory reafforestation have done much towards bringing the soil to a high state of cultivation. Sponge fishing is remunerative, but sea fishing has declined. The imports, consisting mainly of cottons, flour, woollens, sugar, rice, petroleum, tobacco, minerals, etc., were valued, exclusive of specie, for 1911 at £547,772 (£402,961 in 1902); and the exports at £626,557 (£271,098 in 1902). The main articles of export (1911) were carobs, £182,883; live animals, £94,932; barley, £56,415; wine, £53,685; raisins, £29,636; silk cocoons, £27,587; raw cotton, £22,593; fruits, £21,585; vegetables, £14,106; wool, £13,452; hides and skins, £10,735; etc.

The formation of the coast line is unfavorable to commercial development, as there are few harbors. The Famagusta harbor was completed in June, 1906. Improvements were subsequently introduced to make it accessible to large steamers, an area 900 by 600 feet having been dredged, up to 1913, to a depth of 24 feet at low water; the channel of approach is 250 feet wide and 26 feet deep. The town, little more than a fortified ruin, is to be rebuilt and expanded. Its population in 1911 was 5327.

VOL. VI.—27

Larnaca (9262 inhabitants) and Limassol (10,302) are open roadsteads. An extension of the pier at Larnaca was completed in 1909. The ancient harbor at Paphos, the old capital of Paphos, has been dredged to admit coasting craft. Nicosia (Lefkosia), with 16,052 inhabitants, is situated near the centre of the island and is the capital. The six administrative districts are Nicosia (capital, Nicosia), Larnaca (Larnaca), Limassol (Limassol), Famagusta (Famagusta), Paphos (Ktima, with 3091 inhabitants), and Kyrenia (Kyrenia, with 1726). A government railway from Famagusta to Nicosia (36 miles) was opened to traffic in August, 1905, and was subsequently extended to Morphou, a total distance of 60 miles. Telegraphic communication is maintained between the principal towns and by cable with Egypt by the Eastern Telegraph Company, Ltd.; the Imperial Ottoman Telegraph Administration has a cable to the coast of Asia Minor. Good roads connect the important towns and villages.

By the Convention of June 4, 1878, between the British government and the Ottoman Empire, the former promised to defend Asiatic Turkey against further aggression by Russia, in return for the permission to occupy Cyprus. Sir Garnet Wolseley was appointed Governor, and was installed as administrator, July 23. The head of the administration is the high commissioner, who is assisted by an executive council consisting of three office-holders, and a legislative council of 18 members, one-third of whom are office-holders, the rest are elected on a property qualification, three by the Mohammedan and nine by the non-Mohammedan population. The municipalities are administered by elected councils. Education is to some extent controlled by the government and is chiefly of an elementary character. The total number of elementary schools in 1911-12 was 595 (191 Moslem, 404 Christian), with a total enrollment of 31,780 (5926 Moslems, 25,854 Christians). Government aid amounted to £6110. Justice is administered by a supreme court, assize, district magistrate, and village courts, all of them, with the exception of the first, having natives for judges. The chief sources of revenue are tithes on cereals grown on the island, which are paid in kind, taxes on property, salt monopoly, customs, excise, export dues, etc. The revenue was £319,572 in 1911-12, and the expenditure £235,256. Under the terms of the Convention of 1878 the sum of £92,800 annually was payable to the Porte; it was not actually paid over, however, but was retained and applied to the interest on the guaranteed loan of 1855. Cyprus was definitely ceded to Great Britain in 1913. The currency consists of English, Turkish, French, and native coins. The Imperial Ottoman Bank has branches on the island. The weights and measures are Turkish.

The population by districts follows, census of 1911: Nicosia, 81,497 (56,300 in 1881); Famagusta, 58,530 (38,207); Larnaca, 29,737 (20,760); Limassol, 46,084 (28,717); Paphos, 38,508 (28,424); Kyrenia, 19,752 (13,216)—total, 274,108 (185,630). About 25.9 per cent of the people are Mohammedans; the majority of the remainder belong to the Cypriote church, an autocephalous branch of the Orthodox Greek.

The early civilization of the island is known only from the excavations of recent years, which have thrown little light on the ethnic affinities of the primitive inhabitants. (See *CYPRIOTES*.)

There are but scanty traces of the Stone age, but the Bronze age (c.3000-1000 B.C.), both in the earlier period when pure copper is used and in the later period after the introduction of tin and the making of bronze, is characterized by a well-developed and clearly marked civilization, presenting close analogies to that represented in the lower strata at Troy (Cyprus was one of the chief early sources of supply for copper; see COPPER). The people seem to have been pastoral and to have avoided the mountains and forests. They early learned to work the rich copper mines of the island, and seem to have been somewhat in advance of their neighbors in Syria and on the islands of the Aegean. From its situation, Cyprus was exposed to foreign influences and seems to have served as intermediary between Egypt and Syria and the Mycenaean civilization of the West. The Mycenaean (Late Minoan) civilization seems to have reached the island about 1600 B.C. and to have continued for about 800 years. Whether it was introduced by Greek colonists is uncertain, but these colonists certainly came to the island before the Dorians had occupied Peloponnesus, and before the introduction of the later Greek alphabet; for they spoke a dialect closely akin to that of the Arcadians and used a clumsy syllabic mode of writing, akin to that of Crete. The Greek and Phœnician settlements belong to the Iron age; the latter are found chiefly along the southern coast, where they remained predominant in Citium, Amathus, and Marion even in later times. The Greeks at first settled along the northern shores and at the eastern and western extremities of the great plain which crosses the island at Amathus, Salamis, Soli, and later predominated in Paphos, Curium, and Lapathus. Whether the worship of Aphrodite, which flourished greatly in Cyprus, developed from that of a nude nature goddess of the original inhabitants or from that of the Phœnician Astarte is uncertain, but it reached the greatest splendor and sensuality among the Greeks, who regarded Cyprus as specially favored by the goddess. The island was invaded by Thothmes III of Egypt, about 1500 B.C., and was forced to pay tribute. In the eighth century before Christ it was tributary to the Assyrians. In the sixth century it was conquered by Amasis of Egypt, on the conquest of Egypt by Cambyse it passed under Persian rule. The Greeks of Cyprus joined in the Ionic revolt against Persia (500 B.C.), but were conquered, and Cypriote vessels were in the fleet of Xerxes. The attempt of Cimon (q.v.) to bring Cyprus into the Athenian League was unsuccessful, and the island remained tributary until Evagoras (q.v.) became King of Salamis (410-374 B.C.), made himself master of much of the island, and nearly succeeded in casting off the Persian yoke. After the battle of Issus, when Alexander advanced into Phœnicia, all the cities of Cyprus declared in his favor and sent ships to assist him in the siege of Tyre. Under the Persian rule the cities had been allowed a large measure of self-government under the control of kings, who seem to have claimed descent from heroic ancestors. After the death of Alexander the island, so important for its seemingly inexhaustible forests (it is now quite bare of trees), became an object of contention among his successors, being especially sought by Antigonus and Ptolemy I. It finally passed into the hands of the latter and was for a long time

a valued dependency of Egypt. In 58-57 B.C. the tribune Clodius proposed, and Cato effected, its annexation by Rome. Under Augustus it was made a proconsular province and from this time is scarcely mentioned in ancient history. Cyprus is noticed in Acts iv. 36, where it is mentioned as the native place of Barnabas; and in Acts xi. 19-20 it appears prominently in connection with the earliest spreading of Christianity. During the reign of Trajan (116 A.D.) it was the scene of a rising of the Jews, who are said to have killed 240,000 of the other inhabitants. After the division of the Roman Empire Cyprus passed under the Byzantine emperors. In 646 the Arabs became masters and destroyed the city of Salamis. Two years later the Greeks recovered sway; but in 802 it was again conquered by Harun al-Rashid, who was soon compelled to relinquish it to the Byzantine rulers. In 1184 Isaac Comnenus made Cyprus an independent sovereignty. In 1191 Richard of England ejected Comnenus because he had ill-treated the Crusaders, and in 1193 put Guy de Lusignan in possession as compensation for the loss of Jerusalem, of which Guy had been appointed King. For three centuries, under this dynasty, the feudal system flourished in Cyprus, the cities of Nicosia and Famagusta were adorned with churches, splendid even in their ruins, and the island seems to have been rich and prosperous. Through the Venetian Catarina Cornaro, the wife of James II, the Republic of Venice came into full possession of the island in 1489, after the death of James and his son, James III, and held it for about 80 years. In 1570 the Turks invaded Cyprus, quickly subdued the country districts, took the capital (Nicosia) after a siege, and murdered 20,000 of its inhabitants. Famagusta held out for a year and then made a capitulation, which was immediately violated by the Moslem general, who slowly tortured to death the governor of the city. From that period Cyprus continued a part of the Turkish Empire. In 1878 it was placed under English control by a treaty which recognized the sovereignty of the Sultan and assured him an annual income of £92,746. In 1882 a new constitution was promulgated, and under English rule the prosperity of the island has greatly increased.

The antiquities of the island have repeatedly been the subject of exploration; at first these efforts were largely unscientific and inaccurate, conducted chiefly for the purpose of obtaining booty. Of the earlier excavations the most productive were those of L. P. di Cesnola (q.v.), whose collections are for the most part in the Metropolitan Museum in New York. Later excavations in the modern scientific method have been conducted by the Cyprus Exploration Fund, the British Museum, Ohnefalsch-Richter, and others. Consult *Excavations in Cyprus*, published by the British Museum (London, 1900). See also IDALUM; LAENACA; PAPHO; the second SALAMIS.

**CYRANO DE BERGERAC**, sê'râ'nô' dō bâr'zh-râk'. See BERGERAC.

**CYRANO DE BERGERAC**. An opera by Walter Damrosch (q.v.), first produced in New York, Feb. 27, 1913.

**CYRENAICA** (Lat., from Gk. *Κυρηναία*, *Kyrēnaika*). The name of the district whose capital was Cyrene (q.v.) It comprised the table-land on the north coast of Africa from the Great Syrtis to the promontory of Ardanis (Râs el-Mellah), though its boundaries fluctuated according to the degree of subjection in which the neighboring tribes were held. This plateau of Cyrenaica was, and still is, one of the loveliest and most agreeable regions of the world. The climate is delicious, mountains on the south sheltering the land from the scorching blasts of the Sahara, and cool sea winds fanning it on the north. From the central plateau, whose breadth is about 80 miles, the land slopes down in verdant terraces to the Mediterranean. These terraces are cut and watered by mountain streams, forming luxuriant ravines. The productions of Cyrenaica mentioned by ancient writers are wheat, oil, wine, honey, fruits of all kinds, cucumbers, trifles, cabbage, flowers yielding the richest perfumes: and a plant called *silphium*. This plant, which was figured on the coins of Cyrene, has not been identified. The country was also celebrated for its breed of horses, but was much exposed to the ravages of locusts.

The chief cities of Cyrenaica were Cyrene, Taucheira (afterward called Arsinoë), Hesperides (afterward called Berenice), Barca, and Apollonia. Since it possessed five cities, in the time of the Ptolemies Cyrenaica was named Pentapolis and Pentapolitana Regia. To each city a certain amount of territory was attached. This favored their individual independence: and the consequence was that the dynasty of Battus, who led the first Greek colony to Cyrene (q.v.), exercised very little influence over Cyrenaica in general. After the death of Alexander the Great Cyrenaica became part of the Egyptian kingdom under the Ptolemies: in the second century B.C. it was a separate kingdom under a branch of the Ptolemaic family. In 96 B.C. it was bequeathed to the Romans by Apion, the last King, and shortly afterward was united with Crete as a Roman province. It continued

to prosper for some time, but with the increasing weakness of the Eastern Empire, to which it belonged, was more and more exposed to the encroachments of the desert tribes, and in 647 A.D. was overrun by the Arabs. Ancient Cyrenaica nearly corresponds to modern Barca (q.v.).

**CYRENAÏC SCHOOL**. A school of philosophy established by the followers of Socrates upon his death. Aristippus of Cyrene, its founder, taught that pleasure was the highest, good, thus developing one side of the Socratic teaching to the exclusion of all others. Virtue for this school meant the course of life that secured the greatest enjoyment. For this, wisdom is necessary, since the pursuit of pleasure, prompted by instincts and impulses as they arise, often defeats itself. The wise man is the man who knows how he can obtain the maximum of enjoyment and who acts upon this knowledge. This doctrine received various modifications according to the view its adherents took as to the way in which the hedonistic end is attainable. Thus Theodorus insisted that in the form, not of the pleasure of the moment, but of enduring joy or "cheerful frame of mind," can true satisfaction be obtained. Hegesias urged that an excess of pleasure over pain is unattainable, hence the true end of human endeavor is to minimize the discomforts of life, and he carried this doctrine to its logical outcome, that death is preferable to life: hence he was called the "recommender of death." This is perhaps the earliest appearance of pessimism (q.v.) in Occidental philosophy. On the other hand, Anniceris maintained that in the search for pleasure the friendly, social, filial, patriotic man is most highly successful, and thus went far towards carrying egoistic hedonism beyond its most obvious limitations. The Cyrenaic school was the precursor of the Epicurean (q.v.). Consult Watson, *Hedonistic Theories from Aristippus to Spencer* (Glasgow, 1895), and the authorities referred to in the article on ETHICS. See ETHICS, HEDONISM, UTILITARIANISM.

**CYRENE**, sî-rê'nê (Lat., from Gk. *Κυρήνη*, *Kyrîne*). In ancient geography, the capital of Cyrenaica, in northern Africa, situated about 10 miles distant from the coast and 1800 feet above sea level (Map: Roman Empire, with article ROME, E 3). It is said to have been founded in 631 B.C., by Battus and a body of Dorian colonists from the island of Thera. (See BATTIADÆ.) After the expulsion of the Battiade, about 450 B.C., Cyrene had varying forms of government, republic and tyranny interchanging. The city submitted to Alexander in 331 B.C.; shortly afterward it passed into the control of the Ptolemies. (For its later history, see CYRENAICA.) For centuries the site has been without permanent inhabitants. In ancient days Cyrene carried on an extensive commerce with Egypt and Greece and was the birthplace of many distinguished men—the philosophers Aristippus and Carneades, the poet Callimachus, the astronomer Eratosthenes, and Bishop Synesius. Between 1703 and 1910 the site had been visited by various travelers. Explorations and excavations were made in 1821–22, and again in 1861, on the latter occasion in behalf of the British Museum. For a report of the latter excavations, consult Smith and Porcher, *Discoveries in Cyrene* (London, 1864). For earlier visits, consult Barth, *Wanderungen durch die Küstenländer des Mittelmeers* (1849), and

Hamilton, *Wanderings in North Africa* (1851). In May, 1910, a firman was issued to a representative of the Archaeological Institute of America for the excavation of Cyrene, and the sum of \$15,000 a year for three years was subscribed by members of the Institute. From October, 1910, to May, 1911, excavations were conducted at the site. On a hill believed to be the site of the ancient acropolis Greek and Roman walls were uncovered, and many small objects were discovered. It was found that a circle with the acropolis as its centre and a radius of 5 miles would not cover all the terraces, tombs, buildings, and reservoirs in sight. For a popular account of these excavations, consult the *Bulletin of the Archaeological Institute of America*, ii (1910-11). Later work uncovered a group of Ptolemaic buildings, and 3000 terra cotta and some fine sculptures were found. Work was then suspended because of the war between Italy and Turkey in Africa. Consult Robinson, "Inscriptions from the Cyrenaica," in *American Journal of Archaeology*, 2d series, vol. xvii (1913).

**CYRILIACUS**, or CIRIACO DE' PIZZICOLLI (1391-c.1449). One of the most diligent antiquarians of the Renaissance in Italy. He was born at Ancona. He early entered upon the life of a merchant, which enabled him to gratify his passion for travel. Led by his admiration for Dante to Vergil, and thence to Homer, he turned to the study of the classics and devoted his travels to the enthusiastic study and description of the remains of the past. He visited Syria, Egypt, the islands of the Ægean, and finally Athens and the mainland of Greece, everywhere purchasing manuscripts, coins, and works of art, copying inscriptions, sketching and describing roads, walls, buildings, and any other evidences of the life of ancient Greece. His notes and drawings were collected in three large folio volumes, but after his death, which occurred about 1449, they became scattered and now are known only by fragments or partial copies. Though Cyriacus never became a thoroughly learned man and often made ludicrous mistakes, his breadth of interest and untiring zeal led him to copy much that others neglected, and to him we owe our knowledge of many inscriptions and monuments which have since disappeared. Consult: Voigt, *Wiederbelebung des klassischen Altertums*, vol. i (Berlin, 1893). Jahn, "Cyriacus von Ancona und Albrecht Dürer," in *Aus der Altertumswissenschaft* (Bonn, 1868). Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

**CYRIL**, sirīl (Lat. *Cyrillus*, Gk. *Κύριλλος*, Kyrillos). SAINT (c.376-444). A bishop of Alexandria, one of the most energetic but least amiable of the Church fathers. He was born in Alexandria and was educated in the desert, 65 miles south of Alexandria, by the cenobitic monks of Nitria, with whom he lived for five years, and who probably inspired him with that fiery, intolerant, and impetuous zeal which characterized him through life. Subsequently he went to Alexandria, where he became a presbyter, and on the death of his uncle, Theophilus (412 A.D.), obtained the episcopal see. The Alexandrian Jews, who were numerous and riotous, were the first to feel the effects of his inflexible character. Some Christian blood having been shed by them in a city tumult, Cyril put himself at the head of a rabble of zealots, attacked the Jewish quarter of Alexandria, de-

stroyed the houses, and banished the inhabitants. Orestes, the Prefect of Egypt, having drawn up an accusation against Cyril, was attacked in the streets by 500 monks, who had come up from the deserts of Nitria, at the call of their old companion, ready to defend him against his foes. One of these monks having fallen in the skirmish, his corpse was carried in procession to the high church of Alexandria, where Cyril delivered a sanguinary discourse, gave the dead monk the name of Thaumasius ('the excellent'), and pronounced him a martyr and a saint. The violent death of Hypatia (q.v.), the famous woman philosopher of Alexandria, a friend of the Prefect Orestes, at the hands of a mob, has often been laid to the charge of Cyril, but perhaps all that can be justly alleged against him is that he was in great measure responsible for the riotous conditions which led up to this deplorable event. But the most important historic event in his career was his controversy with Nestorius (q.v.), whose doctrines were condemned by the Council of Ephesus, presided over by Cyril (431). All the sternest features of his disposition appeared in this contest. In the midst of disquietudes, which he himself had largely occasioned, he died June 9, 444 A.D. In the Greek church his day in the calendar of saints is June 9, in the Latin church January 28. Cyril's numerous writings consist of commentaries, treatises, homilies, epistles, etc. The best edition was published by Jean Aubert (Paris, 1638, reprinted in Migne, *Patrol. Græca*, lxxviii-lxxvii). Certain of his works have been published in critical editions by English scholars, among them his commentaries on Luke (1859), John (1872), Minor Prophets (1868), *Five Tomes against Nestorius* (1881), and his *Scholia on the Incarnation* (London, 1907). For his biography, consult Kopallik (Mayence, 1881). Charles Kingsley's brilliant romance *Hypatia* gives a view of Cyril tinged with the author's prejudices against monasticism.

**CYRIL**, SAINT (c.315-386). A bishop of Jerusalem and an eminent Church father. He was born in Jerusalem about 315 A.D., and ordained a deacon in 334, a presbyter in 345, and on the death of Maximus, in 351 was elected Bishop of his native city. His metropolitan was the Arian Bishop Acacius of Cæsarea, with whom he was soon engaged in hot conflict concerning originally the rights of his office, but ultimately their differences of doctrine. Acacius accused Cyril before a council at Cæsarea in 358, whose competency Cyril did not acknowledge, of selling the treasures of his church in a time of famine to feed the poor, and this Arianizing assembly undertook to depose him. He appealed to a larger synod, which was held at Seleucia (359), and was by it restored to his office; but once more, through the persevering hostility of Acacius, he was deposed by a council assembled in Constantinople in 360. On the death of the Emperor Constantius (361) he was again restored to his episcopate. Soon after his old enemy Acacius died, but Cyril was immediately involved in new difficulties, and was banished, by the Emperor Valens, in 367; he returned after the Emperor's death in 378. He died March 18, 386.

Cyril's writings are extremely valuable for the history of theology and ritual. They consist of 23 treatises, 18 of which are addressed to catechumens and five to the newly baptized.

The former are for the most part doctrinal and present to us in a more complete and systematic manner than the writings of any other father the creed of the Church; the latter are ritual and give us a minute account of baptism, chrism, and the Lord's Supper. Their style is simple and unattractive. Cyril's works were published by A. A. Touttée, the Benedictine monk (Paris, 1720; Venice, 1761); they were reprinted in Migne, *Patrol. Graeca*, xxxiii, and by G. C. Reischl and J. Rupp (2 vols., Munich, 1848-60, Eng. trans. by E. H. Gifford in *The Nicene and Post-Nicene Fathers*, 2d series, vol. vii, New York, 1894). Consult Delacroix, *Saint Cyrille de Jérusalem, sa vie et ses œuvres* (Paris, 1865), and Mader, *Der heiligen Cyrillus* (Einsiedeln, 1901).

**CYRIL** (827-869) and **METHODIUS** (c.825-885). The apostles of the Slavs in the ninth century. They were brothers and sprang from a family of high rank in the half-Slavic, half-Greek town of Thessalonica. Having been ordained priest, Cyril (whose name was properly Constantine) became secretary to the Patriarch of Constantinople and later prominently connected with the anti-Jewish polemics. The latter interest it was which induced him to go forth, during the reign of the Byzantine Emperor Michael III, to evangelize the Khazars, dwelling by the Caspian Sea under a Jewish king who allowed Jews, Mohammedans, and Christians to live peacefully together. His labors were very successful, the Khan himself being among the converts. At this time Methodius, his elder brother, was abbot of a famous monastery in Constantinople. The Duke of Moravia, Rostislav, having established an independent Slavic kingdom and driven out the German priests, applied to Constantinople for Christian teaching. The Patriarch sent him Cyril and Methodius (864). Cyril was long thought to have invented the Slavic alphabet (see **CYRILLIC ALPHABET**), a modification of the Greek, and the brothers, assisted by a number of their pupils, completed their translation of the Holy Scriptures, which is in use to the present day among all Slavic Greek Catholic Christians (Russians, Bulgarians, and Serbs). Feeling the necessity of linking the Moravian church to the power of Rome, the brothers, after three and one-half years of work, went to Rome. There they were cordially received and were ordained. The younger of the two brothers died Feb. 14, 869, as monk in a monastery at Constantinople, where he had taken the name of Cyril. Methodius continued the work among the Slavs, but in Pannonia, not in Moravia. In 870 the Pope made him a bishop and in 873 archbishop. Supported by the Pope, he long kept up a constant fight with the German emissaries. He died at Wehlerad, April 6, 885. Consult: Ginzel, *Geschichte der Slawenapostel Cyril und Methodius* (2d ed., Vienna, 1861), Dümmler and Miklosich, *Die Legende vom heiligen Cyrillus* (Vienna, 1870); Goetz, *Geschichte der Slawenapostel Constantinus (Cyrillus) und Methodius* (Gotha, 1897); also *Vita Sancti Methodii*, ed. by Miklosich (Vienna, 1870); Maclear, *Conversion of the Slavs* (London, 1879). The *Apologia Moravi* ascribed to Cyril was published by Corter (Vienna, 1630).

**CYRILLA** (named in honor of Domenico Cirillo or Cyrillo, an Italian physician). An evergreen tree or shrub, of which there is but one species, leatherwood (*Cyrilla racemiflora*),

found from the southern United States to Brazil. In the United States it occurs from North Carolina to Texas and is hardy as far north as Philadelphia. It has bright green leaves, and white flowers in racemes. The species is variable, and under cultivation some of the varieties are very ornamental.

**CYRILLIC ALPHABET**, or **KIRILLITS**, *kiril'itsa*. A method of writing long supposed, wrongly, to have been invented by Cyril, apostle of the Slavs (see **CYRIL** and **METHODIUS**) between 855 and 863. It is based upon the Greek uncials of the ninth century, with the addition of some signs to represent sounds not found in Greek. It originally consisted of 38 characters, to which 10 more were added later. This alphabet is of somewhat more recent origin than the *glagolitic*, or *glagolitsa* (q.v.), which is probably the alphabet invented by Cyril. The oldest-known document written in Cyrillic characters is an inscription of the Bulgarian Tsar Samuel, of 993 A.D. The Old Bulgarian (Old Church Slavonic) manuscripts are mostly written in glagolitic characters, there being only two important Cyrillic manuscripts, the *Coder Suprasliensis*, and the *Gospel of Priest Sabba* (Savvina Kniga). With some modifications, the Cyrillic is the alphabet now used in Russia, Bulgaria, and Servia; it was formerly also used in the writing of Rumanian, although this is not a Slavic language. Consult: Taylor, *The Alphabet*, vol. ii (London, 1899); Karskit, *Ocherk Slavianskoi Kiril'skoi Paleografi* (Warsaw, 1901), the introductory portion of Leskien, *Grammatik der althulgarischen Sprache* (Heidelberg, 1909), and, passim, the *Archiv für slavische Philologie*.

**CYRIL LU'CAR**. See **LUCAS**, **CYRIL**. **CYR'OPÆDIA** (Lat., from Gk. *Kypov παιδεία*, *Kyrou paidia*, education of Cyrus), THE. The longest work of Xenophon (q.v.), purporting to give a history of the early life and training of Cyrus the Great, but in reality an historical romance. Its elaborate scheme of government and education are Spartan rather than Persian, and the whole work is to be regarded as the exposition of an ideal government.

**CYRTOCERAS**, *ser-tōs'ē-ras* (Neo-Lat., from Gk. *kyrtos*, *kyrtos*, curved + *képas*, *keras*, horn). A genus of curved tetrabranchiate cephalopods, of which fossil species are found in rocks of Devonian age. They have large, laterally compressed, or triangular curved shells, with subtriangular or T-shaped openings. The camera, or chambers, are very short, so that the septa are close together, and the siphuncle is large, ventral, or subventral, and restricted at each septum so that in a longitudinal section of the shell it gives the appearance of a string of elongated beads. The genus *Cyrtoceras* formerly included a great variety of curved shells, most of which have been proved by Hyatt to belong to other genera and even other families from that which includes the type species. Consult: Hyatt, "The Genera of Fossil Cephalopods," *Proceedings Boston Society of Natural History*, vol. xxii (Boston, 1884); Von Zittel and Eastman, *Textbook of Palaeontology*, vol. i (London and New York, 1900). See also **CEPHALOPODA**; **ORTHO CERAS**; **NAUTILUS**; **NAUTILOIDEA**. For illustration, see **PLATE OF CEPHALOPODA**.

**CYRUS**. River in Transcaucasia. See **KUR**. **CYRUS THE GREAT**, or **CYRUS THE ELDER** (c.600-529 B.C.). The founder of the Persian Empire and conqueror of Babylon, whom Isaiah

called the *anointed* of the Lord and his *shepherd* (Isa. xlv. 28; xlv. 1). The name of this monarch appears in Old Persian as *Kūruš*, in the Babylonian inscriptions as *Kuraš*, in Hebrew as *Kōres*, and in Greek as *Kūros*, whence Latin *Cyrus*. According to Herodotus, the name signifies *sun*; but there is some possibility, judging from the Neo-Elamitic, that its signification may have been *shepherd*, with which the Isaiah passage might be compared. The lineage of this great King we have on his own authority on a famous cuneiform cylinder discovered some years ago. (Consult Rawlinson, *Journal Asiatic Society*, London, 1880, and Hagen, in Delitzsch and Haupt, *Beiträge zur Assyriologie*, vol. ii, Leipzig, 1894.) This was written in the Babylonian language and is now among the treasures of the British Museum. In this *Cyrus* traces his royal claim through his father, Cambyases, and his grandfather, Cyrus, back to Teispes; the latter was the son of Achæmenes (q.v.), founder of the Achæmenian line. The ancestral home was Anshan, or Anzan, which is believed to have been a city or district of Elam (q.v.). However that may be, there can be no doubt that *Cyrus* was a Persian, and he is rightly so called in the Old Testament.

According to the cuneiform records of Nabonidus (*Nabū-nā'id*), *Cyrus* was a vassal of Astyages (*Īštuvegu*), who is spoken of as King of the Medes, or again of the Scythians. There is good ground for believing that *Cyrus* was directly connected with this ruler by the ties of blood. Herodotus (i, 107 ff.) expressly states that *Cyrus* was the grandson of Astyages, whose daughter Mandane had been married to Cambyases, a Persian noble. The Greek historian has a number of interesting and highly colored legends to narrate regarding the fear of Astyages for the infant as his future vanquisher, with popular stories also regarding the fortunes of the youthful prince and his rapid elevation to power. Whatever value is to be placed on these picturesque accounts, there is no question that *Cyrus's* triumphant career began with his overthrow of Astyages and his final mastery of Media before the year 550 B.C. The conquest of the Median Empire opened the way for further success, and *Cyrus* turned his victorious arms against Cræsus of Lydia, whom he vanquished 546 B.C. Asia Minor was thus brought practically under this ambitious ruler's sway.

The time had now arrived to strike a mighty blow against Babylon. Nabonidus, the King of that ancient capital, seems to have estranged himself from his subjects and to have lost the favor of the priestly class. By preference he lived at Temā, or Tevā, and when the condition of affairs within Babylon itself became such as to call him back, it was too late. The account of the fall of the city we can gather by combining the testimony of the cuneiform records with the biblical narrative and Herodotus. Internal factions seem to have been numerous: the Jews, who were in captivity in the city, apparently played a part. Babylon is stated to have fallen *without fighting* before the victorious hosts of *Cyrus*, and Nabonidus was utterly overthrown. Belshazzar of the Old Testament may have been Bel-šar-usur, the son of Nabonidus, who, according to the inscriptions, offered resistance to the advance of *Cyrus's* forces. The fall of the city itself occurred at the moment of the great Tamuz festival (July, 539), and it was actually accomplished by *Cyrus's* satrap Gobryas (Gu-

baru or Ugbaru of the inscriptions), who was in command of the advance army. *Cyrus* himself made his triumphal entry into the city in October, 539, and became King of Babylon. The famous cylinder above referred to records the inauguration of his rule. We know in general that his policy towards the conquered people was a most liberal one, and even though it may have fallen somewhat short, perhaps, of the enthusiastic hopes of a prophetic Isaiah, its ultimate influence and effects are undoubted as having contributed towards the restoration of the Jews from captivity. See BABYLON.

The ambition of *Cyrus*, growing with advancing years, led finally, it seems, to his own destruction. The vision which Herodotus tells us Astyages beheld in a dream of the figure of the youthful *Cyrus* adorned with wings that overshadowed all Asia seemed now on the eve of fulfillment. The great conqueror's dominions actually extended almost from the Hellespont to the Indus. But disaster was at hand. *Cyrus* engaged in an invading expedition against the Scythian hordes of the north (Herodotus, i, 204; Ammianus Marcellinus, 20, 6, 7, 40). In a battle against their Queen, Tomyris, *Cyrus* is said to have been slain. Ctesias (*Pers.* 6-8), however, states that *Cyrus* fell in battle against the Derbices, a tribe bordering on India. The year of his death was 529-528 B.C., and his age is given as 71 years. His body is said to have received a final resting place at Pasargade. A tomb, now empty, still stands there surmounting a series of rising stone steps. Near by is a huge monolith slab that once bore his name; but this is broken and tumbled down, a monument, like the empty and lonely mausoleum, silently recording the fall of greatness.

In estimating the character of *Cyrus*, after we have considered all the accounts of him, we may judge him to have been not only a man of great personal power, but an ideal king. The Persians called him father (Herodotus, iii, 89, 160); the Jews looked upon him as their liberator, the Greeks admired his qualities as a ruler and legislator (Æschylus, *Pers.* 764-68); and Xenophon chose him as the hero of his famous historic romance, the *Cyropædia*. Taken for all in all, his claim to be entitled *Cyrus the Great*, as history has crowned him, remains unchallenged with time. The best short account of *Cyrus*, with abundant references, is that of Justi, in Geiger and Kuhn, *Grundriss der iranischen Philologie* (Strassburg, 1897). Consult also Duncker, *History of Antiquity*, Eng. trans. (London, 1881). Passing mention may be made of Horner, *Daniel, Darius the Median, Cyrus the Great* (Pittsburgh, 1901); Amiaud, *Cyrus, roi de Perse* (Paris, 1887); and Lessman, *Die Kyrossage in Europa* (Charlottenburg, 1906).

**CYRUS THE YOUNGER** (?-401 B.C.). The second of the sons of Darius Nothus, or Ochus, and Parysatis, familiarly known through Xenophon's *Anabasis*. When his elder brother, Artaxerxes Mnemon (q.v.), succeeded to the throne (404 B.C.), *Cyrus* conspired to deprive him of his crown and his life. The plot, however, being discovered, he was at first sentenced to death, but afterward pardoned, through his mother's intervention, and was even restored to his dignity of satrap of Asia Minor. Here he employed himself in making arrangements for war against his brother, although he concealed

his purposes to the very last. In the spring of 401 B.C. he left Sardis at the head of 100,000 Asiatics and 13,000 Greek mercenaries, under pretense of chastising the robbers of Pisidia. These numbers given by Xenophon are greatly exaggerated, for the two armies combined probably failed to reach 100,000. Artaxerxes, being warned of Cyrus's perfidy, made preparations to oppose him, and the two armies encountered each other, in October, 401 B.C., in the Plains of Cunaxa, between 60 and 70 miles from Babylon. Cyrus was defeated and slain, although the Greeks fought with the greatest courage, and even routed that portion of Artaxerxes' troops immediately opposed to them. The fortunes of the Greeks, on their retreat through the highlands of Kurdistan and Armenia in severe winter weather, are recorded by Xenophon in his *Anabasis* (q.v.). That historian represents Cyrus the Younger as endowed with every amiable quality.

**CYST** (from Gk. *kýstis*, *kystis*, bladder). A tumor containing one or more cavities, the contents of which are of a fluid or semifluid consistency. Cysts arise from distention of pre-existing spaces (retention or exudation cysts); or in spaces of new formation, as blood cysts; or they may be of congenital origin or parasitic. The cyst wall is formed of connective and fibrous tissue, rarely of muscular fibres, and the inner surface of the cavity is lined with epithelium. Cysts are classified according to their mode of development. Some are found in glands and are due to an excess of the normal cell secretion; others are caused by obstruction of the ducts through which the secretion naturally escapes. One class, known as dermoid cysts, are due to faulty embryonic development, and these at times contain hair, nails, or teeth. Occasionally solid tumors undergo cystic degeneration. Hydatid cysts are of parasitic origin and occur most frequently in the liver. Besides these there are numerous other varieties depending upon the tissues in which they grow. Cysts vary from minute retention cysts on the face to the enormous tumors of the ovary, weighing over 100 pounds. Surgical interference is frequently required. See OVARY; HYDATID. WEN.

**CYSTEIN**, sis'té-in, or  $\alpha$ -amino-thiolactic acid,  $\text{CH}_3\text{C}(\text{NH}_2)(\text{SH})\text{CO}_2\text{H}$ . A substance obtained by Baumann, by reducing cystin (q.v.) with nascent hydrogen from tin and hydrochloric acid. It is a white crystalline powder, soluble in water and in acetic acid as well as in the strong mineral acids. Its aqueous solution is readily oxidized by the air, with re-formation of cystin.

**CYSTICER/CUS**. See TAPEWORM.

**CYSTID/EA**. See CYSTOIDEA.

**CYSTIN** (from Gk. *kýstis*, *kystis*, bladder),  $\text{C}_4\text{H}_{12}\text{N}_4\text{S}_2\text{O}_4$ . An organic acid (amido-sulpholactic acid), allied to lactic acid. It occurs normally in urine in very small quantities, and it is the principal constituent of the urinary calculus known as cystic calculus, from which it may be obtained by dissolving in ammonia and allowing the solution to evaporate, the cystin separating out in the form of characteristic colorless hexagonal or orthorhombic crystals, which are insoluble in water, alcohol, or ether. The ammoniacal or hydrochloric-acid solution of cystin turns the plane of polarized light strongly to the left. The internal administration of sulphur appears to be the only remedy that produces an appreciable diminution of cystin in

pathological cases. The constitutional formula of cystin is

**CYSTITIS** (Neo-Lat., from Gk. *kýstis*, *kystis*, bladder). Inflammation of the urinary bladder. Among the causes of cystitis may be mentioned injuries, exposure to cold, injection of irritating medicaments in treating the urethra, insertion of a dirty catheter when drawing off the urine, retention of fermenting urine, extension of inflammation from other adjacent tissues, or the presence of a calculus (q.v.). The inflammation is accompanied by chills, fever, some nausea, pain in the bladder, and a continual desire to urinate. The urine is generally cloudy, from mucus and pus, or bloody. In treating cystitis, heat should be applied to the abdomen, or the patient should take a hot sitz bath; he should take large quantities of alkaline drinks, and rest in bed. In many cases it is necessary to wash out the bladder, and a variety of drugs are used, according to the exact nature of the symptoms.

**CYSTOCARP** (Gk. *kýstis*, *kystis*, bladder + *karpos*, *karpos*, fruit). A complex form of fructification developed in the red algae as a result of the sexual act. See RHODOPHYCEÆ; ALGÆ.

**CYSTOIDEA** (Neo-Lat. nom. pl., from Gk. *kýstis*, *kystis*, bladder + *eidos*, *eidos*, form). A class of extinct echinoderms of the subphylum *Pelmatozoa* (q.v.), allied to the crinoids and blastoids, but differing from these chiefly in the irregular arrangement of the plates of the calyx and the imperfect development of their arms. In general appearance the Cystoidea resemble the crinoids, with the remains of which they are often found associated in the Ordovician and Silurian strata. The cystoid body was inclosed in a case or "calyx" of variable form, spherical, cylindrical, hemispherical, or discoid, which is made up of polygonal calcareous plates without regular arrangement. The calyx plates seem to have been, in many early genera, loosely united to each other, so that they became easily dissociated after death of the animal. This explains the rarity of perfect individuals in the Ordovician rocks, where the fragments are often exceedingly abundant. Another characteristic is the presence of pores that perforate the plates and that are arranged in rhombic series. These pores are supposed to have been connected with the respiratory apparatus. The number of plates in the calyx is very variable, from 10 or 12 to over 100, and as a rule those forms with the largest number of plates show the greatest irregularity in their arrangement. In some of the forms, with less number of plates, these are arranged in regular transverse rows, and the calyx then approaches more nearly the aspect of the simpler forms of crinoids.

The arms are absent in many genera of cystoids, and when present are seldom found attached to the calyx. They are never pinnulated like those of the crinoids, though they are composed in a similar manner, and are often supplied with grooves. In those cystoids without free arms there is generally found on the ventral surface of the calyx a system of ambulacral furrows that radiate irregularly from the mouth opening. These furrows, representing the arms, are bordered by rows of small plates that often

bear pinnules of delicate construction, as seen in *Callocystites*, *Glyptosphaerites*, and *Agelacrinus*. The more primitive cystoids have neither arms nor ambulacral furrows. The openings of the calyx are four in number. The mouth is central or subcentral on the upper or ventral surface; the anal opening is eccentric, and is generally closed by a pyramid of small, triangular plates; a third opening, often present near the anal opening and generally closed by triangular plates, is considered to be the genital orifice; and a fourth small, slitlike aperture, present in only a few genera, is of problematic nature. The calyx of the cystoid is usually elevated on a stem which often resembles that of the crinoid in being composed of a single series of plates pierced by a central canal. In some genera (as *Dendrocystites*) the stem is made up of plates arranged in transverse rows, and the central cavity is then much enlarged and continuous with the general cavity of the calyx. In *Echinospherites* the stem is reduced to a tubercle on the dorsal surface, and the animal seems to have been a free living form. The discoid genera *Agelacrinus* and its allies are sessile, and are attached either by a pedestal or by cementation of the dorsal surface of the calyx to foreign objects, generally the shells of mollusks.

Classification of the Cystoidea is a matter of difficulty, not alone because of the general imperfection of the material, but also on account of the great diversity of structure seen within the class, which contains a number of synthetic or ancestral types that seem to have given rise to all the other more specialized groups of the Echinodermata. Through assumption of a more regular arrangement of the plates and the development of the arms, with consequent rearrangement of the ventral surface, as in *Cryptocrinus*, *Porocrinus*, and *Caryocrinus*, they gave rise to the Crinoida. Reduction of the plates and enlargement of the ambulacral grooves, with the assumption of the pentamerous gemmiform shape, as in *Asteroblastus*, leads to the Blastoida. *Agelacrinus* is suggestive of the starfish (Asteroidea) and brittle stars (Ophiuroidea), and finally the Echinoidea and Holothuroidea may be imagined to have been derived from the more spherical forms of armless cystoids, the echinoids presenting a series of progressive evolution, the holothurians a regressive series.

**Range.** The cystoidea is the oldest-known class of echinoderms, their isolated plates, rarely united to give a clue to the form of the animal, known under the names of *Eocystites*, *Protocystites*, etc., from the Cambrian rocks, are the earliest representatives. The class enjoyed two periods of expansion. First, in the early Ordovician time they flourished in hosts in some regions, their remains forming the larger part of certain limestones, such as the lower Chazy limestones of Lake Champlain. Other limestones, of Beekmantown and Trenton age, in the St. Lawrence and Champlain valleys, and beds of equivalent age in the Baltic provinces of Europe, contain abundant cystoid remains. The second expansion of the class occurred during the Silurian time, when these creatures lived in abundance in some portions of the seas of northern and middle Europe and eastern North America. In all about 250 species are known, and of this number only about 15 have been found in rocks above the Silurian system. The group entirely disappeared with the close of Paleozoic time.

**Bibliography.** Consult: Forbes, "On the Cystoidea of the Silurian Rocks of the British Islands," *Memoirs of the Geological Survey of Great Britain*, vol. ii, part ii (London, 1848); Billings, "On the Cystoidea of the Lower Silurian Rocks of Canada," *Figures and Descriptions of Canadian Organic Remains, Decade III* (Montreal, 1858); Hall, "Descriptions of Some New Fossils from the Niagara Group," *Twentieth Annual Report of the New York State Cabinet of Natural History* (Albany, 1867); Barrande, "Cystidées," *Système Silurien du Centre de la Bohême*, vol. vii (Prague and Paris, 1887); Bather, "The Cystoidea," in *Lankester's Treatise on Zoology*, part iii, chap. ix (London, 1900); Von Zittel and Eastman, *Textbook of Paleontology*, vol. i (London and New York, 1900); Jackel, *Stammesgeschichte der Paläozoischen* (Berlin, 1899); Schuchert, "On Siluric and Devonian Cystoidea and Camarocrinus," *Smithsonian Miscellaneous Collections*, vol. xlvii, part ii (Washington, 1904). See CRINOIDEA; ECHINODERMATA, and articles on the other classes of echinoderms.

**CYSTOLITHS** (Gk. *kýstis*, *kystis*, bladder + *lithos*, *lithos*, stone). Masses of cellulose and calcium carbonate (the chief constituent of limestones), found in the cells of plants belonging to the families Urticaceae and Acanthaceae. They are most common in the epidermis of both leaves and stems, but are found also in the cortex and pith. A single cystolith occupies a cell, nearly filling it, though the cell is enlarged. Cystoliths are irregularly warty or nodulated like a compact bunch of grapes. Each is attached to the wall of the cell in which it lies by a short stalk of cellulose. In reality the cystolith is an outgrowth from the cell wall, at first peg-shaped, later club-shaped, and finally warty. Its foundation substance is cellulose (the same as that of the wall), which is impregnated with a large quantity of calcium carbonate in the form of very fine granules, thus forming a stony mass. The stalk often contains silica. The carbonate is to be regarded as a waste product from the chemical processes occurring in the plant and is of no further direct use. It can readily be dissolved out by weak acids, the process of solution being accompanied by effervescence and the evolution of carbonic-acid gas (carbon dioxide). Good examples of cystoliths are to be found in the leaves of nettles (*Urtica*) and of the fig (*Ficus*).

**CYSTOSCOPE.** An instrument for examining the interior of the bladder, and consisting of a hollow tube, electrically lighted, and furnished with miniature lenses which reflect the image to the eyepiece outside of the body. Several types of the instrument are in use, some being used merely for examination and others devised to carry instruments for operating, making applications to the interior of the bladder, or even catheterizing the ureters and pelvis of the kidneys. Previous to using the cystoscope the bladder is partly filled with warm, clear, sterile fluid, in order to keep its walls apart and prevent burning from the lights.

**CYTASE** (from Gk. *kýros*, *kýtos*, cavity, cell). A name now commonly applied to an enzyme or perhaps a number of different enzymes that hydrolyze hemicellulose (q.v.), giving as final products mannose and galactose. It is of functional importance in digesting the reserve food in the seeds of *Iris*, *Phoenix*, *Lupinus*, and others. The enzymes that hydrolyze cellulose,

as well as those that digest wood vessels, are sometimes included under this general term.

**CYTHERA.** See CERIGO.

**CYTHEREA.** See VENUS.

**CYTHERIS.** A well-known Roman courtesan, the mistress of Marcus Antonius and later of Gallus, the elegiac poet. She is referred to under the name of Lycoris in Vergil's tenth Eclogue.

**CYTISUS** (Lat., shrubby kind of clover). A genus of plants of the family Leguminosae, of which some of the species, having long twiggy branches, are popularly called "broom," others are called "laburnum," while others still are generally known by the name "cytusus." The species are numerous—small trees or shrubs, with leaves of three leaflets, and yellow, white, or purple flowers, natives chiefly of the warmer temperate parts of the Old World. Many of them are very beautiful, and some are among the esteemed ornaments of our shrubberies, others of our greenhouses. Several species of *Cytisus* have been recommended as forage plants, stock readily browsing upon their green twigs. *Cytisus scoparius*, the Scotch broom, is a form so valued, while *Cytisus proliferus alba*, the tagasaste of the Canary Islands, is highly commended. Trials in California have not substantiated the rather extravagant claims made for it.

*Cytisus adami*, an interesting shrub that bears yellow and purple flowers on different branches, is a so-called graft hybrid between *Cytisus purpureus* and *Laburnum vulgare*.

**CYTOLOGY** (Gk. *κύτος*, *kytos*, cell + *λογία*, *logia*, account, from *λέγειν*, *legen*, to say). A branch of the sciences of botany and zoology. As histology is largely concerned with tissues, so cytology deals principally with cells, the elements which make up the tissues. Although it is only recently that botanists have begun to make a specialty of this subject, the work has been prosecuted with great vigor, and the subject is beginning to assume some definiteness. The chief problems at present are the structure and activities of protoplasm, the life history of plastids, the structure and function of the nucleus, the reduction of chromosomes, the origin and development of the achromatic figure, the centrosome, the cell wall, the development of the sex cells, fertilization and the formation of the embryo, and, most difficult of all, the problem of heredity.

**Botanical Cytology.** As yet little is known regarding the structure of protoplasm in plants, but the investigations which have been made favor the assumption that its structure is identical with that in animals. Much more attention has been paid to the nucleus. Even the small nuclei of many of the algae and fungi have been studied, and the details of their structure and mode of division quite accurately determined. No organ of the cell has been so assiduously investigated as the chromosome, but nevertheless most of its important problems remain to be solved. The fact that the number of chromosomes is constant for a given species, and the phenomena of fertilization, indicate that the chromosome is a permanent organ of the cell, but its life history from one cell generation to another has not yet been traced, the identity of the several chromosomes being lost in the resting nucleus. In vegetative cells the splitting of the chromosomes during nuclear division is longitudinal. During the process of forming

four spores from a mother cell the number of chromosomes is reduced by one-half, and some claim that during the reduction there is a transverse splitting in the sense of the Weissmann school; most observers, however, now believe that the reduction in the number is brought about by a pairing and subsequent separation of whole chromosomes without any splitting. Both observations and theories are still very conflicting. The origin and development of the achromatic figure have received large attention, especially since the beginning of the present century. It was formerly supposed that the achromatic figure always rose under the influence of the centrosomes, but recent observations have proved that no centrosome exists at all in the angiosperms, and it is doubtful whether such an organ exists in the gymnosperms and pteridophytes, unless the "blepharoplast," a centrosome-like body which develops the cilia of the male cell, be interpreted as a genuine centrosome. In the other groups, except the mosses, which have received scant attention, an undoubted centrosome has been demonstrated.

The development of the sex cells, from the earliest appearance of the archesporium up to the time of fertilization, has been repeatedly studied in various plants, but the work has been morphological rather than cytological, little attention having been paid to the details of cell contents except in case of mother cells. In the study of cells more immediately concerned in fertilization, the cells of the sporogenous tissue have been slighted. Some of the most important cytological work deals with the problems of fertilization. The question of sexuality in the Ascomycetes has received a definite answer in the case of several forms by the demonstration of an actual process of fertilization. The fusion of the sex nuclei in ferns has been described with more or less completeness. In the gymnosperms, where the sex cells are extremely large, the process of fertilization has been more satisfactorily investigated, and it has been found that both the nucleus and the cytoplasm of the male cell enter the egg, but that the nucleus slips out from its cytoplasmic mantle before it reaches the nucleus of the egg. The male nucleus with its nuclear membrane still intact is then received bodily into the much larger egg nucleus. The chromatin of the two nuclei in the form of two distinct spires has been observed, and in some species the chromatins of the two nuclei may remain distinct during the later stages of fertilization, and possibly during the cell divisions which follow. In the angiosperms, while the union of the sex nuclei has been repeatedly observed, the behavior of the chromatin has received little attention, but in a few carefully studied species the chromatin of the sex nuclei remains distinct during fertilization. Two male cells are discharged from the pollen tube into the embryo sac: the nucleus of one of these cells unites with the nucleus of the egg and the first cell of the sporophyte is formed. The second male cell often unites with the definitive nucleus of the embryo sac formed by the fusion of the two polar nuclei, so that there is a "double fertilization." Double fertilization has been observed in monocotyledons and dicotyledons, and it is the usual method. While it is becoming conceded that the problems of heredity must be ultimately problems of the cell, nearly all the work of botanists along this line

must be classed as morphological. See CELL (in plants); EMBRYOLOGY; SEX.

In medicine, cytology is the investigation of the cellular elements of exudates or other body fluids, particularly those not containing pus. In order to separate the cells, the fluid to be studied is shaken up in a sterile container having within it small glass beads in order to prevent clotting, or to disintegrate a clot if one is already present. The fluid thus separated is centrifuged for several minutes and the residue examined under the microscope after being stained. The method (termed "cyto-diagnosis") is useful in differentiating the various types of pleurisy; an undue proportion of lymphocytes and endothelial cells, e.g., indicates tuberculous or typhoid pleurisy, while in malignant pleurisy tumor cells may be found in the precipitate. In the same way the different types of peritonitis may be distinguished. Tuberculous peritonitis is characterized by lymphocytosis and the presence of polynuclear white blood corpuscles, whereas the fluid from ovarian cysts and that found in ascites contain only a few endothelial cells. Tuberculous meningitis is characterized by a lymphocytosis of the cerebrospinal fluid, while epidemic meningitis, due either to the pneumococcus or the meningococcus, will contain polynuclear white blood corpuscles.

**CYTOPLASM.** See CELL (in plants).

**CYZICUS** (Lat., from Gk. *Kyzikos*, *Kyzikos*). A colony of Miletus in the Propontis, founded about 700 B.C., on the south shore of the island of Arctonnesus, which has now become a peninsula (Map: Greece, Ancient, E 1). In ancient times the island was connected with the mainland by bridges. Its situation and two good harbors made it early a prosperous town, while its strong position enabled it to maintain its freedom. It was favored by the Romans, and after sustaining a long siege by Mithridates it was made a free city, a privilege which it lost under Tiberius. By 1100 A.D. the city had been destroyed by a series of earthquakes. The site is still covered with extensive ruins, which include walls, an amphitheatre, and the substructures of a splendid temple of Hadrian. It lies to the southeast of the island of Marmora, and about 70 miles southwest of Constantinople. Consult Hasluck, *Cyzicus* (Cambridge, 1913).

**CZACKI**, cháts'ká. **TADEUSZ**, COUNT (1765-1813). A Polish writer and statesman. He was born at Poryck, Volhynia. At 20 he obtained an office in the Superior Court of Justice at Warsaw, and in 1788 was appointed to the Treasury Commission of the Diet. His interest in the economic welfare of his country impelled him to travel through Poland and to produce a map of its river system. The development of navigation on the Dniester engaged his particular attention. When his property was confiscated at the second partition of Poland, he became a professor at Cracow; but Paul I, to whose coronation he went as deputy from Volhynia, restored what he had lost. After this Czacki's whole life was devoted to the education of his countrymen. His plans for disseminating instruction in the Polish provinces of Russia, the people of which were extremely ignorant, met with the approval of Alexander I, and in 1803 he was made inspector of the schools in the governments of Volhynia, Podolia, and Kiev. He gave out of his various resources, about 500,000 thalers to various schools. He also

donated a library containing some 4000 manuscripts, 12,000 works in Polish, and 80,000 miscellaneous works. The Gymnasium of Kremenetz, which he founded, was the main object of his care. For a generation this institution was the spiritual centre of Poland, furnishing the champions of national self-consciousness against the deadening influence of French pseudoclassicism. Accused of stirring up political discontent among his countrymen, Czacki went to St. Petersburg in 1807 and so ably defended himself that Alexander I appointed him deputy of Prince Czartoryski, who was curator of public instruction in the Polish section of Russia. Czacki died at Dubno, and his collections passed into the hands of Czartoryski. His miscellaneous works were published in 3 vols. (Posen, 1843). They are in the main historical and archaeological. His most valuable work is a treatise *On Lithuanian and Polish Laws* (2 vols., Warsaw, 1800; 3d ed., Cracow, 1861).

**CZAJKOWSKI**, chí-kóf'ské, MICHAŁ (1808-86). A Polish novelist. He was born near Berdichev in the Ukraine, where, in 1831, he participated in the insurrection against Russia and was compelled to flee to Paris. In 1840 a number of Polish émigrés sent him on a secret mission to Turkey, and in 1851 he embraced Mohammedanism. As Mohammed Sadik, he commanded a body of troops called the Cossacks of the Sultan. He fought with distinction against the Russians in 1853-54. Amnestied by Russia in 1873, he removed to Kiev. In consequence of an accusation of treason subsequently made against him, he committed suicide. Czajkowski obtained wide celebrity through his stories of Cossack life, several of which have become extremely popular and have been translated into German, French, and English.

**CZAR**, zar (Russ. *tsari*, Bohem. *tsar*, OChurch Slav. *tsarsari*, *tsarsari*, through OHG. *keisar*, from Lat. *Casar*). The alternative title of the Russian Emperor, written also Tzar. During the Middle Ages the Emperor of the East and the Mongol Khans appear under the title of Czars in Russian contemporary literature, while the rulers of the various Russian provinces are called grand dukes till the sixteenth century. In 1547, however, Ivan the Terrible caused himself to be solemnly crowned 'Czar of Moscow. Henceforth the Russian monarchs called themselves by this title until the conquest of Little Russia and Smolensk caused them to assume that of Czar of All the Russias. The word then became practically synonymous with Emperor. Yet in 1724 Peter I thought fit to assume this latter title in addition, and, as the Russian language had no term corresponding to it, the Latin word *Imperator* was introduced, while the Empress was termed *Imperatrix*. At first several European powers refused to sanction the assumption of Imperial dignity by the Russian Czar, but ultimately they consented to do so. The wife of the Czar was named *Czaritsa* (Czarina); his son, *Czarevich*; his daughter, *Czarevna*. After the death of Alexis, Peter I's son, these titles were abolished, the Imperial princes being called grand dukes and the Imperial princesses grand duchesses. In 1799 the Emperor Paul I introduced the title of *Cesarevich* (not *Czarevich*) for his second son, the Grand Duke Constantine. The heir apparent and his wife are still called *Cesarevich* and *Cesarevna*. Among the Russians

themselves the Emperor is more frequently called Gosudar, i.e., lord, than Czar. See RUSSIA.

**CZARDAS.** See CSÁRDÁS.

**CZARNIECKI, or CZARNECKI,** *chärn-yét'ské, STEFAN* (1599-1665). A Polish general. He was distinguished by his bravery and brilliant generalship in the war against Charles X of Sweden (1655-60), upon the conclusion of which he was hailed as the liberator of his country, which, simultaneously with the great onslaught of the Scandinavians, had been assailed by the Russians and Transylvanians. He also won laurels in the war against the Cossacks (1660-61), successively defeating them in two great battles. He had attained the highest rank in the Polish army when, attended by only a few horsemen, he undertook an expedition to the Crimea, in order to secure an alliance with the Tatars. In consequence of the fatigue and exposure of this journey he died at a village in Volhynia. He has been styled the Polish Du Guesclin.

**CZARTORYSKI,** *chär'to-ris'ké, ADAM JERZY* (GEORGE), PRINCE (1770-1861). A Polish patriot, born at Warsaw, Jan. 14, 1770. He was the son of Prince Adam Casimir Czartoryski, the head of an ancient Polish house. After studying in Edinburgh and London, he returned to his native country and took part against Russia in the war following the second partition of Poland, in 1793. On the defeat of the Poles Czartoryski was taken to St. Petersburg as a hostage, and here he exhibited so much ability and prudence as to gain the friendship of the Grand Duke Alexander and the confidence of Emperor Paul, who made him Ambassador to Sardinia. When Alexander ascended the throne (1801), he appointed Czartoryski assistant to the Minister of Foreign Affairs; and he took an active part in official life until after the Peace of Tilsit (1807). As curator of the University of Vilna he exerted all his influence to keep alive a spirit of nationality among the Poles, and when some of the students were arrested on a charge of sedition and sent to Siberia, Czartoryski resigned his office. His successor reported to the Emperor that the amalgamation of Russia and Lithuania had been delayed a century by Czartoryski's activity as head of the university. When the revolution of 1830 broke out, he threw in his lot with his countrymen. He was elected President of the provisional government, and in this capacity summoned a national diet, which met in January, 1831, and declared the Polish throne vacant, and elected Czartoryski head of the national government. He immediately devoted half of his large estates to the public service and adopted energetic measures to meet the Russian invasion. The Poles were soon crushed by superior numbers, and Czartoryski—specially excluded from the general amnesty, and his estates in Poland confiscated—escaped to Paris, where he afterward resided, the friend of his poor expatriated countrymen, and the centre of their hopes of a revived nationality. In 1848 he liberated all the serfs on his Galician estates, and during the Crimean War he ineffectually endeavored to induce the Allies to identify the cause of Poland with that of Turkey. He refused an amnesty offered to him by Alexander II, and died in Paris, July 16, 1861. Consult his *Mémoires et correspondance avec l'empereur Alexandre Ier* (Paris, 1887; Eng. trans., Sielgerd, London, 1888); Morfill, *Story of Poland*,

in "Stories of the Nations Series" (London, 1893); Zaleski, *Life of Adam Czartoryski* (Pol.) (Paris, 1881). See POLAND.

**CZAR UND ZIMMERMANN** (Ger., Czar and Carpenter). An opera by Lortzing (q.v.), first produced in Leipzig, Dec. 22, 1837; in the United States in 1855 (New York).

**CZASLAU, chäs'lou, or CASLAU, Bohem.** *pron. chäs'láv.* A town of Bohemia, about 40 miles east-southeast of Prague (Map: Austria, D 2). The church of St. Peter and St. Paul was the place of burial of the blind Hussite leader Ziska, a fine statue of whom adorns one of the public squares. The town's manufactures include beet sugar, alcohol, pressed yeast, and beer. Between Czaslau and the neighboring village of Chotusitz the Prussians under Frederick the Great gained a decisive victory over the Austrians under Charles of Lorraine, May 17, 1742. Pop., 1890, 8145. 1900, 9105; 1910, 9122; mostly Czechs.

**CZECH** (*chék*), or **BOHEMIAN, LANGUAGE.** The Czech language, like the Polish, Kashubian, and Sorbian, belongs to the north-western group of the Slavic languages. The number of persons speaking Czech, exclusive of the Slovaks, is over 7,100,000. These are distributed as follows: in Austria, about 6,500,000; in Germany, about 125,000; in Russia, about 65,000; and in America, about 500,000. The Czechs occupy the quadrangle bounded by the Bohemian Forest, the Erzgebirge, the Sudetic Mountains, and the Little Carpathians. They are thus surrounded on three sides by Germans, and only on the eastern side do the Czechs come in contact with Slavs. In Silesia with the Poles, and in southeastern Moravia and Hungary with the Slovaks, their nearest kindred, with whom the Czechs are usually grouped into the Czecho-Slovakian division. Within the quadrangle the Czechs are interspersed with Germans, against whom they have maintained a continuous struggle. (See CZECH LITERATURE.) Literary Czech is most nearly related to the dialect of the Prague District; but, taken as a whole, the Czech language presents a great variety of well-defined dialects.

The first mention of the existence of Czech dialects is found in Jan Blahoslav's *Grammar* (1571), published by Jireček in 1857. Just as Roman Catholicism displaced the earlier Greek Orthodox religion, so the Roman alphabet superseded the earliest Slavic characters. The Latin alphabet was insufficient to reproduce all the native sounds, and diacritical letters were introduced. Thus, *č* = Eng. *ch*, *ž* = Eng. *zh* (as in pleasure), *š* = *sh*, while the acute accent is used to denote long vowels. Among the phonetic characteristics of the language may be noted: 1. The disappearance of the old Slavic sounds, *ū*, *ī*, and their transition into *e*: Old Church Slavic *nūnū*, sleep, *dini*, day, *livū*, lion, *liva* (1d., gen. sing.) = Czech *sen*, den, *lev*, *lva*. 2. The substitution of open sounds *u*, *ú* and *a*, *ě*, *e* for the old Slavic nasal vowels *ā* and *ē* *muka*, torture. *nesu*, I carry = Old Church Slavic *māka*, *nesā*; *patero*, five, *deset*, older *desēt*, ten = Old Church Slavic *pētero*, *desētī*. 3. The so-called transvocalization, whereby *a* becomes *ē* (*e*), *ā*, *ie* (*ē*, *i*) *zeme*, land, *foi zemta*, *dušē*, soul, for *\*dušta*, while *u*, *ú* = *tu*, *tú*, *buše*, *č*, *č*: *duši* for *\*duku* (acc. sing., cf. Russian *dushu*), *duši* for *dušū* (abl. sing., cf. Russian *dushoyu*), *lid* for *\*lud*, people (Russian *lyudi*). 4. The obliteration of distinction be-

tween *y* (= Eng. *i*) and *i* (Eng. *e*) in pronunciation: *býk*, bull, *mýš*, mouse, *sýr*, cheese, are pronounced as if spelled *bík*, *miš*, *sir*; *byl*, I was, and *bíl*, I beat, are pronounced precisely alike. 5. The syllabic or vocalic *r*, *l*, *m*, *n*: *zrno*, grain, *srdce*, heart, *vlna*, wave, wool, *sliny*, strong, correspond to Russian *zerno*, *serdtse*, *volna*, *silny*; *Rožmberk*, *Ličmburk*, represent German Rosenberg, Luxemburg. This peculiarity is common also to the Slovakian and Serbo-Horvatan (Serbo-Croat). 6. Long and short vowels: short, *a*, *e*, *i*, *o*, *u*, *y*; long, *á*, *é*, *í*, *ó*, *ú*, *ý*. 7. The primary accent is expiratory or stressed and is always on the first syllable of the word, as in Slovakian, Serbo-Lusatian, and South Kashubian. This accent has been proved to be an historical development of the primitive Slavic free accent. See SLAVIC LANGUAGES.

The quantitative system of versification based on the Latin has been almost entirely superseded of late by the tonic system, better suited to the spirit of Slavic languages. Among the inflectional peculiarities of the language the following are most noteworthy. In the declension of nouns—loss of dual; confusion of various stems: confusion of case endings; change of quality and quantity of the root vowels. In conjugation it comes very close to the primitive Slavic, retaining both the infinitive and the supine. All past tenses are periphrastic, and the forms of the future are either periphrastic—in verbs of incomplete or imperfective action—or are represented by the present in verbs of completed or perfective action.

From the point of view of euphony, the Czech language stands lower than the Russian or Polish, although superior to the latter in some particulars, as in the comparative rarity of sibilants and the absence of nasal vowels.

**Slovakian.** Along with the Czech language must be mentioned the Slovakian language, spoken by some 3,112,000 persons—about 2,610,000 in Austria-Hungary, 500,000 in America, and 2000 elsewhere. Its literature is only a century old, and its independent development was due entirely to the great wave of national reawakening that swept over Europe at the end of the eighteenth and the beginning of the nineteenth centuries. The movement, communicated to the Czech language, spread to the kindred Slovakian. In spite of the serious opposition on the part of such prominent Bohemians as Havlíček, Šafařík, and Kollar—the last himself a Slovak—a Slovakian literature was established. The pioneer of the movement was Antonín Bernolák (1762-1813), whose *Disertatio Philologica-Critica de Literis Sclavorum, Grammatica Sclavica* (Pressburg, 1790) and *Lexicon Sclavicum Bohemico-Latino-Germanico-Hungaricum* (6 vols., Buda, 1825-27) supplied the foundation for Slovak literature. The other great names are: the poet Jan Holý (1785-1849), who wrote odes and epics in classical style, Ljudevit Štur (1815-56), Josef Hurban, and Michael Hodž, who brought the language to its high standard of literary perfection. Among the more recent writers the following deserve especial mention: the famous Martin Hattala, one of the foremost of Slavic linguists; Svoťaz Hurban Vajanský, son of Josef Hurban; the lyric poet Otař Hvizdoslav, and the novelist Kukučín, a powerful portrayer of popular life and manners. The language, in the works of these writers, though closely kindred to the Czech, exhibits many well-defined peculiarities

which justify its classification as a separate branch. There are numerous works that are not found in the Czech language, and many features bring it nearer to the Russian, Polish, and Servian than to the Czech. Ethnographically considered, the Slovaks are yielding before the march of the stronger and politically dominant Hungarian nationality; but Slovakian literature has received too strong an impetus at the outset to allow of any doubt as to its future development.

**Bibliography.** GRAMMARS OF THE CZECH LANGUAGE: Blahoslav, *Grammatica Česka* (1867); Dobrovský, *Lehrgebäude der böhmischen Sprache* (Prague, 1819); Hattala, *Srovnávací mluvnice jazyka českého a slovenského* (ib., 1857); Gebauer, *Hláskosloví, jazyka českého* (ib., 1876); id., *Mluvnice česká pro školy střední* (ib., 1890), excellent; id., *Historická mluvnice jazyka českého* (ib., 1894, 1896-98), an epoch-making work; Vymazal, *Bohmische Grammatik für deutsche Mittelschulen und Lehrerbildungs-Anstalten* (Brunn, 1881)—although somewhat behind latest philological researches, a most practical and simple handbook; Masarík, *Bohmische Schulgrammatik* (5th ed., Prague, 1890).

DICTIONARIES OF THE CZECH LANGUAGE: Jungmann, *Slovník česko-německý* (5 vols., Prague, 1835-39); Čelakovský, *Aditioes to Jungmann's Dictionary* (Prague, 1851); Gebauer, *Slovník staročeský* (ib., 1901); Herzer, *Bohmisch-deutsches Wörterbuch* (ib., 1901); Jónás, *Dictionary of the Bohemian and English Languages* (Wisconsin, 1891); Kott, *Bohmisch-deutsches Wörterbuch*, especially *Grammatico-Phraseological* (7 vols., Prague, 1878-93); Sumavský, *Bohmisch-deutsches Wörterbuch* (3d ed., ib., 1874); Rank, *Taschenwörterbuch der böhmisch-deutschen Sprache* (6th ed., ib., 1895).

**CZECH, or BOHEMIAN, LITERATURE.** Among the Slavic literatures the Czech is inferior to the Russian or the Polish, although chronologically it precedes them both.

*First Period* (to 1410).—The earliest literature of the Czech language came into existence with the introduction of Christianity in Bohemia, in 865, by Cyril and Methodius, the apostles of the Slavs. The earliest extant monument is the Kyrie Eleison *Hospodine pomiluj ny* ('Lord, have mercy upon us'). Greek Christianity and the Cyrillic alphabet (q v), however, gave way to Latin Catholicism and Roman script. The famous Gruneberg manuscript (eighth or ninth century), the *Judgment of Libusha*, and the Koniginhof manuscript (thirteenth or fourteenth century), discovered by Ilanka in 1817, are the only remains in the native tongue which belong to this period, and even their authenticity is somewhat doubtful. The influence of the Teutonic knights was growing rapidly among the natives, with the result that up to the fourteenth century Latin literature completely displaced works in the vernacular. At the end of the thirteenth century a Czech translation of the Latin *Alexandreis* of Gualterus de Insulis (Philip Gautier de Châtillon) was made, and to the early years of the following century belong Czech versions of two episodes from the Arthurian legend.—*Tristram*, according to Eilhart of Oberg and Gottfried of Strassburg, and *Tausaria* and *Floribella*, after Pleier. Original works in Czech are the famous *Rhymed Chronicle of Bohemia*, by Dalimil, of 1314, and the romantic story *Tkadleček* (The Weaver), written in strikingly beautiful prose

about the end of the fourteenth century. Other works that contributed to the development of the literature were translations of the travels of Marco Polo and Sir John Mandeville. The original writers of the period are: Thomas Stitný (1325-1410), one of the first alumni of the University of Prague (founded in 1348); Andrew of Duba; and the poet Flaska. Stitný exercised a great influence over religion and literature in Bohemia, and paved the way, as it were, for the later Hussite movement. Andrew of Duba is the reputed author of *The Book of the Old Lord Rosenberg* and *The Exposition of the Laic of the Bohemian Land*. Smil Flaska, Lord of Pardubitz, composed the didactic and satirical poems, "Father's Advice to his Son," "Contest between Water and Wine," "Dispute between Body and Soul," "New Council," and "The Groom and the Scholar." They abound in local allusions and are a rich mine of information for the culture history of the country.

*Second Period* (1410-1620).—The golden age of Czech literature.

The reformer John Huss, who, by the religious movement he inaugurated, contributed so powerfully towards the assertion of nationality by the Czechs, gave an immense impulse to the development of Czech literature, and 1410—the year of his open breach with Rome—is commonly considered the beginning of a new era. Though a master of the Latin tongue, Huss preferred Czech for works which were designed for the people as a whole, and the language received at his hands a perfection which it had never before attained. Since his time Czech has undergone comparatively little change from a linguistic point of view. Huss adopted as his basis the speech in actual use around Prague. He contributed, moreover, to the development of the language by grammatical works like his *Czech Orthography* (published in 1857 by Sembera). After the death of Huss the Moravian Brethren assiduously cultivated the spirit of nationalism and directed their energies to developing their native idiom. Among these champions of the people the following are the most noteworthy: Peter Chelčický (1390-1460), a pupil of Huss, was the theoretical expounder of his master's doctrines. In his works—in such as *The Net of Faith* and *Book of Expositions of Sunday Lessons*—various religious and political questions are treated in a surprisingly liberal manner. Other writers of distinction of this period are Victorin Cornelius Všehrd (1460-1520), the author of *Nine Books of Laics . . . in Bohemia*, and Ctibor Cimburg (1437-94), who wrote the famous *Toračov Book*—only two out of a long line of famous jurists, who devoted their time and labors to the scientific exposition and systematization of Bohemian law. Their works, written in masterly style, contributed much to the progress of the Czech juridical language. These two, with several others, constituted the Hussite minority among the humanists who made their appearance in Bohemia with the Renaissance. The other, more numerous, faction of the humanists was, strange as it may seem, solidly opposed to the doctrines of Huss. Among these were Bohuslav of Lobkovic (1462-1510) and Rehor Hrubý of Jelen (1450-1514). Lobkovic collected the most remarkable library of his time, wherein he was greatly helped by the introduction of printing in Bohemia in 1468, when the *Trojan Chronicle*, the first book to be printed in the Czech language, appeared at Pil-

sen. Lobkovic and his contemporaries laid all subsequent Bohemian literature under deep obligations. They translated Greek and Latin classics, such as Cicero, Seneca, and Isocrates; wrote Latin poems, compiled lexicographical works (such as the *Lexicon Symphonum*) of the Czech, Greek, Latin, and German languages, by Siegmund Hrubý (1497-1554), son of Rehor Hrubý. Grammatical studies of the Czech language were embodied in Jan Blahoslav's (1523-71) *Czech Grammar* (1571). It contains disquisitions on the subject of how to translate idiomatically various words, phrases, constructions, etc. Literary and scientific activity was at its height, and such men of science as Tych Brahe and Kepler made Bohemia their home. The Bohemian historians of this period combined with their patriotic zeal a scientific preparation and seriousness of purpose which made their work especially valuable and reliable. They found their prototype in the anonymous *Old Bohemian Annals*, embracing the period of 1378-1527. Adam Veleslavín (1545-99), whose *Historical Calendar* is his best-known work, represents the highest type among these historians. Vaclav Hájek (?-1553) is the author of a *Chronicle* more interesting than accurate. Jan Blahoslav, who has been mentioned above, wrote an excellent history of the Moravian Brethren, of whom he was a Bishop. He is also famous for his supervision of the Czech translation of the Bible from the original tongues, which is for the Czech what the King James Version of the Bible is for the English. Blahoslav did not live to see his work printed: it was published in 6 vols. in 1579-93, at the expense of Jan of Siegmund Hrubý (1497-1554), son of Rehor Zerotin, a Moravian patron of letters, and is known as the *Kralitz Bible*. The unusual vigor displayed in the domain of prose and the widening of the intellectual horizon were naturally communicated to the field of poetry. Prince Hynek Poděbrad (1452-92) wrote his *May Dream* and other poems which won favor. Nicholas Dačický (1553-1626) composed a satirical poem, *Prostopravda*, and many works of an historical character. Among the religious poets Jan (1500-72), a Moravian bishop, deserves special mention. The greatest poet of the latter part of this period, which is known as the "golden age," was Simon Lomnický (1552-after 1622). His works include didactic and satirical poems and sacred dramas. Chief among them are the satire *Cupid's Arrow*, for which the King, Rudolph II, ennobled him and granted him an annuity; and the didactic *Short Precept for a Young Householder*, which is full of valuable allusions to the manners and customs of the time.

*Third Period* (1620-1774).—In the battle at the White Mountain in 1620 the Bohemians lost their political independence. Seven years later Ferdinand I of Austria made Catholicism the state religion of Bohemia. The works of the Protestant writers that had made the golden age so brilliant were now seized everywhere and destroyed. Nevertheless, it was during the opening years of this period that Czech literature reached its highest stage of purity and finish in the works of Karl Zerotin and Jan Komenský. Karl Zerotin (1564-1636), great as are his polemical and historical writings, acquired a lasting fame through his enormous correspondence, in which he stands in the very first rank with the few famous letter writers

of the world. Jan Amos Komenský (see CO-MENIUS) (1592-1670), who became one of the great educational reformers, spent his life in exile, like Karl Zerotín. His *Magna Didactica*, *Jannua Linguarum Reserata Aurea*, and *Informatorium* form his permanent contributions to the domain of pedagogy, philosophy, and religious controversy; they, besides, advanced materially the stylistic standard of Czech literature. His purely literary work, *Labyrinth of the World and Paradise of the Heart*, is naturally more important as a product of pure literature. All the other writers of this period are of little importance. The systematic efforts of the Hapsburgs to crush the Czechs were successful. Higher society became Germanized, the Czech language was heard only in out-of-the-way hamlets, and Czech books became a great rarity. The works of the Jesuit writers of the period, who employed the Czech language for religious propaganda among the masses—Sturm, Berlička, Steyer, and Koniáš—are full of barbarisms, monstrous forms and words. In 1774 Maria Theresa enforced by a decree the use of German in the intermediate schools as the language of instruction.

**Fourth Period—Renaissance** (1774 to the present day).—The forcible suppression of the native tongue in the common schools of Bohemia produced results entirely contrary to those expected and met a vigorous protest. Count Kinský published in German a plea for the Czech language under the title *Erinnerung über einen hochwichtigen Gegenstand* (1774), which was followed in 1775 by Balbin's *Disseratio Apologetica Linguae Slovacicae*, published by Pelzel. Pelzel himself (1734-1801) was one of a number of young scholars who devoted themselves to the study of their native tongue and the history of their country. Thus appeared Fr. Thoma's *Bohmische Sprachlehre* (1782) and K. I. Thám's *Kurzfassste böhmische Sprachlehre* (1785), which laid the foundations for the study of the language. Pelzel's own contributions were: *Typus Declinationum Linguae Bohemicae Novo Methodo Dispositarum* (1793); *Grundsätze der böhmischen Grammatik* (1795); and, especially, his historical works, of which the *New Bohemian Chronicle* was chief. These latter works awakened interest among the Czechs in their own history. A chair of Czech language was established at Prague in 1793 (Pelzel). The greatest name of this period of Czech literature is that of Josef Dobrovský (1753-1829), the "patriarch of Slavic philology." In his works on grammar and literary history he gathered enormous lexical materials, and the historical and comparative method brought him to the discovery of the richness of the ancient classical language, to the study of which his main efforts were directed. It is true that he made a *Collection of Czech Proverbs* in 1804, but all his works were written in German. Such men as Procházka, Rulík, Puchmayer, Jan Nejedlý, V. Nejedlý, Hněvkovsky, and others wrote pamphlets for the instruction of the people, compiled dictionaries and grammars, translated the classics of European literature, published periodicals, composed plays for the theatre, and even poetry in the sentimental style of the idyls of Gessner. These attempts met with very serious obstacles, owing to the imperfect state of the language, which was practically that of the old language of the classical period and which naturally

lacked terms for new ideas and concepts that had come into vogue during the third period. The language was brought to its final state of perfection in the works of Jungmann (1773-1847), the most illustrious name of the early renaissance. His translation of *Paradise Lost* (1811), an almost incredible *tour de force*, widened the horizon of poetical speech; his *Czech Dictionary* contained the vocabulary of the language; while his *History of Czech Literature* presented a complete survey of all the literary remains. He was particularly happy in coining new words, and whenever this expedient proved unsatisfactory he borrowed from other Slavic languages, more commonly Russian and Polish. The four other names that are most closely linked with that of Jungmann as leaders of the renaissance of Bohemia are Kollar, Šafárik, Palacký, and Hanka. Kollar (1793-1852), poet and scholar, is famous for his *Daughter of Slava* (1824), one of the poetic masterpieces of the Czech language, and his numerous prose works, among which that *On the Literary Reciprocity between the Families and Dialects of the Slavic Nation* (1831) advocated literary Panslavism. Šafárik (1795-1861) was one of the greatest philologists the Slavic countries have produced. Among his works, his *Slavic Antiquities* (1837) and editions of many literary monuments are works of importance. Palacký (1798-1876) is a historian, whose *History of Bohemia* (5 vols., 1836-67) presents an ideal combination of critical judgment, profound erudition, and striking style. Along with them may be mentioned Hanka (1791-1861), who discovered the manuscripts of Grineberg and Koniginhof and published a number of other important remains of Czech antiquities. The greatest poet of the period is František Ladislav Čelakovský (1799-1852), whose *Echoes of Russian and Czech songs* and the long poem *The Rose of a Hundred Leaves*, together with the poetic works of Kollar, were most responsible for the reawakening of the poetic spirit of the nation. Other names of importance are those of the lyric poets Jablonský and Vinařický, the epic writers Wocel, Marek, Holý, and Erben, and dramatists like Klicpera and Tyl. Poetry seems to have absorbed all the best energies of the nation at that time, and the novel, which holds the chief place of honor in the literature of all other nations, did not reach any high level of development. Most works of fiction dealt with themes from Bohemian history. The most noted novelists are Chochołoušek, Tyl, and, especially, Božena Němcová (1820-62), who deals with simple country life. The masterpiece of the latter, *Babička* ('Grandmother'), has been translated into English.

The reorganization of the Austrian Empire on a constitutional basis in 1860-61, which allowed the people of Bohemia scope in the development of political life, and the furtherance of national aspirations, marks the beginning of the modern period in Czech literature. The foundation of a new national theatre at Prague and the establishment of a Czech university by the side of the old one (1882) gave a great stimulus to literary activity. Little by little the narrow "national" current gave way to cosmopolitanism, with Mácha as the leading representative of Byronism. The recognized head of the young generation is Vítěslav Halek (1835-74). The greatest recent poet is Vrch-

lický (1853-1912), whose *A Year in the South, Pilgrimages to Eldorado*, and the historical dramas *Brothers and Drahomíra*, as well as translations from European classics, are especially noteworthy. Equal in popularity is the poet and novelist Svatopluk Cech, whose best-known work is *Arabský*. Zeyer, Heyduk, Arbes, Vlček, and the two women Eliška Krásnohorská (born 1847) and Karolína Světlá (1830-1899) are the most popular novelists of the present day. Great activity has also been exhibited in the departments of science, philology, and literary history, the most important names therein being those of Jireček, Šembera, Gebauer, and Patěra.

**Bibliography.** In BOHEMIAN: J. Jungmann, *Historie literatury české* (Prague, 1825); K. Sabina, *Dějepis literatury československé* (ib., 1863-66); J. Jireček, *Rukověť k dějinám literatury české* (ib., 1874); A. Šembera, *Dějiny řeči a literatury české* (4th ed., Vienna, 1874); K. Tietztrunk, *Historie literatury české* (3d ed., Prague, 1885); Fr. Bayer, *Stručné dějiny literatury české* (Olmütz, 1879); Backovský, *Zevrubné dějiny českého písemnictví doby nově* (Prague, 1888). GERMAN: Pypin and Spasovitch, *Geschichte der slavischen Literaturen*, bd. 2, abt. 2 (Leipzig, 1884). ENGLISH: Francis, Count Lützow, *A History of Bohemian Literature* (New York and London, 1899 and 1907).

**CZECH MUSIC.** See SLAVONIC MUSIC.

**CZEGLED,** tsé'gléd. A market town of Hungary, about 46 miles southeast of Budapest (Map: Hungary, F 3). The inhabitants are chiefly employed in agricultural pursuits, the surrounding country being particularly adapted to the raising of grain, fruit, and cattle. Grain is ground in local mills. Considerable red wine is produced. It is a large military post for cavalry. Pop. (largely Magyar), 1900, 30,106, 1910, 33,942.

**CZEKANOWSKI,** ché'ká-nóv'ské, ALEXANDER (1832-76). A Russian explorer. He was born in Volhynia and studied at Kiev and Dorpat. Banned to Siberia in 1863 for his participation in the Polish insurrection of that year, he was permitted to settle at Irkutsk in 1868. Here, as the agent of the Imperial Geographical Society, he began a series of geological investigations extending along the lower Tunguska, the Olenek, and the Lena, the results of which were published chiefly in Petermann's *Mitteilungen* (1874 et seq.). Amnestied by the government, he returned to St. Petersburg, where during an attack of melancholy he committed suicide.

**CZELAKOWSKY,** ché'lá-kóv'ské. See CELAKOVSKY.

**CZERMAK,** chér'mák, JAROSLAW (1831-78). A Bohemian painter, brother of Johann Nepomuk Czermak, the physiologist. He was born in Prague, and studied in that city under Christian Ruben, in Antwerp under Wappers, and in Brussels under Gallait. His early paintings treated chiefly subjects from the history of Bohemia. They are powerfully conceived and carefully executed, but less rich and interesting in color than the genre scenes treating the southern Slavs, to which he devoted himself after a journey in 1858 through Hungary, Croatia, Bosnia, Dalmatia, and Montenegro. Among his most noteworthy pictures are: "Murder of Wallenstein's Companions at Eger," "Slavonian Emigrants," "Norman Fishermen in a Boat Reading the Bible" (1850); "The

Court Poet of Rudolf II Begging on the Bridge of Prague" (1854; Czernin Gallery, Vienna); "Montenegrin Woman and Child" (1861); "Rape of a Herzegovinian Woman" (1867); "Return of Montenegrins to their Devastated Village" (1877). Consult Hantich, *L'Art tchéque en XIXe siècle* (Paris and Prague, 1904).

**CZERMAK,** JOHANN NEPOMUK (1828-73). A German physician, born in Prague. He studied at the universities of Vienna, Breslau, and Würzburg, and was appointed a lecturer on physiology and microscopic anatomy at the University of Prague. Subsequently he held a professorship of zoology and comparative anatomy at Graz (1855-56), and of physiology at Cracow (1856-58), Pest (1858-60), Jena (1865-69), and Leipzig (1869-73). At Leipzig he erected at his own expense a laboratory and an auditorium specially arranged for demonstrations in experimental physiology. He is best known for having made notable improvements in the laryngoscope and for having been the first systematically to employ that instrument. His publications include *Der Kehlkopfspiegel und seine Verwertung für Physiologie und Medecin* (1860; 2d ed., 1863). Consult the biography by Springer in the *Gesammelte Schriften* (2 vols., Leipzig, 1879), and *Populäre physiologische Vorträge* (1869).

**CZERNHAUSEN,** BARON VON. See CZORNIG, KARL.

**CZERNOWITZ,** chér'nó-vits (Ruman. *Cernăuți*). The capital of the Austrian Crownland of Bukowina, situated on a hill near the right bank of the Pruth, about 164 miles east-southeast of Lemberg, near the Rumanian and Russian frontiers (Map: Austria, J 2). Its growth has been largely within the last 40 years. Among the noteworthy public buildings are the Archiepiscopal Palace, a handsome Byzantine structure, the Greek Oriental cathedral, copied from the church of St. Isaac in St. Petersburg, the Armenian Church, the sumptuous Jewish synagogue in Moorish style, and a municipal theatre. Czernowitz is the seat of a Greek Oriental archbishop and the governor of the Bukowina. Its educational institutions include the Francis Joseph University, founded in 1875 (about 1000 students), with a library of 94,000 volumes, a gymnasium, industrial and trade schools. It has manufactures of machinery and oil, lumber and beer. It carries on a trade in wool, cattle, and spirits. Pop., 1890, 54,171; 1900, 67,622, of whom 34,441 were Germans, 13,030 Ruthenes, 9400 Rumanians, and 8601 Poles; among them 21,587 Jews; in 1910, 87,128. Up to 1774, when it was occupied by the Austrians, who made it the capital of the Province of Bukowina, Czernowitz was an unimportant village.

**CZERNY,** chér'né, KARL (1791-1857). An Austrian pianist and composer, born in Vienna. He was at first instructed by his father, Wenzel Czerny (1752-1832), then studied under Beethoven, with whom he was a great favorite, and under Clementi. At the early age of 15 he was in great demand as a teacher and also rapidly won high reputation as a virtuoso. Among his pupils were Liszt, Thalberg, Jaell, and Kullak. He left over 1000 compositions, of which his instructive works for the pianoforte are of permanent value. They are: "Die Schule der Geläufigkeit," op. 299; "Tägliche Studien," op. 337; "Die Schule des Virtuosen," op. 365; "Die

Schule der Fingerfertigkeit," op. 740; and others.

**CZERNY, VINCENTZ** (1842-1916). An Austrian surgeon, born at Trautenuau, Bohemia. He studied at Vienna, and until 1871 acted as Billroth's assistant. In the latter year he was made professor of surgery at Frieberg-im-Breisgau and in 1877 at Heidelberg. In 1906 he was made director of the Institute for Cancer Experimentation. He introduced important improvements in operative surgery and published the following works: *Ueber die Beziehungen der Chirurgie zu den Naturwissenschaften* (1872); *Beiträge zur operativen Chirurgie* (1878); *Das Heidelberger Institut für experimentelle Krebsforschung* (1912).

**CZERNY** (chér'né) **GEORGE** (i.e., Black George) (1766-1817). The leader of the Serbians in their struggle for independence, generally known as **KARA** (Turk. *kara*, black) **GEORGE**. He was born, Dec. 21, 1766, in the neighborhood of Belgrade. In 1787 he was involved in a rising against Turkish rule, but later settled down as a cattle dealer. In August, 1801, a band of Janizaries broke into his dwelling and plundered it, and in retaliation he collected a band of malcontents and entered upon a course of guerrilla warfare. Gradually his followers increased; in 1804 he captured the fortress of Shabatz and subsequently invested Belgrade. In the beginning of 1806 he routed the Turks at the rivers Drina and Morava and captured Belgrade in December, 1806. The cause of Serbia was aided by the war which at this time broke out between Russia and Turkey. After the Treaty of Slobosic (July 8, 1808), Czerny George was elected Governor by the people and recognized as Prince of Serbia by the Sultan. The French invasion of Russia in 1812 compelled the latter country to let Serbia shift for itself. Hostilities recommenced; the Turks were successful, and Czerny had to flee to Russia. He afterward went to Austria, where he lived for some time. Meanwhile the freedom of Serbia was secured through the leadership of Milosh Obrenovitch, and in July, 1817, when Kara George returned, intending, as some suppose, to rally his partisans round him for the furtherance of his ambitious schemes, he was murdered at the instigation of Prince Milosh. This was the beginning of a feud between the families of Obrenovitch and Karageorgevitch which lasted into the twentieth century. Kara George's second son, Alexander Karageorgevitch, was Prince of Serbia from 1842 to 1858, but was finally expelled, and the Obrenovitch family held the throne till 1903, when, after the assassination of Alexander I (q.v.), Peter Karageorgevitch, grandson of Czerny George, assumed the crown as Peter I (q.v.). See **SERBIA**.

**CZERNYSCHIEWSKY**, chér'n't-shév'ské. See **TCERNYSHEVSKI**.

**CZERSKI**, chér'ská, **JOHANNES** (1813-93). A German divine, one of the founders of the German Catholics. He was born at Werlubien, West Prussia, and was educated at the Priests' Seminary at Posen. Sentenced to penitential confinement for contracting a secret marriage in 1844, he resigned his vicariate in Silesia and

founded an independent community of Catholics, known as the Christlich-Apostolisch-Katholische Gemeinde. He was excommunicated in 1845. Although he maintained his own views, he participated in the struggles of the German Catholics and upon their downfall devoted himself to quiet religious activity. His most important work is the *Nachlass des sterbenden Papsttums* (12th ed., 1870). He defended his defection from Rome in *Rechtfertigung meines Abfalles von der römischen Hofkirche* (1845).

**CZIRKNITZER SEE**. See **ZIRKNITZER SEE**.

**CZOLGOSZ**, chól'gosh, **LEON** (1873-1901). An American anarchist, the assassin of William McKinley, twenty-fifth President of the United States. He was born of Polish-German parents at Detroit, Mich., and was by trade an iron-worker. He was tried before the criminal term of the State Supreme Court at Buffalo, N. Y., on Sept. 23-24, 1901, and convicted of murder in the first degree. No witnesses were summoned for the defense, but ex-Judge Lewis, of counsel for the prisoner, protected his constitutional and legal rights and at the conclusion of the case addressed the jury in his behalf. The assassin was electrocuted in the State prison at Auburn, N. Y., on Oct. 29, 1901. See **McKINLEY, WILLIAM**.

**CZÖRNIG**, chér'nik, **KARL**, **BARON VON CZERNHAUSEN** (1804-89). An Austrian statistician, born at Czernhausen, Bohemia. He studied at Prague and Vienna, and in 1841 became director of the bureau of administrative statistics at Vienna. In 1850 he represented his district in the Ministry of Commerce, in 1852 was made a baron, and from 1852 to 1863 was leader of a society for the preservation of architectural monuments. In 1859 he was appointed chief of the section of railway affairs in the Ministry of Commerce. In 1863-65 he was president of the central statistical commission, organized by himself. He published an ethnographic chart of the Empire, with text (1855), and other works.

**CZUCZOR**, tsóv'sór, **GREGELY** (or **GREGOR**) (1800-66). An Hungarian poet and linguist. He was born at Andód (County of Neutra), became a member of the Benedictine Order, and from 1825 to 1835 was a professor successively in the gymnasias at Raab and Komorn. In 1835 he was appointed second secretary and archivist of the Hungarian Academy, by which he was commissioned in 1844 to prepare the great lexicon of the Hungarian language (6 vols., 1861-74). Four volumes were edited by him, the remaining two by János Fogarassy (q.v.). His disregard of the historical and comparative method in philology often impaired the scientific value of his work as a lexicographer, particularly in connection with etymologies. His popularity was due chiefly to his epic poems, whose principal hero was John Hunyady. He was imprisoned in 1849 for the publication of his *Riado*, a poem calling Hungarians to action on behalf of their liberties, but obtained his release under the Amnesty of 1850. His poems appeared collected in 3 vols. at Pest in 1858. Besides his fables and translations of Latin authors, he composed a *Life of Washington*, which ranks among his best works in prose.

# D

**D** The fourth letter and third consonant in the Græco-Roman alphabets. Its form is derived by a rounding of the sign Δ, evidently a cursive corruption of the triangle which is found in the West Greek inscriptions rather than from the familiar form of delta (Δ) seen in most Greek scripts. (See ALPHABET, LETTERS.) Flinders Petrie (*The Formation of the Alphabet*, London, 1912) considers it one of the oldest and most generally used signs in the prehistoric signaries of Egypt. It is probable that it gave rise to the regular hieroglyphic, with value *d* or *du*, the sign of giving, and *da* is one of the earliest and most widespread roots having that meaning. The rounded form is distinctly European, occurring in Athens and Italy and in the Runic inscriptions. The Greek name of the letter, *delta*, is a modification of the Semitic word *daleth* (originally *dalt*), which means a 'door.' The Greek capital, Δ, still retains the shape of the opening of a tent, the kind of door most familiar to a nomadic people. From the rounded form of the capital letter were gradually evolved during the Middle Ages the uncial and minuscule forms, the latter giving rise to our small *d*. Consult E. M. Thompson, *Introduction to Greek and Latin Palaeography*, pp. 284 et seq. (Oxford, 1912).

**Sound.** In sound the English *d* is a dental or rather alveolar (lingual) voiced explosive, made by a contact of the tip of the tongue and the roof of the mouth near the upper front teeth. (Consult Jones, *The Pronunciation of English*, p. 16, Cambridge, 1909.) In French the contact is rather dental than alveolar. (Consult Passy, *The Sounds of the French Language*, p. 72, trans. by Savory and Jones, Oxford, 1907.) The North German *d* is between the English and the French. There is also in Northern English a slightly more cerebral *d*, as in *drown*, made by bending up the tip of the tongue and touching the roof of the mouth farther back than in the so-called dental sound. This is due to its position before the lingual *r*.

**Source.** English *d* comes: (1) from Indo-Ger. *dh* (Gk. *θ*, Lat. *f*, *d* (with *r*), *b*), as *door*, Gk. *thura*, Lat. *foras*; *udder*, Skt. *udhar*, Gk. *oithas*, Lat. *uber*; (2) from Indo-Ger. *t* when not immediately preceded by the accent; *hundred*, Skt. *catām*, Gk. *ekator*, Lat. *centum*; (3) from Germanic *p*, with *l*; *gold*, Goth. *gulþ*; (4) *d* arises as a special development from the affinity of *n* for *d* (as a transfer sound), in such words as *Eng. gender*, Lat. *gener*, Eng. *thunder* (OE.

*þunor*), *riband* (ME. *riban*). The *d* sometimes disappears, as in *cruel* (Lat. *crudelis*), borrowed from French. The letter *d* is often assimilated, as *affirm*, *accept*, *gossip* (OE. *godsbibb*); and in certain linguistic developments it interchanges phonetically with *l*, e.g., *l*, Lat. *Ulysses*, from Gk. *Odysseus*, or with *r* in Lat. *arbiter*, from *ad betere*. According to Grimm's Law, original *d* becomes *t* in English, *z* in German. Thus, Indo-Ger. *\*dekm*, Eng. *ten*, Ger. *zehn*. *Di* followed by a vowel becomes *j*, as in *journal* from *diurnal*, a phonetic law common to the Romance languages, from which this form is borrowed. Consult Schwan-Behrens *Grammaire de l'ancien français* (Paris, 1913).

**As Symbol.** 1. As a numeral, D = 500;  $\bar{D}$  = 5000. This use of D to denote 500 arose from a confusion with  $\Phi$ , the original symbol for that number. 2. In Roman names D = Decimus, Divus, Dominus, and Deus. 3. In academic degrees D stands for Doctor. 4. In music D is the second note of the natural scale and is a whole tone above C. It is written in the first added space below the treble clef or on the fourth line; in the bass clef it is on the third line or in the second added space above. (See MUSICAL NOTATION.) 5. In chemistry D = didymium. 6. In reckoning English money (£ s. d.), *d* = pence, penny (Lat. *denarius*). 7. In mathematics D = derivation, *d* = differentiation,  $\Delta$  = differencing, and  $\delta$  = variation.

**DAB** (probably from *dab*, gentle blow). A fish (*Limanda limanda*) closely related to the plaice and flounder (qq.v.). It is common on the sandy shores of northern Europe. It can easily be distinguished from the common flounder by the distinct arch in the lateral line at the anterior end. It attains a length of 12 inches and is much esteemed as food. A nearly related species, the rusty dab (*Limanda ferruginea*), possessing smaller scales, is rather abundant on the eastern coast of North America.

**DAB, DABB, or DHABB**, dūb (Ar. *ḍabb*, lizard). A lizard of northeastern Africa, as the common spiny-tailed agamoid *Uromastix acontinurus*. Two or more species, about a foot in length, are common in Algeria, Tunis, and Egypt, and in Algeria are called "lézards des palmiers," perhaps because they eat dates. This genus has no voice, and their color, which is very changeable, depends upon the weather, being dull on cool days and much brighter when it is warm. The term is also given to the dried flesh of lizards, especially of the skink (*Scincus officinalis*), preserved for use in medicine among the Arabs.

**DAB/BAT** (Ar. *ḍabbat*, reptile). The third

sign of the coming of the judgment, the Apocalyptic beast of the Mohammedan religion.

**DAB'CHICK** (variant of *dob-chick*, a diving bird, from *dap*, to drop bait into water, AS. *doppa*, a water bird, from *dypettan*, to dive, from *dypan*, to dip). A small grebe, as (1) in the United States, the pied-billed grebe (*Podilymbus podiceps*); (2) in England, the little grebe (*Podiceps minor*). See GREEBE.

**DABNEY**, dāb'nī, CHARLES WILLIAM (1855- ). An American agriculturist and educator, born at Hampden-Sidney, Va., and educated at Hampden-Sidney College and at the universities of Virginia, Berlin, and Göttingen (Ph.D., 1880). He was professor of chemistry at Emory and Henry College and at the University of North Carolina between 1877 and 1881, director of the North Carolina Agricultural Experiment Station and State chemist (1880-87), and director of the Tennessee Agricultural Experiment Station (1887-90). From 1887 to 1904 he served as president of the University of Tennessee; he then accepted the presidency of the University of Cincinnati. While in the South he added to his other duties those of Assistant Secretary of the United States Department of Agriculture (1893-96) and of president of the Summer School of the South (1902-04). He discovered phosphate and tin-ore deposits in North Carolina. Besides Agricultural Experiment Station reports his publications include: *Old College and New* (1896); *A National University* (1897); *Agricultural Education* (1900; 2d ed., 1904); *The Problem in the South* (1903); *Educational Principles in the South* (1904); *The Relation of Agriculture to Other Sciences* (1904); *Washington—Educationist* (1911).

**DABNEY**, dāb'nī, ROBERT LEWIS (1820-98). An American Presbyterian clergyman. He was born in Louisa Co., Va., and studied at Hampden-Sidney College, at the University of Virginia, and at the Union Theological Seminary of Virginia, in which he was professor of church history from 1853 to 1883. In the Civil War he served as chaplain of the Eighteenth Virginia Regiment and later became major and chief of staff to General "Stonewall" Jackson. In 1870 he was Moderator of the Presbyterian General Assembly of the South and in 1883 was appointed professor of moral philosophy in the University of Texas. He founded the Austin School of Theology. He published: *Life of Gen. T. J. (Stonewall) Jackson* (1864-66); *Sacred Rhetoric* (Richmond, 1867; 3d ed., 1881); *Defense of Virginia* (1867); *Sensualistic Philosophy of the Nineteenth Century Examined* (1875; 2d ed., 1888); *Theology, Dogmatic and Polemic* (1879; 3d ed., 1885); and the posthumous *Penal Character of the Atonement* (1898) and *Discussions* (4 vols., 1890-97). Consult Johnson, *Life and Letters of R. L. Dabney* (Richmond, 1903).

**DABO**, LEON (1869- ). An American mural and landscape painter. He was born in Detroit, studied in Paris at the Ecole des Arts Decoratifs, the Académie Julian, and under the Spaniard Vierge, and in Rome and Florence under Gagliardi. He began as a mural painter, as may be seen in his decorations of the church of St. John the Baptist in Brooklyn and the frieze in the Flower Memorial Library, Watertown, N. Y. After 1900 he turned to landscape painting under the influence of Whistler and the Japanese, but with a distinct originality. His paintings are usually harmonies in a single or

in related tones, wonderfully blended. They are highly decorative, subtle in the rendition of values, broad and precise in brush work. He has found even more appreciation abroad than in his native country. His favorite subjects are the Hudson, of which he has painted over 100 pictures, or the shores of Staten Island, with the subtle conflict of sunlight and mist, light and shadow. He is represented in the Luxembourg, Paris, in the museums of St. Louis, New York, Washington, Chicago, Detroit, and Tokyo, and in private collections. Among the best of his works are two "Nocturnal Fêtes on the Hudson," "The Wave," "Winter Scene" (Reisinger collection, New York), "Dawn beyond the Hudson" (1910), "The Rocket" (1912), and a portrait of Whistler.—His younger brother, THEODORE SCOTT DABO (1877- ), born in New Orleans, paints landscapes, very similar in style. Consult Clemen, in *Kunst für Alle* (Munich, 1910), and the *Studio* for 1906.

**DABOYA** (East Indian). The formerly accepted generic name, which has passed into English, of the very deadly Russell's viper (*Daboia*—now *Vipera—russellii*). See VIPER; SNAKE, and Plate of SNAKE.

**DABROWSKI**, dā-brōv'ské, JAN HENRYK. See DOMBROWSKI.

**DA CAPO**, dā kā'pō (It., from the beginning). A term in music, frequently placed at the end of a phrase or movement, indicating that the performer must return to the beginning of the movement, or to some other part of it, usually marked with the sign  $\text{§}$ , and finish where the word *fine* is placed. Scarlatti is generally credited with being the first to introduce the use of the *da capo* in his opera of *Teodora* (1693), though it appears that a *da capo* occurs in Tenaglia's opera, *Clearco*, as early as 1661. The words are generally abbreviated *D.C.*, sometimes *D. C. al fine*. See ARIA.

**DACCA**, dāk'kā, or **DHAKA**. The Islam capital of the Presidency of Bengal, in the division and district of the same name in British India (Map: India, F 4). It is situated on the left bank of the Burhi Ganga, which connects the Brahmaputra with the Ganges, 150 miles northeast of Calcutta. It extends along the river bank for 6 miles; its port is Narryangany. The surrounding country is low and overflows during the rainy season. Many of the old temples and other public buildings are in ruins and give to the city an appearance of decay. Since 1870, however, it has recovered some of its ancient prosperity, and there are now a number of modern public buildings and educational institutions, including a college. The city has modern water works and gas. In 1801 Dacca was a flourishing city of great commercial importance, famous for its muslins, which in the phraseology of the East were characterized as "flowing water," "woven air," and "evening dew." In those days Dacca was filled with magnificent temples and palaces, and its population was estimated at 200,000. It was formerly on the Padma, but the change in the river system of that part of India broke up its inland commerce, while the invasion of British manufactures almost completely ruined the native textile industry. With the construction of the Dacca-Maimansingh Railway line the trade of Dacca has revived, and there is again a demand for the native textile products. Besides textiles, Dacca also produces fine silver and gold plate, filigree work, steel ornaments, carved shells, and

4. GOLDEN SHINER (*Abramis chrysoleucas*).
5. SPOT-TAILED MINNOW (*Notropis hudsonius*).
6. HORNED DACE (*Notropis cornutus*).
7. SILVER-FIN (*Notropis whipplei*).

boats. There is a considerable trade in elephants. The chief exports are jute, oil seeds, and hides. Besides Dacca College, it has a college of fine arts, a college of medicine, and technical schools. In 1914 it had been decided to combine these into a university. Dacca was the capital of Bengal in the seventeenth century. Since 1912, when Bengal (q.v.) was reunited, it has been occupied by the entire administration for a certain period every year. Pop., 1891, 81,585; 1901, 89,733; 1911, 108,551.

**DACE, DARE, or DART** (OF. *dars*, dace, dart, ML. *dardus*; ultimately connected with Eng. *dart*, OHG. *tart*, javelin). A fresh-water fish (*Leuciscus leuciscus*) of the family Cyprinidae, belonging to the same genus as the chub (q.v.) and common in the streams of western Europe. The body is robust and covered with rather large scales; the mouth is rather large. The upper parts are dusky blue, becoming paler on the sides and passing into white on the belly; the cheek and gill covers silvery white. The dace is gregarious and swims in shoals. They furnish the angler fair sport both with fly and bait, but the flesh is not highly esteemed. The genus includes many other species both in Europe and in the United States. In the United States the name is applied to species of various genera of the family, especially *Semotilus*, of which the best known is the "horned" dace, or creek chub (*Semotilus atromaculatus*), which commonly frequents brooks from the Hudson valley to that of the Missouri. It grows to a length of 10 inches, is bluish above and creamy below, has a vague dusky band on the side, and its dorsal fin always bears a conspicuous black spot at the base in front, bordered with red in the males. It is one of the favorite objects of boys' fishing, and it is a good fish for the aquarium. Several other species of *Semotilus* occur east of the Rocky Mountains and are called chubs, fallfishes, etc. See Plate of DACE AND MINNOWS

**DACELO** (transposed from Lat. *alcedo*, also *alcyon*, Gk. ἀλκυών, *alkyōn*, kingfisher, halcyon). A book name for a genus (*Dacelo*) of Australasian kingfishers, representative of a subfamily (Daceloninae) of kingfishers (q.v.), characterized by their large size, harsh voices, and their adaptations to a forest life and a diet of reptiles and insects. The best known is the laughing kingfisher (*Dacelo gigas*), also called laughing jackass and king hunter, which is the largest of kingfishers, and widely distributed throughout Australia. "It is an uncouth-looking bird," says Wheelwright, "nearly the size of a crow, of a rich chestnut brown and dirty-white color; the wings slightly checkered with light blue after the manner of the British jay, the tail feathers long, rather pointed, and barred with brown. It has the foot of a kingfisher; a very formidable, long, pointed beak, and a large mouth, it has also a kind of crest, which it erects when angry or frightened, and this gives it a very ferocious appearance. It is a common bird in all the forests of Australia throughout the year: breeds in a hole in a tree, and the eggs are white. . . . Its principal food appears to be small reptiles, grubs, and caterpillars. . . . The laughing jackass is the bushman's clock, and, being by no means shy, of a companionable nature, a constant attendant about the bush tent, and a destroyer of snakes, is regarded, like the robin at home, as a sacred bird in the Australian forests." See illustration of KINGFISHERS.

**DACHSHUND**, daks'hunt'. A breed of small, long-bodied dogs, formerly employed in central Europe in hunting badgers, but now kept wholly as pets. See HOUND.

**DACIA**, dā'shi-ā. The land of the Daci, or Getæ. Its geographical limits were very indefinite until its conquest by the Romans. After that period it comprised modern Transylvania, with adjacent parts of Hungary, Rumania, and Bukowina (Map: Roman Empire, with Article ROME, E 2). The inhabitants, properly called Daoi or Dakoi (Daci), came originally from Thrace. Greek and Roman writers frequently confuse or identify them with their kinsmen the Getæ (q.v.). Their course northward can be only imperfectly traced, but we know that shortly before the time of Alexander the Great (335 B.C.) they had migrated across the Danube. It is not known when or for what reason the Getæ changed their name to Daci. They seem to have been the most valiant of the Thracian barbarians. Curio, the first Roman general to penetrate as far north as the Danube, did not venture to assail them. Julius Cæsar, however, is said to have contemplated their subjugation. In 10 B.C. Augustus sent an army up the valley of the Maros. From this time there was almost continual fighting between the Romans and the Daci, on the whole to the advantage of the latter, who actually compelled their civilized enemies, in the reign of Domitian, to pay tribute, in return for immunity from further raids. In 101 A.D. the Emperor Trajan crossed the Theiss and marched into Transylvania, where he fought a great battle near Torda. The Wallach peasant calls the battlefield, to the present day, *Prat de Trajan* (*Pratum Traiani*, 'Field of Trajan'). The Daci, who were commanded by their famous chief, Decebalus, were defeated. A second expedition of the Emperor resulted in the destruction of their capital, the death of Decebalus, and the loss of their freedom (106 A.D.). (See **TRAJAN'S COLUMN**.) Roman colonists were sent into the country, a bridge was built over the Danube—the ruins of which are still extant—and three great roads were constructed. The chief towns were Apulum and Sarmizegetusa. In 270-275 A.D. the Romans abandoned the country to the Goths, and the colonists were transferred to Mæsia.

**DACIER**, dā'syā', ANDRÉ (1651-1722). A French classical scholar. He was born of Protestant parents at Castres, in Upper Languedoc, studied at Saumur, and in 1672 came to Paris, where he was employed to bring out, as part of the Delphin Classics (q.v.), an edition of the Latin writer *Pestus* (1681). In 1683 he married Anne Lefèvre, also a Protestant. Two years later both entered the Roman Catholic church. Dacier subsequently became royal librarian, member of the Académie des Inscriptions, and perpetual secretary of the Académie. Dacier's principal works, besides his *Pestus*, are *Œuvres d'Horace en Latin et en Français* (Paris, 1681-89), an edition of Valerius Flaccus, and numerous translations into French of Greek authors, such as Plutarch and Epictetus, all of which, in spite of his erudition, are of mediocre quality, while the expositions and criticisms are shallow.

**DACIER**, ANNE (1654-1720). The wife of the preceding. She was born at Saumur, and after the death of her learned father, Tanneguy Lefèvre, who had developed her talent, came to Paris, where she acquired such a reputation by her edition of Callimachus (1674) that the

Duke of Montausier commissioned her to edit Aurelius Victor, Dictys Cretensis, Eutropius, and Florus, for the Delphin Classics. Similarity of tastes and employment led to a marriage between her and André Dacier. Besides editing various classical works, she translated the comedies of Terence; the *Amphitryon*, *Epidicus*, and *Rudens* of Plautus, accompanied by an able dissertation on the origin, progress, and mutations of dramatic poetry; Anacreon, Sappho, and the *Plutus* and *Clouds* of Aristophanes. Her admiration of Homer was unbounded and led to her translation of the *Iliad* (1699), and of the *Odyssey* (1708), her masterpiece, which made Homer known for the first time to many French men of letters, and yet involved her in a controversy with two of these men concerning the relative literary merits of the ancients and the moderns. Consult Rigault, *Histoire de la querelle des anciens et des modernes* (1856). Madame Dacier is generally acknowledged to have possessed a more acute and vigorous mind than her husband.

**DACITE.** A volcanic rock of generally porphyritic texture, characterized by the occurrence of lime-soda feldspar and of quartz, and by mica, hornblende, or pyroxene. These minerals are imbedded in a ground mass or matrix of rock glasses or of a finer-grained aggregate of crystals. The color of the rock is generally gray, but under prolonged weathering it may become brownish. The newer or younger dacites are therefore, in contrast with the older, much less brown in color. The average chemical composition of dacite is: silica, 68 per cent, alumina, 17 per cent, ferric oxide, 2 per cent; ferrous oxide, 1.5 per cent, magnesia, 1.5 per cent; lime, 3 per cent; soda, 4 per cent; potash, 3 per cent. Dacite differs from andesite (q.v.) principally in its higher percentage of silica, due to the presence of quartz and a greater abundance of the light-colored mineral constituents. The name "dacite" has been given because of the great development of this type of rock in Dacia, an ancient Roman province comprising part of modern Hungary and vicinity. Many recent as well as more ancient volcanic lavas are dacite. Dacite graduates into trachyte, rhyolite, and diorite (qq.v.).

**DACOITS'** (Hind. *ḍakait*, *ḍālāyat*, robber, *dākā*, attack by robbers, from *dāknā*, to shout). The name given to bands of men in India who live by robbery. They resemble the thugs (q.v.) in that a slight religious element seems to enter into their conduct, but plunder, and not murder, is their guiding motive. On the whole, they are a national type of banditti, closely resembling the brigands of Sicily or Greece. Driven out by the British government from Hindustan, they are still fairly active in Burma. Technically, dacoity in British-Indian law means the conspiring of five or more men to engage in any act of theft.

**DA COSTA, CLAUDIO M.** See COSTA, CLAUDIO M. DA.

**DACOSTA, dā-kō'stā, GABRIEL.** See ACOSTA, GABRIEL.

**DA COSTA, dā kō'stā, ISAAC (1798-1860).** A Dutch poet and Protestant theologian, born in Amsterdam. He studied at Leyden, in 1818 received the degree of LL.D., and that of Ph.D. in 1821. Though by parentage he was a Portuguese Jew, he embraced Christianity in 1822, and became a professor and director of the Free Scotch Church Seminary. He was an effective public

lecturer. The friend of Bilderdijk, the latter's poetic mantle fell upon him, and he was thenceforth esteemed the greatest of Holland's poets. The more noteworthy of his volumes of verse are: *Prometheus* (1820); *Poems* (1821-22); *Festive Songs* (1828); *Hagar* (1840); *The Battle of Nieuwpoort* (1859). Da Costa translated Byron's *Cain* and, as a theologian, produced a *Gospel Harmony and Israel and the Gentiles*, both translated. He died at Leyden, April 28, 1860. His poems were collected and published by Hasebroek (1861-62).

**DA COSTA, JACOB MENDEZ (1833-1900).** An American physician, one of the greatest clinical teachers of his time. He came of an ancient Portuguese family long resident in St. Thomas, West Indies, received his early education in Europe, chiefly in Dresden, and his medical training at Jefferson College, Philadelphia, from which he graduated in 1852 at the age of 19. Subsequently he studied in Paris and Vienna and returned to Philadelphia to establish a practice. He specialized in pathology and clinical medicine and soon became a factor in the medical life of his city, his method of teaching and ability as a lecturer attracting much attention. In 1858 he became identified with Jefferson College, first as instructor, then as clinical lecturer, and finally, in 1872, as professor in the chair of practice. In 1858 he was made a fellow of the College of Physicians of Philadelphia, and he served as its president in 1884-85 and 1893-98. He was a member of the staff of the Pennsylvania Hospital from 1865 until the time of his death, was also connected with the Philadelphia Hospital and with the Episcopal and the Children's hospitals of that city, and took an active part in medical organizations—he helped to found the Pathological Society of Philadelphia and was its president from 1864 to 1867, and was president of the Association of American Physicians in 1897. He was made honorary and corresponding member of many learned and scientific organizations, and the degree of LL.D. was conferred upon him by Jefferson College, the University of Pennsylvania, and Harvard. As a writer, his style is clean cut, scholarly, and entertaining. His work includes many papers and addresses, among these being: *Harvey and his Discovery* (Philadelphia, 1879); *Modern Medicine* (Philadelphia, 1872); *The Physicians of the Last Century* (Philadelphia, 1857); *The Scholar in Medicine* (Boston, 1891). His chief work is his textbook on *Medical Diagnosis* (9th ed., Philadelphia and London, 1900). This has been translated into several foreign languages.

**DACRES, dā'kērz, JAMES RICHARD (1788-1853).** An English naval officer, born at Lowestoft. He entered the navy in 1796, accompanied the expedition sent against Ferrol, and in 1806 was promoted captain and put in command of the sloop *Bacchante*. After distinguished service he was in 1811 transferred to the *Guerrière*. Upon the loss of that vessel in the famous contest with the *Constitution* he was taken aboard the latter—he and Captain Isaac Hull were intimate friends—and subsequently paroled at Boston. By the court-martial assembled in 1812 at Halifax he was honorably acquitted of all blame for the surrender of his vessel. In 1815, while commanding the *Tiber*, he captured the *Leo*, an American privateer. He became a rear admiral in 1838, commander at the Cape of Good Hope in 1845, and vice admiral in 1848.

**DACRES**, SIR SYDNEY COLPOYS (1805-84). An English admiral. He entered the navy in 1817 and was captain of the flagship of the Channel fleet under Sir Charles Napier from 1847 to 1849, and as commander of the *Sans Pareil* took a prominent part in the bombardment of Sebastopol, for which he was made C.B. He was made rear admiral in 1858, and commanded the first ironclad squadron. He was second in command on the North American station during the controversy over the Trent affair (1861) and commanded the Channel squadron in 1863-66. In 1868 he was appointed Senior Lord of the Admiralty and in 1872 governor of Greenwich Hospital. He had been promoted admiral in 1870. In 1875 he retired.

**DACRYDIUM** (Neo-Lat., from Gk. δακρυδιον, *dakrydion*, dim. of δακρυ, *dakry*, tear; referring to the drops of gum exuded by the tree). A coniferous genus of lofty trees of the family Taxaceæ, belonging to the podocarp tribe. The species are chiefly natives of Australia and New Zealand. *Dacrydium franklinii* is called Huon pine, although it is not a pine. Its timber is harder than any Baltic pine and is excellent for spars for naval purposes. The tree attains a height of 100 feet, and a diameter of 6 feet. The wood is light, tough, and very durable. It is said to be one of the best Australian woods for carving. *Dacrydium cupressinum* and *Dacrydium kirkii* are two species occurring in New Zealand, where they are large trees of considerable economic value. The fleshy seeds of both species are edible. The young twigs of *Dacrydium cupressinum* are sometimes used for making a kind of beer. Closely related are the species of *Podocarpus*, of which there are about 40 species in Asia and through the islands of Australia. *Podocarpus totara* is the most valuable timber tree of New Zealand, where it attains a height of 60 to 100 feet and a diameter of 6 to 8 feet. The bark is extensively used for roofing houses. *Podocarpus spicata* and *Podocarpus excelsa* are other species of value.

**DACTYL** (Lat. *dactylus*, Gk. δακτύλος, *daktylos*, finger). The name of a measure, or "foot," in Greek and Latin versification. It consists of one long and two short syllables, as in the word *omnibūs*, and was so called from its resemblance to the finger, which consists of three joints—one long and two short. The same name is applied to a trisyllable measure in English verse, consisting of one accented syllable and two unaccented syllables, as in *dēstiny*. (See VERSIFICATION.) Dactylic verses consist of dactyls and equivalent feet. See HEXAMETER.

**DACTYLES**. See ORCHARD GRASS.

**DACTYLOLOGY** (from Gk. δακτύλος, *daktylos*, finger + λόγια, *logia*, reasoning, from λέγειν, *legēin*, to say). The art of communicating thought by the fingers. See DEAF MUTE.

**DACTYLOMANCY**. See SUPERSTITION.

**DACTYLS**, **DACTYLI**, **DAKTYLOI**. In Greek legend, a supernatural folk who dwelt on Mount Ida in Phrygia. They were the discoverers of copper and iron and were deeply versed in the metal-working arts. The legends later transferred them to the Cretan Mount Ida and identified them with the Corybantes. They were originally three in number—Kelmis, the Smelter; Damnameneus, the Hammer; and Acmon, the Anvil. Later, they were increased to 5, 10, 52, and at last 100.

**DADDY LONGLEGS**. 1. In the United States, the long-legged, spider-like creatures of

the arachnid family Opilioniæ. (See HARVEST-MAN.) 2. In England, the flies of the family Tipulidæ, which includes the crane flies—big, long-legged insects, resembling exaggerated mosquitoes, that swarm in late summer in grassy and bushy places. The eggs are not known. The larvæ of some live in damp earth, decaying wood, etc., and of others in the water, feeding on vegetable material, diatoms, etc. One curious wingless genus (*Chirona*) contains the "snow insects" occasionally seen in swarms on the surface of snow banks. Some of the earth-inhabiting forms injure the roots of grain and other grasses. More than 1000 species have been described.

**DA'DO** (It., a die). In architecture, the die or body of a pedestal. It is also applied to the lower part of the wall of a room, between the baseboard and the chair rail or cap molding, whether wainscoted with wood or other material, or otherwise decoratively treated to distinguish it from the rest of the wall. It is usually not over 3 or 4 feet in height. See WAINSCOT.

**DADOK'YLON** (Neo-Lat., from Gk. δάς, *das*, torch + ξύλον, *xylos*, wood). Fossil wood of Paleozoic age, found in the Devonian rocks of Europe and America, and having a microscopic structure like that of Cordaites wood and Araucaria wood. See CONIFERÆ. CORDAITES.

**DÆDALUS** (Lat., from Gk. Δαίδαλος, *Daidalos*, literally, the 'cunning worker'). The mythical sculptor, placed by Greek legend at the beginning of native art, to whom were attributed many early wooden statues, apparently of the type of the early nude male figures, such as the "Apollo of Orchomenos." The early forms of the legend seem to have made him a native of Crete, and there seems to have been an early school of Cretan artists, the Dædalidae, who claimed him as their ancestor. Later, under Athenian influences, however, the more common forms of the myth arose. In these Dædalus was a descendant of the Athenian royal race, the Erechthidae, and having killed his pupil Talos, fled to Crete, where he was received by King Minos, for whom he built the Labyrinth for the Minotaur, and, for Pasiphaë (q.v.), the wooden cow. These stories seem to imply that Crete exercised an important influence on early Greek art. Having incurred the wrath of Minos, he fitted wings to his son, Icarus, and himself, and fled across the sea. Icarus flew too near the sun, the wax which fastened the wings melted, and he was drowned in the Icarian Sea. Dædalus escaped to Italy, where he built the temple of Apollo at Cumæ, and then crossed to Sicily, where local legend attributed to him many architectural works. Consult: Kuhnert, *Dædalus* (Leipzig, 1886). Pottier, in Daremberg and Saglio, *Dictionnaire des antiquités* (Paris, 1873). Robert, "Die Daidaliden," in *Archæologische Mittheilungen* (Berlin, 1886); E. A. Gardner, *A Handbook of Greek Sculpture* (London, 1911).

**DÆDALUS OF SICYON**, δαίδηλον. A Greek sculptor, who lived in the earlier half of the fourth century B.C., the son of Patrocles of Sicyon, and kinsman of the famous Polyclitus (q.v.). One of his earliest works was a "Trophy," erected at Olympia by the Eleians to commemorate a victory over the Lacedæmonians. His other productions include the figures of "Two Boys Using the Strigil," the portrait statues of several of the victors in the Olympian or the Pythian games, and statues of Nike and

Arcadias in a large group set up at Delphi, by the Arcadians, after a victory gained in 369 B.C. over the Spartans. Consult Daidalos, 2, in Pauly-Wissowa, *Realencyclopädie der klassischen Altertumswissenschaft*, vol. iv (Stuttgart, 1901).

**DÆDICURUS.** See GLYPHODON.

**DÆMON.** See DEMON.

**DÆMON/ELIX** (Neo-Lat., from Gk. *δαίμων*, *daímōn*, demon + *ἥλιος*, *helios*, spiral). A problematic fossil found in great numbers in the sandstones of the Loup Fork Tertiary of northwestern Nebraska and adjacent portions of Wyoming, and known to the ranchmen of the vicinity by the name of Devil's corkscrews. The fossil ranges through a thickness of about 250 feet of sandstones and varies in form from delicate fibrous structures in the lowermost beds, through cylindrical, spherical, cakelike, and irregularly twisted forms in successively higher horizons, till in the uppermost beds it assumes the form of a vertical left- or right-handed spiral spring, 2 to 10 feet high, with or without a central axis, and usually with a more or less curved fusiform or cylindrical "trunk," 3 to 20 feet long, that rises obliquely from the base of the spiral. The fibrous forms penetrate the sandstone and are also found traversing the surfaces of skulls and bones of fossil mammals entombed in the same beds. The spiral screws are wonderfully regular in their proportions, both as to the angle of pitch of the spiral and as to the increase in diameter of the same from bottom to top. The whole mass of the fossil consists of an aggregation of twisted plant fibres, which on examination with a microscope prove to have a simple cellular structure like that of parenchyma tissue. This cellular structure has been found in all parts of the fossil and clearly indicates its vegetable nature. The beds in which the Dæmonelix is found are of lacustrine origin, and it is possible that the fossil is largely of algal affinity. The finding of numerous fossils of burrowing rodents within the corkscrews has, however, led some to consider the latter as well-preserved burrows of animals; and no single suggestion as to the manner of origin seems as yet to cover all the varied features. Prof. E. H. Barbour, the discoverer of Dæmonelix, has described it fully in a paper on the "Nature, Structure, and Phylogeny of Dæmonelix," in the *Bulletin of the Geological Society of America*, vol. viii (Rochester, 1897). Consult also O. A. Peterson, "Description of New Rodents and Discussion of the Origin of Dæmonelix," in *Carnegie Museum Memoirs*, vol. ii (Pittsburgh, 1905).

**DAENDELS**, dān'dēls, HERMAN WILLEM (1762-1818). A Dutch general. He was born at Hattem, in Gelderland, where he took part in the revolutionary disturbances that broke out in 1787. Compelled to seek refuge in France, he rendered important service to Dumouriez in 1793, in the latter's campaign against Holland, was made brigadier general, and, after the proclamation of the Batavian Republic, entered its service as lieutenant general. In 1799 he commanded a division of the Republican army, which compelled the Anglo-Russian forces to surrender. Daendels became successively Governor of Münster, commander in chief of the Dutch cavalry, marshal of Holland, and Governor-General of the Dutch East India possessions. This last office he held from 1808 to 1811 and discharged his duties with great ability and prudence. He participated in the Russian cam-

paign of 1812-13 and distinguished himself by his stalwart defense of Modlin. On the overthrow of Napoleon his services were secured by the new King of Holland, William I, who intrusted him with the organization of government in those colonies on the west coast of Africa which had been restored to the Dutch. In this capacity he labored with energy and success until his death. The work he published (1814) on his administration of Java was an important contribution to our knowledge of that island.

**DAET**, dā-ät'. A town of Luzon, Philippines, on a river of the same name, in the Province of Ambos Camarines (Map: Philippine Islands, D 3). It is situated near the coast, 138 miles southeast of Manila. It has the ruins of an old Spanish fort. There are gold mines in the vicinity. Pop., 1903, 13,423.

**DAE'FODIL.** See NARCISSUS.

**DAFNE.** The first, strictly speaking, of the Italian operas, produced in 1594, under the auspices of the Society of the Alterati. The score was by Peri, and the libretto by Ottavio Rinuccini. When translated by Opitz to the new music of Heinrich Schütz, it became the first German opera as well (1627).

**DAFOE**, dā'fō, JOHN WESLEY (1866- ). A Canadian journalist. He was born at Bangor, Hastings Co., Ontario, and was educated at the Arnprior high school. After some experience as a school-teacher, he became in 1883 the parliamentary correspondent of the *Montreal Star* and in 1885 was appointed editor of the *Ottawa Evening Journal*. In 1886 he went to Winnipeg, Manitoba, and for six years was a member of the editorial staff of the *Manitoba Free Press*, the most influential Liberal journal in the Canadian Northwest. In 1892 he became editor of the *Montreal Herald* and in 1895 joined the editorial staff of the *Montreal Star*. In 1901 he returned to Winnipeg and was appointed editor of the *Manitoba Free Press*. In 1906 he was a delegate to the Commercial Congress of the Empire at London, England; and in 1909 he was a delegate to the Imperial Press Conference, London. Among his publications are: *The Fortunes of a Manitoban* (1891). *Western Canada* (1907). *The Imperial Press Conference* (1909).

**DAGAMI**, dā-gā'mē. A town on the Binahaan River, of the island Province of Leyte, Philippines, 15 miles southwest of Tacloan (Map: Philippine Islands, E 5). It is in a plain, near the east coast of the island. The women of Dagami make fine embroidery. Pop. in 1903, 12,591.

**DAGAN.** See DAGON.

**DAGDEN.** See DAGO.

**DAG'GER** (Icel. *daggdr*, dagger, from Ir. *daigear*, Welsh *dagr*, dagger, from Bret. *dag*, OGael. *daga*, knife). A short sword, or two-edged, sharp-pointed knife. It is one of the oldest forms of the *arme blanche* and has its modern representative in the infantry sword bayonet. (See BAYONET.) In the Middle Ages soldiers often fought with sword or rapier and dagger, the latter being held in the left hand. (See FENCING.) The dagger proper has ceased to be part of the modern military equipment, except with some of the native or tribal troops of the British and Russian empires.

The dirk, practically a dagger, is still carried by the Highlanders of the British army, but only as an ornamental part of their national dress. The American bowie knife (q.v.) is in

effect a dagger. Many kinds of daggers are used by the Filipinos and Moros, the Malay *Kreesse* being one of the most common. The *poniard*, *stiletto*, *misericorde*, and *anlaoe* are daggers, as is also the Indian *khuttar*.

**DAGGER MOTH.** A moth of the noctuid genus *Acronycta*, so named because of dagger-shaped marks on the wings.

**DAGGERWING.** One of the small, slender-tailed North American butterflies of the nymphalid genus *Timetes*.

**DAGHESTAN**, dā'ge-stān' (Pers., place of mountains, from Turk. *dagh*, *tagh*, mountain + Pers. *stān*. OPers. *stāna*, place, from *stā*, Skt. *sthā*, to stand). A province of Transcaucasia, Russia, bounded by the Caucasian Province of Terek on the north, the Caspian Sea on the east, Baku on the south, and the Caucasus mountain chain on the west (Map: Russia, G 6). Area, 11,471 square miles. A large portion of the territory belongs to the region of the Caucasus Mountains. Behind a narrow strip of level coast land rise heavily forested mountain ridges with single peaks attaining an altitude of 14,000 feet. The climate of the plateaus is severe: the rainfall is everywhere meagre, varying from 17 to 21 inches per annum. With the aid of irrigation the coast districts produce cereals, wine, fruit, cotton, and tobacco. Cattle and sheep are raised in the mountain regions. Sulphur, salt, and copper are worked. The commerce is insignificant, and the transportation facilities inadequate. Pop., Jan. 1, 1911, 689,300, mostly Lesghians; the remainder being made up of Tatars, Georgians, and a few Russians, Jews, and Persians. The natives are chiefly Mohammedans; educational facilities are very meagre.

The seat of the provincial government is Temir-Khan-Shura, and the chief commercial centres are Darbent (q.v.), and Petrovsk, both on the coast. Until 1812 Daghestan formed a province of Persia, although the inhabitants enjoyed partial independence under native khans and manifested their opposition to Persian rule by periodic revolts. It then passed into the nominal possession of Russia, whose authority was not established until after a fierce struggle of many years. (See SHAMYL.) Daghestan still continued to be ruled by native khans until 1868. The last outbreak of the natives against Russian rule occurred during the Russo-Turkish War in 1877.

**DAGNAN-BOUVERET**, dā'nyān' būv'rā', PASCAL ADOLPHE JEAN (1852- ). A French historical and portrait painter. He was born in Paris, Jan. 7, 1852, studied under Gérôme, and won his first important success with "A Wedding at the Photographer's" (1879, Lyons Museum). "The Consecrated Bread" (1886), now in the Luxembourg, admirably displays his management of light in interiors and is painted with a sentiment that is poetic, yet quiet and serene. Other important paintings are: "The Conscripts" (1891, Ministère des Beaux-Arts); several Breton scenes; "Painting" and "Lady with a Child" (Palais des Beaux-Arts); "Madonna" (Pinakothek, Munich, and "Madonna of the Rose" (Metropolitan Museum, New York). Bouveret was made Chevalier of the Legion of Honor in 1885 and received the first medal at the Salon of 1889 for his "Breton Women at the Pardon." He painted excellent portraits of Gérôme, Courbet, and other prominent persons. Among his later pictures are "Spanish Dancer" (1909) and "Marguerite au

Sabat" (1912). His work is characterized by a fine color sense and excellent draftsmanship. Consult Van Dyke, *Modern French Masters* (New York, 1896).

**DA'GO.** A name originally given by sailors to Spaniards, Portuguese, and Italians in general. It is said to be a corruption of the Spanish name Diego, equivalent to the English name James, or Jack. By others it is supposed to be a title given exclusively to those born of Spanish parents. Still others believe it to be purely a corruption or nickname derived from *kidalgo*, which came to be applied to any foreigner from Latin Europe. Whatever the derivation of the word may have been, it is a term of opprobrium applied chiefly to the lower class of Italian immigrants in America.

**DAGÖ**, dā'gö, or **DAGDEN**, dā'gden. An island in the Baltic Sea, belonging to the Russian Government of Esthonia. It lies near the entrance to the Gulf of Finland, north of the island of Ösel, is quadrilateral in shape, and covers an area of 370 square miles (Map Russia, B 3). The surface is mostly low land, partly covered with marshes; the rest is chalk land and infertile. Fishing and farming are the main industries. Pop., about 16,400, composed of Esthonians, Swedes, and Germans. Dagö belonged to Denmark until 1645, when it was acquired by Sweden, and was annexed to Russia in 1721.

**DAGOEBERT**, Fr. pron. dā'gö'bār', I (7-638). King of the Franks, son of Clotaire II. He ruled in Austrasia from 622 to 632 and in Neustria and Burgundy from 628 to 638. In 632 he gave Austrasia to his son Sigibert. Consult Albers, *König Dagobert in Geschichte, Legende und Sage* (Kaiserslautern, 1884).

**DAGOBERT**, CHANSON DU ROI (Fr., song of King Dagobert). A French song, in which the characters are King Dagobert and St. Eloi, his counselor. It became very popular as a political song, the couplets being altered to fit different political conditions. A notable version which sprang up in 1814, aimed at Napoleon, was suppressed by police regulations.

**DAGON**, or **DAGAN**. A god worshiped by the Philistines, the Canaanites, the Amorites, the Chanaites in Mesopotamia, the Akkadians, and the Assyrians. In the Old Testament he is mentioned as a deity to whom a temple was dedicated at Gaza (Judg. xvi. 23), and another at Ashdod (1 Sam. v. 1 ff.; 1 Macc. x. 83 f., xi. 4). There seems to have been another at Ashkelon (Jerome to Isa. xlv. 1). There was a Beth Dagon in Judah (Josh. xv. 41) and another in Asher (Josh. xix. 27). According to Philo Byblius, Dagon was one of the highest gods of the Phenicians. The name Dagan takala occurs in the Amarna tablets (317, 318, ed. Knudtzon). Dagon was the chief god of Tirkia, the capital of Chana, south of the Chaboras in southern Mesopotamia. Names compounded with Dagan meet us as early as in the days of Manishtusu, King of Kish, who is now supposed by Poebel (*Or. Lit. Zeitung*, 1912, pp. 481 ff.) and Ed. Meyer (*Gesch. d. Altertums*, 1913, 3d ed., i, 2, p. 517), to be the second successor of Sargon I of Akkad. Two kings of the dynasty of Isin have names compounded with Dagan, and Isme Dagan occurs at an early time in Assyria. (See BABYLONIA; ASSYRIA.) Dagon was probably an Amoritic deity, adopted by the Canaanites, and at a much later time by the invading Philistines, who probably found.

him worshiped in the cities of the Shephela which they conquered. Since the time of Sargon I of Akkad he may have been recognized to some extent in Babylonia, but it was no doubt through the Amoritic dynasties in Babylonia and Assyria that his worship was established there. Priests and worshippers avoided stepping on the threshold of Dagon's temple at Ashdod, and this custom was explained in Israel as due to the fall of a part of the statue of Dagon on the threshold (1 Sam. v. 2-5); the same custom seems to have prevailed in Jerusalem (Zeph. i. 9) and probably originated everywhere in fear of, or respect for, the guardian spirits watching the threshold. Concerning the character of Dagon very little is known. Kimchi says that he was half man and half fish, but this may not be based on any tradition, but only on a popular etymology, deriving the name from *dag*, 'fish.' Whether the connection of the name with *dagan*, 'grain,' has any more validity is still uncertain. Consult: Menant, "Le mythe de Dagon," in *Revue de l'histoire des religions*, vol. ix (1886); Jensen, *Kosmologie der Babylonier* (1890); Martin A. Meyer, *History of the City of Gaza*, pp. 118 ff. (1907); Jastrow, *Die Religion Babylonien und Assyrien* (1902-12); Ed. Meyer, *Geschichte des Altertums*; 3d ed., i, 2, pp. 613, 606, 633 (1913).

**DAG'ONET**, Sir. King Arthur's fool, in the "Round Table" legends.

**DAGUERRE**, da'gâr', LOUIS JACQUES MANDÉ (1789-1851). A French painter and physicist, inventor of photography in the form of the daguerreotype, born at Cormeilles, Seine-et-Oise. He first became a scene painter under Degoti, and was so successful in this art that he began to paint extensive panoramas and finally evolved the diorama, which attracted much attention. About 1829 he began to interest himself in the discoveries which became famous under his name. He entered into a correspondence with Nicéphore Niépce, who had been studying in the same direction since 1814. Together they invented the art of photography on metal, the well-known daguerreotype process, the improvement of which was to result in modern photography. Before the completion of their experiments Niépce died. In 1839 the discovery was made known, and immediately its value was appreciated. Daguerre was given a pension of 6000 francs and made a member of the Legion of Honor. While he was still laboring to bring his work nearer perfection, he died suddenly at Petit-Brie-sur-Marne, near Paris. He wrote the following volumes descriptive of his inventions. *Historique et description des procédés du daguerrétype et diorama* (1839) and *Nouveau moyen de préparer la couche sensible des plaques destinées à recevoir les images photographiques* (1844). Consult: Ernout, *Les inventeurs du gaz et de la photographie* (Paris, 1885). See **DAGUERRETYPE**

**DAGUERRETYPE** (da-gér'ô-tip) **PROCESS** (Fr. *daguerrétype*, from *Daguerre* + Gk. *typos*, *typos*, impression). The original photographic process, as introduced by its inventor, Daguerre, in 1839. The pictures are positive or direct, though they appear as negative when viewed at certain angles, and are the result of the successive action of the vapors of iodine, bromine, and mercury upon a highly polished surface of chemically pure silver. The manipulations involved in conducting the process are: (1) cleaning and polishing the plate: (2) ren-

dering the plate sensitive; (3) exposing it in the camera; (4) developing the latent image; (5) fixing the picture.

A copper plate of moderate thickness is first coated with silver by electroplating and polished as highly as possible; it is then exposed first to the vapor of iodine, and then to the vapor of bromine for a length of time, ascertained in practice by watching the succession of prismatic colors which begin to appear with the first contact of the vapor. The plate is then exposed in a camera, and the development of the latent image, which is the next operation, is effected by subjecting the plate to the action of the vapor of mercury, which attaches itself to the various parts of the picture in proportion as it has been acted on by the light. Those portions of iodide and bromide of silver unaffected by light are next removed by immersing the plate in a solution of hyposulphite of soda; and the picture is subsequently fixed and intensified by pouring over its surface a solution of hyposulphite of soda and chloride of gold and applying heat; by which means it is coated with a thin film of metallic gold and thereby rendered so permanent that it requires a chemical solvent for its removal. It may be mentioned in conclusion that, though Daguerre published in 1839 the first practicable process for taking pictures by the agency of light, his experiments would seem to have been suggested by the researches of Niépce, who about 1820 obtained impressions on silver plates rendered sensitive by being coated with asphaltum saturated with oil of lavender. Consult: Hunt, *A Manual of Photography* (London and Glasgow, 1854). Chapters from this volume, revised by T. W. Smillie, United States National Museum, as "The History of Some Discoveries in Photography," will be found in *The Annual Report of the Smithsonian Institution*, 1904 (Washington, 1905). The Reports for 1903 and 1905 also contain valuable chapters on the early history of photography. See **PHOTOGRAPHY**

**D'AGUESSEAU**, da'gê'sô'. See **AGUESSEAU**. **DAGUPÁN**, dà'gû-pân'. A town of Luzon, Philippines, in the Province of Pangasinán, situated 8 miles from Lingayen, on the Dagupán River near the Gulf of Lingayen (Map: Luzon, C 2). It is the terminal of the Manila-Dagupán Railway. The surrounding region, generally level, is very fertile, producing cane, corn, and tobacco. Pop., 1903, 20,337.

**DAHABEĀH**, dà'hā-be'ā (Ar. *dahabiya*, from *dahaba*, to go). The name given to barges on the river Nile, much used by tourists, by whom they are hired by the week. They resemble in their conveniences and comforts the house boats so popular on English rivers.

**DAHALAK**. See **DAHLAK**.

**DAHL**, dāl, JOHAN CHRISTIAN CLAUSEN (1788-1857). A Norwegian landscape painter. He was born at Bergen, the son of a poor fisherman, and early showed such talent for drawing that he was sent to the Copenhagen Academy, where he studied under Lorentzen. He quickly developed an original style based upon nature and the old Dutch painters, particularly Everdingen, which made him one of the pioneers of modern landscape painting. In 1818 he removed to Dresden, where he was appointed professor at the Academy in 1824. In 1826 he revisited Norway, and his landscapes, until then romantic and dreamy, became more truthful to nature. Dahl is best represented in the galleries of Christiania, Ber-

gen, and Copenhagen. One of his finest paintings, "Kronberg by Moonlight," is in Schiefer Castle near Gotha. Consult Aubert, *Maleren Professor Dahl, 1788-1857* (Christiania, 1892-94).

**DAHL, VLADIMIR IVANOVICH** (1801-72). A Russian lexicographer, born in Lugansk (Government of Ekaterinoslav). He was educated at the University of Dorpat and in 1828-31 accompanied the Russian army in a medical capacity in the Turkish and Polish campaigns. Subsequently he was a government official at Orenburg. Neither medicine nor his military experiences fully satisfied him; however. He therefore turned his attention to literature, coming into intimate contact with Pushkin, Krylov, Gogol, and other great Russian writers of his day. His first literary work—a number of short stories—was published in 1832. After a few years' interruption came numerous papers, books, and essays on medicine, philology, and other subjects. At the same time he wrote or edited a number of textbooks on botany, zoology, and other biological subjects. From 1849 to 1859 he held an important government post, which gave him an excellent opportunity to organize his accumulated ethnographic material and publish his results to the world. His studies in Russian ethnography and philology are valuable, in particular his *Dictionary of Existing Russian Dialects* (4 vols., 1861-68; 2d ed., 1882). His works in belles-lettres were collected at St. Petersburg in 1860-61 (8 vols.).

**DAHLAK**, da-'lik', or **DAHAIKAK**, dá-'há-lik'. An archipelago (a dependency of Italy) just off Massawa, Abyssinia, consisting of a number of islands of coral, rock, and sand (Map. Egypt, E 4). Three only have a permanent population. The entire area is about 420 square miles, the larger portion of which is taken up by the main island, Dahlak-el-Kehir, 32 miles long and 18 wide. The chief occupation since the days of the Roman Empire has been fishing for pearls and sponges. Domestic animals are raised to some extent. The people are of mixed Nubian and Arab extraction. The permanent population is about 1500.

**DAHLBERG**, däl'bërg, ERIK JOENSSON, COUNT (1625-1703). A Swedish military engineer, born in Stockholm. He served under Charles X (1656-60) as an engineer officer, took part in that monarch's famous winter march across the ice belt, and directed the engineers in the sieges of Copenhagen and Kronberg. Becoming in 1676 director of fortifications, he rebuilt most of the works then existing with such skill as to be called the "Vauban of Sweden." He was appointed a royal counselor, in 1696 Governor of Livonia, defended Riga in two sieges in 1700, and retired as field marshal in 1702. Consult H. N. Heden, *Erik Dahlberg* (Stockholm, 1900).

**DAHLGREN**, däl'grën, FREDRIK AUGUST (1816-95). A Swedish poet and historian, born at Nordmark, Aug. 20, 1816. He is the author of many popular dialect songs and ballads (3 vols., 1876) and of some successful dramas, of which *Värmländingarne* (1846) is most noteworthy. He was also a facile translator for the theatre and wrote a history of the Swedish stage.

**DAHLGREN**, däl'grën, JOHN ADOLF (1809-70). An American naval officer, prominent on the Federal side during the Civil War. He was born in Philadelphia of Swedish parentage; entered the United States navy as a midshipman in 1826; cruised for a time on the *Macedonian* and the *Ontario*; and from 1834 to 1838 was en-

gaged in the United States Coast Survey work, for which his aptitude and training in mathematical studies had well fitted him. In 1837 he was promoted to the rank of lieutenant, but in the same year was forced by failing eyesight to leave the active service and did not resume his duties until 1842. After a cruise of two years in the Mediterranean on board the *Cumberland*, he was assigned to the Ordnance Department, which absorbed the greater part of his energies from this time on, and of which he was twice chief—in 1862-63 and in 1868-70. In his many years of service he greatly increased the efficiency of the department and became especially well known through his invention (1850) of the Dahlgren gun, which proved of the utmost value to the government during the Civil War. In April, 1861, on the defection of Franklin Buchanan (q.v.), he succeeded that officer as commandant of the Washington Navy Yard, a position which he held until the fall of 1862, when he became chief of the Bureau of Ordnance. In February, 1863, he was raised to the rank of rear admiral, and in July replaced Admiral Dupont as commander in chief of the South Atlantic blockading squadron, the greater part of which was engaged in the siege of Charleston, S. C. Soon after taking command, he, in cooperation with General Gillmore, the commander of the Federal troops near Charleston, succeeded in capturing Morris Island, silencing Fort Sumter, and completing the closing of the port. Finally, in February, 1865, Charleston was evacuated by the Confederates, and Dahlgren occupied Charleston harbor, while General Schummelpennig took possession of the city. Soon afterward he resigned as commander of the South Atlantic squadron and from 1866 to 1868 commanded the South Pacific squadron. After finishing his second term as chief of the Bureau of Ordnance, he was placed in command, at his own request, of the United States Navy Yard in Washington, where several months later he died. In addition to many reports and magazine articles, he published: *Thirty-two-Pound Practice for Ranges* (1850); *Systems of Boat Armament in the United States Navy* (1852); *Naval Percussion Locks and Primers* (1852); *Ordnance Memoranda* (1853); *Shell and Shell Guns* (1856). An uncompleted volume entitled *Notes on Maritime and International Law* was published posthumously in 1877. Consult Madeleine V. Dahlgren (his widow), *Memoir of John A. Dahlgren* (Boston, 1882).

**DAHLGREN**, däl'grën, KARL FREDRIK (1791-1844). A Swedish humorist and poet whose ballads and songs are widely sung. He was born near Norrköping, June 20, 1791, studied at Upsala, and was clergyman at Stockholm from 1815. Descriptions of natural scenes and the burlesque idyll are his fortes. Like Hood, whom in many ways he resembled, he published for some years an annual, *The Muses' Almanac*, as a receptacle for his stories and comic sketches. His sole novel, *Nahum Fredrik Bergstroms kronika* (1831), is excellent. He died at Stockholm, May 2, 1844.

**DAHLGREN**, däl'grën, MADELEINE VINTON (1835-98). An American author, wife of Admiral J. A. Dahlgren, born in Gallipolis, Ohio. Under the name of Corinne, and later that of Cornelia, she wrote many sketches and poems. A list of her works includes the following: *Idealities* (1859); *South Sea Sketches* (1881); *Etiquette of Social Life in Washington* (1873; 5th

ed., 1881); *South Mountain Magic* (1882); *The Lost Name* (1886); *Lights and Shadows of a Life* (1887); *Divorced* (1887); *Chim* (1892). She also rendered from the Spanish Donoso Cortés's *Catholicism, Liberalism, and Socialism*, and from the French the *Pius IX* of Montalembert and the *Executive Power* of De Chambrun (1874), with a preface by James A. Garfield. She also wrote a memoir of her husband.

**DAHLGREN GUN.** The type of gun designed by Admiral Dahlgren after a series of experiments to determine the pressures at different parts of the bore. They were introduced into the navy in 1852 and were in general use during the Civil War, but are now obsolete. See BALLISTICS; GUNS, NAVAL; ORDNANCE.

**DAHLIA**, dā'l'yā or dā'l'yā (Neo-Lat.). A genus of large perennial herbaceous plants of the family Compositae, natives of Mexico. Most of the varieties in cultivation are derived from the species *Dahlia variabilis* and *Dahlia yarezei*, the latter being the parent of the cactus forms. Dahlias were first brought to Madrid by Spanish botanists in 1789. The name was given in honor of Dahl, a Swedish botanist. The dahlia varies greatly under cultivation. Some 3000 varieties have been catalogued. Most of these have been the showy and fancy kinds with spherical, symmetrical flowers differing mainly in color. The cactus or decorative types are more chrysanthemum-like in form. Their introduction within recent years has done much to increase the popularity of the dahlia. The dahlia possesses a wide range of colors and lacks practically only sky-blue and kindred shades. It is propagated by division of the root, cuttings, and seed. The first method is that usually employed by the amateur, the second that of the commercial grower, and the last is used chiefly in the production of new varieties. Interesting color effects can be secured by starting seedlings indoors and transplanting to the open when the weather is settled. In gardens the roots are planted 18 to 36 inches apart in any good soil and require ordinary cultivation, which should be frequent, but not more than 1 or 2 inches deep when the plants come into bloom. If the roots are set on their sides about 8 inches deep, covered at first with only 2 or 3 inches of soil, and the shoots pinched back when two or three sets of leaves have formed, the plants will branch below the surface of the ground and will be well braced against wind storms by the time they are ready to bloom. In the fall the roots are dug and stored in the cellar like potatoes.

A beetle injurious to dahlias (*Diabrotica 12-punctata*) is illustrated under CORN INSECTS.

**DAHLMANN**, dā'l'mān, FRIEDRICH CHRISTOPH (1785-1860). A German historian and statesman, born May 13, 1785, at Wismar. His earlier studies in Copenhagen and Halle were devoted to archaeology and philology, but his attention was subsequently directed to political science and history. In 1812 he was made a professor in the University of Kiel, and in 1815 became secretary of the permanent committee of the Schleswig-Holstein clergy and nobility, in which capacity he opposed the Danish policy concerning those duchies. He published several historical works, and in 1829 was appointed professor of political science in Göttingen, where he published his valuable work, *Quellenkunde der deutschen Geschichte* (1st ed., 1830; reëdited by Weitz, 1875, and subsequent editions). Dismissed from the university in 1837, with six of

his colleagues, by King Ernest Augustus, on account of their protest against the abrogation of the Hanoverian constitution, he went to Leipzig and afterward to Jena, where he wrote his admirable *Geschichte von Dänemark* (Hamburg, 1840-43). In 1842 he became professor of history and political science at Bonn, and later on took a prominent part in the political affairs of Germany. At the outbreak of the revolution, in 1848, he was appointed deputy of Prussia in the Germanic Diet, and was the principal member of the committee appointed to draft a new German constitution. He exerted his influence in the Frankfurt Parliament in favor of an hereditary German empire, the dignity to inhere in the King of Prussia, but his views were not accepted, either by King Frederick William IV or the majority of the Parliament. After a less conspicuous parliamentary activity at Erfurt and Berlin, Dahlmann returned to his academic duties, to which he devoted himself till his death, Dec. 5, 1860. Besides the works mentioned above, he was the author of important histories of the English and French revolutions, of a work in two volumes on early Germanic history, and the editor of the *Ditmarsh Chronicle*. Consult: Springer, *F. C. Dahlmann* (Leipzig, 1870-72); Nasse, *F. C. Dahlmann*, an inaugural lecture (Kiel, 1885).

**DAHLONEGA**, dā'lō-nē'gā. A town and the county seat of Lumpkin Co., Ga., about 60 miles (direct) north-northeast of Atlanta (Map: Georgia, C 1). It is situated among the foothills of the southern portion of the Blue Ridge Mountains in a gold-mining region and has gold mills. Until the Civil War a United States branch mint was situated here. Dahlonega is the seat of the North Georgia Agricultural College, a department of the State University. The Cherokee Indians called the place Dah-lō-ne-ga, meaning "yellow money." Settled in 1831, it was incorporated in the following year and is governed by a mayor and a city council. Pop., 1890, 896; 1900, 1255; 1910, 829.

**DAHLSTIERNA**, dāl-shēr'nā, GUNNO EURELIUS (1661-1709). A Swedish poet, born at Ohr, Sept. 7, 1661. He was an intense patriot and beguiled the tedium of surveying expeditions in Sweden, Livonia, and Pomerania by composing songs that are at times the best of his epoch, and again nearly the worst in their pathetic puerility. He had the misfortune to choose bad models, the Silesian poets of the school of Lohenstein and the Italians of the school of Marini. But their florid pomposity could not always smother his true poetic fire, and his "Elegy on the Death of Charles XI" (1697) (*Kunga Skald*) is sometimes sublime, while his "Goth's Battle Song" (1701) is an admirable popular ballad, an exulting defiance of the Russians, whose triumph at Poltava Dahlstierna could not survive. He was a man of varied gifts, distinguished as a cartographer and as the author of a number of scientific papers. He died in Pomerania, Sept. 7, 1709.

**DAHN**, dān, FELIX (1834-1912). An historian, jurist, and novelist. He was born in Hamburg, Feb. 9, 1834. His parents were celebrated actors, his early training was classic. He studied history and law in Munich and Berlin, became privatdozent in Munich in 1857 and professor of law there in 1862. He afterward occupied the same position in Würzburg (1863), Königsberg (1872), and Breslau (from 1888). To history he contributed *Die Könige der Germanen* (9

# DAHLIA ETC.

1. DOGBANE (*Apocynum androsaemifolium*).
2. CACTUS DAHLIA (*Dahlia juarezii*).
3. SHOW DAHLIA (*Dahlia* sp.).
4. SINGLE DAHLIA (*Dahlia* sp.).

5. MALE FERN (*Aspidium Filix-mas*). Tip of frond showing a portion of the sorus.
6. DURIAN LEAVES (*Durio zibethinus*).
- 7a. DURIAN FRUIT, much reduced.

vols., 1861-1902), *Urgeschichte der germanischen und romanischen Völker*, 4 vols. (1881-90), and many other works; to jurisprudence, *Das Kriegesrecht* (1870); *Handelsrechtliche Vorträge* (1875); *deutsches Privatrecht* (1878); *Die Vernunft im Recht* (1879); *Die Landnot der Germanen* (1889); to poetry, several collections of ballads and lyrics. He also wrote several dramas, of which *Markgraf Rudeger van Bechelaren* (1875) is typical, as also the comedy, *Die Staatskunst der Frau'n* (1877). He also wrote some opera texts, as *Armin* (1880), composed by H. Hofmann. But Dahn is most widely known, and deservedly, for his historical novels, which deal mainly with the primitive Germanic peoples, from the Vikings of Norway to the Goths of Italy, and from prehistoric times to the Crusades. Of these there are more than 20, the chief of which are *Odhins Trost* (1880) and the longest and best of all, *Ein Kampf um Rom* (1876). This latter work has an epic breadth and an artistic unity that make it one of the most striking historical novels of recent times, but its characters are actors and its life only that of the stage. It is an epitome of the history of the German invasion of Italy, involving immense learning, borne so lightly by the author that it only now and then oppresses the reader. The period is that of Justinian and Theodora, of the Gothic kings Theodoric, Totila, Vitiges, and Teja. Through the four volumes the interest seldom flags, and the dread of impending fate increases to the tragic close. Much of Dahn's later work was not carefully done. There are also many shorter stories of the Migrations, *Felicitas* (1883), *Fredigundis* (1885), *Attila* (1888), and *Stilicho* (1900). Later publications are *Sigvald und Sigridh* (1898), *Herzog Ernst von Schwaben* (1902), and *Die Germanen* (1905). Dahn's complete literary works appeared in 21 vols. (1898-99, continued in 1903 et seq.).

**DAHOMÉY**, da-hō'mē or dā'hō'mā'. Formerly a negro kingdom, now one of the colonies of French West Africa. With a coast line of about 75 miles on the Gulf of Guinea, the colony (which extends much farther north than the old kingdom) is bounded on the north by the colony of Upper Senegal and Niger (French) and the Military Territory of the Niger (French), on the east by Nigeria (British), and on the west by Togo (German): the Niger River forms the boundary between the Military Territory and Dahomey (Map Africa, E 4). In 1907 the circles of Fada N'Gurma and Say were, for ethnical reasons, incorporated with Upper Senegal and Niger, from which they had previously been detached: so that the area of Dahomey, as now estimated, is 107,000 square kilometers (41,313 square miles). The population in 1911 was estimated at 902,000. The terms "Upper Dahomey" and "Lower Dahomey" are often used, indicating the territories lying north and south respectively of 10° N. The littoral, which is part of the old Slave Coast, is low and sandy and contains a series of lagoons. The country for about 50 miles inland is flat and covered with dense vegetation. There is then a gradual rise to about 1300 feet near the 10th parallel. South of this line the watercourses flow south: north of it, mostly to the northeast. Upper Dahomey is hilly, but the highest point is only about 2600 feet; this is in the Atacora hills of the northwest, which form a watershed between the basins of the Niger, the Weme, and the Volta. The Weme, about 280 miles long, is the most im-

portant river within the colony. The climate is unhealthful in the coast lands, being moist, foggy, and hot (average temperature about 80° F., though the highest temperatures rarely exceed 95° F.). In the interior the climate is more favorable. The wet season is from May to November.

The forests contain baobab trees and coconut and oil palms. The soil is generally fertile, though waste districts occur in Upper Dahomey. Palm oil is the leading product, but corn, sweet potatoes, manioc, yams, plantains and other fruits, etc., are cultivated. Some cotton is produced. Fishing is important in the lagoons, and there is some native weaving and pottery making. Trade, which formerly was little more than an exchange of trinkets for gold and other valuable articles, has assumed a modern aspect and importance. The chief ports are Porto Novo, Kotonu, and Whydah. In 1910 imports were valued at 17,838,853 francs, and exports at 17,886,254 francs. In 1911, 19,524,531 and 21,958,301. In the latter year the importation of cotton tissues amounted to nearly 6,000,000 francs, and of alcoholic liquors to 2,250,000 francs (in 1914 the government undertook to reduce the consumption of alcohol, which was working much harm among the natives). Principal exports in 1911: palm kernels, 12,577,000 francs, palm oil, 8,088,000; dried fish, 441,000. About one-fourth of the trade is with France, the rest mainly with the United Kingdom and Germany.

A railway (begun in 1900) is under construction from Kotonu to the Niger River, 429 miles distant. A branch (20 miles long) passes through Whydah to Seghoru. Another line (about 25 miles) opens up the well-cultivated district between Porto Novo and Sakete. Kotonu is connected by telegraph with Porto Novo, Abomey (capital of the old kingdom), and other towns of the colony and with the French territories to the north, there being through telegraphic communication to Senegal. By cable Kotonu is connected with Lagos, Grand Bassam, and Libreville. At Kotonu, also, is a wireless-telegraph station. There is regular steamship communication with Europe.

Dahomey was an absolute monarchy previous to the French occupation. There was a standing army estimated at over 15,000, consisting partly of female warriors or amazons, who were distinguished for superior physique and high skill in the use of weapons. At present the colony, which is an integral part of the governor-generalship of French West Africa, is administered by a lieutenant governor, assisted by a council of three officials and three prominent residents. The seat of the lieutenant governor is Porto Novo. The natives are full-blooded Guinea Negroes, or Nigritians of the coast (Deniker). The Dahomans are tall, very long-headed (index 75.1), but not so black as the tribes of Senegal. In their own tongue, a dialect of the Ewe language, common on this part of the Slave Coast, they are called Fon or Fawin. Their religion is purely fetish, and the sacrifice of human beings, a widespread custom in former times, is still supposed to be practiced. In spite of a low standard of morality and warlike attributes and usages, the Dahomans are polite in their intercourse. The activity of missionaries has thus far been attended with little success, except in the case of the dervishes, who are indefatigable in their efforts to spread the gospel of Islam. The population of Dahomey

was estimated in 1911 at 902,000. Whites number less than 500. Porto Novo had about 40,000 inhabitants; Whydah, 13,000; Abomey, 10,730; Grand Popo and Kotonu, 2000 each.

The kingdom of Dahomey arose in the seventeenth century around the city of Abomey as a nucleus. By successive conquests the kings extended their rule to the highlands of the Mahé on the north and to the Slave Coast on the south (1772). There they came into contact with the Europeans and succeeded in obtaining control of a large part of the slave trade, which was then carried on actively by the English, the French, and Portuguese. With the cessation of the slave traffic the prosperity of the country came to an end. France secured a firm footing on the coast in the second half of the nineteenth century. Between 1878 and 1885 it obtained possession of Kotonu, Porto Novo, and Grand Popo, and after a bloody contest in 1890 forced King Behanzin to acknowledge its title to the coast region. War broke out again in 1892 and resulted in the taking of Abomey, the deposition of Behanzin (since retained as prisoner at Fort-de-France, Martinique), and the establishment of a virtual French protectorate. Since then the French have been actively engaged in extending their authority over the region to the north, so as to bring Dahomey into touch with their possessions in the Sudan. In 1897 and 1898 they concluded treaties with the Germans and the English, and the sphere of influence claimed by each was determined. The boundary question settled, the French government busied itself with Gallicizing the native population. In 1902 compulsory education for all in the French language was inaugurated, and in a dozen different ways the paternal government undertook to win over the natives. Negro doctors educated in Paris dispensed free medical advice, and an elaborate system of medals and decorations was invented to show the rewards of virtue and patriotism. The second decade of the twentieth century has been marked by the beginnings of extensive railroad construction.

Careb, *Les territoires africains et les conventions anglaises* (Paris, 1901); Toutée, *Du Dahomé au Sahara* (ib. 1899); Keane, in *Stanford's Africa* (London, 1895); Verdier, *Trente-cinq années de lutte aux colonies, côte occidentale d'Afrique* (Paris, 1897); François, *Notre colonie du Dahomey* (ib., 1906); Le Herissé, *L'Ancien royaume du Dahomey* (ib., 1911).

**DAIBUTSU**, dā'bu'tsu (Jap., great Buddha). A famous Japanese image of Buddha at Kamakura, near Yokohama. It dates from 1252 and is a unique production of Japanese art, wrought of bronze and silver, with eyes of gold, and measures 50 feet in height and 97 feet in circumference. More ancient, even, dating from 749, and of more gigantic proportions, but of inferior artistic merit, is the Daibutsu at Nara, in the main island of Japan.

**DAIGUEBELLE**, dā'gē'bēl. See AIGUEBELLE.

**DAILLÉ**, dā'yā', or **DALLÉUS**, dāl'lē'ūs, JEAN (1594-1670). A French Reformed theologian, born at Châtelleraut. He was tutor to the grandsons of Philippe de Mornay and traveled with them through Italy, Germany, Holland, and England in 1612-21. He was ordained in 1623, became preacher at Saumur in 1625 and at Charenton in 1626, and was president of the last national synod of the Reformed church held in France in 1659. He held the modified

predestinarianism of Amyraut (q.v.) and wrote a considerable number of controversial works, among which the *Traité de l'emploi des Saints Pères* (1623) is of permanent value.

**DAILY COURANT**, THE. A journal called the first English daily newspaper, which first appeared March 11, 1702.

**DAIMIEL**, dā-myāl'. A town in Spain, in the Province of Ciudad Real, 20 miles east-north-east of the city of that name, with which it is connected by rail (Map: Spain, D 3). It lies on the Auer River, in the fertile Campo de Calatrava; it has several squares, and its principal streets, though unpaved, are wide and comparatively clean. Its chief buildings are the churches of San Pedro and Santa María—the former a Doric and the latter a Gothic structure—a town hall, and a hospital. One of the most important towns in the La Mancha district, Daimiel has manufactures of woollens, linens, bricks, liquors, soap, hats, etc. Pop., 1900, 11,825; 1910, 15,940.

**DAIMYO**, dā'mē-ō (Jap., great name). A term applied in Japan to a territorial feudal lord, in contrast with the *kuge*, or landless noble of the Imperial court. There were two classes of *daimyos*, *fudai-daimyo*, and *tozama-daimyo*. The *daimyos* of the former class were the kin of the *shogun's* house and were naturally given special favors and privileges, while those of the latter class, who were not the *shogun's* relatives, not infrequently were suspected as rebellious. From the decay of the Mikado's power in the twelfth century this class, numbering nearly 350, flourished until the abolition of feudalism in 1868, when they were amalgamated with the *kuge*, the two forming the Kwazoku, or flowery nobility. According to their former rank, wealth, power, historical or personal importance, the individual *daimyos* have become princes, marquises, counts, viscounts, and barons. Consult Dickson, *Sketch of the History and Government of Japan* (London, 1869); Griffiths, *The Mikado's Empire* (New York, 1900); *The Japanese Nation in Evolution* (ib., 1907); Lloyd, *Every-day Japan* (London, New York, Toronto, and Melbourne, 1909).

**DAINGERFIELD**, ELLIOTT (1859- ). An American historical and landscape painter. He was born at Harper's Ferry, Va., studied at the Art Students' League, New York, and first exhibited at the National Academy in 1880. In 1897 he visited Europe for purposes of study and later was appointed professor at the School of Design in Philadelphia. Among his religious subjects, the rich and glowing color of which is reminiscent of the Italian masters of the sixteenth century, are the pictures in Lady Chapel, St. Mary the Virgin, New York, a "Madonna and Child," "The Child of Mary," and "The Story of the Madonna," awarded a prize in 1902. He is also important as a landscape painter in such works as "Slumbering Fog" (Metropolitan Museum), "The Midnight Moon" (Brooklyn Museum), and "Pearls of the Morning." He was elected to the National Academy of Design in 1906.

**DAIR/CELL**. An Irish saint of the seventh century, the illegitimate son of a farmer at Luachair (near Castleisland, Kerry). He was born in the wilderness and would have been killed at birth by his mother, had not a dove descended from heaven to protect him, or "gather him to her in her wings"; whence his name *Daircell*, meaning "a gathering."

**DAIREN**. See DALNY.

**DAIRYING** (ME. *deyery*, from *doye*, dairy-maid, Icel. *deigja*; probably connected with OSwed. *daggja*, to suckle, Skt. *duh*, to milk). That branch of agriculture which has to do with the production and utilization of milk. It embraces the feeding and management of milch cows, the supplying of cream and milk, and the making of butter, cheese, etc. The term *dairy husbandry* is applied to a system of farming under which cows are kept and bred, and the principal crops grown with special reference to the dairy herd. *Dairy* was formerly used to designate the place or house where the milk was kept, cheese was made, etc. Like almost all other occupations, dairying has become in recent years divided into several distinct and special lines. These differ as to the form of the product and the manner of disposing of it. In one case milk or cream may be produced for delivery to consumers direct from the dairy, or the same product may be delivered to a creamery to be manufactured into butter and cheese, or the product of the herd may be converted into butter and cheese at home.

In no branch of agriculture has greater progress been made in recent years than in dairying, and it is now regarded as among the most progressive and highly developed forms of farming in the United States. While formerly believed to be confined by natural conditions to a limited area, known as the "dairy belt," it has been shown that the industry can be profitably and successfully carried on over a wide range of country, and that, generally speaking, good butter and cheese can be made by proper management in almost all parts of North America. Dairying was formerly confined to the spring and summer months, when pasturage could be had for the cows, and it was planned to have the cows calve as far as possible in the spring; they were generally allowed to go dry during the fall and early winter, and were neither well fed nor well housed through the winter. Winter dairying was practically unknown, as it was not supposed to be feasible or profitable. Under the system at present followed, dairying is not confined to any season, and the cows are fed succulent fodder during the winter in the form of corn silage, and roots, in addition to hay and liberal grain rations, composed largely of bran, cornmeal, and the by-products of factories where glucose and similar products are made. Great stress is laid upon the value of succulent foods as supplements to dry feed in winter, and in all countries where dairying has attained a high degree of development succulent feeds have occupied a prominent place in the ration given throughout the year. Corn silage is extensively relied upon for this purpose in the United States, being the cheapest food which can be supplied over a wide extent of the country. There may now be said to be two general systems of summer-feeding cows, the pasturage system and the "soiling" system, in which latter the green crops are cut for the animals. Pasturage is still extensively practiced where practicable, and it is quite customary to feed some grain to good cows on pasture. A large number of cows in the eastern part of the United States are now "kept up" during summer, such green feed as comes into condition in succession throughout the season being raised for them. This method is thought to be more economical in sections where land commands a high price. A much larger number of cows can be kept on a given area by this "soiling" system,

and the animals are found to keep healthy and do well under it. Perhaps the most remarkable advance in dairying has been in the keeping of better cows and in giving more attention to their feeding, comfort, and general management. The introduction of the creamery and cheese-factory (qq.v.) systems has caused a great revolution in dairy practice, to a large extent transferring the manufacture of butter and cheese from the farm to the factory. The invention of the Babcock test, which has made practicable the payment for milk by test and placed it within the power of dairymen to test their individual cows, has been a very potent factor in improving the grade of cows which are kept and has probably done more than any other single thing to advance American dairying. Milk of guaranteed fat-content is now sold in most of the large cities, and cream is supplied of various degrees of richness, according to the purposes for which it is intended. The sanitary conditions of milk production have been greatly improved as a result of bacteriological and other studies which have been made, and pasteurized milk and cream are now extensively used.

Dairying has been very greatly advanced by the invention and introduction of various kinds of dairy machinery, such as creaming apparatus, notably the separator; hand and power churns, butterworkers, cheese vats and presses, etc. The cream separator, aside from its increased efficiency and reduction of labor, has almost eliminated the disturbing factor of climate from a large part of dairy management and has altogether worked a revolution in this industry. See BUTTER.

The numerous by-products of the dairy are now very generally utilized in a variety of ways. The skim milk and buttermilk are, where practicable, fed to animals. Considerable quantities are sold in towns and cities for household consumption, and milk sugar is made from skim milk and whey. The casein of skim milk is also dried and prepared as a bakers' supply and substitute for eggs, as the basis of an enamel paint, as a substitute for glue in paper sizing, and is also solidified and used for making buttons, combs, and many similar articles.

The value of the principal dairy products of the United States (milk, butter, and cheese) was estimated by the thirteenth census (1909) at \$596,413,463.

The leading dairy States are New York, Wisconsin, Pennsylvania, Illinois, Iowa, Ohio, Minnesota, Michigan, Indiana, Missouri, and Kansas. In the Middle and Eastern States the milk is used quite largely to supply the numerous large towns and cities. In the Central West and Northwest butter is the principal dairy product. The United States is far in the lead of all foreign countries in the extent of its stock-raising interests and the value of its dairy products. Dairying is also quite extensively practiced in Canada, where both butter and cheese of good quality are made. Canadian cheese, especially, enjoys an excellent reputation. Denmark has long been famous as a dairy country, having an unusually large number of cows in proportion to its inhabitants. The farms are small and numerous, and most of the butter is made in creameries. In 1902 that country, which is only about one-third the size of New York, exported 193,061,998 pounds of butter. Dairying is also extensively practiced in Australia and of late years has greatly developed in Russia.

For further discussion of topics relating to dairying, see **CATTLE**, *Dairy Cattle*; **BUTTER MAKING**; **CHEESE MAKING**; **MILK PRODUCTION**; **CHEESE FACTORY**; **CREAMERY**.

Consult: Gurler, *American Dairying*; Lane, *The Business of Dairying*; Wing, *Milk and its Products*; Eckles, *Dairy Cattle and Milk Production*.

**DAIS** (Fr., canopy). This term was used with considerable latitude by mediaeval writers. Its most usual significations are the following: 1. A canopy over an altar, shrine, font, throne, stall, chair, statue, or the like. The term was applied to the canopy without regard to the materials of which it was composed, which might be cloth, wood, stone, metal, or other substance. 2. The chief seat at the high table in a hall, with the canopy which covered it, from which probably the word in all its significations was introduced, its French meaning being a "canopy." 3. The high table itself. 4. The raised portion of the floor, or *estrade*, on which the high table stood, and by which the upper was divided from the lower portion of the hall. 5. A cloth of state for covering a throne or table. In old writings the word occasionally takes the form of *dois*, and more rarely that of *dez* or *dets*.

**DAISY** (AS. *dages*, *éage*, day's eye, referring to the form of the flower). A plant of the genus *Bellis*, of the family Compositae. The common daisy (*Bellis perennis*), plentiful throughout Europe, flowers almost all the year in pastures, meadows, and grassy places. (For illustration, see Plate of **DAHLIA**, ETC.) What are called double varieties, with flowers of various and often brilliant colors, are very commonly cultivated in gardens. One variety has the flower (head of flowers) surrounded by smaller ones, the short stems of which grow from the summit of the scape or leafless stem. The daisy (*govan* of the Scotch) has long been a favorite with poets and lovers of nature, characteristic as it is of many of the fairest summer scenes, its blossoms gemming the pastures, and recommended also by its frequent appearance during the severer seasons of the year. Its flowers close at night. It is sparingly introduced in America. A species of *Bellis* is, however, found in the United States (*Bellis integrifolia*), but it is confined to Kentucky, Tennessee, Arkansas, and the Southwestern States. The flower commonly called daisy, or oxeye daisy, in the United States is a species of *chrysanthemum* (*Chrysanthemum leucanthemum*). A number of other plants are called daisies in the United States, among them *Rudbeckia hirta*, also called yellow daisy and black-eyed susan. *Erigeron annuus*, *Erigeron ramosus*, and other species are called daisies or daisy fleabane, and a number of species of wild aster are likewise known as daisies.

**DAISY MILLER**. A well-known novel by Henry James (1878), so called from the name of its heroine, an American girl who disregarded European rules of conduct. This character sketch was much criticized as not being a true representation of the American type, but its veracity is now admitted.

**DAITYA**, *dī'tyā* (Skt., sons of *Diti*, a popular formation from *Aditi*, the boundless goddess). The Titans of Hindu mythology, hostile to the gods and disturbers of religious observances.

**DAKAR**, *dā-kār'*. A fortified seaport in the French colony of Senegal, Africa, situated on the Gulf of Gorée at the extreme point of Cape

Verde (Map: Africa, C 3). It has an excellent harbor, finished in 1908, and is the terminal of the railway to St. Louis, 163 miles distant. The climate is unhealthy. There are four big docks, and an arsenal with a torpedo-boat basin. It is the chief port of call in the West African trade with South America. Pop., 1910, 24,914.

**DA'KER HEN** (dialectic Eng. and Scottish daker, to luter; cf. OFlem. *daeckeren*, to move to and fro). An English local name for a corn crane. See **CHRAKE**.

**DAKOTA**. See **NORTH DAKOTA**; **SOUTH DAKOTA**.

**DAKOTA INDIANS**. See **SIoux**.

**DAKOTA RIVER**. A river of North and South Dakota, more commonly called the James River (q.v.).

**DAKOTA STAGE**. A subdivision of the Cretaceous system in America, the rocks of which were first described as occurring in Dakota. It comprises conglomerates, sandstones, and clays, with layers of lignite, and is found along the western edge of the great plains from Texas to Canada. In the Black Hills the series of rocks is from 250 feet to 400 feet thick. The sandstone, which is the main element in the formation, has considerable importance in the plains region on account of its affording artesian waters. The supply of water comes from the mountain regions where the beds are upturned and then flows down along the dip of the latter under the plains, coming to the surface under its own pressure when tapped by wells. See **CRETACEOUS SYSTEM**.

**DAKOTA WESLEYAN UNIVERSITY**. An institution for higher education, under the auspices of the Methodist Episcopal church, founded at Mitchell, S. Dak., in 1883. The university consists of a College of Liberal Arts, and schools of education, commerce, elocution, and art. There is also a preparatory academy in connection with the university. The total enrollment in all departments in 1913 was 407. Of these, 133 were in the College of Liberal Arts, 134 in the School of Music, and 124 in the School of Commerce. The endowment of the university in 1914 was \$250,000, and the annual income about \$40,000. The library contained 40,000 volumes. The president is William Grant Seaman, Ph.D.

**DAKSHA**, *dāk'shā*. A deity in Hindu mythology, represented as having a goat's head and regarded as a son of Brahma (q.v.). His name means the *dexterous* or *clever* god, and in the oldest of the Vedas he is accounted especially as a progenitor of the race of the gods. His daughter Umā, according to later mythology, was married to Siva (q.v.). Owing to an affront received in connection with a great sacrificial feast, Siva slew Daksha and cut off his head. The scene is portrayed in Hindu sculpture. Siva later restored his father-in-law to life and replaced his head, which had accidentally been destroyed, by the head of a goat, which the god still wears.

**DALAGUETE**, *dāl'gā-gē'tā*. A town of Cebu, Philippines, 46 miles southwest of Cebu (Map: Philippine Islands, D 6). It is situated on the coast, at the mouth of the river of the same name. Dalaguete was founded in 1711. Pop., 1903, 21,354.

**DALAT-LAMA**, *dā-lā't-lā'mā*. See **LAMAISM**. **DAL'ARA'DIA**. The ancient name applied to a district in Ireland, including the southern half of the present County of Antrim and the

eastern part of the County of Down. The name is not to be confounded with Dalriada (q.v.), as Dalaradia, or "Dal Araidh," takes its name from "Fiacha Ariad," a king of Ulster of the Irian race, while Dalriada belonged to the race of Heremon. A Pictish colony from Scotland settled in Dalaradia a century before the beginning of the Christian era. Consult Skene, *Celtic Scotland* (3 vols., Edinburgh, 1876-80).

**DALARNE.** See DALECARLIA.

**DALAYRAC,** dā'la'rāk', NICOLAS (1753-1809). A French dramatic composer, born at Muret. He was a pupil of Langlé and in 1781 produced his first opera, *Le petit souper*. Its success encouraged him, and in the next 28 years he wrote no less than 61 operas, of which several became very popular. In 1798 he was made a member of the Stockholm Academy and a little later a chevalier of the Legion of Honor. He died in Paris, and his bust is now in the foyer of the Opéra Comique.

**DALBERG,** dāl'bérk. The name of an ancient German family, the members of which possessed under the Holy Roman Empire the dignity of "First Knight of the Empire." The most distinguished member of the family was KARL THEODOR, BARON VON DALBERG (1744-1817), Archbishop of Mainz, and famous as a clerical magnate and patron of arts and letters. He assisted in the negotiations between Napoleon and Pius VII at Paris in 1804 and was much esteemed, both personally and as a scholar and ecclesiastical prince, by such men as Wieland, Schiller, and Goethe. He was made Prince Primate of the Confederation of the Rhine (1806) and Grand Duke of Frankfurt (1810), but was constrained by public opinion to retire into private life on the fall of Napoleon (1814). His numerous writings are no longer of much value. For his *Life*, consult Krämer (Leipzig, 1821), and Beaulieu-Marconnay, *Karl von Dalberg und seine Zeit* (2 vols., 1879).

**DALBERGIA,** dāl-bér'jā (Neo-Lat., named in honor of the Swedish botanist *Dalberg*). A genus of trees and climbing shrubs of the family Leguminosæ, having a stalked membranous pod, which is flat, tapers to both ends, and contains one to three flat seeds. The leaves are pinnate, with a terminal leaflet. All the species, about 75 in number, are natives of warm climates. Some of them are valuable timber trees, particularly the sissoo of Bengal (*Dalbergia sissoo*), much prized, and more extensively used in the north of India than any other timber tree except the sal (q.v.). The sissoo extends through India to Afghanistan, growing at elevations up to 5000 feet. The trees become 60 feet high, the wood is elastic, seasons well, does not warp, and has a greater transverse strength than teak or sal. *Dalbergia latifolia* furnishes the East Indian rosewood, or Malabar blackwood, which attains a diameter of 6 feet. The wood is heavy, dark, and very strong, and is extensively used in cabinetwork, for ship knees, gun carriages, and agricultural implements. *Dalbergia nigra* and *Dalbergia miscolobum* of Brazil furnish valuable woods for export. *Ecastophyllum monetaria*, a related tree, a native of Surinam, yields a resin very similar to dragon's blood. See ROSEWOOD.

**D'ALBERT,** dāl'bār', EUGEN FRANCIS CHARLES. See ALBERT.

**DALCROZE,** dāl'kröz', EMILE JACQUES (1865-). A Swiss composer and originator of a system of rhythmic training, eurythmics. He was

born of Swiss parents at Vienna, July 6, 1865, but lived in Geneva from 1873 to 1910. While pursuing the study of literature at the University of Geneva, he also attended the conservatory. Later he studied with Fuchs, Graedener, and Bruckner at the Vienna Conservatory, and also with Delibes (orchestration) in Paris. In 1892 he became professor of harmony and solfeggio at the Conservatory of Geneva. It was here that he first conceived his idea of laying special stress on rhythm. He began by insisting on his pupils beating the time with their hands. Gradually the feet and the entire body were called into play, thus coordinating the music with elaborate and graceful rhythmic movement. He had developed his ideas to a considerable extent when he succeeded in interesting the French psychologist Edouard Claparède, and together with him he elaborated a special terminology and reduced his practice to a system. When his request to have his system introduced as a regular course into the conservatory was refused, he resigned and left Geneva. At Helderau, near Dresden, he established in 1910 a special school for eurythmics, of which he was thereafter the director. The fame of this institution spread rapidly, so that within three years the system found its way into many schools of Germany, France, Russia, and England. In 1913 it was introduced into Bryn Mawr College, and two special schools were established in New York and Chicago respectively. Dalcroze's compositions show considerable inventive power and originality, but are deficient in formal structure. They include two operas, *Janie* (1893) and *Sancho Panza* (1897); *La Veillée* and *Poème Alpestre* for soli, chorus, and orchestra; a violin concerto, a string quartet and some really excellent songs.

**DALE,** DAVID (1739-1806). A Scottish manufacturer, born at Stewarton, Ayrshire. He secured the use of Arkwright's spinning patent, founded the New Lanark mills, and subsequently other important establishments, and became widely known for his many benevolences. Robert Owen married his daughter and succeeded him in the Lanark mills. Dale was the founder and chief pastor of a Scottish church of Congregational principles, the members of which were called Dalites, or Old Independents.

**DALE,** JAMES WILKINSON (1812-81). An American Presbyterian divine. He graduated in 1831 at the University of Pennsylvania and studied medicine there after studying theology at Andover and Princeton, was ordained in 1837, but had to give up his plan of being a foreign missionary, and was pastor from 1845 to 1876, with his last charge at Wayne, Pa. He died at Media, Pa. He wrote the elaborate works on baptism: *Classic* (1867), *Judaic* (1869), *Jo-hannic* (1871), and *Christic and Patristic Baptism* (1874). For his biography, consult James Roberts (Philadelphia, 1886).

**DALE,** RICHARD (1756-1826). An American naval officer. At the opening of the Revolutionary War he entered the English service, but afterward joined the American navy, served under John Barry in the brig *Lexington* and later as first lieutenant under Paul Jones and gained distinction in the engagement between the *Bon Homme Richard* and the *Serapis*. He was several times taken prisoner. After the declaration of peace with England he was appointed captain and in 1801 had command of the squadron sent against Tripoli. (See BAR-

RARY POWERS, WARS WITH.) He resigned in 1802 and spent the rest of his life in retirement.

**DALE, ROBERT WILLIAM** (1829-95). An English Congregational minister and author. He was born in London, graduated at the University of London in 1853, and in the same year was ordained to the ministry and became pastor of Carr's Lane Chapel, Birmingham. He was chairman of the Congregational Union in 1868 and 1869, edited *The Congregationalist* for seven years, and in 1877 visited the United States to give the Lyman Beecher lectures on preaching at the Yale Divinity School. In 1891 he was president of the first International Council of Congregationalists. He was influential in municipal politics and was a member of the Birmingham school board. Among his writings are: a biography (1861) of John Angell James, copastor of Carr's Lane Chapel; *The Jewish Temple and the Christian Church* (1863); *The Atonement* (1875); *Impressions of America* (1878); *Congregational Church Polity* (1885); *The Fellowship of Christ* (1891); and a *History of English Congregationalism*, completed by his son (1907).

**DALE, SIR THOMAS** (1-1619). A Colonial governor of Virginia. He served for some time as an English officer in the Netherlands and in 1606 was knighted by King James. In 1611 he was sent to Virginia, by the London Company, with supplies, and, in the absence of Lord de la Warr (q.v.), the Governor-General, assumed control of the government, acting as Deputy Governor from May till August of this year. He was nominally relieved in August of this year by Sir Thomas Gates, but nevertheless remained the leading spirit of the Colony, holding the position of High Marshal, and from 1614 to 1616 was again in full control. He returned to England in 1616, was put in command of a fleet sent out by the East India Company against the Dutch in 1618, defeated a Dutch fleet off the site of the present Batavia in November of this year, and in 1619 died at Masulipatam, India. His administration in Virginia was remarkable for its pitiless severity. Finding the colonists dejected, listless, and disinclined to work, he placed them under martial law and republished a code which is always known as "Dale's Code," whose rigor has become proverbial. The years 1611-16 were long known among the colonists as "the five years of slavery." Dale founded a new settlement at Henrico and also Bermuda Hundred, overcame the Appomattox Indians, and by apportioning some of the lands among private individuals took the first step towards abolishing the pernicious communal system. His settlement at Henrico practically saved the Colony from destruction; for he thereby secured a more healthful location, thus preventing disease, and also a place comparatively safe from Indian attack, thus enabling the colonists to raise a supply of corn. His administration of affairs was approved by the London Company, and Sir Edwin Sandys (q.v.), one of the most influential members, said in 1619 that "Dale . . . with great and constant severity reclamation almost miraculously those idle and disordered people, and reduced them to labor and an honest fashion of life." Much information concerning Dale and his administration is given in Brown, *The Genesis of the United States* (Boston, 1890), and *The First Republic in America* (ib., 1898). A copy of "Dale's Laws" may be found in Force, *Tracts and Other Papers Relating to the Colonies in*

*America*, vol. iii (Washington, 1836-46). Consult also Prince, "The First Criminal Code of Virginia," in the *Report of the American Historical Association for 1899* (Washington, 1900); Bruce, *Economic History of Virginia*, vol. i (New York, 1907).

**DALE, THOMAS NELSON** (1845- ). An American geologist, born in New York City. He joined (1885) the United States Geological Survey, of which he became geologist in 1892. From 1893 to 1901 he was instructor in geology and botany at Williams College. He is author of *The Scientific Spirit Applied to Living Subjects* (1913), and also of the following bulletins of the United States Geological Survey: *Structural Details in the Green Mountain Region and in Eastern New York* (1902); *Geology of the Hudson Valley* (1904); *The Granites of Maine* (1907); *The Chief Commercial Granites of Massachusetts, New Hampshire, and Rhode Island* (1908); *The Commercial Granites of Vermont* (1909); *The Granites of Connecticut* (1911); *The Commercial Marbles of Western Vermont* (1912).

**DALECARLIA**, dāl'e-kār'li-ä, or **DALARNE**, däl'är-ne. An old province of Sweden, now forming the Län of Kopparberg or Falun. The Dalecarlians are celebrated for the part they took under Gustavus Vasa in freeing their country from the yoke of Christian II of Denmark in 1519-23.

Besides the peasants who till the soil, there is a large number who are engaged in industrial occupations, especially in the manufacture of wood pulp and different steel trades due to the existence of extensive forests and iron mines in this region.

**D'ALEMBERT**, däl'än'bär' (1717-83). The assumed name of Jean le Rond, a French mathematician, philosopher, and encyclopedist. He was the natural son of Chevalier Destouches and Madame de Tencin and was left as an infant on the steps of the chapel of St. Jean le Rond, from which he received his name. He was tenderly reared by a glazier's wife, his father contributing secretly to his support, and was educated by Jansenists at the Collège Mazarin, where he showed a brilliant promise in mathematics, physics, and astronomy, to which he reverted after essaying law and medicine. At 22 he published a scholarly *Mémoire sur le calcul intégral*; at 24 another, *Sur la réfraction des corps solides*. His *Traité de dynamique* (1743) marks an epoch in mechanical philosophy. This work is based on the theory known as D'Alembert's principle, discovered by him at the age of 26 and expressed in the proposition: The impressed forces are equivalent to the effective force. His *Réflexions sur la cause générale des vents* (1746) contains the first conception of the calculus of partial differences. In 1749 he published the first analytical solution of the precession of the equinoxes. He was made a member of the Academy of Sciences in 1741, and in 1754 of the French Academy, whose perpetual secretary he became in 1772. As such he wrote a series of *Eloges* of members deceased between 1770 and 1772. In 1751 he undertook, with Diderot, the editing of the great French *Encyclopédie*, and, though he withdrew from the editorship in 1758, because of government interference with the publication, he continued to contribute articles in science and philosophy. Very noteworthy is his preliminary discourse, or general introduction, to the work, in which he traces in broad outlines the evolution

of human society, civilization, science, and art. An article of his on Geneva involved him in a celebrated dispute with Rousseau on the merits of Calvinism and the stage as teachers of morals. Meantime his scientific work had attracted the attention of Frederick II, who repeatedly offered him the presidency of the Berlin Academy. Catharine II of Russia offered him (1762) 100,000 francs a year as tutor to her son. This he also declined. David Hume left him a legacy of £200, and on the recommendation of Pope Benedict XIV he was admitted to membership in the Institute of Bologna (1755). But he continued to live simply, being by nature a plain, independent, bluff, benevolent, though sometimes rude man. He was a total abstainer from alcohol. His last years are closely associated with the name of Mlle. de l'Épinaisse (q.v.), whom he learned to admire at the literary salon of Mme. du Deffand (q.v.). She nursed him during a serious illness in 1765, and they were never after separated, though not a breath of scandal attached to their connection till her death (1776), a shock from which he never recovered. D'Alembert is fully as important for his personality as for his works. While he ranks among the first geometers of his century, he was not so highly esteemed in literature and philosophy, though his works abound in ingenious and often profound thoughts, and his style is always clear and firm. He gave learning an official status in French society and did a great service to letters, both by his example and by his *Essai sur les gens de lettres* (1753), in fostering the independence of his class from subservience to social prominence and political power. This essay exposed thoroughly and finally the evils of patronage. His religious opinions, once the subject of eager controversy, are revealed as a tolerant theism in his correspondence with Voltaire, published in Bossange's partial edition of *D'Alembert's Works* (1821). Condorcet's *Eloge* of him before the French Academy (1784) gives a judicious account of D'Alembert's life and writings. Consult Bertrand, *D'Alembert* (Paris, 1889), and Tallentyre, "D'Alembert, the Thinker," in *his The Friends of Voltaire* (London, 1906).

**DALÉN**, dāl'ēn, (NILS) GUSTAF (1869- ). A Swedish engineer and expert on gas lighting. He was born in Stenstorp and was educated at the Gothenburg Engineering Institute and the Zurich Polytechnicum. An eminent consulting engineer, he was employed by the Swedish Carbide and Acetone Company (1905) and then by the Swedish Gas-Accumulator Company. He invented a method for dissolving acetylene in acetone which is used for automatic lighting in unmanned lighthouses and for railway signals; and he improved hot-air turbines, air compressors, and milking machines. In 1912 he received the Nobel prize in physics and in 1913 was elected to the Royal Swedish Academy of Science. He wrote technical papers and a book, *Chemische Technologie des Papiers* (1911).

**DALGAARD**, NO, GEORGE (c.1626-87). A Scottish writer, who interested himself in the subject of a universal language and in the methods of teaching the deaf and dumb. He was born at Aberdeen, studied at Marischal College, and afterward kept a school in Oxford for 30 years. His *Arta Signorum, Vulgo Character Universalis et Lingua Philosophica* (1661) is an attempt to represent and classify ideas by specific arbitrary characters irrespective of words. His *Didascaloprophus, or the Deaf and Dumb Man's Tutor*

(1680) was designed "to bring the way of teaching the deaf man to read and write as near as possible to that of teaching young ones to speak and understand their mother tongue."

**DALHART**. A city in Hartley and Dallam counties, Tex., and the county seat of the latter, 280 miles west of Oklahoma City, Okla., on the Fort Worth and Denver and the Chicago, Rock Island, and Gulf railroads (Map: Texas, A 1). It contains machine shops of the Rock Island system and has cattle, sheep, and horse-raising interests. Dalhart was incorporated in 1901. Pop., 1910, 2580.

**DALHOUSIE**, dāl-hōo'zī or dāl-hou'zī. A popular summer resort and port of entry, the capital of Restigouche Co., New Brunswick, Canada (Map. New Brunswick, C 1). It is situated on the Intercolonial Railway, at the mouth of the Restigouche estuary on Chaleurs Bay, and has a large and well-protected harbor. Steamship connection with points along the coast is maintained. Good fishing and hunting abound. Among the manufacturing industries are lumber and shingle mills. There is a good trade in fresh and frozen fish and also in lumber. Boating, bathing, and beautiful hill scenery are among the town's varied attractions. Pop., 1901, 862; 1911, 1650.

**DALHOUSIE**, JAMES ANDREW BROWN RAMSAY, tenth EARL and first MARQUIS of (1812-60). A governor-general of India. The third son of the ninth Earl, he was born at Dalhousie Castle, Midlothian, Scotland, April 22, 1812. He was educated at Harrow and Oxford. In 1837 he was elected Conservative member of Parliament for Haddingtonshire, and at the death of his father in 1838 became Earl of Dalhousie and took his seat in the House of Lords. In 1843 he was appointed Vice President of the Board of Trade and in 1845 succeeded Gladstone as President. His administration at the time of the so-called "Railway Mania" marked his ability, and at the change of ministry in 1846 Lord John Russell paid him a rare compliment in asking him to remain in office to complete his work. In 1847 he became the youngest governor-general ever sent to India. His administration, through additions of territory, development of resources by railways, canals, and other public improvements, forms an important era in Indian history, although, on account of his reduction of the army of occupation, the Indian Mutiny was subsequently laid to his charge. He was the recipient of many honors and in 1849 was created Marquis of Dalhousie. In 1856 he returned to England as an invalid and died after a lingering illness, Dec. 19, 1860. Consult: Arnold, *History of the Marquis of Dalhousie's Administration of British India* (London, 1862-65); the Duke of Argyll, *India under Dalhousie and Canning* (London, 1865); Trotter, *Life of Dalhousie*, in the "Statesmen Series" (London, 1889); Oswell, "Final Development of the Company's Rule," in *Sketches of the Rulers of India*, vol. i (Oxford, 1908); Gilliat, "Lord Dalhousie: a masterful Ruler," in *Heroes of Modern India* (London, 1910); *Private Letters*, edited by Baird (Edinburgh, 1910).

**DALIBOR**, dāl'ib-ōr. An opera by Smetana (q.v.), first produced in Prague, May 16, 1868.

**DALIN**, dāl'ēn', OLOF VON (1708-63). "The Father of modern Swedish poetry," whose literary maturity is known in Sweden as the "age of Dalin," a period of transition from the domi-

nance of German to that of French, and especially English, literary ideals. He was born in the Province of Halland, Aug. 29, 1708, the son of a clergyman. He studied at Lund, went to Stockholm as tutor, and entered the civil service in 1731. In 1733 he began to issue anonymously a literary weekly, *Svenska Argus*, that soon became widely popular for its piquant wit. Dalin announced his editorship, published *Thoughts about Criticism*; a comedy, *The Jealous Man* (1738); a tragedy, *Brynhilde* (1739); and the witty *Story of the Horse* (1739), through which runs a satire on the history of Sweden, following it by another satire on contemporary politics, *April Work of our Glorious Time*. Dalin's highest poetic flight is *Swedish Freedom* (1742), a didactic allegory. In 1751 he was made tutor of the Crown Prince (later King Gustavus III), and commissioned by Queen Louise Ulrika, sister of Frederick the Great, to write a *History of Sweden* (4 vols., 1747-62). She also consulted him in establishing the Academy of Arts and Sciences (1753), of which he was made secretary. In this year he was made Privy Councillor, but fell under suspicion of political intrigue and was banished from the court, to which he returned in 1761, two years before his death at Drottningholm, Aug. 12, 1763. Dalin's selected *Works* (issued in 1767 by his half brother) show little of really permanent value, but his personal influence was path breaking and transforming in the national literature. Consult Lamm, *Olof Dalin*, an elaborate biography in Swedish (Upsala, 1908), and also a sketch in the *Nordisk Farmijebok*, vol. v (Stockholm, 1906).

**DALKEITH**, däl-kéth'. A market town of Scotland, 6 miles southeast of Edinburgh (Map. Scotland, E 4). It has a corn market, a large and commodious market hall, erected in 1854; manufactures of carpets, brushes, and bricks, besides iron foundries and tanneries. There are large coal mines near by. Much truck gardening for Edinburgh is carried on in the neighboring country. Dalkeith arose around an ancient castle, which was long a stronghold. It was successively held by the Gabriels, the Douglasses, the Earls of Morton, and the Earls of Buccleuch. Dalkeith Palace, the chief seat of the Duke of Buccleuch and Queensberry, built about 1700 on the site of the old castle, is a large square structure overhanging the North Esk. Three times English rulers have occupied the palace on visits to Scotland. Three miles to the south of the town lies Cockpen, which took its place in literature in Baroness Nairne's lyric, "The Laird of Cockpen." Pop. (police burgh), 1901, 6733; 1911, 7019.

**DALL**, CAROLINE WELLS HEALY (1822-1912). An American author and philanthropist, born in Boston. She lectured frequently on theological subjects and on questions associated with the amelioration of conditions affecting woman and was a founder of the Social Science Association, the constitution of which she framed. For many years she conducted a class in literature and morals at her home in Washington. With Mrs. Pauline Wright Davis she founded *Una*, a journal devoted to woman's rights and the pioneer publication of its kind in Boston. The writings of Mrs. Dall are devoted chiefly to a discussion of the rights of woman, and her work entitled *The College, the Market, and the Court, or Woman's Relation to Education, Employment, and Citizenship* (1867), is a widely known contribution to that subject. She is also author

of *What we Really Know about Shakespeare* (1885; 2d ed., 1886); *Nazareth* (1903); *Fog Bells* (1905).

**DALL**, WILLIAM HEALEY (1845- ). An American naturalist, born in Boston. He was a special student under Louis Agassiz. In 1865-68 he accompanied the International Telegraph expedition to Alaska, and from 1871 to 1884 he was on the United States Coast Survey of Alaska. In 1880 he became honorary curator of the United States National Museum, and in 1893 professor of invertebrate paleontology at the Wagner Institute of Science, Philadelphia. In 1884-1905 he was paleontologist to the United States Geological Survey. He wrote works on the natural history of Alaska, such as *Alaska and its Resources* (1870); *Reports of the Molusca of the Blake Expedition* (1880-90); *Molusca of the Southwestern Coast of the United States* (1890).

**DALLÆUS**. See DAILLÉ.

**DALLAS**. A town and the county seat of Paulding Co., Ga., 34 miles northwest of Atlanta, on the Southern and the Seaboard Air Line railroads (Map: Georgia, B 2). There are cotton yarn, hosiery mills, and several gold mines. New Hope Church, 4 miles from Dallas, was the scene of a sharp conflict (May 25-28, 1864) between the armies of General Sherman and General Johnston. Pop., 1900, 644; 1910, 1259.

**DALLAS**. A city and the county seat of Polk Co., Oreg., 63 miles southwest of Portland, on the Southern Pacific, the Salem, Fall City and Western, and the Independence and Monmouth railroads, and on La Creole Creek (Map: Oregon, B 3). It is situated in the fertile Willamette valley, has lumber, saw, and planing mills, and railroad machine shops, and manufactures flour, woolen goods, sashes and doors, organs, foundry products, and tanned leather, the industrial interests being promoted by good water power. Sandstone is quarried in the vicinity. Dallas was settled in 1849 and in 1891 was chartered as a city. It contains a Carnegie library. Pop., 1890, 848; 1910, 2124.

**DALLAS**. The leading manufacturing city of Texas and the county seat of Dallas County, situated 185 miles (direct) north-northeast of Austin, the State capital, on Trinity River, and on the Chicago, Rock Island, and Gulf, the Gulf, Colorado, and Santa Fe, the St. Louis Southwestern, the St. Louis and San Francisco, the Trinity and Brazos valley, the Texas and Pacific, the Houston and Texas Central, the Texas and New Orleans, and the Missouri, Kansas, and Texas railroads, and on several interurban trolley lines (Map: Texas, D 3). Dallas is the seat of the Southern Methodist University, which has a campus of 625 acres and a \$2,000,000 endowment. There are a number of other educational institutions, including the University of Dallas and St. Mary's College. Other noteworthy features are the municipal building, a fine Carnegie library, Baptist Memorial Sanitarium, St. Paul's Sanitarium, two city hospitals, the cathedrals of St. Matthews and the Sacred Heart, a concrete viaduct across Trinity River to Oak Cliff, and the courthouse. A city plan has been adopted, and all developments and changes are being made in accordance with it under the supervision of a city-planning expert. Eight parks and playgrounds, comprising 713 acres, have been set aside. City Park, Fair Park, and Forest Park with its zoo, are especially attractive. A boulevard system of 62 miles is being

developed. The State Fair of Texas, which has met here annually since 1886, and which in 1913 had 700,000 visitors, has grounds and permanent fireproof buildings worth \$1,364,000. Dallas is the leading industrial city of Texas. Builders' casting, cement, confectionery and bakery products, leather goods, men's clothing, machine-shop products, and sheet-iron goods are among the principal manufactures. In the output of saddlery and harness and cotton-gin machinery Dallas occupies one of the leading positions in the country. The city is situated in the black-waxy belt, the chief cotton-producing region of Texas. The largest inland cotton market in the United States, Dallas handles 1,500,000 bales of spot cotton a year. It ranks second in the country in the distribution of agricultural implements. The city has a commission form of government, with a mayor, and four other commissioners who act as heads of the departments of police and fire, street and public property, water works and sewerage, and revenue and finance. The mayor and commissioners are elected by the people at large and appoint all the other city officers, who are responsible to the commissioners. The city's income in 1913 was \$2,072,072; expenditures, \$1,666,427, the chief items of which were \$342,000 for education and \$267,500 for streets. Because of the agricultural development of the surrounding region, the express and parcel-post businesses of Dallas have made great gains, the former now being seventh in volume of all cities in the United States. In 1914 Dallas was chosen as one of the reserve centres under the Banking Act of 1913. Pop., 1890, 38,067; 1900, 42,638; 1910, 92,104; 1914 (local est.), 131,278.

**DALLAS, ALEXANDER JAMES** (1759-1817). An American politician. He was born in the island of Jamaica, was educated at Edinburgh and at Westminster, and in 1783 removed from Jamaica to Philadelphia. In 1785 he was admitted to the bar and soon became prominent both as a lawyer and a politician. From 1810 to 1814 Dallas was district attorney for the eastern district of Pennsylvania. He was Secretary of the Treasury in President Madison's cabinet from 1814 to 1816, and it was on his recommendation that in 1816 Congress passed an act to incorporate a new United States bank. For a time in 1815 he discharged the duties of the War as well as of the Treasury Department. The bankrupt treasury that he found on entering office he left with a surplus of \$20,000,000, and with a definite financial policy for the future. He published *Reports of Cases Ruled and Adjudged by the Courts of the United States and of Pennsylvania before and since the Revolution* (4 vols., 1790-1807); *Address to the Society of Constitutional Republicans* (1805); *Exposition of the Causes and Character of the War of 1812-15* (1815). Consult *Life and Writings of Alexander James Dallas*, by his son, George Mifflin Dallas (Philadelphia, 1871).

**DALLAS, GEORGE MIFFLIN** (1792-1864). An American statesman and diplomat. He was born in Philadelphia, the son of Alexander J. Dallas, graduated at Princeton in 1810 and was admitted to the bar in 1813, and accompanied Mr. Gallatin in his special embassy to St. Petersburg, as private secretary. On his return he practiced law and filled the offices of deputy attorney-general and mayor in Philadelphia; he was also district attorney for the eastern district of Pennsylvania in 1829-31. From 1831 to 1833 he rep-

resented Pennsylvania in the United States Senate and from 1833 to 1835 was Attorney-General of Pennsylvania. In 1837 he was appointed American Minister at St. Petersburg, but was recalled at his own request in 1839. From 1845 to 1849 he was Vice President of the United States, and as such cast the deciding vote for the Tariff Bill of 1846. From 1856 to 1861 he was Minister to the Court of St. James's, where he was called upon to deal with two matters of importance, the Central American question and the recall of the British Minister at Washington, Sir John Crampton, both of which threatened for a time to cause considerable friction between the British and American governments. Consult his *Diary* of his stay in St. Petersburg and in London (Philadelphia, 1892).

**DALLAS, ROBERT CHARLES** (1754-1824). An English miscellaneous writer and a friend of Lord Byron. He was born at Kingston, Jamaica. He passed his life in Jamaica, the United States, England, and France. On his return from the East Byron showed Dallas the manuscript of *Childe Harold* (first two cantos) and was encouraged by Dallas to publish it. In gratitude for his many services Byron gave him the sums received for this poem and the *Corsair*. Dallas's *Recollections of Lord Byron* appeared in 1824. Dallas also wrote novels, tales, and tragedies.

**DALLES, dälz** (Fr., slabs, flagstones). A term applied, in regions which have been under French influence, to rapids where the rocky river bed wears in smooth slabs, and consequently especially to rapids produced by the narrowing of rivers between basaltic rocks. The best-known dalles are those in the Columbia, the Wisconsin, the St. Louis, Minn., and the St. Croix, Minn. (qq.v.).

**DALLES, THE, or DALLIES CITY.** A city and the county seat of Wasco Co., Oreg., 85 miles by rail east of Portland, on the Columbia River, at the head of navigation, on the Great Southern Railroad, and on the line of the Oregon-Washington Railroad and Navigation Company (Map: Oregon, D 2). The Dalles contains St. Mary's Academy, a Carnegie library, and a hospital. The city carries on an extensive trade in wool, live stock, grain, and fruit, its manufactures include flouring and planing mills, a wool-scouring plant, box factories, salmon and fruit cannery, lumber yards, machine shops, etc. A Methodist mission, followed by a trading station and military post, was established here in 1838, and the settlement was incorporated in 1858. The government is administered by a mayor, elected annually, and a municipal council. The water works are owned by the city. Pop., 1910, 4880.

**DALLES INDIANS.** See CHINOOK.

**DALLIN, CYRUS EDWIN** (1861- ). An American sculptor. He was born at Springville, Utah, where he came into close contact with Indian life, in the realistic and impressive portrayal of which he excels all other artists. He studied under Truman Bartlett in Boston and under Chapu in Paris, where Buffalo Bill's Wild West Show inspired his first equestrian statue, the "Signal for Peace" (1890), which received a gold medal at the Chicago Exposition (1893), and is now in Lincoln Park in that city; this was followed in 1899 by "The Medicine Man" (Fairmount Park, Philadelphia), considered one of the most notable products of American sculpture. His other works include the marble statue of Sir Isaac Newton in the Congressional Library at Washington; "Don Quixote," which received

a gold medal at the St. Louis Exposition (1904); the monument to the pioneers in Salt Lake City, and "Peace or War" (1906); and the "Redskin's Prayer" (1909). Consult his biography by Downs, in *Brush and Pencil*, vol. v, and Taft, *History of American Sculpture* (New York, 1903).

**DALLING AND BULWER**, BARON. See BULWER, WILLIAM HENRY LYTON.

**DALLINGER**, WILLIAM HENRY (1841-1909). An English scientist, born at Devonport. He entered the Wesleyan ministry in 1861 and for many years preached in Liverpool. But he also gave a great deal of his time to scientific investigation with the microscope, and this work he continued while acting as principal of Wesley College, Sheffield (1880-88), as well as later. In 1880 he was made a fellow of the Royal Society and from 1883 to 1887 was president of the Royal Microscopical Society. He also lectured at Cambridge and at Oxford and was senior lecturer to the Gilchrist Educational Trust. He wrote *Minute Forms of Life* (1886); *The Origin of Life* (1878); *The Creator and What we May Know of the Method of Creation* (1887); and a thorough revision of Carpenter's *The Microscope and its Revelations* (1901).

**DALL'ONGARO**, dāl-on'gā-rō, FRANCESCO (1808-73). An Italian poet, novelist, and patriot, born near Treviso. Abandoning the priesthood, for which he found himself unfitted, he started at Trieste a revolutionary journal, the *Favilla*, served under Garibaldi in 1849, and, after living for some years in exile in Paris and Brussels, returned to Florence to accept a chair of literature. Later he taught at Naples. He led a life full of sorrow and misfortune. He left a great variety of writings, including plays once quite popular. He is remembered chiefly, however, for his graceful and spirited poems, many of them in the Venetian dialect, and for having adopted the *stornello*, a particular form of folk poem, as a medium for patriotic verse, his famous *Stornelli politici*.

**DALLMAN**, GUSTAF (HERMANN) (1855- ). A German Orientalist, born in Niesky, Silesia, and educated at Moravian schools there and in Gadenfeld. In 1881 he was made instructor in Old Testament theology at Gadenfeld and in 1887, after becoming doctor of philosophy at Leipzig, lectured in Delitzsch's Hebrew College. In 1891 he was appointed instructor, and in 1896 professor, at the University of Leipzig, from which in 1900 he went to a chair of theology at Halle. In 1902 he took charge of the German Evangelical Archaeological Institute at Jerusalem, where he received appointments as Swedish Consul (1903) and Danish Consul (1910). His most important work was done in Palestine and includes: *Grammatik des jüdisch-palästinischen Aramäisch* (1894; revised 1905); *Aramäisch-neuhebraisches Wörterbuch* (1897-1901); *Wörter Jesu* (1898; Eng. by Kay, 1902); *Palästinajahrbuch* (1905 et seq.); *Petra und seine Felsheiligtümer* (1908); *Neue Petra-Forschungen* (1912).

**DALMANITES**, dāl-mā-nī'tez (named in honor of the geologist Dalman). A genus of fossil trilobites found in rocks of Ordovician to Devonian age, especially in those of the Silurian, in North America, Europe, Asia, and Australia. The carapace is depressed, with well-marked axis, is ovate in outline, tapering to the tail, and has 11 thoracic segments, with a large, often pointed, pygidium. The head

shield is broad, sometimes with an anterior point, and the genal angles are pointed. The eyes are large and usually well raised above the general surface and are provided with numerous distinct facets. The glabella has a broad frontal lobe and three lateral lobes. *Dalmanites* has several related genera—*Acaste*, *Chasmops*, *Pterygomotopus*, etc.—which differ in more or less conspicuous features, and which are all members of the family Phacopidae, of which the type genus is *Phacops*. About 100 species are known in the genus *Dalmanites*, and of these the best known are *Dalmanites timulurus* of the North American Niagara series, its representative *Dalmanites caudatus* of the English Wenlock, and *Dalmanites socialis* of the Bohemian Ordovician. See PHACOPS and TRILOBITE.

**DALMANOUTH** (Lat., from Gk. *Δαλμανούθ*, *Dalmanoutha*). A place mentioned in Mark viii. 10, as the locality to which Jesus retired after feeding the 4000. Its site is not certainly identified. Matthew, in the parallel passage (xv. 39), has "Magadan," which, if taken for "Magdala," must have been on the western shore of the lake, some 7 miles south of the Plain of Gennesaret. It is of interest to note that between Tiberias and Magdala there is a bowl-shaped valley or hollow, containing the ruins of a village and some more ancient foundations near several copious springs, called *Ain el-Bārideh*. The dragomans speak of this valley as *Wādy Dalmanoutha*, and it is possible that Matthew and Mark may refer to the same general locality. Consult Tristram, *The Land of Israel*, p. 413 (1876), and Sanday, *Sacred Sites of the Gospels*, p. 22 (1903). Burkitt, *Earliest Sources of the Life of Jesus*, p. 328 (1910), considers the name due to the confusion of the copyist who was struggling with a poorly legible text, but offers no suggestion as to what the original name may have been.

**DALMATIA**, dāl-mā'shi-á (Fr. *Dalmatie*, Ger. *Dalmatien*, It. *Dalmazia*, Serbo-Croatian, *Dalmacija*, Gk. *Δαλματία*, from the name of the former capital city of the province, Gk. *Δελμύιον*, Lat. *Delmnum* or *Dalmum*, an Illyrian word believed to signify a sheep pasture). The southernmost crownland of Austria, occupying a narrow strip of land along the Adriatic, and bordering on Croatia, Bosnia, the Herzegovina, and Montenegro (Map: Austria, E 5). Its area, including the adjacent islands, is 4936 square miles. The eastern part of Dalmatia belongs to the region of the Dinaric Alps, which form a wall on the side of Bosnia, while parallel to the coast rise the mountain chains of Castella, Mosor, and a few others. The coast is deeply indented with numerous rock-bound bays and inlets and is skirted by many islands. The scenery of the Dalmatian coast is famed for its picturesqueness. The Gulf of Cattaro is one of the finest natural harbors in Europe. The mountains are generally composed of limestone and barren of vegetation. The limestone is porous, abounding in caverns and passages, so that there is a system of underground water-courses. There are no rivers of importance. A few small lakes occur, and considerable tracts are covered with swamps and morasses, but most of the country suffers from drought. Dalmatia has almost a subtropical climate. The average annual temperature varies between 57° and 63°.

Owing to the frequency of political upheavals in Dalmatia, agriculture has been in a back-

ward state. In 1912 about 12 per cent of the total area was in arable land; in addition, vineyard, garden, orchard, etc., probably covered less than 10 per cent. The geographical position of the region makes it well adapted to the cultivation of southern fruits. The vine and the olive grow profusely on the coast. The famous maraschino cordial comes from Dalmatia, where it is made from a cherry (marasca) peculiar to the country. Fishing is carried on to a considerable extent. Cattle raising and dairying are also of some importance. The chief mineral products are lignite, asphalt, and salt, mined on a small scale. The shipbuilding and the wine and oil-pressing industries should be mentioned. The most important ports are Zara, Ragusa, and Spalato. Cereals are imported; olive oil, fish, meat, hides, honey, wine, and asphalt are exported. In 1911 there were 145 miles of railway, 153 telegraph offices, and 217 post offices.

Local affairs are under the control of the Diet, consisting of 43 members, of whom 10 are elected by citizens paying a direct annual tax of at least 100 kronen, 8 by the towns, and 20 by the rural communities, and the remaining 5 consist of the Roman Catholic Archbishop, the Greek Orthodox Bishop, and three representatives of the chambers of commerce of Zara, Ragusa, and Spalato. To the Lower House of the Austrian Parliament Dalmatia sends 11 delegates, of whom two are elected by indirect universal suffrage. The crownland is divided into 14 administrative districts. In 1911 there were 458 public elementary schools, with an enrollment of 58,606 pupils. There are five gymnasia and three realschulen. The majority of the inhabitants, perhaps three-fourths, are illiterate. The population of Dalmatia in 1890 was 527,426; in 1900, 593,784; in 1910 (census of December 31), 645,666, or 2.26 per cent of the population of Austria. According to vernacular, in 1910, about 96.2 per cent of the inhabitants were Serbo-Croat, 2.8 per cent Italian, and 0.5 per cent German. Roman Catholics constituted over 83.3 per cent, and Greek Orthodox over 16.3 per cent. The population of the larger towns was as follows at the 1910 census (population of communes in parenthesis): Zara, capital of the crownland, 14,056 (36,595); Spalato, 21,407 (27,492); Sebenico, 12,588 (29,579); Ragusa, 8958 (14,367); Blatta, 6837 (8862). The Dalmatians are tall and short-headed (height, 1.715 m.; index, 87). They are supposed to be fundamentally the modern representatives of the ancient Illyrians, subjected by Augustus and modified afterward by Mæso-Goths, Avars, and Slavs. These Dalmatian Slavs often figure under the name of Morlaks. Capital, Zara (q.v.).

In ancient times Dalmatia was inhabited by the Dalmatii, who for nearly 150 years resisted successfully the Romans, but who were finally subdued by Augustus. After the fall of the Western Empire Dalmatia, which had formed the southern part of the Province of Illyricum, was occupied by the Goths, from whom it was taken by the Byzantines. Early in the seventh century the Croats and Serbs took possession of the country districts, but not the cities, which were the places of refuge for the older population. About the beginning of the twelfth century King Ladislas of Hungary incorporated a part of Dalmatia with Croatia, while the other part was in the possession of the Venetian Re-

public, the Doge of which had in 998 assumed the title of Duke of Dalmatia. In the south the little Republic of Ragusa (q.v.) maintained an independent existence. In the sixteenth century most of the country was conquered by the Turks. In 1699 almost all except Ragusa was restored to Venice. By the Peace of Campo Formio (1797) Dalmatia, with Venice itself, became subject to Austrian rule; and when Austria, in 1805, retroceded it to Napoleon, it was annexed to the Kingdom of Italy. In 1809 it was constituted part of the dominion of the Illyrian Provinces. Since 1814 Dalmatia has formed part of the Austrian Empire. Consult: Jackson, *Dalmatia, the Quarnero and Istria, etc.* (London, 1893); Freeman, *Subject and Neighbor Lands of Venice* (ib., 1881); Modrich, *La Dalmazia* (Turin, 1892); Royle, *Dalmatia Illustrated* (London, 1900).

**DALMATIA**, DUKE OF. See SOULT.  
**DALMATIAN** (dál-má'shan) **DOG**. See COACH DOG.

**DALMATIC**. In ecclesiastical art and in the usage of the Roman Catholic church, the distinguishing vestment of a deacon or subdeacon, taking its name from the ordinary costume of Dalmatia. Pope Sylvester, in the fourth century, ordered deacons to wear it in the church. It is also worn by bishops, cardinal priests, and abbots at pontifical functions. As an ecclesiastical vestment it was originally white, with broad perpendicular stripes of purple, it now follows the color of the day, with the stripes represented in embroidery. It reaches to the knee and has wide sleeves. Consult Simpson, *Use of Vestments in the English Church* (New York, 1909). And Namta, *Costumes of Prelates of the Catholic Church* (Baltimore, Md., 1909). See COSTUME, ECCLESIASTICAL.

**DALMORES**, dál'mó'res, CHARLES (1871- ). A distinguished French dramatic tenor, born at Nancy. His musical talent manifested itself at an early age, and when only six years old he received systematic instruction. His first ambition was to become a violinist, and for this purpose he entered the conservatory at Nancy. Having to abandon the violin after breaking his arm, he took up the horn. He continued his study at the Paris Conservatory, won the first prize, and began his career as hornist in the Colonne orchestra. From 1888 to 1894 he was a member of the Lamoureux orchestra. At the same time he studied the cello and attained considerable skill on this instrument also. Ever since his arrival in Paris he had felt a burning desire to become a great singer. His opportunity for study came in 1894, when he accepted a position as teacher of the horn at the conservatory at Lyons. Here Dauphin, one of the singing masters, heard him and trained his voice. His début at Rome in 1899 was an emphatic success. His great fame began when in 1906 he appeared as one of the principal tenors of the Manhattan Opera House in New York. After his return to Europe the doors of the principal opera houses were open to him, but he would not bind himself permanently. Until the dissolution of the Manhattan Company in 1910 Dalmore's remained leading tenor of the organization, and after that he was the foremost tenor of the Chicago Opera Company. He is not only a great singer, but also an actor of more than ordinary ability.

**DALNY**, dál'ní, or TAIBEN, or DAIBEN. A seaport in Manchuria, on the peninsula of Lia-

tung, about 20 miles north of Port Arthur (Map: China, F 4). The harbor of 132 acres, ice-free throughout the year, is deep enough for large vessels. The port was intended by the Russians to become the centre of their trade on the Pacific, especially with Japan and China. Although founded in 1899, Dalny has a considerable and rapidly increasing population. It was occupied by the Japanese, under General Oku, May 28, 1904, following the battle of Kin-Chow or Nanshan. The lease of it, together with the rest of the Liao-tung peninsula, by Russia was transferred to Japan by the Treaty of Portsmouth. On Sept. 1, 1906, it became a free port. Its commerce has greatly increased in recent years. The imports, which a decade ago were extremely small, were in 1911 \$17,047,199 and in 1913 \$21,572,000; exports in 1911, \$22,975,000, 1913, \$28,973,000. About three-fourths of the most important imports are from Japan, chiefly cotton goods and other manufactures. Soyabean oil and cake are the articles of export. The area of the leased territory is 1220 square miles and its population in 1913 was about 510,000.

**DALOU**, dā'loo', (AIMÉ) JULES (1838-1902). The most eminent French sculptor, after Rodin, of the later nineteenth century. He was born in Paris, Dec. 31, 1838, the son of a glove maker. As a lad, he fought behind the barricades of 1848, and ever after he was identified with the workingman's cause. His talent in modeling attracted the attention of Carpeaux, under whom he studied at the Ecole des Arts Decoratifs, and although he afterward was a pupil of the Classicist Duret in the Ecole des Beaux-Arts, Carpeaux was his real master. The young revolutionary held aloof from official contests, but exhibited with varying success until 1870, when his "Women Embroidering" obtained a prize. He was also occupied with decorative works, such as the four groups for the Hôtel Paiva, and with designs for goldsmith's work and ceramics. Having held office under the Commune, he was compelled in 1871 to flee to England. In London he was welcomed by his friend the painter Legros, who procured him commissions and aided him to secure an appointment as adjunct professor in the South Kensington Museum schools. The fruitful training which he gave his pupils was the principal factor in breaking the dreary classic traditions of British sculpture and establishing its present excellence. While in London he modeled many terra-cotta busts, statuettes, and several statues, one of which, reproduced in bronze as "Maternity," is in front of the Royal Exchange. After the general amnesty of 1879 he returned to Paris and soon received from the city the commission for his principal work, the colossal bronze "Triumph of the Republic," in the Place de la Nation (1880-89), one of the most important public monuments in modern sculpture. The figure of the Republic towers over a chariot drawn by two lions, attended by the four figures of liberty, justice, freedom, and peace. In 1883 he received a medal of honor for two admirable high reliefs, "The Republic" and "Mirabeau Answering Dreux-Brézé," the latter a composition of great power, now in the Chamber of Deputies. A bronze cast of his group "Silenus" (1885) is in the Jardin de Luxembourg. In 1889 he was awarded the Grand Prix of the International Exposition. He was an officer of the Legion of Honor and the first president of the sculpture section of the secessionist Société Nationale des Beaux-Arts.

Dalou may be well called the official sculptor of the Third Republic. His powerful public monuments adorn the provincial cities as well as Paris. Most of them are groups, in which the statue or bust of a hero surmounts the pedestal with allegorical or other figures at the base. Among the best are the monument to Delacroix in the Luxembourg Gardens, that of the engineer Alphonse with the statues of Dalou and three others at the base, Lavoisier in the amphitheatre of the Sorbonne, Gambetta at Bordeaux, and Hoche in Quiberon. He also executed many genre groups, reliefs, and portrait busts, such as those of Charcot, Rochefort, and others, and much decorative work, architectural as well as ceramic, including the two celebrated vases in the Luxembourg. His last years were devoted to a colossal "Monument of Labor," for which many plastic sketches survive, but which an untimely death prevented him from completing. Dalou and Rodin are the most prominent and representative figures in French sculpture of the later nineteenth century. The former is the logical successor of Rude and Carpeaux, whose influence appears in his work; but his art is also reminiscent of mediæval sculpture and especially of the decorative art of the eighteenth century. For, unlike Rodin, who broke entirely with the past, he insisted upon conserving the national tradition. The best monograph on Dalou is by his friend Dreyfous (Paris, 1903); see also that of Cornu, in *Portraits d'her* (ib., 1909).

**DALRIADA**. The ancient name for the northern half of the County of Antrim in Ireland, now known as "The Route." The Dalriads are supposed to have descended from Carbrí Riada (Riogh-fhada, i.e., of the long wrist), a son of a chief of the Scots in Ireland, who ruled not only in the district of Ireland, named after him, but, according to Bede, crossed to Scotland and settled in the lands of the Picts. In the beginning of the sixth century the Dalriads, led by Fergus, passed over to Argyllshire, where they settled themselves permanently, and formed the kingdom of "Dalriada in Albany." The Scottish colonists increased so much in power that they threw off the yoke of Ireland and about 627 attempted to subdue that island, but were defeated at Magh Rath, in County Down. The Dalriads nevertheless extended their kingdom in Scotland, and in 844 their king, Kenneth, became King of the Picts and thus united under one sceptre the Dalriads, or Scots, and the Picts. Later his kingdom was known as the Kingdom of Albany, or Scotland. Consult Skene, *Celtic Scotland* (3 vols., Edinburgh, 1876-80).

**DALRYMPLE**, dāl'rim-p'l, ALEXANDER (1737-1808). A British hydrographer; a younger brother of Sir David Dalrymple, Lord Hailes (q.v.). He was born at New Hailes, near Edinburgh, July 24, 1737. In 1752 he obtained an appointment in the East India Company's service; but he labored under the disadvantage of youth and imperfect education, until Lord Pigot, Governor of the Presidency, gave him lessons in writing. In 1758 he made a voyage of observation among the Eastern islands, and at Sulu negotiated a commercial treaty with the Sultan, which he returned to consummate in 1762, but was unsuccessful. In 1765 he returned to Britain and in 1775 was sent to Madras as a member of council, but was recalled in two years, apparently without good reason. Four years later

he was appointed hydrographer to the East India Company and shortly after received a pension. In 1795, when the British Admiralty resolved to establish a similar office, it was conferred on Dalrymple, who held it until his summary dismissal, occasioned by an excess of zeal, on May 28, 1808. Depression at the humiliation occasioned his death, three weeks afterward, on June 19, 1808, at Marylebone, London. He wrote a vast number of letters, pamphlets, etc., containing plans for the promotion of British commerce in various parts of the world, political dissertations, accounts of geographical expeditions, etc., and his library, containing valuable geographical and scientific works, was acquired by the Admiralty.

**DALRYMPLE, SIR DAVID, LORD HAILES** (1726-92). A Scottish judge and antiquarian, born in Edinburgh, Oct. 28, 1726. He was the grandson of Sir David Dalrymple, youngest son of Viscount Stair. Educated at Eton, in Edinburgh, and finally in Leyden, he returned to Scotland in 1746 and in 1748 was called to the Scottish bar. In 1766 he was appointed judge of the Court of Session, with the title of Lord Hailes. Ten years after, he was made Justiciary Lord. He set a high standard for humanitarian treatment of criminal cases—a practice which was not prevalent at that time. He died Nov. 29, 1792. He was a voluminous writer. His most important works are, *Annals of Scotland, from the Accession of Malcolm III, Surnamed Canmore, to the Accession of Robert I* (1776), with continuation to the *Accession of the House of Stuart* (1779); and *An Inquiry into the Secondary Causes which Mr. Gibbon Has Assigned to the Rapid Growth of Christianity* (1786). He also wrote works on legal antiquities and ancient church history, edited old Scottish poems, and published biographical sketches of notable Scotchmen. He was the esteemed friend and correspondent of Dr. Johnson. Consult "Memoirs of Lord Hailes," in late editions of the *Inquiry*. Consult also Boswell, *Life of Johnson*.

**DALRYMPLE, SIR JAMES, first VISCOUNT STAIR** (1619-95). A Scottish lawyer and statesman. The son of a small proprietor in Ayrshire, he was born at Drummurchie in May, 1619. Educated at Glasgow and Edinburgh universities, at an early age he entered the army raised in Scotland to repel the religious innovations of Charles I, but returned to civil and literary pursuits, and in 1641 was appointed professor of philosophy at Glasgow. In 1648 he entered as an advocate at the Scottish bar, where he rapidly acquired distinction. In 1649 and again in 1650 he was appointed secretary to the commissioners sent to Holland by the Scottish Parliament to treat with Charles II, and in 1657 was induced to become one of the "commissioners for the administration of justice" in Scotland under Cromwell's government. Dalrymple was a Royalist, but resigned his seat in 1664 on his refusal to take the "declaration" oath, which denied the right of the nation to take up arms against the King. Charles, however, unwilling to lose so faithful a servant, allowed him to take the oath in a modified form, and he returned to the bench. The King further honored him with a baronetcy and in 1671 appointed him Lord President of the Court of Session. He was invariably the advocate of moderate measures. In 1681 he refused to take the new test oath and resigned his appointments. The same year he published the *Institutions of*

*the Law of Scotland*, which is still the grand textbook of the Scottish lawyer. After some time spent on his estate in Wigtownshire Dalrymple went to Holland in 1682 to escape factious persecution. During 1684-87, while residing at Leyden, he published at Edinburgh his *Decisions*; and in 1686, at Leyden, a Latin work entitled *Physiologia Nova Experimentalis*. He accompanied the Prince of Orange on his expedition to England. William reappointed him Lord President of the Court of Session and created him Viscount Stair, Lord Glenluce and Stanraer in 1690. He died in Edinburgh, Nov. 25, 1695. His daughter Janet, who died in 1669, within a month of her marriage to Dunbar, Laird of Baldoon, is the original of Scott's *Bride of Lammermoor*. Consult Mackey, *Memoirs of Sir James Dalrymple, First Viscount Stair* (Edinburgh, 1873), and Graham, *Annals and Correspondence of the Viscount and First and Second Earls of Stair* (ib., 1875).

**DALRYMPLE, SIR JAMES** (1-c.1714). The second son of Viscount Stair and the author of *Collections Concerning Scottish History Preceding the Death of David I* (1705). He was appointed one of the commissaries of Edinburgh following his admission to membership of the faculty of advocates in 1675. He was made a baronet of Nova Scotia in 1698. As an antiquary he ranked among the best of his time.

**DALRYMPLE, SIR JOHN, first EARL OF STAIR** (1648-1707). A Scottish statesman. He early became the leader of the Presbyterians in Scotland, and in 1687 he became Lord Advocate as a concession to that party. He took a leading part in the revolution of 1688 in Scotland and was one of those who brought the offer of the Scottish crown to William and Mary. William reappointed him Lord Advocate, and in 1690, on his father's elevation to a viscountcy, he became the Master of Stair. But, inspired by his fanatical hatred for the Highland clans, he instigated the "Massacre of Glencoe," which brought great odium on his head and forced his retirement. At the accession of Anne (1702) he was a privy counselor for Scotland, and the next year he was created Earl of Stair. He earnestly promoted the union of Scotland with England, and his death from apoplexy, Jan. 8, 1707, was very possibly brought about by his efforts in behalf of the treaty. Dalrymple was a strong partisan, and many of his acts are open to criticism, but his patriotism and love for Scotland are undoubted. Consult Graham, *Annals and Correspondence of the Viscount and First and Second Earls of Stair* (Edinburgh, 1875).

**DALRYMPLE, SIR JOHN, of Cranston** (1726-1810). The grandson of Sir James Dalrymple, and author of *Memoirs of Great Britain and Ireland from the Dissolution of the Last Parliament of Charles II until the Sea Battle off La Hogue* (3 vols., 1771), which created a sensation at its appearance, owing to the revelations it contained, culled from authoritative state papers.

**DALRYMPLE, SIR JOHN, second EARL OF STAIR** (1673-1747). A Scottish general and diplomat. The second son of the first Earl and grandson of Viscount Stair, he was born in Edinburgh, July 20, 1673. When eight years old he killed his elder brother by the accidental discharge of a pistol. Alienated from parental affection by this unhappy circumstance, he was placed under the care of a clergyman, who by prudence and kindness developed the excellent

qualities of the youth. He proceeded to Leyden University, where he won a reputation for scholarship, and, after completing his curriculum at Edinburgh, in 1701, accepted a commission as lieutenant colonel of the Scottish Regiment of Foot Guards and gained high distinction in Marlborough's campaigns. In 1711 he retired from the army, and, when George I succeeded to the throne, Dalrymple, who had become Earl of Stair by the death of his father in 1707, was made lord of the bedchamber, Privy Councillor, and commander in chief of the forces of Scotland. In 1715 he went as Ambassador to France and exhibited the highest ability in counteracting the schemes for the reinstatement of the Pretender. But, as he refused to flatter his countryman, Law, then high in favor with the regent Orleans, he was recalled. For 22 years he lived in retirement at Newliston, near Edinburgh, and devoted himself chiefly to scientific agriculture, in which he originated distinct advancements. He was the first to plant turnips and cabbages in the open fields. In 1742 he was sent as Ambassador to Holland and in the following year served under George II at the battle of Dettingen. Later he was made commander in chief of the forces of Great Britain. He died in Edinburgh, May 9, 1747. His Countess, a beautiful and cultured woman, who survived him 12 years, is the heroine of Scott's novel *My Aunt Margery's Mirror*. Consult Graham, *Annals and Correspondence of the Viscount and First and Second Earls of Stair* (Edinburgh, 1875).

**DALSGAARD**, dāls'gård, CHRISTEN (1824-1907). A Danish genre painter, born at Knabesholm, near Skive, Jutland. He studied at the Copenhagen Academy and under Rörbye, was made professor of drawing at the Academy of Sorø in 1862, and was elected to the Copenhagen Academy in 1872. His impressive delineations of Danish peasant life, showing a keen sense of observation and imbued with sincere sentiment, have justly caused him to be esteemed one of the typical masters of Denmark. Especially noteworthy among them are: "Christmas Morning on a Farm" (1848); "Seizure for Debt" (1860); "Fisherman and Daughter" (1854); "Mormons Visiting a Joiner's Home" (1856); all in the Gallery at Copenhagen and "The Farewell" (1860), in the Museum at Aarhus. Consult his biography by Knud Søbørg (1902).

**DALTON**, dāl'ton. A city and the county seat of Whitfield Co., Ga., 98 miles north-northwest of Atlanta, on the Southern and the Western and Atlantic railroads (Map: Georgia, A 1). It is in a region possessing extensive deposits of iron, limestone, and manganese; exports cotton, grain, and fruits, and has agricultural-implement and marble works, foundries, jail and convict car factory, and machine shops, cotton mills, chair factory, and lumber mills. Settled and incorporated in 1848, Dalton is governed by a mayor chosen every two years, a board of aldermen, and three commissioners. The water works, and gas and electric-light plants are owned by the city. During the latter part of 1863 and the spring of 1864 Dalton was the headquarters of the Confederate General Joseph E. Johnston, who commanded the army for the defense of Atlanta. Several minor battles were fought in this vicinity. Pop., 1890, 3046; 1900, 4315; 1910, 5324.

**DALTON**. A town in Berkshire Co., Mass., 5 miles east of Pittsfield, on the Boston and Albany Railroad (Map: Massachusetts, A 3). It

contains a public library. The chief manufactures are paper, woollens, and spark coil, the paper being of an unusually high grade and used by the government for currency. Pop., 1900, 3014; 1910, 3568.

**DALTON, HERMANN** (1833- ). A German Protestant theologian. He was born at Offenbach-on-the-Main, Aug. 20, 1833; studied at Marburg, Berlin, and Heidelberg; was pastor of the German Reformed congregation in St. Petersburg (1858-88) and has since lived in Berlin. He has written much on the history of religion in Russia, including *Geschichte der reformierten Kirche in Russland* (1865); *Johannes a Lasco* (1881; Eng. trans. 1886); *Verfassungsgeschichte der evangelisch-lutherischen Kirche in Russland* (1887); *Urkundenbuch der evangelisch-reformierten Kirche in Russland* (1888); *Zur Gewissensfreiheit in Russland* (1890); *Die russische Kirche* (1891); *Zur Geschichte der evangelischen Kirche in Russland* (1893-98); and also *Lebenserinnerungen*, vols. i-iii (1905-09).

**D'ALTON**, JOHANN SAMUEL EDUARD. See ALTON.

**DALTON**, JOHN (1766-1844). A celebrated English chemist and natural philosopher, born at Eaglesfield, near Cockermouth, in Cumberland. He received his early education in the Quakers' school of his native place, and from 1781 to 1793 acted as assistant and as joint manager in a boarding school kept by a relative in Kendal. Here his love of mathematical and physical studies was first developed. He wrote several mathematical essays and in 1788 commenced a journal of meteorological observations, which he continued throughout his whole life. From 1793 to 1799 he was teacher of mathematics and the physical sciences in the new college at Manchester, where he chiefly resided during the remainder of his life, though frequently employed, after 1804, in giving lectures on chemistry in several large towns. In the years 1808 to 1810 he published his *New System of Chemical Philosophy* (2 parts, London), to which he added a third part in 1827. In 1817 he was appointed president of the Literary and Philosophical Society at Manchester. He was also a member of the Royal Society and of the Paris Academy and in 1833 received a pension of £150, afterward raised to £300. In the same year Dalton's friends and fellow townsmen collected £2000 to raise a statue to his honor, which was executed by Chantry and placed at the entrance of the Royal Institution in Manchester. Dalton was also honored by the University of Oxford with the degree of D.C.L. and with that of LL.D. by the University of Edinburgh. His chief physical researches were those on the constitution of mixed gases, on the force of steam, on the elasticity of vapors, and on the expansion of gases by heat. In chemistry he distinguished himself by his progressive development of the atomic theory (see CHEMISTRY), as also by his researches on the absorption of gases by water, on carbonic acid, carburetted hydrogen, etc. His papers are mostly contained in the *Memoirs of the Literary and Philosophical Society of Manchester*, the *Philosophical Transactions*, Nicholson's *Philosophical Journal*, and Thomson's *Annals of Philosophy*. Besides these, we have his *Meteorological Essays and Observations* (London, 1793; 2d ed., 1834). Profound, patient, and intuitive, Dalton had precisely the faculties requisite for

a great scientific discoverer. His atomic theory has revolutionized the science of chemistry and has yielded a greater number of valuable results than, perhaps, any other idea ever introduced into physical science. In his habits Dalton was simple; in his manners, grave and reserved, but kindly. Consult Roscoe and Harden, *A New View of the Origin of Dalton's Atomic Theory* (New York, 1896), and Meldrum, *Avogadro and Dalton* (Aberdeen, 1904, University Studies).

**DALTON, JOHN CALL** (1825-89). An American physiologist and physician. He was born in Chelmsford, Mass., and graduated at Harvard in 1844 and at the Harvard Medical School in 1847. He was professor of physiology successively in the University of Buffalo, in the Vermont Medical College, and in the College of Physicians and Surgeons, and in 1883 succeeded Alonzo Clark as president of the last. During the Civil War he served as surgeon in the Federal army. He contributed many articles on medical subjects to scientific journals and, in addition, published a *Treatise on Human Physiology* (1859); *A Treatise on Human Physiology for Schools, Families, and Colleges* (1868); *The Experimental Method of Medicine* (1882); *Doctrines of the Circulation* (1884); *Topographical Anatomy of the Brain* (1885).

**DALTON-IN-FURNESS**, dal'ton-in-fur'nēs. A market town in Lancashire, England, on the peninsula of Furness, about 4 miles northeast of Barrow-in-Furness (Map: England, C 2). The church of St. Mary, restored, is famous as the burial place of the painter George Romney. A canal about 3 miles long connects the town with the Irish Sea. It has extensive iron mines and iron works. Pop., 1890, 13,300; 1901, 13,020; 1911, 10,763.

**DALTONISM**. See COLOR BLINDNESS.

**DALTON'S LAW**. See GASES, GENERAL PROPERTIES OF.

**D'ALVIELLA**, däl'-vyel'lä, COUNT GOBELT (1846- ). A Belgian legislator and writer, born at Brussels. He served in the Belgian Parliament and as rector of the University of Brussels, and was Hibbert lecturer at Oxford in 1891. As correspondent of the *Independence Belge*, he went to India with Edward VII, then Prince of Wales; later he was Envoy Extraordinary to Constantinople; and for long he was director of the *Revue Belge*; finally he became Vice President of the Belgian Senate, and professor in the University of Brussels. His publications include: *Sahara and Lapland* (1874); *Inde et Himalaya* (1877; 2d ed., 1880); *Contemporary Evolution of Religious Thought in England, America, and India* (1885); *The Migration of Symbols* (1894); *Ce que l'Inde doit à la Grèce* (1897); *Elucisima de quelques problèmes relatifs aux mystères d'Elucisima* (1903); *A travers le Far West, souvenirs des États-Unis* (1906); *L'Université de Bruxelles pendant son troisième quart de siècle* (1909); *Croyances, Rites, Institutions* (3 vols., 1911).

**DALY, ARNOLD** (1875- ). An American actor, born in Brooklyn, N. Y. He made his first stage appearance in 1892 in *The Jolly Squire*. He became known especially as a producer of the dramas of Bernard Shaw, having brought out that playwright's *Candida* (1903), and *Mrs. Warren's Profession* and *You Never Can Tell* (1904), and having toured with *Arms and the Man*, *Candida*, and *The Man of Destiny* in 1906. In 1911 he played the part of Brunt-

schli, in *Arms and the Man* at the Criterion Theatre in London. He appeared in *General John Regan* in 1913-14 in New York.

**DALY, däl'ä', CÉSAR DENIS** (1811-94). A French architect and writer on architecture, born at Verdun, Meuse. His principal work as an architect is the restoration of the cathedral of St. Cecilia at Albi, for which designs were shown at the Exposition in 1855. But the work upon which his reputation rests is the monumental journal, *Revue générale de l'architecture et des travaux publics* (1840-90). The 45 volumes contain a theoretical and practical library of architecture. Among his other publications are: *Les motifs historiques d'architecture et de sculpture d'ornement* (1874); *L'Architecture funéraire* (1870); *L'Architecture priée au XIXème siècle* (Paris, 1870-77); *Motifs divers de serrurerie* (ib., 1881-82); *Des hautes études d'architecture* (1889).

**DALY, CHARLES PATRICK** (1816-99). An American jurist and geographer, born in New York City. He was admitted to the bar in 1837 and was Chief Justice of the Court of Common Pleas in New York for 27 years, until retired by the age limit in 1868. From its organization in 1864 until his death, Judge Daly was president of the American Geographical Society. Besides his *Historical Sketch of the Judicial Tribunals of New York* (1855), and many legal papers of importance, he wrote: *When Was the Drama Introduced into America?* (1864); *First Settlement of Jews in North America* (1875); *What we Know of Maps and Map-Making before Mercator* (1879); and a *History of Physical Geography*.

**DALY, JOHN AUGUSTIN** (1838-99). An American playwright and theatrical manager. He was born at Plymouth, N. C., and educated at Norfolk, Va., and in the public schools of New York City. He was dramatic critic for the *Sunday Courier* in 1859 and held similar positions on the *Express*, *Citizen*, *Sun*, and *Times* for some years. Meanwhile he was producing adaptations of several plays, and in 1867 his first original success, *Under the Gaslight*, was brought out at the New York Theatre. In 1869 he opened in Twenty-Fourth Street the playhouse known as the Fifth Avenue Theatre, which, with such "stars" as Fanny Davenport, Mrs. Scott Siddons, E. L. Davenport, and Clara Morris, quickly became very popular. After the destruction of this theatre by fire and an interval of a few months in another, he opened, in 1874, Daly's Fifth Avenue Theatre, which he managed till 1877. In 1879 he returned, after a year of study in Europe, and opened the house since known as Daly's Theatre on Broadway, near Thirtieth Street, which he controlled until the time of his sudden death in Paris. Mr. Daly had in his company at various times many of the best-known players in America. For years Miss Ada Rehan was his leading actress. Several times he went with his whole company to California, to England, and to Germany and France. In 1893 he leased a theatre in London. He wrote many adaptations from German and French plays, one of his earliest efforts being from Mosenthal's *Deborah* in 1862. In the long list of works which he wrote or adapted are: *Divorce*, *Pique*, *Under the Gaslight*, *The Railroad of Love*, *Seven-Twenty-Eight*, *The Great Unknown*, *Love on Crutches*, and *The Last Word* (1890). Mr. Daly was especially noted for excellence in scenic presentation, and his Shakespearean revivals

have received warm praise both in this country and in England. In 1894 he was presented with the Letare medal of the University of Notre Dame, Ind. He was a great book lover and made a remarkable collection of plates on biblical subjects, Thackeray, etc., which was sold at auction in the settlement of his estate. Besides his plays and dramatic adaptations, he was the author of *Woffington: A Tribute to the Actress and the Woman* (1888), and various minor articles.

**DALY, JOSEPH FRANCIS** (1840- ). An American jurist, born at Plymouth, N. C. He studied law in New York City in 1855-62, was admitted to the bar in 1862, and from 1870 to 1890 was a judge of the Court of Common Pleas of New York, of which he in the latter year became Chief Justice. In 1896-98 he was a justice of the State Supreme Court and in 1900 was appointed United States Law Commissioner to Porto Rico.

**DALY, SIR MALACHY BOWEN** (1836- ). A Canadian administrator. He was born at Quebec and was educated at St. Mary's College, Oscott, England. He entered the legal profession and was called to the bar in 1864. In 1878-87 he represented Halifax in the House of Commons in the Conservative interest, and in 1882-86 was Deputy Speaker of the House. In 1890 he was appointed Lieutenant Governor of Nova Scotia, and in 1895 he was appointed for a second term, which expired in 1900. He was knighted the same year. He became known as a prominent Imperialist.

**DALY, THOMAS MAYNE** (1852-1911). A Canadian lawyer and statesman. He was born at Stratford, Ontario, was educated at Upper Canada College, and was called to the bar in 1876. He later entered municipal life and was a member of the Stratford city council and public school board; but removed to Manitoba, and in 1887-96 was a Conservative member of the House of Commons. During 1892-96 he was Minister of the Interior in the administrations of Sir John Thompson and Sir Mackenzie Bowell. During his official term he went abroad on a mission in connection with the reorganization of the Canadian immigration system, in behalf of which he carried into effect important reforms. In 1897 he went to Rossland, British Columbia, where he became police commissioner; and he removed afterward to Winnipeg, where he was police magistrate in 1901-08. In 1909-11 he was judge of the juvenile court in that city. He published *The Canadian Spirit of the North-West* (1907). He was an ardent imperial federationist.

**DALYELL, or DALZELL, THOMAS** (c.1599-1685). A Scottish general, born at Binns, Linlithgowshire. In 1642 he accompanied Gen. Robert Monro in the expedition to Ireland and fought in 1651 at Worcester and in 1654 in the Highland rebellion. Especially excluded by Cromwell from the Act of Grace, he took service under the Czar of Russia and participated as a general against the Turks and Tatars. In 1666 he was appointed by Charles II commander in chief of the forces in Scotland and was particularly commissioned to repress the Covenanters. His defeat of the Covenanting troops at Rullion Green was followed by cruelties which made his name a byword through the countryside. A stubborn Royalist, he did not, says Creighton, "shave his beard since the murder of King Charles I." In 1681 he enrolled the regiment afterward known as the Scots Greys.

**DAM, TINKER'S.** A guard of dough or clay placed by a tinker around a cavity to confine the melted metal until it "sets." It is worthless after use; hence the vernacular expression, "not worth a tinker's dam."

**DAMA, dā'mā** (Lat.). A gazelle (*Gazella dama*) of the Sudan, with short lyrate horns and no dark band on the sides. See *GAZELLE*.

**DAMAGES** (OF *damage, domage*, Fr. *domage*, from Lat. *damnum*, loss). The pecuniary recompense given by a court of law to one who has suffered an invasion of a legal right through the act of another. The right invaded may be one which the plaintiff enjoys in common with other members of society, as, e.g., his right to have his person or property not interfered with; or his right not to be injured through the negligence of others; or it may be a right which he has acquired through entering into a special legal relation with another, as by contract.

But, although the law furnishes a legal remedy for every violation of a legal right, that remedy is not always an action for damages. The entire jurisdiction of the equity tribunals is concerned with remedies of a different order—as injunction, the specific enforcement of contracts, etc.—the remedy of damages being for the most part left to the courts of common law. Furthermore, not even at common law does every invasion of a legal right give rise to an action for damages. The breach of a condition, e.g., is remediable only by action on the part of the one injured restoring both parties to their former condition. Thus, if the condition was attached to a sale of land or goods, its breach enables the injured party to rescind the transaction and place himself *in statu quo*, but not to sue for damages.

Strictly speaking, the term "damages" is not applicable to all cases of a recovery of money for infringement of legal rights, but only to such as call for an estimate or admeasurement by the court or jury of the injury suffered and of the proper compensation to be made therefor. Where the damages are liquidated, i.e., where the amount to be recovered is fixed in advance by agreement of the parties, they are not damages in the technical sense of the term. Thus, an action to recover the amount payable on a bond, or the amount due for goods sold and delivered, or to recover a sum of money paid to the defendant by mistake, is not an action for damages, but an action to recover a debt. But where the amount claimed is not ascertained, as where an injury has been done to a man's character or property, or in the ordinary case of breach of contract, the action will be to recover the damages suffered through the defendant's wrongful act or default. The complaint or declaration of the plaintiff sets forth an estimate of the damages sustained by him, the amount of which will then be conclusively ascertained by the court or jury (usually the latter) upon principles determined by law.

The principles upon which damages are measured by the courts vary according to the nature of the right infringed and sometimes of the act by which it was violated, and are of a most illogical and unsatisfactory character. To a considerable extent they are still influenced by considerations which belong rather to the conditions and feelings of primitive society than to those which now govern the relations of the parties and the administration of justice. In their origin damages were a pecuniary commu-

tation of the right of private vengeance, and were based not on any principle of restitution, but on that of satisfaction to the injured party. It was a long step towards the orderly administration of justice when the victim of a theft was compelled to rest satisfied with four times the value of the thing taken, instead of scourging the thief and selling him into slavery, as was the law of the Twelve Tables. But the damages so awarded were as clearly vindictive in character as was the harsher penalty of the earlier law, and this vindictive element still survives in the modern law of damages. Thus, it is still the law in England and in many of the United States that a tenant who commits willful waste on the premises shall pay thrice the amount of the damage committed, and that a tenant who refuses to quit after due notice shall thereafter pay his landlord double rent. To the same principle is due the doctrine of aggravation of damages, or "vindictive," "retributory," or "exemplary" damages, which permits a recovery in excess of the actual damage suffered in certain cases of breach of promise of marriage, libel, slander, and seduction. There was abundant justification for furnishing this solace to the vindictive feelings of the injured party in an age when it was necessary to buy him off from a more violent vindication of them, but it is submitted that the survival of this barbarous principle into our milder age cannot be justified.

Obviously, the sound principle for the award of damages is that of restitution rather than of satisfaction—the restoring to the injured party of the property of which he has been deprived, or making to him due compensation for the injury sustained by him—and this principle is generally followed by our law in most actions other than those above referred to. It is expressed in the phrase that damages are limited to the loss which the plaintiff has actually sustained. In practice, however, a more restricted rule is followed, the defendant being liable only for such damages as he did in fact contemplate or which are the natural and probable consequences of his acts, whether contemplated by him or not. This rule is equally applicable in cases of contract and of tort and operates to exclude what are called "remote" or merely "consequential" damages. That, under a perfect system, the latter would also be included in an award of damages can hardly be doubted, but the judicial distrust of the jury, by whom, both in England and America, the award is usually made, has induced the courts to adopt the narrower rule.

Damages are also an available remedy in some cases of injury, even where no actual loss has been sustained. It is the violation of a legal right, and not the detriment or loss resulting therefrom, which furnishes the ground for an action for damages. Such an action, accordingly, is the appropriate remedy in the case of a trespass upon land, an unauthorized interference with a watercourse, and the like, although no injury or serious inconvenience to the tenant or riparian proprietor results. The damages to which the plaintiff is entitled in such a case are not "substantial," but "nominal." And, on the other hand, where loss or harm is sustained, but without the violation of a legal right, the damage is irremediable by any legal process. It is *damnum absque injuria*.

For the measure of damages appropriate to the various classes of rights, see the articles in which those rights and the remedies for their

infringement are considered. See especially CONTRACT; TORT; QUASI CONTRACT; INJURY; LIQUIDATED DAMAGES. Consult: Holmes, *The Common Law* (Boston, 1881); *Essays on Anglo-Saxon Law* (ib., 1876); Lee, *Historical Jurisprudence* (New York, 1900); Arthur G. Sedgwick, *Elements of Damages* (Boston, 1896); id., *Treatise on the Measure of Damages* (8th ed., New York, 1891); Sutherland, *Treatise on the Law of Damages* (3d ed., Chicago, 1903); Mayne, *Treatise on the Law of Damages* (5th ed., London, 1894); Watson, *Treatise on the Law of Damages for Personal Injuries* (Charlottesville, 1901); Harris, *Treatise on Damages by Corporations* (Rochester, 1894).

**DAMAN**, dā-mān', or Portug. **DAMÃO**, dā-moun'. A fortified seaport and district on the west coast of India, belonging to the Portuguese since 1558. The town stands at the mouth of the Damian River, about 100 miles north of Bombay, and has a good harbor (Map. India, B 4). The neighborhood is well stocked with suitable timber for the building and repairing of ships, which largely employ the inhabitants. Though the land is fertile, it has been little cultivated. The principal crops are rice, wheat, cereals, and tobacco. Damian has important deep-sea fisheries and salt works. It also engages in weaving and dyeing and the manufacture of mats and baskets. There is a scarcity of fresh water. The district is an administrative dependency of Goa. Area of district, 169 square miles. Pop. of district 1910, about 70,000.

**DAMAN**, dā'mān (Syrian). An old name for the Syrian hyrax (*Procapra syriaca*), the "coney" of Scripture (Prov. xxx. 24, 28, etc.), also called rock rabbit. See HYRAX, and cf. DASSIE.

**DAMANHUR**, dā'mān-hoor' (Egypt. *Temen-hor*, city of Horus, Lat. *Hermopolis Minor*). A town of Lower Egypt, capital of the Province of Behira (Map. Egypt, C 1). It is situated on the Mahmudieh Canal, and has a cotton gin and considerable commerce in cotton and woolen goods. Pop., 1897, 32,122, 1907, 38,752. Known as Hermopolis Parva, it was the ancient "City of Horus."

**DAMÃO**. See DAMAN.

**DAMAR**, or **DHAMAR**, dā-mār'. A town of Yemen, Arabia, situated about 63 miles south of Sana, on the route to Mecca (Map: Arabia, with Turkey in Asia, Q 12). It is situated in the centre of an agricultural district and carries on some trade in horses. Pop. about 20,000.

**DAMARALAND**, dā-mār'ā-lānd. See GERMAN SOUTHWEST AFRICA.

**DAMASCENING**. See DAMASKEENING.

**DAMASCENUS**, NICOLAUS. A Greek historian. He lived in the time of Augustus and Herod the Great, at whose court he spent the greater part of his life. His principal work was a universal history in 144 books, of which only fragments remain. He also wrote an autobiography and a history of the education of the Emperor. Fragments of these works, as of the first seven books of his universal history, are preserved in the collections of Constantinus Porphyrogenitus. Nicolaus was, in philosophy, an adherent of the Peripatetic school and wrote a compendium of Aristotelianism. The historical fragments are edited by Müller, *Fragmenta Historicorum Græcorum*, vol. iii (Paris, 1868-83).

**DAMASCIVS** (Lat., from Gk. *Δαμάσιος*, *Damaskios*). A Neoplatonic philosopher of the

sixth century A.D. He was born at Damascus and was the last teacher of Neoplatonism (q.v.) at Athens. When the philosophic schools were closed by Imperial edict of Justinian in 529, he, with Simplicius, Diogenes, Priscian, and others, was forced to go to Persia. Of his writings we possess his book *On First Principles*, a discussion of the nature and attributes of God and of the human soul, a commentary to Aristotle, and an extract from his life of Isidorus of Gaza, preserved by Photius. His *On First Principles* was edited by Ruelle (Paris, 1889). Consult Whitaker, *The Neo-Platonists* (Cambridge, 1901).

**DAMASCUS** (Arab. *Dimshk-ash-Shām*). The largest city of Syria, Asiatic Turkey, and capital of the vilayet of Syria (Map: Turkey in Asia, G 6). It is situated in a plain at the eastern base of the Anti-Libanus, 53 miles south-east of Beirut. The city, with its beautiful surroundings and its abundant supply of water, has since the earliest times been regarded by the Arabs as the most beautiful spot in the world and is supposed to have served as a model for the paradise described in the Koran. The appearance of Damascus from a distance is impressive, but upon a closer inspection it is, like most Oriental cities, disappointing. It is about 5 miles in circumference and is surrounded by partly ruined walls, pierced by seven gates. The streets, with the exception of the "Straight Street," on which St. Paul is supposed to have lived, are crooked and narrow. The houses are generally built in the Moorish style and not infrequently combine a splendidly decorated interior with a plain and sombre exterior. The walls fronting the street are usually without windows; the courts in the houses of the wealthy residents are adorned with splendid marble fountains, fine trees, and flowers. Damascus derives its water supply, by an excellent system of canals, conduits, and pipes, from the Barada, the Abana of the Old Testament, which traverses the city from west to east and divides the newer portion of the city on the north from the ancient walled city with its sectarian quarters on the south. The surrounding plain is rich in vineyards, orchards, and gardens, being well irrigated by the Barada, which, separating into seven branches, loses itself in marshlands about 18 miles east of the city.

Damascus has over 200 mosques. Of the 71 large mosques, that of the Omniada is the most important. It is supposed to have been originally a heathen temple converted into a Christian church at the end of the fourth century. It then contained what was believed to be the head of John the Baptist and was named the church of St. John. The site of the church was later acquired by the sixth Omniad caliph, who erected on it a mosque of fabulous splendor, according to the description of the Arabic writers. After the conquest of Damascus by Timur the mosque was despoiled. It covers a site of 143 × 41½ yards and has the shape of a basilica. It was partially destroyed by fire in 1893, and, though subsequently rebuilt, has lost much of its historical interest. The dome, 120 feet high, is flanked by three minarets, one 250 feet high. Other noteworthy mosques are the Sināniyyeh with its striking green-tiled minaret, and the Tekkiyeh, with its graceful minarets and dome, founded in 1516 on the river bank to the west of the city as a refuge for indigent pilgrims. There are also numerous beautifully ornamented chapels. The chapel of Abraham in the northern

suburb of Burzeh, the leper hospital in the house of Naaman, the house of Ananias, the place of St. Paul's conversion near the east gate, and the point where he was lowered from the walls are traditionally sanctified localities. The English cemetery on the southeast contains the grave of Buckle the historian, who died here in 1862.

Damascus was once a famous seat of learning and contained numerous schools in which grammar, theology, and jurisprudence were taught. The higher schools, with a few exceptions, are now closed, and Damascus as a centre of culture has been surpassed by Cairo. Elementary education is provided to some extent by the missionary schools, and a number of higher schools are conducted by the French orders.

The municipal affairs are administered by a council in which Christians as well as Jewish residents are represented. Damascus is the seat of the governor (*vah*) of the vilayet of Syria and of the commander of the Syrian troops. The chief manufactures consist of silver and gold ornaments, stuffs interwoven with silver and gold threads, brass and copper work, and inlaid furniture. The manufacture of the blades for which Damascus was famous has ceased. The commercial importance of the city rests chiefly on the transit trade, which, however, has considerably declined since the construction of the Suez Canal. The bazaars of Damascus are numerous and well kept, but they are generally poorly stocked, and the magnificent khans formerly thronged by merchants are now but indifferently attended. The exports, which amount to about \$2,000,000 annually, consist chiefly of wool, hemp, grain, and animal products, grapes, and dried fruit. The imports amount to about 4½ million dollars annually and consist chiefly of textiles, sugar, and rice. Damascus is connected by rail with its port, Beirut, and is the northern terminus of the Damascus-Medina line. It is visited monthly by caravans from Aleppo. The population is variously estimated, a figure often quoted being 154,000; a later estimate is 350,000. About three-fourths of the inhabitants are Mohammedans; Jews number upward of 11,000; and the rest are Christians of various denominations. The United States is represented by a consular agent.

Damascus has been thought to be the oldest city in the world. Its foundation is attributed by Josephus to Uz, the son of Aram. The city was the seat of a kingdom at the time of the Hebrew monarchy. Subjugated by David, according to 2 Sam. viii. 5, 6, and 1 Chron. xviii. 5, it soon regained its independence and even recovered sufficiently to attack the Kingdom of Israel, weakened by internal strife. In the second half of the eighth century B.C. Damascus was conquered by the Assyrians, under Tiglath-pileser III, and its inhabitants were carried away to the land of the conquerors and replaced by colonies from Assyria. After the death of Alexander the Great Damascus became part of the Kingdom of the Seleucids. Conquered by Pompey in 64 B.C., it became a dependency of Rome, under which it enjoyed local autonomy and regained a part of its former prosperity. Christianity was early introduced into Damascus (see PAUL), and the city became the seat of a bishopric. In 635 it was taken by the Mohammedans, under whose rule it was for a time (previous to the founding of Bagdad) the residence of the caliphs and was greatly adorned and fortified. After an unsuccessful siege by the Crusaders under Baldwin in 1148, Damascus was

taken by Nureddin in 1164, and, at the death of the latter, passed into the hands of Saladin, who died there in 1193. The victory of Tamerlane over the Egyptians at Damascus in 1401 placed the city in the hands of the Mongol conqueror, who after exacting a large tribute from its residents slaughtered most of them and pillaged and burned the city. It was soon rebuilt and in 1516 was wrested from Egypt by the Turks under Selim I. Retaken by the Egyptians under Ibrahim Pasha in 1832, Damascus remained under the rule of Egypt until 1841, when, together with Syria, it was restored to Turkey. An uprising of the Moslem population in 1860 resulted in the destruction of the Christian quarter and the massacre of about 6000 Christians. Consult: Porter, *Five Years in Damascus* (London, 1870); Macintosh, *Damascus and its People* (ib., 1892); and the article "Damaskos," in Pauly-Wissowa's *Real-Encyclopädie der classischen Altertumswissenschaft* (Stuttgart, 1901).

**DAMASCUS BLADE.** See DAMASKEENING. **DAMASK.** A textile with satin, twill, or taffeta figures on satin ground of the same color, the lines of the figures contrasting sharply with the lines of the ground and causing the shifting sheen that marks the appearance of damask as viewed from different angles. In satin damask the figures are in weft satin, the ground in warp satin. Just as tapestry (q.v.) is primarily a wool weave and a weft weave, so damask is primarily a silk weave and a warp weave, the figures of tapestry being formed by the manipulation of the weft on bobbins, the figures of damask by the manipulation of the warp with harness. In damask the weft, being shuttle-thrown the whole width of the warp, is manipulated with difficulty. In tapestry the warp threads, being divided into only two sets—one consisting of the odd threads, the other of the even threads—instead of five or more sets as in damask, permit plain weave only. Damask, then, marks the development of the loom to a point where the warp threads can be freely manipulated to form figures. (See WEAVING.) Most upholstery and drapery silk damasks have the figures in taffeta, giving a bolder contrast than would the finer lines of the weft satin threads. Damasks are also woven in wool, linen, mercerized cotton, and other materials less expensive than silk.

An important class of damasks are those in linen and cotton intended for use as tablecloths and napkins, usually white (the finer grades being woven in the gray and bleached after weaving), but sometimes (especially in the coarse grades and for the cheaper and less civilized peoples) in red or blue. The better grades are made of very fine linen threads woven close, with the warp in eight or more sets, and in patterns that are often most elaborate, picturing architecture and landscapes and human figures, against a comparatively plain or striped ground.

The word "damask" has for generations been so carelessly and incorrectly used that it is still incorrectly defined in almost all books of reference in all languages, and often employed inaccurately in museum labels and catalogues. Perhaps the simplest and most comprehensive, though hardly the clearest, definition would describe damask as *flat-figured satin*.

**DAMASKEENING**, or **DAMASCENING**. The art of producing upon ordinary steel certain ornamental appearances resembling those

on the famous Damascus blades. Attention was first drawn to this branch of industry by the Crusaders, who brought from Damascus to Europe many articles made of superior steel, such as sword blades and daggers. These were found to possess not only great elasticity, united with considerable hardness, but their surfaces were covered with beautiful designs, formed by a tissue of dark lines on a light ground, or light lines upon a dark ground, and occasionally by the inlaying of gold on the steel-blue ground. In genuine Damascus blades the designs run through the substance of the blade, and the watering, or regular, almost symmetrical, figuring, is not worn off by friction, or even grinding. Imitations of the watering of Damascus steel are produced on common steel by etching with acids; and in this way landscapes, inscriptions, and ornaments and decorations in general, are imprinted on the steel-blue ground. Gold and silver are also inlaid in the higher class of sword blades and other articles. Gun barrels are occasionally subjected to the process of damaskeening.

**DAMASTES**, dā-mās'tēz (Lat., from Gk. *Δαμάστης*, *Damastēs*), or **SIGEUM**. A Greek historian, a contemporary of Herodotus. According to Suidas, he wrote a *History of Greece*, a work on the *Ancestors of Those who Warred Against Troy*, and a *Catalogue of Nations and Towns*. Strabo charges him with ignorance and credulity. Consult Müller's *Fragmenta Historicorum Græcorum* (Paris, 1868-83).

**DAMASUS**. The name of two popes.—**DAMASUS I**, SAINT (Pope 366-84). A Spaniard by extraction, he was born in Rome about 305. In 355 he was made archdeacon. On his consecration to the episcopal office he was opposed by Ursinians, who was the choice of a considerable faction, but finally acknowledged by all. His reign was far from peaceful. It was spent in subduing the still numerous Arians in the West, in combating the heresy of Apollinaris, which he caused to be condemned at the Council of Constantinople in 381, and in defending the cause of Paulinus against Meletius. He was a great friend of St. Jerome and was primarily instrumental in inducing him to undertake the revision of the early Latin texts of the Bible, thus producing the version later known as the Vulgate. His works are in Migne, *Patr. Lat.*, xiii. For his life, consult: Rade, *Damasus, Bischof von Rom* (Freiburg, 1882). Wittig, in *Römische Quartalschrift für christliche Alterthumskunde und für Kirchengeschichte*, 14th suppl. Heft (Freiburg, 1902).—**DAMASUS II** (Pope, for 23 days from July 17, 1048). He was a Bavarian by birth, and Bishop of Brixen, in Tirol, when he was chosen Pope on the nomination of Emperor Henry III. He died in Palestrina, near Rome, Aug. 9, 1048.

**DAMBACH**, dām'băġ, Otto (1831-99). A German jurist, born at Querfurt. In 1862 he was appointed Justiciary of the General (now Imperial) Post Office, Berlin. The copyright laws and the postal laws of the Empire were devised chiefly by him. In 1873 he was appointed professor extraordinary of law in the University of Berlin. He wrote: *Fünfzig Gutachten über Nachdruck und Nachbildung* (Leipzig, 1891); *Das Telegrafien-Strafrecht* (2d ed., ib., 1897); *Das Gesetz über das Postwesen des Deutschen Reichs erläutert* (6th ed., ib., 1900).

**DAMBUL**, dām-bŭl'. A vast rock temple of the Buddhists in Ceylon, about 40 miles north of Kandy, containing, among a profusion of

carvings, figures of Buddha of extraordinary magnitude.

**DAME** (OF, Fr. *dame*, from Lat. *domina*, lady, fern. of *dominus*, master, Skt. *damana*, conquering, Lat. *domare*, Gk. *δαμαίνω*, *daman*, Skt. *dam*, to tame; connected with OHG. *zam*, Ger. *zahn*, Icel. *tamr*, AS. *tom*, Eng. *tame*). A title of honor which long distinguished high-born ladies from the wives of citizens and of the commonalty in general. In the age of chivalry it was customary even for a queen to be so called by her chosen knight ("the dame of his heart," of his thoughts, etc.). Hence, too, the Virgin mother was called in France "Notre Dame" ('our Lady'), as the mother of the whole human race. From *dame*, with the possessive pronoun *ma* prefixed, arose an ordinary title of honor, answering in modern French to the English "Mrs." A daughter of the King of France was called *Madame* as soon as she came into the world; and this was also the sole title of the wife of the King's eldest brother, who was himself known simply as *Monsieur*. In England the word "dame," though not much used, is now applied to married women of all classes. The word "madam" (or "ma'am") is to-day the informal manner of address used in England for the Queen. A curious local usage at Eton College applies the title "dame" to men as well as to women in charge of the boys' boarding houses.

**DAME AUX CAMÉLIAS**, dām ô kâ'mâ'lyâ', LA (Fr., The Lady of the Camellias). A novel by the younger Dumas (1848), dramatized in 1852. It has been translated under the title *Camille*. The heroine is Marguerite Gautier, a courtesan.

**DAME BLANCHE**, LA (Fr., The Lady in White). An opera by Boieldieu (q.v.), first produced in Paris, Dec. 10, 1825; in the United States, May, 1831.

**DAMEROW**, dâ'mc-rô, HEINRICH PHILIPP AUGUST (1798-1866). A German physician, born in Stettin. He studied medicine at the University of Berlin and became professor extraordinary there in 1830. The following years of his life, with the exception of a few years during which he held office in the Ministry of Public Instruction, he spent at Halle as director of a sanitarium for mental and nervous diseases. He is remembered for the important improvements that he introduced in the treatment of insanity and the management of asylums. His published works include the following: *Ueber die relative Verbindung der Irrenheil- und Pflanzanstalten* (1840); *Sefeloge, eine Wahnsinnstudie* (1853); *Zur Kretinen- und Idiotenfrage* (1858); *Ueber die Grundlage der Mimik und Physiognomik, als freier Beitrag zur Anthropologie und Psychiatrie* (1860). He was also one of the founders of the *Allgemeine Zeitschrift für Psychiatrie*.

**DAMES**, dâ'mēs, WILHELM BARNIM (1843-98). A German paleontologist, born in Stolpe. He studied at the universities of Breslau and Berlin, and became teacher of paleontology in Berlin (1878), regular professor (1891), and director (1896) of the department of paleontology at the museum there. Several of Dames's publications, especially those on fossil vertebrates, have been of the greatest importance, nearly all of them having appeared in *Palaontologische Abhandlungen*, issued in Berlin from 1883 to 1886, at which date the place of publication was transferred to Jena. Special features

of his work are his descriptions of the echinoderms of the Jurassic and Tertiary; a memoir on the Jurassic bird *Archaeopteryx*; various publications on the ganoids of the Mesozoic, together with other shorter memoirs on the philogenetic relations of both the invertebrate and vertebrate fossils of Germany. Consult Frech, "Nekrolog an W. B. Dames," in the *Palaontologische Abhandlungen* (Jena, 1900).

**DAME SCHOOLS**. See COMMON SCHOOLS.

**DAME'S VIOLET**, *Hesperia*. A genus of plants of the family Cruciferae, containing about 20 species, annual and biennial herbaceous plants, natives chiefly of the middle and south of Europe. The common dame's violet, or white rocket (*Hesperis matronalis*), cultivated in America to some extent, is found in Great Britain in hilly pastures, but has perhaps escaped from cultivation. It has an erect branched stem, with ovate-lanceolate leaves, and terminated by numerous large lilac flowers, which are scentless by day but very fragrant at night, on which account it is often cultivated in flower-pots by ladies, from which custom the plant appears to have derived its common name. The night-scented rocket (*Hesperis tristis*) is a favorite flower in Germany, numerous double, hardy, attractive forms of which are well known.

**DAMGHAN**, dām-gân'. A town of Persia, in the Province of Semna va Damghan, on the south slope of the Elburz Mountains, 45 miles south of Astrabad (Map: Persia, E 3). It is on the highroad from Khorasan to Teheran, at an altitude of 3770 feet. It was a large city, containing 15,000 houses, in the reign of Shah Abbas, and has a ruined mosque, fine wood carvings, and several minarets of the eleventh century. It has a large export trade in nuts, especially of khaghazi, or thin-shelled almonds, and pecans. The extensive ruins of Hecatompylos lie a few miles to the southwest. Pop. (est.), 10,000.

**DA'MI'ANA**. See APHRODISIACS.

**DAMIANI**, dâ'mê-â'nê, PIETRO (1006-72). A saint and doctor (1828) of the Catholic church. He was born in Ravenna in 1006 or 1007 and had a sad boyhood through neglect and cruelty. Feeling the call to the monastic life, he resigned a promising career as teacher and became a hermit at Fonte Avellana, near Perugia, in 1035, became prior in 1043, and did much to reform his monastery and to cure the abuses which had crept in. He also threw himself energetically into reform of the clergy throughout the whole church. To these ends he employed his promotion in 1057 to be Cardinal Bishop of Ostia, and his friendship with successive popes. He also endeavored to effect reforms through the German emperors. His efforts were, however, not always successful, as he could not secure the requisite backing; but he prepared the way for the greater reformer, Gregory VIII. He died at Faenza, Feb. 23, 1072. His works are printed in Migne, *Pat. Lat.*, cxliv, cxlv. His *Liber Gomorrhianus* gives a frightful picture of the corruptions of the time. For his biography, consult L. Guérrier (Orleans, 1881); J. Kleiner-mann (Steyl, 1882).

**DAMIANISTS**, or ANGELISTS. 1. A sect of the sixth century, followers of Damianus, a Monophysite patriarch of Alexandria, who taught that there was only a single substance in the Godhead. 2. A name for the Sisters of St. Clare, a Franciscan order of nuns, which began with the convent of San Damiano, Assisi.

**DAMIA'NUS** (Lat., from Gk. *Δαμιανός*). A celebrated sophist and rhetorician of Ephesus, who lived about 200 A.D. He taught rhetoric at Ephesus and followed the methods of Adrianus and Elius Aristides, of whom he had been a pupil. Philostratus gives an account of him in his *Lives of the Sophists*.

**DAMIANUS**. See COSMAS AND DAMIANUS. **DAMIEN DE VEUSTER**, dā'myān' de vē-stār', JOSEPH (1840-89). A Belgian priest of the Roman Catholic church, better known as Father Damien, a missionary to the leper settlement of Molokai, Hawaii. He was born near Louvain, studied theology at the university there, entered the Society of the Sacred Hearts of Jesus and Mary in 1863, was appointed to the mission to the Hawaiian Islands. In 1873 he was sent, at his own request, to the Molokai settlement established by the Hawaiian government in 1865 for the enforced segregation of lepers and their maintenance at public expense in the villages of Kalapaupapa and Kalawao. He found the water supply unfit, the food bad, the people ill-washed, ill-clothed, and ill-housed. He improved these conditions, organized religious worship, established schools, erected a general shop for leper trade, lent his own skilled hand to the building of the church at Kalapaupapa, and dug the graves of many of his parishioners. He gradually gathered about him priests, lay brethren, and nuns as associates. In 1884 he perceived in the insensibility of his skin the sign of the approach of the disease and could begin his sermons with the words, "We lepers." He finally succumbed to the concentration of the leprosy in his lungs. His simple, heroic life and death attracted wide notice, and led to agitation by Englishmen of the difficult leper problem in India. Much of his fame is due to Robert Louis Stevenson's *Open Letter to the Reverend Dr. Hyde*, a reply to an attack on Damien by a Presbyterian clergyman. Consult: Stoddard, *The Lepers of Molokai* (Notre Dame, 1885); Father Pamphile, *Life and Letters of Father Damien* (London, 1889), and a biography (1889) by Clifford.

**DAMIENS**, dā'myān', ROBERT FRANÇOIS (1715-57). A French fanatic, known for his attempt to assassinate Louis XV. He was born near Arras, in France. Opium and accompanying dementia caused him to crown a life of idleness, mischief, and dishonesty with an attempt to kill the King of France. He himself alleged that it was the conduct of Louis towards the Parlement that drove him to the act. The opponents of the Jesuits sought to implicate them in this crime. On Jan. 5, 1757, as the King was entering his carriage, bound for the Trianon, Damiens stabbed him in the side, but not seriously. All the agencies of slow fire, glowing pincers, and boiling oil were visited upon the poor wretch to make him reveal the names of possible accomplices. He confessed nothing, however. He was torn apart by four strong horses, and his remains were burned and his family was driven from France. Consult d'Heilly, *Le Parlement, la cour, et la ville pendant le procès de Robert-François Damiens* (Paris, 1875).

**DAMIETTA**, dā'mī-ēt'tā (Ar. *Damyāt*, Copt. *Damiati*, Lat. *Tamiathis*). A town of Lower Egypt, situated on the right bank of the eastern branch of the Nile, about 10 miles above its mouth and 125 miles north-northeast of Cairo by rail (Map: Egypt, C 1). It contains a number

of ancient mosques, marble baths, and several bazars. It is the seat of a governor and a Coptic bishop and of a number of European consular representatives. The mouth of the river is closed by a bar which prevents the entrance of large vessels. In former years Damietta was a flourishing manufacturing and commercial centre, with a population of about 80,000. With the opening of the Suez Canal and the rise of Alexandria its commerce declined and its manufacturing industries, with the exception of the weaving of cotton fabrics, have almost wholly disappeared. The exports consist of rice, southern fruits, and fish. Damietta is connected by rail with Cairo and Alexandria and had a population in 1907 of 29,354, including a few foreigners. The existing town was erected about 1260, but prior to that a city of the same name (anciently Tamiathis) stood about 4 miles nearer the sea. It was strongly fortified by the Saracens and formed on that side the bulwark of Egypt against the Crusaders, who, however, succeeded in capturing it in 1219 and 1249. It was razed and rebuilt farther inland, on the site it now occupies, by the Sultan Bibars.

**DAMIRON**, dā'mérōn', JEAN PHILIBERT (1794-1862). A French philosophical writer. He studied under Burnouf, Villemain, and Cousin, lectured on philosophy in various Parisian institutions, and became professor in the Normal School and titular professor at the Sorbonne. He was one of the founders (1824) of the *Globe*, contributed largely to it, and afterward collected his contributions under the title *Essais sur l'histoire de la philosophie en France au XIX siècle* (1828). His most important works are on the history of French philosophy: *Cours complet de philosophie* (1842); *Essai sur l'histoire de la philosophie en France au XVII siècle* (1846); *Mémoires pour servir à l'histoire de la philosophie du XVIII siècle* (1858-64), and an edition of Jouffroy in which he so edited and changed the original text as to stir up a famous controversy, especially with Pierre Leroux.

**DAMJANICS**, dōm'yō-nīts, JOHANN (1804-49). A Hungarian revolutionist, of Servian origin. He entered the Austrian army, in which he rose to a captaincy; was received into the councils of Kossuth in 1848, and, at the outbreak of hostilities, organized a battalion, with which he fought bravely against the Servians. In March, 1849, he took Szolnok and was made general. He fought under Görgei and was placed in command of the fortress of Arad. After the disaster of Világos he surrendered to the Russians, by whom he was turned over to Austria. He was condemned to death and with 12 other generals was hanged by Haynau at Arad.

**DAMMAR**, or **DAMKAR PINE** (Hind *dāmar*, pitch, resin), *Agathis*, formerly called *Dammara*. A genus of coniferous trees of the araucarian tribe, distinguished by their broad, lanceolate, leathery leaves, which have numerous nearly parallel veins. The name, originally applied to its resinous product, has been extended to a number of different trees, one of which is the Moluccan dammar (*Agathis orientalis*), which grows on the high mountain ridges of the Molucca Islands. It grows to a great height, attains a diameter of 9 feet, and generally has the lower part of the trunk beset with knots as large as a man's hand. The timber is light and of inferior quality, and the tree is chiefly valuable for its resin, which is soft, transparent,

hardens in a few days, and is then white, with a crystalline appearance. The resin often flows spontaneously from the tree in such quantity that it hangs in masses like icicles of a hand-breadth and a foot long. At another period of the year it is yellow and less valued. By incision, especially in the protuberances, of the stem, it is obtained in large pieces. So long as dammar resin is soft it has a strong smell; upon drying this odor is lost. It contains only a trace of volatile oil, but consists of two distinct resins, one of which is soluble in alcohol, the other not. It is light, brittle, and easily friable, readily soluble in oil of turpentine. It is used in Asia for domestic purposes, and in the arts like other resins; it is an article of commerce, and in Europe is employed in various ways to form varnishes, which dry quickly, have a very bright lustre, are colorless, but readily become viscid again, and are not permanent, so that this resin cannot be made a substitute for copal and amber. It is almost completely soluble in benzole and in this solvent makes an excellent colorless varnish for positive photographs on glass. To this genus belongs also *Agathis australis*, the Kauri pine (q.v.) of New Zealand, which produces the resin known as Kauri resin, or Kauri gum. The tree attains a height of 80 to 100 feet and a diameter of 15 feet. The timber is straight-grained and very durable. The Kauri resin is dug in waste places where there were Kauri forests in the past, whence the trees have long since disappeared through fire, etc. This gum is fossilized. *Agathis robusta* is a valuable Queensland tree. The resin known as black dammar is obtained in the Molucca Islands from the trunk of *Protium obtusifolium*, a tree of the family Burseraceæ. It is a semifluid, strong-smelling resin, which becomes black when dry; it is used as pitch, also to yield a kind of turpentine, which is obtained by distillation. *Canarium microcarpum* and *Canarium strictum*, trees of the same family, also natives of the farthest East, yield by incision of the trunk a viscid, odorous, yellowish substance, very similar to balsam of copaiva, which is called damar, or dammar, and is used in naval yards, mixed with a little chalk and the bark of reeds, for calking boats. The resin called white dammar, or piney dammar, in India, often also called copal in India, is the product of *Vateria indica* and related species, large trees of the family Dipterocarpaceæ. It is obtained by wounding the tree, and when fresh is clear, fragrant, and acridly bitter; when dried, it becomes yellow, brittle, and glasslike. It is used in India as a varnish ("piney varnish") which is hard, tenacious, and much esteemed. It is also made into candles in Malabar, which, in burning, diffuse an agreeable fragrance and give a clear light with little smoke. *Shorea robusta*, the Sal (q.v.), so much valued in India as a timber tree, of the same natural order, and some other species of *Shorea*, yield a resin, also known as dammar and as ral and dhoona, which is much used in dockyards in India as pitch. For illustration of *Agathis dammara*, see Plate of DAHLIA, etc.

**DAMMARA.** See KAURI PINE.

**DAMMARTIN**, dā'mā'r'tān'. A family of distinguished French architects of the late fourteenth and early fifteenth centuries.—ANDRÉ DAMMARTIN was architect of the Chartreuse, near Dijon (1383), in the service of the Duke of Burgundy.—GUY DAMMARTIN was architect

of the Duke de Berri. Both were engaged on the Old Louvre and died about 1400.—JEAN DAMMARTIN was employed (1421-32) in the construction of the great cathedrals of Le Mans and Tours, completing the north transept of the former and the nave of the latter of these cathedrals.

**DAMNATION DE FAUST**, dā'nā'syōn' de fōst, LA (Fr., The Damnation of Faust). The title of a symphony cantata by Berlioz, first produced in Paris, Dec. 6, 1846; in the United States in 1880 (New York).

**DAMOCLES**, dām'ō-klēz (Lat., from Gk. Δαμοκλῆς, *Damoklēs*). A courtier and sycophant of the elder Dionysius, the tyrant of Syracuse. When Damocles lauded the lot of royalty, Dionysius, to set him right, invited him to a luxurious banquet. On looking upward, he saw a keen-edged sword suspended over his head by a single hair, and at once changed his views concerning the happiness of kings. Consult Horace, *Odes*, iii, 1, 17 ff.

**DAM'ODAR.** A river of India, rising in Ramgarh, in Bengal, and, after a generally southeasterly course of 350 miles, entering the Hooghly from the right, below Calcutta (Map: India, E 4), draining an area of 248 square miles. The valley of the Damodar, traversed by the East Indian Railway, abounds in coal and iron. It is navigable from the mouth of its chief tributary, the Barakhar, which flows into it from the north. It is the sacred river of the Santals of Hazaribagh.

**DĀMON**, DER. An opera by Rubinstein (q.v.), first produced in St. Petersburg, Jan. 25, 1875.

**DAMON**, ISAAC (?1780-?1840). An American architect of the early nineteenth century, a pupil of Ithiel Town (q.v.), and the designer of many churches, houses, and public buildings in Springfield, Northampton, Lenox, and other Massachusetts towns.

**DAMON AND PHILTIDA.** A mock pastoral in dramatic form by Cibber (1729), published anonymously.

**DAMON** (Lat., from Gk. Δάμων) **AND PHINTIAS** (Lat., from Gk. Φιντίας), less correctly PYTHIAS. Two Pythagoreans of Syracuse, models of faithful friendship. When Phintias was condemned to death by Dionysius, the Tyrant of Syracuse, he begged to be allowed to go home, to arrange his affairs, and Damon pledged his own life for the reappearance of his friend. Dionysius consented, and Phintias returned just in time to save Damon from death. The tyrant pardoned Phintias, and desired to be admitted to fellowship with the friends. Consult: Plutarch, *De Amicitia*; Valerius Maximus, iv, 7; Cicero, *De Officiis*, iii, § 45.

**DAM'OPHON** (Lat., from Gk. Δαμόφων). A brilliant, erratic Greek sculptor of Messene, whose works, statues of gods in temples, were found chiefly at Messene, Megalopolis, and Lycœura. He was skilled enough in chryselephantine technique to be called upon to repair the statue of Zeus by Phidias at Olympia. His date is uncertain. Frazer, in his *Pausanias*, iv, 372-379, puts him in the fourth century B.C. Dickens, *Annual of the British School at Athens*, xii, xiii, assigns him to the second century B.C.; so too Ida C. Thallon, "The Date of Damophon of Messene," in *The American Journal of Archaeology*, 2d series, x (1906). For a good account of Damophon's work, consult E. A.

Gardner, *A Handbook of Greek Sculpture* (London, 1911).

**DAMOXENUS** (Lat., from Gk. Δαμοξένος). An Athenian comic poet. Two of his plays, *The Foster-Brothers* (Συρρεπεί) and *The Self-Tormentor* (Ἐαυτὸν Ἠερῶν), are mentioned by Suidas and by Athenæus, who quotes a long passage from the former and a few lines from the latter work. Consult Meineke's *Fragmenta Comicorum Historicorum*, vol. iv (1839-57).

**DAMP'ER**. 1. A door or valve which, by sliding, rising and falling, turning on a hinge, or otherwise, diminishes the aperture of a chimney or air flue; this lessens the quantity of air that can pass through a furnace or other fire and thus "damps" or checks the combustion. The damper of a pianoforte is that part of the mechanism which, after a key is struck, and the finger is lifted up from the key, immediately checks or stops the vibration of the string. It consists of a second hammer, which, on the rising of the key, strikes the string and remains upon it instead of bounding off as the sounding hammer does. 2. Damper is also the name given in Australia to a simple kind of unleavened bread formed of wheat flour. It is made while traveling in the bush and baked among the ashes of a fire.

**DAMP'IER**, dām'pēr, WILLIAM (1652-1715). An English freebooter and explorer. He early went to sea with a party of buccaneers, crossed the Isthmus of Panama in 1679, and embarked on the Pacific with a considerable force in canoes and similar small craft, and captured several Spanish vessels, in which he cruised along the coast of Spanish America, waging war on Spanish subjects. In 1684 he engaged in another buccaneering expedition with Captain Cook, in which he coasted along the shores of Chile, Peru, and Mexico. After Cook's death he sailed with Captain Swan to the East Indies, touching at Australia and stopping six months in the Philippine Islands. In desperation Dampier and the majority of the crew left Swan and 36 others marooned in the islands where they might continue their orgies. In 1688 Dampier was himself marooned at his own request in the Nicobars. After great hardships he was again in England in 1691, where in 1697 he published an interesting account of the expedition, entitled *A New Voyage Round the World*. He was afterward (1699) deputed by the government to conduct a voyage of discovery to the South Seas, during which he explored the west and northwest coasts of Australia and the coasts of New Guinea, New Britain, and New Ireland, giving his name to the Dampier Archipelago and the Dampier Strait. In 1703-07 he made his third, and in 1708-11 his fourth, trip around the world, the last time as pilot of the privateer *Duke*, which returned with specie and merchandise to the value of nearly £200,000. He also published: *A Discourse of Winds* (1699); *A Vindication of the Voyage to the South Sea in the Ship St. George* (1707); *Voyages to the Bay of Campechy* (1729).

**DAMP'IER ARCHIPELAGO**. A group of high rocky islands, extending about 40 miles east-northeast and west-southwest, off the northwest coast of Australia, between lat. 20° and 21° S. and long. 116° and 117° E. (Map: Western Australia, C 5). Rosemary, the outer island of the group, is distant 12 miles from the mainland.

**DAMP'IERRE**, dām'pyär', AUGUSTE HENRI MARIE PICOT, MARQUIS DE (1756-93). A French

general. He was born in Paris and entered the military service at the age of 16. After the battle of Valmy (Sept. 20, 1792) he was made general of division, and he contributed largely to the victory of Jemappes (November 6). He was in command of the centre at Neerwinden (March 18, 1793), where he stood his ground until the retreat of the left wing of the army. After the defection of Dumouriez to the Austrian ranks he assumed supreme command. He was mortally wounded, May 8, 1793, while leading the attack on the intrenchments of the Allies near the city of Condé.

**DAMP'IER STRAIT**. 1. A strait, 35 miles wide, separating the island of Waigiu from western New Guinea (Map: East Indies, H 5). It offers one of the safest channels from the Indian to the Pacific Ocean. 2. A strait separating New Pomerania from Rook Island, east of New Guinea (Map: East Indies, J 2).

**DAMPING OFF**. A fungus disease of plants induced by an excess of moisture in the soil and atmosphere. Young seedlings in hothouses and hotbeds are particularly liable to it. Although the cause is sufficiently obvious, prevention is not always easy; not only because some plants are very sensitive to moisture, but also because the necessity of keeping sashes closed on account of temperature often stands in the way of the ventilation which would otherwise be desirable, and it is when a moist atmosphere stagnates around them, and the temperature is not very low, that plants are most liable to damp off.

The excessive moisture of soil and atmosphere gives the proper conditions for the development of the fungus *Pythium debaryanum*, which is the most common cause of damping off. It is a soil fungus that lives on decaying vegetation until the conditions are right for attacking seedlings. If examined, the seedlings will be seen to show weak, thin spots near the surface of the soil, and on account of this weakening the plant falls over and dies. The disease spreads with great rapidity in the seed bed, so that in a few days all the plants may be reduced to a rotten mass. This fungus attacks many kinds of plants in the open ground, among which are mustard, cress, spurry, maize, clover, lettuce, eggplant, peppers, cucumbers, melons, and forest-tree seedlings. Drying or freezing does not destroy the fungus or its spores. The best precautionary measures are to avoid infested soil, sow thinly, ventilate freely, shade little, water sparingly, and burn all diseased plants.

Damping off is also caused by species of *Rhizoctonia*, *Sclerotinia*, *Phoma*, *Phytophthora*, etc., the general symptoms and conditions applying to all.

**DAMBOSCH**, dām'rósh, FRANK HEINO (1859- ). A prominent American musician, a son of Leopold Damrosch. He was born in Breslau, where he received his musical instruction from Pruckner and Vogt. In 1871 he came to New York and continued to study with Von Inten and his father. From 1885 to 1891 he was chorus master of the Metropolitan Opera House. In 1892 he organized the People's Singing Classes in New York. (See CHORAL SOCIETIES.) In 1893 he established the Musical Art Society, and in 1898 the Symphony Concerts for Young People. In 1898 he also succeeded his brother Walter as conductor of the Oratorio Society, which he directed until 1912. In 1897-1905 he was director of music in the public schools of New York, which position he resigned to become

the director of the newly established Institute of Musical Art.

**DAMROSCH, LEOPOLD** (1832-85). A German-American musician, violinist, composer, and conductor, born in Posen, Prussia, Oct. 22, 1832. His parents chose the profession of medicine for him, and after graduating at the University of Berlin he returned to Posen to practice; but his passionate love of music, which he had continued to study incidentally, prevailed, and in 1854 he abandoned medicine for the study of counterpoint and composition under Hubert, Ries, and Dehn. In 1855 he started out as a concert violinist in Magdeburg, became acquainted with Liszt, and under his influence began to write for the *Neue Zeitschrift für Musik*. He was director in Posen and in Breslau, and in 1871 came to New York as director of the Arion Society. The credit of firmly establishing choral organizations in New York belongs entirely to Damrosch. He founded the Oratorio Society (1873) and the Symphony Society (1877) and organized several large musical festivals. All these played a most important part in the musical life of New York City. But the most brilliant achievement of his life was the successful establishment, in 1884, of German opera in New York City, at the Metropolitan Opera House, notwithstanding the obvious difficulties of the undertaking. Among the operas given, *Fidelio*, *Tannhäuser*, *Lohengrin*, and *Die Walküre* were the most important as comparative novelties. He died in New York, Feb. 15, 1885, and imposing funeral services were held in the Opera House. His works comprise several cantatas, a festival overture, violin works (including a concerto in D m.), and songs.

**DAMROSCH, WALTER JOHANNES** (1862- ). An American musician, son of Leopold Damrosch, born in Breslau, Prussia, Jan. 30, 1862. Even before he came to the United States, in 1871, he had studied piano and harmony with his father and F. Draeske. In New York he continued his studies with Von Inten, Boeckmann, and Pinner. He was made conductor of the Harmonic Society of Newark, N. J., in 1881, and organist of Plymouth Church, Brooklyn, in 1884. In 1885 he succeeded his father as conductor of the Oratorio and Symphony societies, and became assistant conductor of German opera at the Metropolitan Opera House, New York. In 1894 he organized the Damrosch Opera Company, which he directed for five seasons, giving German opera, chiefly Wagner, in the principal cities of the United States. For two seasons (1900-02) he conducted the German operas at the Metropolitan Opera House. For the season of 1902-03 he was the conductor of the Philharmonic Society. In 1903 he completely reorganized the New York Symphony Society as a permanent orchestra. He wrote two operas, *The Scarlet Letter*, produced in 1896 in Boston by his own company, and *Cyrano de Bergerac*, produced at the Metropolitan Opera House in 1913; also a *Maria Te Deum* (1898), a sonata for violin and piano, and a number of songs. In 1914 Columbia University conferred on him the degree of Doctor of Music.

**DAMS AND RESERVOIRS.** A dam is a barrier built across a stream or across a valley or other depression, to raise the level of water or to retain or store water for the supply of cities, towns, or villages, for irrigation, hydraulic mining, power, navigation, or manufacturing purposes. A reservoir is a basin or other recep-

tacle used for receiving, storing, or distributing water. Reservoirs are often, but by no means always, formed by a dam connecting the banks of a stream or the sloping sides of a valley, canyon, or some more basin-like depression. The terms "dams" and "reservoirs" are used in speaking of devices to confine substances other than water; as when clay is used to hold back molten metal of any sort, or as in dentistry, where a dam is built by a dentist to keep saliva out of a cavity, or when a receptacle is attached to a stove, lamp, or machine for heating or storing water, oil, or other liquids, prior to or during use. The dams and reservoirs considered below will be only those constructed to retain water.

#### DAMS

Where earth could not be used, the choice of materials until about the close of the nineteenth century was between timber, timber and loose stone, and some kind of masonry or, rarely, steel. Since then many dams of concrete masonry reinforced by steel have been erected. Of course the greatest care must be taken to provide against dam failures, for which there are the following common causes: (1) by sliding on the base or on some horizontal joint; (2) by overturning; (3) by fracture due to tension; (4) by crushing, in the case of masonry dams; (5) by erosion, in the case of earth, or, though rarely, by breaking up and washing away, from the top downward, in the case of masonry structures. After a good site has been chosen and the utmost care devoted to the construction of the foundations and the supervision of the material and workmanship, the chief factor of safety in dam construction is obtained by placing a sufficient volume and weight of material in the dam itself to withstand the pressure upon it. This pressure is directly proportioned to the height of water behind the dam and not to the total volume, as is sometimes supposed. In well-designed earth dams the cross section is so great, for other reasons, as to give a weight far in excess of that which could be removed by the pressure of the retained water. But in masonry dams the cross section may be proportioned to resist the pressure with mathematical nicety, allowing, of course, the factor of safety common to all good engineering work.

A most essential feature in the design of dams of all classes is ample provision for passing waste or flood water. Otherwise the increased pressure against the up-stream face of the dam due to the excessively high water in the reservoir, or else the force of the current in passing over the top of the dam, may cause a serious rupture. In overflow dams relief may be obtained, in some cases, by providing floodgates at one end of the structure, either connected with or detached from the main dam; by having a crest to the whole dam which can be dropped in time of floods (see *movable dams*, below); or, in connection with one or both of the foregoing precautions, there may be an artificial overflow or waste channel leading from a spillway above or at one side of the dam down to the natural channel of the stream some distance below. Such a spillway and overflow channel are essential to all earth dams. It should also be noted that waste gates, or under sluices, are sometimes provided beneath the crest of masonry dams, particularly in India. These may be placed near the bottom of the

reservoir to permit washing out deposits of silt. Where no other means are feasible, waste water may be carried to a point below the dam through a tunnel cut in the solid rock at one side and beyond the structure itself.

**Earth Dams** are usually formed by depositing the natural soil from the vicinity of the site in thin successive layers and carefully rolling or otherwise rendering compact each layer

Works, Southboro, Mass.

before another is added. Water is sometimes applied to the earth to help compact it. Soil that will compact readily and be as little porous as possible should be selected, but it is difficult and generally impracticable to make earth dams impervious to water. Since continuous percolation through an earth dam would lead to its ruin, it is customary, where an attempt is not made to secure imperviousness through the whole structure, to place a water-tight barrier either on the upper face of the dam or at its centre. The former is known as a lining and the latter as a heart or core wall. Both a lining and a heart wall may be used. Heart walls may be composed of a carefully selected mixture of clay and loam or sand, called puddle, of concrete; or of stone masonry plastered with cement. One of the advantages of the heart wall is that it can be carried well into the bed and banks of the valley, beneath and beyond the main part of the dam, which is a great safeguard against leaks between the natural ground and the artificial structure. Whether or not the upper face of the dam is lined to prevent leakage, it must be paved with stone, concrete, or brick to prevent damage to the earth slope by the action of the waves at the water level, which latter varies with the fullness or depletion of the reservoir. Where a water lining is desired, puddle is generally employed, often with concrete or masonry above it. Asphalt has sometimes been used to supplement concrete, brick, or stone lining. Occasionally the lower slope of earth dams is paved; in high dams it is frequently built with a level place, or *berm*, part way up its height. Water is rarely allowed to come within 5 feet of the top of earth dams or reservoir embankments, and it may be kept even lower. The minimum advisable thickness of the base will increase with the height of the dam and the gentleness of the slopes. The angle of repose, or natural slope, of ordinary earth, dumped in banks, gives a base of  $1\frac{1}{2}$  feet to 1 foot of height, but wet earth has a less angle of repose. It is common, therefore, to give dams of ordinary earth a slope of 2 to 1 on the lower or dry face, and  $2\frac{1}{2}$  or 3 to 1 on the wet face, and even these figures may be exceeded. Some earth dams are backed with loose stone or rock, to give greater stability. In some cases the material composing earth dams is brought into place by means of flowing water, instead of by carts,

scrappers, or buckets, running on and dumped from a cableway. *Hydraulic-fill dams* is the name applied to this rather novel class of structures. This process was used to build a part of the San Leandro and Temescal dams of the water works supplying Oakland, Cal., and also in building earth dams at La Mesa and San Joaquin (Lake Christine), Cal., Tyler, Tex., and the two Necaxa dams in Mexico, the latter

being 190 and 175 feet, respectively, in height. Earth dams vary in height from a few feet to 100 feet or more, and in length from a few acres to thousands of feet, or even to miles, although most of the structures running into miles are more properly called reservoir embankments. The San Leandro Dam (water works of San Francisco, Cal.) has a total height of 158 feet from the lowest point of the foundation to its crest

and has no heart wall; it extends 125 feet above the original surface. The Tabaud Dam, near Jackson, Cal., completed in December, 1901, has its crest 123 feet higher than the natural surface of the ground at the toe of the lower slope, which is of course some distance down stream from the crest. The crest of the Tabaud Dam is 120 feet above rock foundation and 110 feet above the natural surface of the ground, both distances measured in a direct vertical line. The Tabaud Dam has no heart wall. See *Engineering News*, July 10 and Sept. 11, 1902, for illustrated descriptions of the Tabaud and San Leandro dams respectively.

A recent example of a high earth dam built in layers is the Goose Creek Dam of the Oakley Irrigation project, about 30 miles east of Twin Falls, Idaho, completed early in 1913. It is 145 feet high from the creek bottom to its crest, 1025 feet long and 750 wide or thick at the base, has slopes of 3 to 1 on the up-stream and 2 to 1 on the down-stream face, and contains about 1,100,000 cubic yards of earth, 65,000 cubic yards of rock for riprapping the slopes, and 6200 cubic yards of concrete for the heart wall. The larger part of the earth composing the dam was lifted by steam shovels into dump cars, hauled half a mile to a loading hopper, from which it was passed in succession over three belt conveyors, 1830 feet in total length, one on a 16 per cent grade. The last conveyor discharged into a storage bin, from which the dirt was loaded into wagons for dumping on the dam. Plows and scrapers leveled the dirt into 6-inch layers, which were then sprinkled and rolled. The dam has a reinforced-concrete heart wall only 1 foot thick down to 9 feet above the natural ground surface. From this point a 3-foot concrete wall is carried 49 feet to bed rock.

The Gatun Dam across the Chagres River on the line of the Panama Canal (q.v.) was constructed in large part by the hydraulic-fill method. Its earth portion is about 116 feet high and about  $1\frac{1}{2}$  miles long, separated into two parts by a spillway channel and dam. The earth portion of the dam has its base at about sea level. Here the dam is 2019 feet thick. At the normal water line, 85 feet higher, the dam is 390 feet thick, and at the top its thickness is 100 feet. The purpose of these unusual dimensions and of the very flat slopes of 4 to 1 above

cement mortar is used to bind the stones in one homogeneous mass, or the dam may be composed of irregularly shaped masses of stone with the intervening spaces filled with concrete, or it may be made of concrete alone. (See CONCRETE.) Overturning is guarded against by giving the structure such a cross section that the lines of pressure will be thrown within the centre third of the dam. To provide against crushing, a material with high resistance to such action is selected, and the structure is so proportioned that its own weight will not crush the material

give a broader base, and in having the extreme upper part built with nearly parallel sides, while the top is flat, or perhaps more or less rounded. While some of the early dams were quite bold in cross section, most of them were far otherwise.

Up to the time of its completion, in 1907, the highest masonry dam in the world was the New Croton Dam, built in connection with the New York City water supply to secure an increased storage reservoir capacity of about 32,000,000-000 gallons of water. It is located on the Croton

† Failed in December, 1881.

in its lower part. As a general rule, the pressure should never exceed 15 tons per square foot, and with some materials it may need to be as low as six tons. Obviously the only way to prevent excessive or crushing pressures at the bottom of very high dams is to diminish the thickness as the height increases. The action of ice and of the actual or possible current of overflowing water renders it necessary to make the top of the dam thicker than would be required to resist water pressure alone; otherwise the dam might be tapered to a knife edge at the top. The common type of cross section for high masonry dams approaches a right-angled triangle, with the perpendicular side upstream, but it varies from a real triangle in having both sides curved somewhat, particularly so as to

River about 3¼ miles from its junction with the Hudson River and has a maximum height of 297 feet and a crest length of 2168 feet. The spillway is at one end of the dam and has a channel 1000 feet long, 50 feet wide at its upper end, and 125 feet wide where it meets the top of the dam. There is a roadway on top of the dam, and a bridge spans the spillway.

The highest dam actually completed up to 1914 in any part of the world was the Shoshone Dam, in Wyoming, which has a maximum height of 328.4 feet above the lowest point in the foundation. The dam was built by the United States Reclamation Service in 1905-10 and forms a 148,500,000,000 gallon reservoir to store water for irrigation. It was built across the Shoshone River, near Cody, Wyo., in a deep narrow can-

originally built to a height of about 96 feet in 1898-1902 and was raised to a height of 112 feet above bedrock in 1907-11. The increase of 16.4 feet in height raised the water level 22.96 feet above that of the original dam, due to changes in the level-regulating works. At the new height the level of the water in the river is affected for a distance of about 180 miles upstream. In raising the dam it was necessary to increase its thickness as well. This was done by adding masonry to the downstream face of the dam. The old and new masonry was bonded together on the inclined face of the dam by (1)  $1\frac{1}{4}$ -inch iron rods 8.25 feet long, spaced about  $3\frac{1}{4}$  feet apart each way; and (2) leaving a 6-inch space between the old and new masonry, divided into compartments, into which space cement grout was forced. To pass the muddy waters of the Nile and yet be able to retain the later clear flood waters, 4600 feet of the 6200 feet of the length of the dam was pierced with 180 sluices, all 6.56 feet wide, at four different levels. The 140 lower sluices are 22.96 feet high and the 40 upper sluices 11.48 feet high. The 130 sluices which work under the greatest head or pressure of water are controlled by Stoney balanced roller gates; the other 50 sluices by simple slide gates. When the dam was enlarged, the sluices were extended horizontally through the masonry added to give greater thickness. Navigation locks are provided at one end of the dam. For a description of the Assuan Dam, with particular reference to its heightening, consult *Engineering News*, Sept. 30, 1909.

**Arched or Curved Dams** have given rise to a great amount of discussion as to the wisdom of utilizing the arch principle to resist a part of the thrust of the water on the dam, instead of relying wholly on *gravity dams*, or those with a section which gives sufficient weight to resist overturning and sliding.

The Shoshone, Roosevelt, and Pathfinder dams, already mentioned, are of the arched type. Earlier examples are the Zola, in France (see No. 4 in table): the Sweetwater, built in California in 1886-88, with a height of 98 feet above bedrock, a thickness of 12 feet at the crest and 46 feet at the base, and a crest length of 380 feet. and, most remarkable of all for slenderness, the (old) Bear Valley Dam, built in 1884, and only 3.17 feet thick on top, 20 feet at the bottom, and 60 feet high. Thirteen concrete dams designed on the arch instead of the gravity principle were built in Australia from 1896 to 1906 and are described in *Proceedings Institution of Civil Engineers*, vol. clxxviii, p. 1 (also in Wegmann's *Dams*, cited below). Most of these dams are only 3 feet thick at the top. Their height ranges from 28 to 87 feet. One of them, the Medlow Dam, is 65 feet high, 3.5 feet thick at the top and for 21 feet below the top, and 8.96 feet thick at the base.

**Multiple-Arch Dams.** Instead of a single arch reaching from bank to bank, a number of thin arches are sometimes thrown between a series of piers or buttresses. The Hume Lake Dam, a concrete structure built in 1908 in California, has 12 circular arches of 50 feet span, supported by 13 buttresses, and with each end of the dam built into the side of the valley. This dam is 61 feet high and 677 feet long, measured on the centre line of the crest. A similar structure is the New Bear Valley Dam, built in 1910-11. It has 10 arches and 11 but-

treesses; the latter spaced 32 feet on centres. It is 91.5 feet high above the lowest point of the foundation and 350 feet long on crest.

**Hollow Reinforced-Concrete Dams.** Since 1904 a considerable number of dams have been built consisting of piers or buttresses supporting a water-tight slab of reinforced concrete. One company alone built more than 60 such

TYPICAL CROSS SECTION BEAR VALLEY MULTIPLE-ARCH DAM  
(The downstream toe of one of the buttresses is 91.5 ft. below the crest of the dam.)

dams from 1904 to 1913, one being 135 feet high. The lower side of this kind of dam may be left open under some conditions, or it may be closed by a concrete slab, much the same as on the upper side. Where the lower side is inclosed, the compartments inside the dam are sometimes used as power houses or for other purposes.

One of the highest hollow reinforced-concrete dams built to the end of 1913 was constructed in 1908-09 across the La Prele River, near Douglas, Wyo., for a private irrigation system. The dam is 130 feet high from the top of its floor to the top of the crest, but it extends about 7 or 8 feet beneath the floor and has parapets  $3\frac{1}{2}$  feet high, making a total height of, say, 140 feet. The top length of the dam is about 330 feet and the bottom length only 110 feet, so narrow is the gorge in which it is built. The dam consists of a deck, or inclined slab, of reinforced concrete, 54 inches thick at the bottom and 12 inches thick at the top, supported by buttresses spaced 18 feet on centres. A concrete floor extends beneath the dam. Five of the bays at one side are formed into a spillway by dropping the crest 5 feet beneath the main crest. There is a roadway across the top of the dam. These hollow dams effect a great saving of masonry, as compared with the solid masonry structures, which is an object at points remote from cement mills or where long wagon hauls are necessary.

**Concrete Dams** are not essentially different from other masonry structures, except in their composition. (See CEMENT; CONCRETE.) The San Mateo or Crystal Springs, concrete dam, near San Mateo, Cal., built in 1887-88 to a height of 115 feet and since raised to a height of 145 feet, is designed to reach ultimately 170 feet, with a top width, when completed, of 25 feet and a width at the base of 176 feet. Various other and later concrete dams have already been mentioned.

**Rock-Fill Dams** are built of large stones, or

rock, loosely put in place, but with hand-laid face or slope walls. To make such dams watertight, or sufficiently so for the objects to be attained, the upstream or wet slope may be faced with plank, concrete, concrete and asphalt, or steel. It is also possible to use earth to form either the upper or the lower section; or riveted steel plates may be built in the centre of the structure. A masonry wall, with earth above and rock fill below, faced on the lower slope with stone laid in mortar, is another variation. The adoption of this form of construction is generally in the interests of economy, in localities where the transportation of cement would be very costly, where earth dams are out of the question, and where stone is abundant and easily thrown into place. The stream flow must be passed around and not over rock-fill dams.

ished in thickness as they neared the top. The dam is 161 feet high above its lowest point, 130 feet high above the natural earth, and is of rock fill for 121 feet. The steel plates were protected by a coat of hot Alcatraz asphalt, then a layer of burlap, then harder asphalt, and finally one foot of Portland cement concrete, on each side. A part of the rock fill was deposited in place by the force of a very heavy blast, and the rest was transported from the quarry by a cableway (q.v.) 948 feet long. Nearly 180,000 cubic yards of stone were used. The Morena Rock-Fill Dam, which, like the Lower Otay, is a part of the water-supply system of San Diego, Cal., is 150 feet high in its rock-fill portion, but, counting a concrete coping wall 3 feet high and a concrete wall carried down 112 feet beneath upstream side of the dam, the structure has a maximum

The Escondido Dam, built by a California irrigation district of that name, was one of the earliest of the rock-fill structures. It is 76 feet high, 10 feet thick at the top, and 140 feet thick at the base, has top and bottom lengths of 380 feet and 100 feet respectively. The hand-laid dry wall on the upper or wet slope is 15 feet thick at the base and 5 feet at the top. It is covered with redwood plank, and the space between the plank and the stone was rammed full of concrete. The joints in the planking were calked with oakum and daubed with asphalt. The Lower Otay Dam, near San Diego, Cal., completed in 1897, is a rock-fill dam with a steel core. The dam was started in masonry, but being carried to a height of 40 feet above its lowest point, when its top length was only 85 feet, it was decided to change the design. An inverted T-iron (thus,  $\perp$ ) was bolted to the masonry, and steel plates  $\frac{1}{4}$  of an inch thick,  $17\frac{1}{2}$  feet long, and 5 feet high were riveted first to the T-iron, then to each other, until three courses had been placed. The plates were dimin-

height of 265 feet. The upstream slope is composed of individually placed stone, with the facing stone laid in cement for water-tightness. The dam was started in 1896, but construction was suspended from 1898 to 1909. The failure of the Walnut Grove rock-fill dam, 110 feet in height, is described under *Failures of Dams*, below.

**Steel Dams** have been built in a few instances. The first of these, so far as known, is near Ash Fork, Ariz., and was built in 1897 or 1898 by the Atchison, Topeka, and Santa Fe Railway Company to supply its engines and incidentally to furnish water to the village of Ash Fork. It forms a reservoir of 36,000,000 gallons' capacity. The steel portion of the structure is 184 feet long at the top, and its greatest height is 46 feet. It consists of a series of triangular steel frames, against the upper sides of which rest the riveted steel plates, three-eighths of an inch thick. These plates are curved so as to form a series of channels from the top to the bottom of the inclined face of the dam, with flat strips be-

teen. Water flows over the top of the steel dam and between two masonry abutments having a combined length of 116 feet.

A similar dam, but higher, longer, and resting on a concrete foundation, was built in 1900-01. at Redridge, Mich., to supply water to copper stamp mills. The steel portion of the Redridge

ROCK-FILL DAM WITH STEEL SHEET WALL OR DIAPHRAGM.  
Southern California Water Company, San Diego, Cal.

Dam is 464 feet long between abutments, and its maximum height is 74 feet, including foundation. Earth embankments at either end bring the total length of the dam to 1006 feet. (Consult *Engineering News*, May 12, 1898, for details of Ash Fork Dam, and Aug. 15, 1901, for Redridge Dam.) The Hauser Lake steel dam, 70 feet high and 630 feet long, built across the Missouri River, near Helena, Mont., failed April 14, 1908, soon after completion. The failure appears to have been due to defective foundations. (Consult *Engineering News*, Nov. 14, 1907, and April 30, 1908.) The dam was rebuilt of concrete.

**Timber Dams** include a great variety of structures built of framed timber, logs, and cribwork of either timber or logs filled with stone. They are generally comparatively low, overflow dams. They frequently have a sloping upstream face and either a sloping or stepped downstream face, with an apron below the toe of the latter, to break the force of falling water. Sometimes piles are used in their construction, and often earth is filled against their upper side. The once famous timber dam at Holyoke, Mass., built in 1849 for water power, 1017 feet long and with a maximum height of 30 feet, was replaced in

shallows or rapids, but where permanent structures to raise the water level might do damage by causing floods at times of high water. They may also be used on any ordinary dam or on waste weirs. It is more common, however, to call movable devices connected with ordinary dams *flashboards* or *floodgates*. Flashboards are generally comparatively low and are of fragile construction or have supports designed to give way in time of freshet. There is a great variety of movable dams, but they fall more or less closely into three groups—*needle*, *wicket*, or *shutter*, and *bear-trap*. The latter have some decided points of superiority, being raised and lowered by the force of the water itself, on its being turned under or discharged from chambers beneath or within the dam. *Needle dams* were developed in France about the close of the eighteenth century. They are an outgrowth of the earlier French and English needle dams and consist of horizontal beams, or stop planks, dropped into grooves built in the two abutments of a pass through the dam. These beams could be lifted out at times of high water. Later, to facilitate handling, they were set vertically, or nearly so, resting against a sill below and a beam above. A chain was finally substituted for this beam to make greater lengths of dam feasible.

CROSS SECTION OF TIMBER AND STONE DAM.  
Bangor, Me.

ible. In this way movable dams 40 feet wide were developed on the Yonne, in France. In 1834 M. Poirée increased the width of one of these dams, or passes, to 72 feet by substituting iron bars for the chains. The bars were short and were supported by means of vertical iron frames, placed at right angles to the length of the dam. To throw down the dam, it was only necessary to remove the needles one by one, detach the horizontal bars, then lower the frames into recesses in the top of the masonry portion of the dam. The needle dams were somewhat modified subsequently and used in various parts of France, in Belgium, in Germany, and in the United States. The first needle dam in this country was built in 1891-97 by the United States government across the Big Sandy River at Louisa, Ky. The whole improvement includes a lock 52 feet wide, a navigable pass 130 feet long, and an overflow weir 140 feet long. The sill of the pass was 13 feet, and that of the weir was 7 feet below the normal height of water in the pool. The steel frames supporting the pass needles were originally 4 feet between centres, but later the alternate frames or trestles were removed. The horizontal bars connecting the frames and supporting the upper ends of the needles were hinged at one end and hooked at the other. The frames had a sheet-iron floor, forming a footbridge, which fell with them, and were connected by a chain. The pass needles were of white pine, 12 inches wide, 8½ inches thick at the bottom, and 4½ inches thick at the top, and 14 feet 3 inches long, each weighing

CROSS SECTION OF STEEL DAM.  
Ash Fork, Ariz.

1895-97 by a masonry structure some 50 to 60 feet high.

**Movable Dams** are those which can be lowered or raised at will, according to the stage of water in the river. They are generally aids to navigation, placed at stretches where there are

263 pounds when wet. The needles were set in place by means of a derrick on a boat, and were lifted out by means of a chain passing through irons fastened to their top, operated by an engine. The frames were raised or lowered from one of the abutments to the pass by means of a chain crab. This dam was raised  $4\frac{1}{2}$  feet in 1907-08, or to a height of  $17\frac{1}{2}$  feet on the pass sill and  $11\frac{1}{2}$  feet on the weir sill. The span of the pass frames or trestles was increased to 20 feet, needles still being used. On the weir the needles were replaced by wickets.

**Wicket or Shutter Dams** have been developed from simple gates or shutters working on a horizontal axis near their tops, which have been used in Holland for centuries. These simple shutters have been elaborated until they are now made of short lengths, which may be revolved on their horizontal axis, then lowered so as to rest flatwise on the sill of the dam. They are operated from a bridge placed above them, which can be lowered much the same as the frames of the needle dams just described. In 1880 two wicket dams were completed on the Great Kanawha River by the United States government, and others have since been built on that stream. One, completed in 1892, has a pass 248 feet long, besides a weir 316 feet long and a lock 55 feet wide. The pass is closed with 62 Chanoine wooden wickets 3 feet 9 inches long and 14 feet high, with a 3-inch space between them, which may be closed by means of a timber, if desired. The first of a series of movable dams in the Ohio River, at Davis Island, near Pittsburgh, was built in 1878-85 and also has Chanoine wickets. There is one pass 716 feet long, another 1223 feet long, besides a fixed dam 456 feet wide, several weirs, and a lock 110 feet wide and 600 feet long between the gates. Many Chanoine wickets were in use on the rivers of the United States in 1912. Most of the wickets were of wood, but some were of steel. Metal wickets were first used at the La Mulatière Dam, near Lyons, France, in 1879.

**Drum Dams** are modifications of the wicket or shutter dam. One of these, named after its inventor, Capt. H. M. Chittenden, may be described, roughly, as being shaped like one-sixth of a cylinder. When lowered by revolving on a horizontal axis at the centre of the cylinder, it drops into the chamber, leaving one radial side of the cylinder flush with the sill. The sections are raised by the force of the water acting from beneath.

**Rolling Dams** are steel cylinders, either alone or provided with sheaths. On being opened, by power, they roll up inclined rails placed in recesses in the abutments or piers between which they extend. The first rolling dam was built in 1901-02, at Schweinfurt, Bavaria, and was 6.6 feet high and 114 feet long. Later rolling dams have been much higher, reaching nearly 28 feet. One built across the Spokane River, Washington, in 1910, is 19 feet high and 100 feet long. Consult *Engineering Record*, Dec. 13, 1913, for list of 50 rolling dams, in various parts of Europe, with three in the United States. The article describes various rolling dams, including their operating mechanism.

**Bear-Trap Dams or Gates**, in their simplest form, consist of two leaves extending across the pass or opening to be closed, and so hinged to the sill of the dam on their outer edge that they form a triangle when in use and lie flat on the sill of the dam when open; one leaf, when open,

overlaps the others. The space within the triangle is filled with water. On drawing out this water through suitable openings, the dam fills, and on admitting water beneath the leaves, when the dam is open, the leaves are raised slowly into position. Thus the dam is operated by the force of the water. The first dam of this type was built on the Lehigh River, in 1818, by Josiah White and Erskine Hazard, managers of the Lehigh Navigation Company, to secure slack water for shipping anthracite coal. In 1819, 12 more of these dams were built on the Lehigh. Until 1880 or later this type seems to have been used but little outside of Pennsylvania; but in 1886 two bear-trap gates, each 60 feet long, were built by United States engineer officers in the Beattyville Dam, across the Kentucky River. Since 1886 a number of other dams of this type have been built in this country. A study of bear-trap dams was made for the United States government by Capt. H. M. Chittenden and Major A. O. Powell, beginning in 1892. (Consult *Journal Association Engineering Societies*, Philadelphia, for June, 1896; also an article by Captain Chittenden reviewing the whole subject, in *Engineering News*, New York, Feb. 7, 1895.) Various modifications of the bear-trap dam have been made, including a hinge at the apex and another in the upper leaf, so in falling the dam falls over on itself, and there is no overlapping at the apex. The largest bear-trap dam yet built forms a part of the regulating works of the Chicago Drainage Canal, where the canal discharges into the Des Plaines River. The pass closed by this dam is 160 feet long and 20 feet high, besides which there are 15 sluice gates, 30 feet wide and 20 feet high, working vertically between masonry piers. Eight of the gates were walled up, as the full capacity was not deemed necessary for some time. This bear-trap dam is not for navigation, so it is mounted on a masonry structure of some height, permitting the upper gate to slide down the upper face of the masonry. This dam differs from others of the same type not only in being of steel instead of wood, but in having various mechanical devices to supplement its operation. A full illustrated description of this structure is given in *Engineering News* (New York) for March 24 and May 26, 1899.

**Stony Roller Sluice Gates**, first built at Belleek, Ireland, in 1883, have been put in at many important dams throughout the world to close large openings. These gates are usually suspended from service bridges by chains or rods, and when lifted from above they work on trains or rollers which with ends of the gates are placed in vertical grooves in piers. They have been used in water depths of 30 feet and, in lesser depth, to close openings 80 feet wide. A general review of movable dams, by B. F. Thomas, is given in the *Transactions of the American Society of Civil Engineers* (New York, 1888); much space is given to the various kinds of movable dams in both Thomas and Watt, *The Improvements of Rivers*, and Wegmann, *On Dams*, each cited below. Consult *Reports Chief of Engineers, United States Army* (Washington, 1860 et seq.), particularly those for 1884 and 1887.

**Cofferdams** (q.v.) are employed to exclude water from foundations and other classes of work while under construction. See **FOUNDATIONS**.

## FAILURES OF DAMS

The Bradford earth dam, Sheffield, England, failed in March, 1864. This dam, built to supply water and furnish power to the city of Sheffield, was about 90 feet in height, 13 feet wide, and 1250 feet long, with slopes of  $2\frac{1}{2}$  to 1. The dam, except for a puddle wall extending from end to end and 60 feet into the ground, was of earth loosely dumped from carts. Cast-iron outlet pipes about 500 feet in length, surrounded by clay puddle, extended through the base of the dam. While the reservoir was being filled for the first time, a leak suddenly appeared, and enlarged so rapidly that in 30 minutes the reservoir had emptied itself. The flood reached Sheffield at midnight, without warning, causing great destruction of property and the loss of 238 lives. In the official inquiry made as to the cause of the failure, it was claimed that in a work of such great magnitude the outlet pipes should not have been placed through the dam itself.

The failure of the Mill River Dam at Williamsburg, Mass., in 1874, was a conspicuous example of improper construction which resulted in complete saturation of the embankment. No engineer had been employed in constructing the work, and no proper means used for consolidating the embankment. One morning, when the water was 4 feet from the top of the dam, masses of earth were observed to slide from the outer slope of the embankment. In 20 minutes the reservoir was emptied of 100,000,000 cubic feet of water, which drowned 143 persons and destroyed \$1,000,000 worth of property.

The most disastrous reservoir failure of the nineteenth century was the destruction of the South Fork Dam, which caused the famous Johnstown flood on May 31, 1889. That this disaster was due to an insufficient spillway has been abundantly proved. The South Fork Dam was built on the headwaters of the Conemaugh River, 10 or 12 miles above Johnstown. It was of earth, 70 feet in extreme height. The dam was built as far back as 1852, and, after various changes in ownership, the reservoir in 1880 came into the possession of the South Fork Hunting and Fishing Club of Pittsburgh, Pa. The original specifications for the dam required a spillway 150 feet wide. The spillway existing at the time of the disaster was 130 feet wide at its upper end, but was obstructed by a bridge and by screens to prevent the escape of fish. It extended across a channel 176 feet long and at its lower end only 69 feet wide. In other words, the spillway was only half that originally contemplated, besides which a brick outlet culvert had been abandoned. Unusually heavy rains had been falling for several days, and for  $3\frac{1}{2}$  hours before the break occurred the water had been flowing over the entire length of the dam. When the dam was carried away, the reservoir emptied itself in about 45 minutes. Over 2000 lives were lost in this disaster, and between \$3,000,000 and \$4,000,000 worth of property. No engineer was employed on the design or construction of the dam.

The Walnut Grove Dam, in Arizona, failed on Feb. 22, 1890. It was one of the highest rock-fill dams ever built, having been 110 feet in height, about 10 feet thick at the top and 140 feet at the base, with a top length of some 400 feet and a bottom length of 100 feet. Both faces were composed of granite blocks, laid by

hand and derrick, these dry-faced walls being 80 feet thick at the base and 5 feet thick at the top. It is supposed that a very heavy rainfall and an altogether inadequate spillway caused the destruction of the dam, which was overtopped for a number of hours. Many deaths resulted from the failure.

The failure of the Puente masonry dam, in Spain, in 1802, was due to defective foundation, the central part of the dam resting upon piles instead of being carried down to bedrock. In the Habra masonry dam, in Algiers (see table), whose failure caused the drowning of 400 persons, the disaster was probably due to defective masonry work. The failure of the Bouzey masonry dam, near Epinal, France, in 1895, was caused by defective construction between the base and the foundation, although in its dimensions the dam was carried to the extreme of lightness.

The failure of the dam on the Colorado River, at Austin, Tex., which occurred in April, 1900, was due to defective foundation, largely on account of the soft limestone rock on which the foundation was laid. The dam was 1090 feet long, 66 feet high above the foundation, and 60 feet above low water. The upstream face of the dam was vertical, and the downstream face was curved, giving a thickness of 66 feet at the base and 20 feet near the top. On April 7, 1900, after a heavy rainfall of several days, when the water was flowing over the crest of the dam to a depth of 11.07 feet, a portion some 500 feet in length was detached from the remainder of the dam, broke into two parts, and was carried downstream. Two sections were left standing upright in the stream a few feet below the original portion. One of these broke up in a few hours, but the other remained intact. When the dam broke, eight people in the power house were drowned by the sudden rush of water, and during the following night the power house itself was partially destroyed.

A dam at Austin, Pa., which had previously failed but had been continued in use, went out on Sept. 30, 1911. The resulting flood in the narrow valley caused the death of 85 persons at Austin,  $1\frac{1}{2}$  miles below the dam, and at Costello, 3 miles farther downstream. The dam was of reinforced concrete, gravity section, about 50 feet high and 554 feet long, with a low spillway near the centre. On its completion, about Dec. 1, 1909, a vertical crack appeared, and later a second one showed. On Jan. 22, 1910, the river being in flood, water leaked through what proved to be porous rock beneath the dam. The following day the middle portion of the dam slid downstream, 18 inches at the bottom and 31 inches at the top, and vertical cracks elsewhere separated the dam into a number of parts. The water was lowered by dynamiting, but the reservoir was subsequently allowed to partly refill. Although engineers employed by the owners advised that the dam be strengthened, nothing to that end was done. On Sept. 30, 1911, heavy rains caused overtopping of the dam, and about four-fifths of its length was broken into seven large fragments, most of which remained upright, but two of which were carried from 15 to 25 feet downstream. The failure was due to defective foundation, which might have been made safe had the engineer not been limited in the sum allowed for building the dam. The Austin failure and many lesser failures about that time led to

more thorough public supervision of the design and construction of reservoirs in a number of States.

#### RESERVOIRS

Reservoirs may be classified broadly into *impounding, settling, storage, and distributing* reservoirs, all of which, except impounding, may be covered or open, the latter being the general form. *Impounding reservoirs* are formed by throwing a dam across some stream and flooding the country above. *Storage reservoirs* are often created in the same way; or they may be formed more or less completely by embankments or excavation, or a combination of the two. Both impounding and storage reservoirs are designed to conserve a supply of water above the normal consumption, for times when either the natural yield is below the average or the consumption is unusually great. Impounding reservoirs are always for storage purposes, whether the capacity be for a few hours' supply or for a much longer period. The larger and more regular the daily yield of the stream or other source of supply, as compared with the consumption, the smaller need be the storage capacity. In some cases storage is required for months or even for a year. The new Croton Dam provides a storage of about 32,000,000,000 gallons; the Kensico Dam of the Catskill Water Supply of New York City, 38,000,000,000 gallons and the Olive Bridge or Ashokan Dam, 132,000,000,000 gallons. The Wachusett Dam, of the Metropolitan Water-Supply District (Boston and vicinity), retains about 63,000,000,000 gallons of water. Much larger are the storage capacities of a number of the reservoirs of the United States Reclamation Service, that formed by the Roosevelt Dam holding 420,000,000,000 gallons.

An important sanitary question involved in the construction of impounding and storage reservoirs for public water supplies is the stripping of the sites, or flooded areas, of all heavy accumulations of organic matter which, either through their decay or through serving as a food supply to low forms of life, would impart unpleasant tastes and odors to the stored water. It is a common practice to remove stumps and timber and to burn over the site, where practicable, before filling such reservoirs; but outside of New England very little more than this has been done towards stripping the sites of storage reservoirs. The estimate for the Wachusett Reservoir, mentioned above, included \$2,910,000, out of a total cost of \$9,105,000, for stripping the reservoir site. Aside from stripping and clearing the sites, the construction of impounding reservoirs pertains mostly to the dam and its accessories. One additional element of importance in some cases is the excavation at the border of reservoirs to prevent shallow flowage and the growth and decay of vegetable matter which would occur when these slopes are alternately exposed and covered by the varying levels of water in the reservoir.

*Settling Reservoirs*, also known as *subsiding* and as *sedimentation* reservoirs, are shallow basins, with long weirs between the several compartments over which the water flows in thin sheets, thus drawing off only the upper and most clarified layer. (See *WATER PURIFICATION*.) It is desirable to make provision for removing the mud, to which end the paved bottoms may slope to a common point and then

connect with a scour pipe, through which the mud may be flushed with a stream of water from a hose.

*Distributing Reservoirs* are generally located within or near the city which they serve. They are often classified as high, low, and middle service, according to their elevation and the areas which they supply. They may afford storage for periods ranging from a day or two up to several weeks; but in the latter case they would perform the duty of a storage reservoir as well. Occasionally distributing reservoirs are formed by a dam across a stream, but, as a rule, they have masonry walls above or below the natural surface. The construction of embankments or walls does not differ essentially from that of earth and masonry dams, except that when masonry is used the principles of design are more like those involved in the planning of earth-retaining walls, subjected, of course, to water pressure on the other side at times, but also liable to be empty. It is common to line the inner slopes of reservoir embankments with stone, brick, concrete, or asphalt. The bottoms are frequently lined like the sides. When concrete is used, it is well to lay it in relatively small squares, with a good filling for the joints, to prevent cracking.

*Covered Reservoirs* may have vaulted roofs of masonry, generally concrete masonry, or else less expensive and more temporary roofs of timber. The cost is so great that covering is rarely attempted in the United States, except for relatively small reservoirs receiving either filtered water or that from underground sources, either of which is liable to injury through the development of organisms giving rise, in their life processes, to bad tastes and odors.

**Bibliography.** Wegmann, *Design and Construction of Dams* (6th ed., New York, 1911); Schuyler, *Reservoirs for Irrigation, Water Power and Domestic Supply* (ib., 1901); Frizzell, *Water Power* (ib., 1901); Morrison and Brodie, *High Masonry Dams* (ib., 1910); Thomas and Watt, *The Improvement of Rivers* (2d ed., ib., 1913); Fortier and Bixby, *The Storage of Water for Irrigation Purposes* (United States Department of Agriculture, 1912, two parts)—describes timber, earth, hydraulic-fill and rock-fill dams; also general treatises on water works by Fanning, Folwell, Goodell, and Turneaure, and Wilson, *Manual of Irrigation Engineering* (New York, 1897).

**DAMSEL FLY** (so called from the French name *demoiselle*). An insect of the family Agrionidae, order Odonata, closely allied to the dragon flies. They are, says Howard, the small, graceful species, with extremely slender bodies and narrow, clear wings, held vertically in repose, which are very commonly found over large bodies of still, fresh water. "All of our North American species [about 75] are small, but in tropical regions they grow to a large size, and some South American forms are among the largest species of the order Odonata. They do not fly high in the air, but frequent low-growing aquatic vegetation. The colors, as a rule, are rather dull, but the slender bodies of some are brilliantly blue, green, or even red." Many authors unite with these as a subfamily the dark-colored, prominent-eyed flies otherwise regarded as constituting the separate family Calopterygidae. The life history of these flies is substantially that of the dragon flies (q.v.). See *PLATE OF DRAGON FLIES*.

**DAMSEL OF BRITTANY.** A title given to Eleanor of Brittany, sister of Arthur, Count of Brittany, and niece of King John of England, who confined her in the castle of Bristol, where she died in 1241.

**DAN.** A city on the northern boundary of Israel, called originally Laish (Judg. xviii. 29), but renamed Dan by the Danite invaders. Owing to its northerly location (Gen. xiv. 14), it was often used in connection with Beersheba (1 Sam. iii. 20; 2 Sam. iii. 10) in the phrase "from Dan to Beersheba," to express the whole land of Israel. The Danites introduced in this city the worship of Yahwe with the image taken from Micah's sanctuary in Mount Ephraim, and with the Levite who is said to have been the grandson of Moses (Judg. xviii). Later Yahwe was worshiped there under the form of a bull, and the cult was organized by Jeroboam (1 Kings xii. 29). At the solicitation of Asa, King of Judah, Bar Hadad, King of Damascus, invaded Israel, and among other cities Dan was destroyed (1 Kings xv. 20; 2 Chron. xvi. 4). The ruins of the city are identified with modern Tel el Kadi. Kadi is the Arabic equivalent of Dan, which means 'judge.' The mound is very extensive. No excavations have yet been undertaken.

**DAN.** The eponymous ancestor of the tribe of Dan, the son of Jacob and his concubine Bilhah (Gen. xxx. 5, 6). The tribe was one of the smallest and weakest of the Hebrew confederacy. Belonging to the northern group, its territory lay southwest of Ephraim, occupying the valleys of Sorek and Ajalon (Josh. xix. 40-46). Owing, however, to difficulties with the Amorites (Judg. i. 34), we find them later migrating to the far north, and conquering the city of Laish, which they rebuilt and called Dan (Josh. xix. 47; Judg. xviii). Samson (q.v.) was of the tribe of Dan (Judg. xiii. 2, 24, 25). The tribe is referred to in the song of Deborah (Judg. v.); the text is somewhat uncertain, but Schmidt has proposed to read "Dan stayed where the stream breaks forth," referring to the Jordan, at whose fountain the city of Dan was situated, and "Asher sought protection in ships, he dwelt on the shore of the sea," which is in harmony with what is otherwise known concerning the location of these tribes. If this is correct, Dan already occupies the territory around Laish in the time of Deborah. The description of Dan in the blessing of Jacob (Gen. xlix.) may even be older. It refers to the tribe as being self-governing and skilled in making raids on travelers. Dan, though designated as a "concubine" tribe, which generally indicates secondary rank, plays no unimportant part in the early traditions and legends. This is in part due to the fame and antiquity of the sanctuary at Dan, which as late as the days of Amos is put on a level with Bethel and Beersheba (Amos viii. 14). In this sanctuary the older rites and practices were preserved with great fidelity, and its priests traced their origin to Moses himself (Judg. xviii. 30). The name Dan ('judge') may originally have been the title of a deity. Consult Ed. Meyer, *Die Israeliten und ihre Nachbarstämme*, pp. 524 ff. (1906); N. Schmidt, *The Messages of the Poets*, pp. 356 ff. (1911).

**DANA, CHARLES ANDERSON** (1819-97). An American journalist, born at Hinsdale, N. H., Aug. 8, 1819. He studied at Harvard, but, owing to defective eyesight, did not graduate.

He joined the Brook Farm Association in 1841, edited in its interest the *Harbinger*, contributed to the *Boston Chronotype*, and, after the failure of Brook Farm, was, with its founder, Ripley (q.v.), connected with the *New York Tribune* (1847-62). Disagreement with Horace Greeley in war politics, proclaimed in a once-famous editorial, "On to Richmond," forced his resignation. He was Assistant Secretary of War in 1863-64. After the war he edited the *Chicago Republican*, which failed. He then returned to New York and became part proprietor and editor in chief of the *New York Sun*—a position which he held from 1868 to his death. With George Ripley he planned and edited the *New American Cyclopaedia* (1857-63), and its successor, the *American Cyclopaedia* (1873-76). He compiled also the well-known *Household Book of Poetry* (1857) and collaborated in a *Life of Grant* (1868). Other works are: *The Art of Newspaper Making* (1895); *Lincoln and his Cabinet* (1896); *Recollections* (1897). At the time of his death at Glen Cove, L. I., on Oct. 17, 1897, Mr. Dana was in many ways the most noted journalist in the country. He had a brilliant intellect, a finished and incisive style, and a gift for mordant irony which made him a dangerous enemy. Every detail of the art of making a good newspaper he thoroughly understood, but he was generally believed to be so intense in his prejudices that he failed to acquire the authority to which his talents entitled him. Consult J. H. Wilson, *Life of Charles A. Dana* (New York, 1907).

**DANA, CHARLES LOOMIS** (1852- ). An American neurologist. He was born at Woodstock, Vt., and was educated at Dartmouth College and the New York College of Physicians and Surgeons. He served as professor of physiology in the New York Woman's Medical College in 1880-86, of nervous and mental diseases at the New York Postgraduate Medical School in 1884-96, and of nervous diseases in Dartmouth Medical College in 1890-93, and four years later he became professor of nervous diseases in Bellevue Hospital Medical College. He was also an editor of the *Journal of Comparative Medicine* and associate editor of the *Medical Record*. His publications include a *Text-Book of Nervous Diseases* (1892; 7th ed., 1908).

**DANA, EDWARD SALISBURY** (1849- ). An American mineralogist, born at New Haven, Conn. He graduated at Yale University in 1870 and became tutor there in 1874. He received his doctor's degree at Yale in 1876 and also studied at Heidelberg and Vienna. In 1879 he was made assistant professor of natural philosophy and astronomy, and later professor of physics, at Yale. After 1875 he edited the *American Journal of Science*. His publications include numerous papers on mineralogical topics; "Appendix I" and "Appendix II" of Dana's *System of Mineralogy*; a *Text-Book of Mineralogy* (1877); *Minerals and How to Study Them*, and a *Text-Book of Mechanics* (1881).

**DANA, FRANCIS** (1743-1811). An American statesman and jurist. He was born in Charlestown, Mass., graduated at Harvard in 1762, soon became a leading member of the bar and, as a Whig, prominent in Colonial politics, and from 1776 to 1780 was a member of the Executive Council of Massachusetts. He was elected to the Continental Congress in 1776 and from the first took an important part in the work of that body. In 1778 he was made chairman

of a committee appointed to draw up plans for the reorganization of the army and in the same year was a member of the committee of three to which the conciliatory proposals of Lord North were referred. He went abroad in September, 1779, as the official secretary of John Adams, recently appointed to negotiate a treaty of peace with Great Britain, and, after spending some time in Paris and Amsterdam, was sent in March, 1781, as United States Minister to the court of St. Petersburg. Catharine persistently refused to receive him as an accredited Minister, however, and in 1783 he returned to America. He was again elected to the Continental Congress (1784) and in January, 1785, was appointed Justice of the Supreme Court of Massachusetts. In 1786 he was a delegate to the Annapolis Convention (q.v.) and in the following year was also elected as a delegate to the Constitutional Convention at Philadelphia, but was prevented by illness from attending. In the State Convention of 1788 he cooperated with Theophilus Parsons and John Hancock in securing the ratification of the Federal Constitution by Massachusetts. He was Chief Justice of the Massachusetts Supreme Court from 1791 to 1806, during which period he took no active part in State or national politics.

**DANA, JAMES DWIGHT** (1813-95). An American geologist and one of the eminent scientists of the nineteenth century. He was born in Utica, N. Y. His father was a successful business man of New England birth, and his mother was Harriet Dwight, daughter of Seth Dwight, of Williamsburg, Mass. Dana early became interested in scientific studies. In his school days at Utica he devoted much time to chemical investigations, and he frequently made excursions to distant points for the purpose of collecting minerals. Attracted by the reputation of the elder Professor Silliman, he entered Yale College in 1830, where for three years he pursued the study of classics, mathematics, and natural sciences. In 1833 Dana received an appointment as instructor in the United States navy, a position that afforded him an opportunity of European travel. During a cruise in the Mediterranean he wrote a description of Vesuvius, the first of his long series of scientific papers that were published in the *American Journal of Science*. Three years afterward he returned to Yale and was appointed assistant to Professor Silliman. While at New Haven he published his first important scientific work (*The System of Mineralogy*), a book that subsequently passed through several editions and attained a reputation in both Europe and America as a standard of reference. From 1838 to 1842 Dana was a member of the Wilkes Exploring Expedition sent out by the United States government. While on this expedition, which explored the little-known parts of the Pacific Ocean, he had a wide field for scientific discovery and description. The opportunities presented were such as few scientists have received; so extensive was the material collected that, upon his return to the United States, Dana devoted 13 years of almost constant labor to its study. The results were published by the government in three voluminous reports: "Zoöphytes," in *United States Exploring Expedition* (Philadelphia, 1846); "Geology," in *United States Exploring Expedition under C. Wilkes, U. S. N.* (Philadelphia, 1849); and "Crustacea," in *United States Exploring Expedition under C. Wilkes,*

*U. S. N. (New York, 1852-54)*. In the work on "Zoöphytes," 230 species were described by Dana for the first time, while the report on "Crustacea" contained descriptions of no less than 658 new species. The intense zeal with which Dana pursued this task seriously impaired his health, and although he was able to accomplish much in after years, his life henceforth was a continual struggle against disability.

The value of Dana's services to science received prompt recognition from Yale College, which appointed him in 1850 to the professorship of natural history, a position he filled from 1855 to 1890. During this period his activities found expression in lectures to college students, in several textbooks on geology and mineralogy, and in numerous contributions to scientific journals. His work was characterized by keenness of perception, great powers of analysis, and by vivid imagination. These qualities eminently fitted him for geological investigations, and his discussions of the grander features of the earth, such as the form and origin of continents, mountain building, and volcanoes, are among the most valuable contributions to scientific literature. From 1846 until his death he served almost continuously as editor of the *American Journal of Science*, in which many of his papers were published. Dana received many marks of honor from American and foreign institutions. He was elected president of the American Association for the Advancement of Science in 1854 and of the Geological Society of America in 1890, and was at various times a member of the Royal Society of London, the Institute of France, the Royal Academy of Berlin, the Royal Academy of Vienna, and of many other learned societies. In 1872 the Geological Society of London conferred upon him the Wollaston medal "in acknowledgment of his services to mineralogy and geology," and in 1877 he received the Copley medal "for his biological, geological, and mineralogical investigations, carried on through half a century, and for the valuable works in which his conclusions and discoveries have been published." The more important of his contributions to scientific literature, in book form, are the reports previously mentioned, and the following, some of which have passed through several editions: *A System of Mineralogy* (1837); *Manual of Mineralogy* (1848); *Manual of Geology* (1862); *Coral and Coral Islands* (1872); *Text-Book of Geology* (1864); *The Geological Story Briefly Told* (1875). He died in New Haven, April 13, 1895.

**DANA, JOHN COTTON** (1856- ). An American librarian, born in Woodstock, Vt. He graduated at Dartmouth College in 1873, studied law, was admitted to the New York bar in 1883, but after working as a land surveyor and civil engineer in Colorado became librarian of the Denver Public Library in 1889. He took charge of the Springfield (Mass.) City Library in 1898, and in 1902 of the Newark (N. J.) Free Public Library, which he brought to a remarkable degree of efficiency. He was president of the American Library Association in 1896. He wrote *A Library Primer* (1899), *Notes on Book-Binding for Libraries* (1906), and several chapters in *Modern American Library Economy* (1910 et seq.) ; and with Henry W. Kent edited *Literature of Libraries in the Seventeenth and Eighteenth Centuries* (6 vols., 1906-07). With C. L. Dana he compiled *Horace: The Roman Poet Presented to Modern Readers* (1908), a selection

of versions of the odes, and published *Cops: The Hostess of the Inn* (1909), a version of the pseudo-Vergilian poem.

**DANA, NAPOLEON JACKSON TECUMSEH** (1822-1905). An American soldier, born in Eastport, Me. He graduated at West Point, and was assigned as second lieutenant of infantry in 1842. During the Mexican War he served in both the northern and the southern campaigns, and in April, 1847, was brevetted captain at Cerro Gordo, where he was severely wounded. In 1855 he resigned and thereafter until 1861 was engaged in the banking business in St. Paul, Minn. On the outbreak of the Civil War he entered the service as colonel of a regiment of Minnesota volunteers, and in February, 1862, was appointed brigadier general of United States volunteers. He served throughout the Peninsular and Maryland campaigns, was seriously wounded at Antietam; became a major general of volunteers in November, 1862; was engaged in various operations in the Department of the Gulf, and then commanded successively the District of Vicksburg, the Sixteenth Army Corps, the districts of West Virginia and Vicksburg, and the Department of the Mississippi. In May, 1865, he resigned from the service, and subsequently took an active interest in railway management, becoming president of the Montana and Union Railway Company in 1885. He was appointed captain and assistant quartermaster U. S. A., by special act of Congress, and retired from active service in 1894.

**DANA, PAUL** (1852- ). An American journalist, born in New York City and educated at Harvard and Columbia universities. He joined the staff of the *New York Sun* in 1880 and in 1897 succeeded his father, Charles Anderson Dana (q.v.), as editor; in 1903 he retired. He was also major in the National Guard of New York State in 1883 and was commissioner of public parks of New York in 1891.

**DANA, RICHARD** (1699-1772). An American jurist. He was born in Cambridge, Mass., graduated at Harvard in 1718, and soon became one of the leaders of the Massachusetts bar. He was also prominent, as a Whig, in Colonial politics, frequently presided over Boston town meetings, was chosen to administer the oath to Andrew Oliver binding him not to carry out the provisions of the Stamp Act, and in 1770 was a member of the committee appointed to make a careful investigation of the Boston Massacre.

**DANA, RICHARD HENRY** (1787-1879). An American poet, essayist, and novelist, born in Cambridge, Mass., Nov. 15, 1787. He entered Harvard College in 1804, but remained there only three years. Adopting law as a profession he was admitted to the Boston bar in 1811, but after some activity in politics renounced the practice of law for literature. In 1815 he became associated with the *North American Review*, to which he contributed, and of which he was for a time an editor. He then (1821) started a miscellany, *The Idle Man*, to which his friend Bryant contributed, but which came to an end after the sixth number had been issued. His published works are: *Poems* (1827); *Thoughts on the Soul* (1829), a poem; *Poems and Prose Writings* (1833; enlarged ed., 2 vols., 1850), the best of which were republished in *The Buccaneer and Other Poems* (London, 1844). He did his best work as a critic and had considerable influence in forming the taste of New

England in the early part of the century. His poetry was good for the time, but is read little to-day. "The Buccaneer" is probably his best poem; his prose tales, such as "Paul Felton," display imagination, but are poorly constructed.

**DANA, RICHARD HENRY** (1815-82). An American author, born in Cambridge, Mass., a son of Richard Henry Dana the poet. He developed in early life a passion for the sea and was with difficulty restrained from entering the navy. He entered Harvard, but suffered from weak eyes, and, to cure them, undertook a Pacific voyage as a common sailor, a record of which is given in his sea classic *Two Years Before the Mast* (1840; augmented ed., 1869), a book often republished and translated. On his return Dana reentered Harvard and graduated in 1837. He studied law and attained eminence in practice. On sea usages and laws he wrote *The Seaman's Friend* (1841), reprinted in England as *The Seaman's Manual*. He contributed to legal journals and to the *North American Review*, wrote *To Cuba and Back* (1859), and edited *Wharton's International Law* (1866). In 1876 he was appointed Minister to England, but was refused confirmation through a paltry political intrigue and unfounded accusations of plagiarism. He richly deserved the honor because of his patriotism, his high character, and his diplomatic and legal learning. To prosecute studies on international law he went to Europe in 1878. He died in Rome of pneumonia. Consult Adams, *Richard Henry Dana: A Biography* (2 vols., 1890). *Two Years Before the Mast* retains its position as a classic in its kind. A notable edition of it, with an introduction by Dr. Wilfred T. Grenfell and with illustrations, appeared in New York and London in 1911.

**DANA, RICHARD HENRY** (1851- ). An American lawyer, son of Richard Henry Dana (1815-82). He was born in Cambridge, Mass., graduated from Harvard College in 1874 and from Harvard Law School in 1877, and was admitted to the bar in Boston. In 1878-79 he organized the Associated Charities of Boston. He drafted the Civil Service Reform Act of Massachusetts in 1884 and the Australian Ballot Act in 1888, and from 1889 to 1892 was editor of the *Civil Service Record*. His activities in behalf of civil service, taxation, ballot, election, and social reforms led to his being made chairman of the Council of the National Civil Service Reform League. He is author of *Double Taxation in Massachusetts* (1895); *The Corrupt Practices Act* (1906); *The Australian Ballot System of Massachusetts* (1911); *Trent: an Aftermath* (1912).

**DANA, SAMUEL LUTHER** (1795-1868). An American chemist. While chemist of the Merrimack print works he invented a method of bleaching cotton goods which was widely adopted, and discovered that sodium phosphate is a mordant, a fact of considerable importance in the art of calico printing. His writings include *A Muck Manual for Farmers* (2d ed., 1843) and *An Essay on Manures* (1850).

**DANA, WILLIAM PARSONS** (1833- ). An American marine, genre, and animal painter, born in Boston. He studied art in Paris under Picot and Le Poitevin and lived in New York and Newport from 1862 to 1870. He then took up his permanent residence in Europe. He depicts the sea in all its phases and reaches a high degree of poetry and sentiment in such marines as "Solitude," exhibited at the Paris Exposition

in 1878, where he was also awarded a medal for his "Gathering Seaweed." Other good examples are "Emby's Admiral" (Pennsylvania Academy of Design, Philadelphia); "Burning Wreck"; "Ebbtide at Yport"; "Chase of the Frigate Constitution," and "Heartsease" (Metropolitan Museum, New York), the best known of his genre pictures, which, though happy in composition, are rather weak in execution. He was elected to the National Academy of Design in 1867.

**DANAË**, dān'ā-s (Lat., from Gk. Δανάη). The daughter of Acrisius, King of Argos. According to the legend, an oracle declared that her son would kill his grandfather. Acrisius therefore confined Danaë in an underground chamber or in a tower of bronze. Here she was visited by Zeus in a shower of gold and bore him Perseus (q.v.). Acrisius set mother and child adrift in a chest. They came safely, however, to the island of Seriphos. Danaë remained in the island until Perseus had grown up and become a hero famous for his exploits. She afterward accompanied him to Argos. On his approach Acrisius fled, but was subsequently slain accidentally by Perseus at Larissa. Danaë's story was often told in Greek and Roman tragedy. Rembrandt, Correggio, and Titian have made the picturesque union of Danaë and Zeus the subject of famous paintings, which hang respectively in the Hermitage at St. Petersburg, the Palazzo Borghese at Rome, and the Museo Nazionale at Naples. A second Titian on the same myth is in the Imperial Gallery, Vienna. Consult Gayley, *The Classic Myths in English Literature and Art* (Boston, 1911).

**DANAËUS**. See DANAUS.

**DANAI**, dān'ā-i, or **DANAOI**, dān'ā-oi (Lat., from Gk. Δαναοί, *Danaoi*). A term originally applied to the Argives as the descendants of King Danaüs (q.v.). Homer uses the name as a general designation of the Greeks before Troy.

**DANAIDE**, dān'ā-id (from Lat. *Danaides*, Gk. Δαναίδες, the 50 daughters of Danaüs, condemned, with one exception, to pour water eternally into sieves as a punishment for murdering their husbands on their wedding night at their father's bidding). An early form of water wheel, sometimes called a tub wheel. It resembled a smaller tub set in a larger one, with a free annular space and with a horizontal space between the two bottoms provided with radial floats, arranged spirally. The whole device revolved on a vertical axis, water flowing through it vertically.

**DANAIS**, dān'ā-is (Neo-Lat., from Gk. Δανάη, daughter of Danaüs). A genus of large blue- and brown-winged, strongly marked nymphalid butterflies of the tropics, of especial interest to the students of mimicry and protective coloration. According to Bates and Wallace certain South American species are distasteful to the local birds, monkeys, and other butterfly hunters, and therefore fly about regardless of exposure; and they are "mimicked" by other butterflies, which are eatable, in order to secure immunity through this gradually acquired resemblance. (See *MIMICRY*.) An Australian species is the bugong "moth," whose grub the aborigines regard as a dainty. (See *BUGONG*.) The representative of the group in the United States is the familiar milkweed butterfly, formerly classified as *Danais arctippus*, now known as *Anosia pleurippus*. See *MILKWEED BUTTERFLY*.

**DANAKIL**, dā'nāk'il. An Ethiopian people, calling themselves Afar. See also *AFRICA, Ethnology*.

**DANAO**, dā-nā'ō. A town of Cebu, Philippines, situated 4 miles north of Cebu, on the coast, near the mouth of the Danao River (Map: Philippine Islands, E 5). Its harbor is poor, the mouth of the Danao River being choked by a sand bar. The town is very old, having existed from the time of the Spanish conquest. Pop., 1903, 16,173.

**DANAËS**, dān'ā-īs (Lat., from Gk. Δαναός). In Greek legend, the son of Belus and Anchinoë, grandson of Poseidon, brother of Ægyptus, and originally ruler of Libya. Thinking his life in danger from the machinations of his brother, accompanied by his 50 daughters, known as the Danaides, he fled to Argos, where he was chosen king, after the banishment of Gelanor, the last of the Inachidæ. The 50 sons of Ægyptus followed him and sought the hands of his daughters in marriage. Danaüs consented, but, in fear of treachery or in revenge for his exile, gave each of his daughters a dagger and made them promise to murder their husbands on their wedding night. All did so, except Hypermnestra, who saved her husband, Lynceus. The future of the Danaides was variously told. According to one version, Danaüs found no suitors for his daughters and finally offered them as prizes in a racing contest. They were thus married to the Argive youth and became the ancestors of the Danai. The story of Lynceus was also variously told: according to one version Hypermnestra was forgiven, and Lynceus chosen by Danaüs as his successor. The other version was that Lynceus later slew Danaüs and his guilty daughters. The Danaides in the lower world were condemned to the never-ending task of filling with water a vessel full of holes. The Danaides seem to have been regarded as nymphs of the springs in the plain of Argos; Danaüs is said to have been the first to dig wells for the inhabitants, who thereupon chose him king. The murder of their husbands by the Danaides has been supposed to represent the drying up of the springs and rivers in summer by the nymphs. The tomb of Danaüs, in the Agora of Argos, was shown as late as the time of Pausanias. See *DANAIDE*.

**DANBURITE**. A silicate of calcium and boron crystallizing in the orthorhombic system. It was first found at Danbury, Conn.

**DANBURY**. A city and one of the county seats of Fairfield Co., Conn., 64 miles by rail north-northeast of New York City, on the Danbury and Highland divisions of the New York, New Haven, and Hartford Railroad (Map: Connecticut, B 4). Noteworthy features include the State normal school, Danbury Hospital, Danbury Agricultural Society, courthouse, State armory, county jail, public library, parks, two soldiers' monuments, and one to General Wooster. The manufacture of hats dates from 1780, and the city in 1914 stood first in that industry in the United States. Other products are machinery for making hats and cutting fur, paper and wooden boxes, underwear, silk, and silver-plated ware. The government is vested in a mayor and a city council, which confirms the mayor's nominations to the police department and elects all other administrative officials. The water works are owned by the city. Pop., (town) 1900, 19,474; 1910, 23,502; (city) 1900, 16,537; 1910, 20,234.

**Danbury** was organized as a town in 1687, was incorporated as a borough in 1822, and was chartered as a city in 1889. Supplies were stored here during the Revolution, and in April, 1777, General Tryon destroyed the stores and burned a large number of the buildings. A force pursued, and, in a skirmish at Ridgefield, General Wooster (q.v.) was mortally wounded. Consult Bailey, *History of Danbury, 1684-1896* (New York, 1896).

**DANBY, FRANCIS** (1793-1861). An Irish painter, born at Common, near Wexford, Nov. 16, 1793. He entered the Royal Dublin Society's school and also studied under O'Connor. In 1820 he began to exhibit, at the Institute and Royal Academy, a number of romantic compositions, such as "Disappointed Love" (South Kensington Museum) and "Sunset at Sea after a Storm," which established his reputation. For "The Delivery of Israel out of Egypt" he was made associate of the Academy, and three scenes from the Apocalypse increased his growing popularity; but in 1829 he was forced to leave England on account of a domestic scandal and went to live in Switzerland. After his return in 1840 he settled at Exmouth, where he painted a number of poetical landscapes, usually sunrise or sunset effects, such as "The Fisherman's Home" (National Gallery, London), and the "Evening Gun." He was a painter of imaginative scenes, reproducing his impressions of nature in a fanciful style which sometimes erred on the side of the theatrical. His execution is smooth and thin. His son, JAMES FRANCIS DANBY, was a landscape painter of some repute.

**DANBY, FRANK** (MRS. JULIA FRANKAU) (1864-1916) A British author. She received her education under Mme. Paul Lafargue, the eldest daughter of Karl Marx, and in 1883 she was married to Arthur Frankau. She contributed to the *Saturday Review* and gained popularity as a novelist. Her writings include: *Dr. Phillips, a Mauda Vale Idyll* (1887). *A Babe in Bohemia* (1889; 3d ed., 1913); *Eighteenth Century Colour Prints* (1900); *Life of John Raphael Smith* (1902); *The Lives of James and William Ward* (1904); *Pigs in Clover* (1903; 2d ed., 1913); *Baccarat* (1904); *The Sphinx's Lawyer* (1906); *A Coquette in Crape* (1907); *The Heart of a Child* (1908; 2d ed., 1913). *An Incomplete Etoman* (1909). *Sebastian* (1909); *Let the Roof Fall In* (1910). *The Story of Emma, Lady Hamilton* (1910); *Joseph in Jeopardy* (1912; 2d ed., 1913); *Concert Pitch* (1913); *Full Swing* (1914).

**DANBY, THOMAS OSBORNE, EARL OF** (1631-1712). An English statesman, Duke of Leeds after 1694. He entered Parliament in 1665, with Buckingham attacked Clarendon in 1667, and became Treasurer of the Navy in 1671. In 1673 he was appointed Lord High Treasurer and in 1674 was created first Earl of Danby. During five years of power he showed himself a venal and unscrupulous politician and was party to Charles II's shameful negotiations with Louis XIV of France. In 1678 he was accused of carrying on treasonable negotiations with France—partly as a result of Louis XIV's intrigues against him—and imprisoned in the Tower, with some interruptions, for five years, his conviction being delayed by repeated dissolutions of Parliament. The marriage of Mary, daughter of the Duke of York, to William of Orange was due mainly to his persistent efforts,

and upon the accession of William III in 1689 he became President of the Council. He was impeached for bribery in 1695, but the charge was not pressed for lack of evidence.

**DANCE, GEORGE, JR.** (1741-1825). An English architect, born in London. He was associated with his brother Nathaniel in the foundation of the Royal Academy, of whose original members he was for several years the last survivor. Newgate Prison was rebuilt in 1770 from his plans, and the front of the Guildhall was also designed by him. In later life he exhibited chalk portraits.

**DANCE OF DEATH.** See **DEATH, DANCE OF**. **DANCETTE**, *dān-sét'* (Fr., irregular formation from Lat. *dens*, tooth). One of the lines of partition in heraldry, which differs from indented (q.v.) only in the greater size of the notches. The indentations where the division is *per fess dancette* never exceed three in number.

**DANCING** (from *dancer*, from OF. *dancer*, *danser*, Fr. *danser*, to dance, from OHG. *dānōn*, to drag, from *dansan*, OS. *thinsan*, to drag; connected with Lat. *tenuis*, cord, Gk. *relais*, *teinein*, Lith. *tensti*, Skt. *tan*, to stretch). The origin of dancing may be traced to a universal desire of expressing emotion by action. At a later period comes the element of pantomime, the suggestion of an *idea* by means of motions. As far into antiquity as history reaches, every dance, whether belonging to civilized or to savage nations, was accompanied by music, or by rhythmic beats on the drum, shells, rattle, sticks, or by clapping of hands. Frequently the dance was accompanied by chants or songs. Records show in a general way that in the very earliest times people danced and sang at the same time; afterward some danced while others sang an accompaniment, and finally musical instruments took the place of voice accompaniment. Ultimately music and the dance separated, the former improving and the latter deteriorating.

A consideration of savage dances as we find them at present (and it is remarkable how world-wide are the principal forms) will give us a general idea of dancing before the beginnings of civilization. Folk dancing may be divided into three groups—*social*, *warlike*, and *religious*. Under the first may be included all comic and erotic dances. Under the second we have those dances which were used to inspire the warriors before a battle, to celebrate a victory, or to imitate the motions of animals after a successful hunt. The *religious* class comprises medicine, incantation, and mystery dances. Although this general classification does not by any means exhaust the list of savage dances, it will be found that all others are derivative or of merely local importance. In all forms of savage dancing exactness is insisted upon. Each dance has its particular step, and among certain tribes mistakes on the part of the performer are sometimes punished by death. This insistence on absolute precision is characteristic of their idea of dancing. It is a serious business, and even in comic dances the performer maintains an air of absolute gravity. The separate forms of savage dances are too numerous to describe, but of greatest importance are the religious ones. A common custom is the dancing of women while the men are away at war. It is a sort of prayer, for they continue it day and night, believing that by so doing they protect the warriors from evil spirits and from danger. The medicine dances have two purposes—one to

ward off harmful influences; the other, strange as it seems, to keep the patient awake. This latter motive is explained by the belief of some savages that when a man is asleep his soul temporarily leaves his body. When he dies, the departure of his soul is final; if, then, the sick man falls asleep, his soul may take advantage of the opportunity to go away and not return; and consequently the most heroic measures are employed to keep him awake. However, all such ideas apply to particular tribes and are by no means universal. Dancing is universal, but the motives vary from tribe to tribe. In the savage mysteries, as in the Greek, dancing plays an important part; but so great and universal is the secrecy maintained about them that we know practically nothing of the elaborate dances used. One of the most sacred rites is the initiation of a lad to manhood. Sword, snake, and fire dances are especially developed among the American Indians.

**Ancient Dances.** In Egypt dancing reached a state of considerable excellence, for, although Egyptian dances were monotonous and unimaginative, the use of the body and of the hands and arms was carried to great perfection. Their most important dances—those in honor of the dead—were slow and gliding, but they had also many lively forms. Being almost entirely religious, most of their dancing consisted of men and women in procession. The *pirouette* in particular was developed in Egypt about 4000 years ago. As dancing was never, at least in the early and middle empires, practiced by the higher classes, its cultivation was carried on wholly from the religious and spectacular standpoints. See EGYPTIAN MUSIC.

Hebrew dancing was essentially a religious rite. It was an act of praise, and no religious festival or feast was complete without dances. Miriam, leading out the women in a dance, is typical of a form used in Arabia to-day. It should be noticed that each sex danced by itself, and that in this particular Hebrew dancing differed from its Egyptian prototype. See HEBREW MUSIC.

When we come to Greece, we approach the golden age of the art of dancing. Here for the first time it ranked with poetry and music, and, as Lucia expresses it, dancing and music were "the married pair." This relation was known as *orchēsis*. Heretofore dancing had represented emotions; now it was also made to represent ideas, and pantomime arose. Hands and arms were used still more than legs; but an atmosphere of gayety and expressiveness foreign to Oriental nations was created. The Greeks were a cheerful nation, whose sense of dignity did not interfere with their dancing, as it did in the case of the Romans; and as long as their morality remained unshaken the dance retained its purity. It was at first religious, then educational, and finally popular. There were four great classes of sacred dances—the *Emmelia*, the *Hyporchēma*, the *Gymnopædia*, and the *Endymatia*. From these four types the later forms were derived. The characteristics of the first were its gentle gravity, strength, and nobility. It was danced without the support of either a chorus or a voice. The second class was danced by both men and women and was of a dignified, elevated character, usually with a chorus. The *Gymnopædia* was a favorite of the Lacedæmonians in the festivals of Apollo. It was danced by youths and was often a pre-

liminary to the wild Pyrrhic dance. In the last, the *Endymatia*, the performers wore most brilliant clothes, and this was the first of all the sacred dances to lose its sacred character and become merely a popular dance. The military dances came later and were principally educational. They were divided into two groups: (a) Pyrrhic and (b) Memphitic. The first was really a military pantomime and was used especially at festivals in honor of Minerva. It was danced by both men and women, was wild and rapid, and finally degenerated into the rites of Bacchus. The Memphitic was less warlike and wild, but its general character was the same. On the Greek stage there were tragic, comic, and satiric dances. The costumes and scenic arrangements were often elaborate, and the evolutions were accompanied by choral song. The forms were multitudinous, and the performers became so adept in the expression of emotions that the sculptors and painters of Greece selected them as their models, and it is from Greek sculpture we get most of the history of the Greek dancing. Although the pantomime was introduced first in Greece, it never reached the height of perfection which characterized it among the Romans.

Rome borrowed her dances, but adapted and made them more vivid. The *Belceprea* was a war dance said to have been invented by Romulus. The Salian dance was the original of many later forms and was danced by the priests of Mars. Later the Romans took some forms from Etruria and still others from Greece. One of the most interesting of their dances was the May-day dance, which corresponded to the flower dance of the Greeks. It is really the original of the old English May-day sports, for, as in England, the youths and maidens danced out into the fields, gathering flowers and branches, returning to the city again to continue their dancing. Upon the deterioration of Greek power Rome inherited its arts, and among them its dances, to which she added more pantomime and an increasing use of the saltatio, or leap. In the reign of Augustus the dance was introduced into the theatre. It became widely popular, there being at the time about 3000 foreign women dancers in Rome. At this time pantomime had reached its height, fable, history, poetry, all being perfectly expressed in mute action. The most cultured persons studied the art; but under Nero and his successors the decline began, dancing became exaggerated and licentious, and, falling into disrepute, was shunned by the higher orders.

**Early and Mediæval Dances.** After the fall of Rome dancing as an art practically disappeared. Christianity at first encouraged it as an inheritance from the Jews; St. Basil recommended the practice of the dance on earth because it was the principal occupation of the angels in heaven, and sacred dances were given on feast days and later every Sunday. In reality they were hardly so much dances as processions, each sex going through the evolutions separately. Gradually, however, they degenerated from their solemn character, and in 692 were expressly forbidden by the Church, though they still lingered in some localities for a considerable length of time. There are curious survivals of these old church dances, such as *Los Sereses* (q.v.), which is still performed annually by the choir boys in the cathedral at Seville, on Corpus Christi and the Immaculate Conception; the

*Giulia di San Paolino* is a ritual dance performed on June 26, in front of the cathedral of Nola, near Naples, in honor of San Paolino, who, on his return from Barbary, was met by a procession of the citizens of Nola. Meanwhile the simpler forms of the dance had been preserved by the peasants of Gaul, who kept them alive until they were taken up by the knights and nobles. In Spain the heritage of dances left by the Romans was more or less imperfectly preserved. Even the Arab invasion could not completely destroy the old forms; and there are some dances used at present in Spain, such as the *Turdion* and *Gibidana*, which date from about the twelfth century. Liveliness is characteristic of early as well as later Spanish dances.

Dancing in Germany and England developed along the lines originated by the barbaric nations which governed their early history. In England the egg dance and the Carole were derived from Saxon sources. The Morris dance was introduced in the reign of Edward III. All English dances are lively and varied in motion. In Germany, war, funeral, and harvest dances were among the earliest popular kind, and with the formation of the guilds each trade adopted its characteristic dance. Hans Sachs gives an excellent description of the Schönpart, which was a carnival dance peculiar to the city of Nuremberg. From the thirteenth century on, each class of society had its own dances, but there were two general classes—the "circular dance" and "the measure." The first was a rapid, uneven sort of dance, the second, a slow, gliding movement.

**Modern Dances.** The revival of dancing as an art began in Italy in the fifteenth century. The Renaissance awoke an interest in dancing as well as in the other arts, and ballets were given on an elaborate scale. Catharine de' Medici introduced the fashion into France, and from that time on France has led the world in the refinement of its dances and the gracefulness of its performers. It borrowed dance forms from almost every civilized country, but so adapted and changed them that their value was immeasurably increased. The origin of modern French forms may be traced to the *dances basses* and the *dances hautes* of the sixteenth century. The former were so called because of their slow, even motion; they were practiced by the nobility. The *dances hautes* were lively, jumping dances and were performed only by the country people and the lower classes. Later the *galliard*, *courante*, and *volta*, which were of a more lively character than the old court dances, were introduced; and still later the *branle* became popular. It was a dance of exceedingly varied character, each province having its own form, the *passepied* of Bretagne and the *minuet* of Poitou being brangles. Court entertainments had developed into formal ballets, and Richelieu gave many famous performances during the reign of Louis XIII, while Louis XIV was himself an enthusiast of the dance, founding in 1661 the Academy of the Dance. In the seventeenth century many of these court dances were enjoyed for the sake of the music alone, and the idea arose of playing several of them in succession as a merely instrumental entertainment. Out of this custom originated the suite. The suites of Bach, Handel, and Corelli contain excellent examples of some of these old dances. In Italy these groups of dances were early known as

*Sonate da Camera*. As the classic composers used these old dance forms, so modern composers have utilized more recent dances in their compositions. Thus the *csárdás* is found in Liszt's *Hungarian Rhapsodies*; the *seguidilla* in Bizet's *Carmen*; and there is a charming series of Spanish dances in Massenet's *Le Cid*. The list of national dances is large, but the most representative are the *acquadilla*, *cachucha*, *fandango*, and *bolero* of Spain, the *tarantella*, the *saltarello*, and the *forlana* of Italy; the *mazurka* and the *polonaise* of Poland, the *camaica* of Russia; the *reel* and the *Highland fling* of Scotland; and the *jig* in Ireland and Wales. Numerous classes of national dancers have arisen, of which the Bayederes or Nautch girls in India and the Geishas in Japan are well-known examples. In all the Eastern countries the dance is really a sort of pantomime containing a series of gestures, postures, and mimics.

Of the more popular modern dances, the *quadrille* is probably the oldest. Its recent development dates from 1815, but before that time it was common in Europe for centuries. The *lancers* was invented in 1836; the *polka* was introduced about 1835; and the *waltz*, from Germany, about 1795. The *tico-tico* is of American origin. During the nineteenth century, owing to the growing popularity of the dance as a theatrical entertainment, the purely social variety has tended to follow the theatre, as it has not done before. Until 1850 the ballet reigned supreme, and private dancing was popular, but with the decline of the stage type in favor of the high kickers and skirt dancers, the waltz, too, which had reigned supreme in social life, became spiritless and out of joint with the times. Of course, in countries like Spain, where the dance is part of the national life and not a social occupation, there was no change. In England, France, and America during this period the dance was engaged in perfunctorily at formal balls, and it was not until the introduction of the two-step about 1890 that interest revived. A few years later, in 1896, Isadora Duncan, a young American girl, after having received little recognition in America, appeared in France in a revival of classic dances and took Paris by storm. After her followed Maud Allan and Adeline Genee. Ruth St. Denis then gave her interpretation of Oriental dances, most famous of which was the Nautch dance. With the visit of ballet performers from the Russian Imperial School to other European capitals, public interest began to revive. In 1911 the "negroid and animal" dances began by the introduction of the *turkey-trot* in San Francisco, Cal. In its train followed the *bunny hug*, the *grizzly bear*, the *Texas Tommy*, and others, all variations of the *turkey-trot*, which spread rapidly over Europe and America. Even more popular proved the *tango* (Tango Argentina), a dance of doubtful character from the Argentine Republic, which being expurgated created a *dansomania* on the Eastern and Western continents. For a discussion of the development of the *ballet*, see that article. There is no authoritative and comprehensive history of dancing, but the best works are: Grove, and collaborators, *Dancing* (London, 1895); Vuillier, *A History of Dancing*, trans. from the French (New York, 1897); Giraudet, *Traité de la danse* (Paris, 1900), which gives exact descriptions of a great number of dances; Cahusac, *La danse ancienne et moderne* (La Hague, 1754), which,

although completely out of date, contains much of historical value; and Emmanuel, *La danse grecque antique d'après les monuments figurés* (Paris, 1896); Flicht, *Modern Dancing and Dancers of Today* (New York, 1912). See also ALLEMANDE; BAYADERE; BOLEERO; CACHUCHA; CANARIE; CANCAN; CARMAGNOLE; CHACONNE; CORROBOREE; COTILLON; COUNTRY DANCE; COU-RANTE; CSÁRDÁS; EGG DANCE; FANDANGO; FARANDOLE; FIRE DANCES; FLOWER DANCE; GALOP; GAVOTTE; GEISHA; HIGHLAND FLING; HORMOS; HORNPIPE; JIG; JOTA; KIRMESS; LANCERS; MAY DANCE; MAZURKA; MEDICINE DANCES; MINUET; MORRIS DANCE; NAUTCH; PASSEPIED; PAVANE; POLKA; POLONAISE; PYRRHIC DANCE; QUADRILE; REDOWA; REEL; RIGADON; SALMON DANCE; SARABANDE; SCHOTTISCHE; SEGUIDILLA; SICILIANA; COVERLEY, SIR ROGER DE; SNAKE DANCES; SUN DANCES; SKIRT DANCES; STRATHSPEY; SWORD DANCES; TAMBOURIN; TARANTELLA; TARASQUE, LA; TORCH DANCE; WALTZ.

**DANCING FAUN.** An antique bronze representing a faun dancing and snapping his fingers to mark the time. It was discovered in 1853 in a house in Pompeii, hence known as the House of the Faun.

**DANCING GIRLS.** See BAYADERE; GEISHA; NAUTCH.

**DANCING MANIA.** A form of epidemic disorder allied to hysteria (q.v.), and evidently the result of imitative emotions acting upon susceptible subjects, under the influence of a craving for sympathy or notoriety. There is little doubt that imposture entered to a considerable extent into all the epidemic forms of the dancing mania, which indeed were usually attended by consequences that showed clearly the presence of impure motives; but there is also evidence that in many cases the convulsive movements were really beyond the control of the will, whatever may have been the original character of the motives that promoted them. Epidemics of this sort were common in Germany during the Middle Ages, in Italy a somewhat similar disease was ascribed to the bite of a spider called the tarantula (see TARANTISM), and similar convulsive affections have been witnessed in Abyssinia, India, and even in comparatively modern times and in the most civilized countries in Europe, under the influence of strong popular excitement, especially connected with religious demonstrations. The true dancing mania of the Middle Ages, however, prevailed chiefly in the crowded cities of Germany.

In July, 1374, there appeared at Aix-la-Chapelle assemblies of men and women who began to dance on the streets, screaming and foaming like persons possessed. The attacks of this mania were various in form, according to mental, local, or religious conditions. The dancers, losing all control over their movements, continued whirling in wild delirium till they fell in extreme exhaustion, and groaned as in the agonies of death; some dashed out their brains against walls. When dancing, they were insensible to external impressions, but were haunted by visions, such as of being immersed in a sea of blood, which obliged them to leap high, or of seeing the heavens open and the Saviour enthroned with the Virgin Mary. The frenzy spread over many of the towns of the Low Countries. Troops of dancers, inflamed by intoxicating music and followed by crowds, who

caught the mental infection, went from place to place, taking possession of the religious houses and pouring out imprecations against the priests. The mania spread to Cologne, Metz, and Strassburg, giving rise to many disorders and impostures and much profligacy. Exorcism had been found an efficacious remedy at the commencement of the outbreak; and in the beginning of the sixteenth century Paracelsus, that great reformer of medicine, applied immersion in cold water with great success. At the beginning of the seventeenth century the St. Vitus's dance, as the affection was called (see CHOREA), was already on the decline; and it now occurs only in single cases as a sort of nervous affection. For a detailed account of the phenomenon, consult Hecker, *The Dancing Mania of the Middle Ages* (3d ed., London, 1859), from which much of the above account is abridged.

**DANCLA**, dän'klä', JEAN BAPTISTE CHARLES (1818-1907). A French violinist and composer. He studied under Baillot, Halévy, and Berton, and gained many prizes for his proficiency. In 1857 he was appointed professor of the violin at the Paris Conservatory and had many eminently successful pupils. He was famous for his execution and tone as a player, as much as for his many successful compositions, notably his *Etudes*, and exercises for the violin.

**D'ANCONA**, ALESSANDRO. See ANCONA.  
**DANCOURT**, dän'kūr', FLORENT CARTON (1661-1725). A French dramatist and actor. He was born at Fontainebleau, Nov. 1, 1661, and was educated by the Jesuits. He practiced law for a time, but after marrying an actress, Thérèse Lenoir de la Thorillière, took to the stage, and in 1685 the two appeared as actors at the Théâtre Français with popular success and royal favor. In that year his first play, *Le notaire obligant*, won applause. It was followed by many others, of which *Le chevalier à la mode* (1687) is his best. In 1718 he retired from Paris and the stage and occupied his declining years with a metrical version of the *Psalms* and a sacred tragedy. He died at Courcelles (Indre et Loire), Dec. 6, 1725. His rather farcical comedies are best when dealing with middle and low life and the peasantry. They are easy and witty in dialogue, realistic in treatment, and not infrequently introduce events and persons of passing notoriety. His two daughters, Manon and Mimi Dancourt, also became distinguished members of the Théâtre Français. Dancourt's *Works* were collected in 12 vols. (1760), his select *Works* in 5 vols. (1810), and, in 1884, an edition of Dancourt's best plays appeared under the title of *Théâtre choisi*, with a preface by F. Sarcey, the eminent dramatic critic. Consult Lemaître, *La comédie après Molière et le théâtre de Dancourt* (Paris, 1882).

**D'ANCRE**, dän'kr'. See ANCRE.

**DANDELION** (Fr. *dent de lion*, tooth of a lion, referring to the teeth on the leaves), *Taraxacum officinale*. A stemless perennial or biennial plant of the family Compositae, native to Europe and Asia, and now common in all temperate countries. A red-seeded dandelion (*Taraxacum erythrospermum*) occurs in dry situations from Maine to Pennsylvania. This plant is usually smaller and the leaves more divided than those of the common dandelion. The dandelion is used to a considerable extent, both in Europe and the United States, for greens, and the blanched leaves for salads. Several im-

proved varieties, mostly of French origin, are in cultivation. The root is employed in medicine and is sometimes ground and used to adulterate coffee. The plant called the fall dandelion is *Leonodon autumnalis*. For illustration, see **SALAD PLANTS**.

**DANDIE DINMONT.** See **TERRIER**.

**DANDIN**, dūn'dēn. A Sanskrit author who is believed to have flourished in the latter part of the sixth century A.D. He composed a well-known Sanskrit novel, or series of stories, entitled *Dasa-kumāra-carita*, or *Adventures of the Ten Princes*, a sort of romance of roguery. He is also the author of a valuable rhetorical treatise entitled *Kāyādarśa*, or *Mirror of Poetry*, and some scholars, like Pischel, have sought to ascribe the Sanskrit play *Mrecha-katikā* (q.v.) to his pen. Dandin was probably the earliest of the Sanskrit novelists whose works are extant, preceding Subandhu, the author of the romance *Vasavadattā*, which formed the model for Bana's *Kādambarī*. Dandin's works have been edited several times: *Dasa-kumāra-carita* (London, 1846; ed., with native commentaries, Bombay, 1883-89; also, with notes by Bühler and Peterson, ib., 1873-91), and translated into English by Jacob, under the title *Hindoo Tales* (London, 1873), by Bhattacharyya (Calcutta, 1899—incomplete), into French by Fauche (Paris, 1862), and into German by J. J. Meyer (Leipzig, 1902). There is an edition with German translation of the *Kāyādarśa* by Bohtlingk (ib., 1890).

**DANDOLO**, dān'dō-lō. A famous Venetian family, already powerful in the seventh century, which furnished four doges.—The most illustrious of its members was **ENRICO DANDOLO**, born about 1120. Eminent in learning, eloquence, and knowledge of affairs, he ascended from one step to another until in 1171 he was sent as Ambassador to Constantinople and in 1193 became Doge. In this latter capacity he extended the bounds of the Republic in Istria and Dalmatia, defeated the Pisans, and took part in the Fourth Crusade (q.v.). By this Venice obtained great possessions in the Ionian Sea and the Archipelago, several harbors and tracts of land on the Hellespont, in Phrygia, the Morea, and Epirus, and also, by purchase, the island of Crete. Soon after the conquest of the Byzantine Empire by the Crusaders Dandolo died (June, 1205) in Constantinople and was buried in the church of St. Sophia. His monument was destroyed by the Turks at the taking of Constantinople in 1453.—**ANDREA DANDOLO**, Doge from 1343 to 1354—was the author of a Latin chronicle recording the history of Venice from the pontificate of St. Mark to the year 1339 in 10 books. The last seven books are printed in Muratori, *Rerum Italicarum Scriptores*, vol. xii. Consult Kretschmayr, *Geschichte von Venedig*, vol. i (Gotha, 1905); Simonsfeld, *Andreas Dandolo und seine Geschichtswerke* (Munich, 1876).

**DANDOLO**, **VINCENZO**, COUNT (1758-1819). An Italian chemist and agriculturist. He was born in Venice, studied at Padua, and became a chemist in his native city. When Venice came under Austrian rule, he went to Milan, where he became a member of the Grand Council of the Cisalpine Republic. He went to Paris in 1799, but soon afterward returned to the vicinity of Milan and engaged in scientific agriculture. In 1805 Napoleon made him Governor of Dalmatia, where he proved himself an ex-

cellent officer. In 1809 he returned to his estate near Varese, where he contributed much to the progress in silkworm culture, and distinguished himself by draining marshes and introducing better methods of agriculture. He published *Fondamenti della fisiocchimica applicati alla formazione de' corpi e de' fenomeni della natura* (6th ed., 1796), and *Il buon governo de' bacchi da seta* (1816).

**DANDRIDGE**, N (ATHANIEL) **PENDLETON** (1846-1910). An American surgeon, born in Cincinnati, Ohio. He graduated from Kenyon College in 1866, studied at the Medical College of Ohio and also in Paris and in Vienna, and received his M.D. from the College of Physicians and Surgeons (Columbia) in 1870. From 1880 to 1907 he served as professor of surgery at Miami Medical College, and he was surgeon to the Cincinnati Hospital and to the Episcopal Hospital for Children. In 1903 he was president of the American Surgical Association.

**DANDRUFF**. See **HAIR**; **PITYRIASIS**.

**DANDUBAIND**, dān'du-rān', RAUL (1861- ). A Canadian lawyer and statesman, born at Montreal and educated at Montreal College and Laval University. He studied law, was admitted to the bar in 1883, and rapidly gained an extensive practice, being acknowledged as one of the leaders of the provincial bar. He was prominent as a local organizer of the Liberal party, and served as member of the Royal Commission on Education in the Province of Quebec in 1910. He was appointed a member of the Senate in 1898, was Speaker of the Senate in 1905-09, and in the latter year became a member of the Privy Council. He published a treatise on criminal law and manuals for police officers and justices of the peace.

**DANDY FEVER**. See **DENGUE**.

**DANE**, GREAT, or **GERMAN BOARHOUND**. See **HOUND**.

**DANE**, **NATHAN** (1752-1835). An American legislator and jurist, born in Ipswich, Mass. He graduated at Harvard in 1778, studied law in Salem, began to practice in 1782 at Beverly, and was successively a member of the Massachusetts House of Representatives, the Continental Congress, and the Massachusetts Senate. In addition, he was appointed on various commissions to codify or revise the laws of the Commonwealth and was judge of Common Pleas. While in Congress, he was a member of the committee appointed to draw up an ordinance for the government of the Northwest Territory and made the original draft of that document, though in a larger sense it seems that Manasseh Cutler (q.v.) probably deserved the credit of authorship. The question of the relative credit due to each man has, however, been much debated. He was a member of the Hartford Convention (q.v.) in 1814. Dane contributed \$15,000 towards founding the Harvard Law School, and the Dane professorship of law was named in his honor. He published *A General Abridgment and Digest of American Law* (1823-29) and an *Appendix* (1830).

**DANEAU**, or **DANÆUS**, dā'nō', **LAMBERT** (c.1530-95). A French Reformed theologian. He was born at Beaugency; studied law at Orléans, Paris, and Bourges; became a Protestant in 1560; was preacher in France (1561-72); fled to Geneva on the outbreak of the St. Bartholomew massacres (Aug. 24, 1572), preached in various places, was pastor and

professor of theology at Leyden (1581-82), and died at Caspree, Nov. 11, 1595. He was the author of many learned volumes, the most famous of which is his *Ethica Christiana* (1577; 7th ed., 1640), the first Protestant attempt at a system of morals apart from dogmatics. For his life, consult Paul de Felice (Paris, 1882).

**DANEBOG**, dān'e-brōg, ORDER OR. The second in rank of the Danish orders, instituted by Waldemar II in 1219. According to tradition the order was founded in honor of the banner of Denmark, which graciously fell from heaven for the inspiration of the army. In 1500 the order was suppressed, but reinstituted in 1671, by Christian V. In 1808 Frederick VI made it an order of merit for all the Danish people. The Danebog has four degrees, besides a class composed of those on whom the cross has been bestowed for certain meritorious services, but who are not members strictly of the order. These are known as "Danebogsmænd." The decoration of the order consists of a cross of gold *pattée*, enameled with white, and bordered with red or gold. Consult Werlauff, *Om Danebog og Danebogorden* (Copenhagen, 1872).

**DANEFF**, dā'nēf', STOJAN (1858- ). A Bulgarian statesman, born in Shumla and educated in Bohemia and at Heidelberg and Paris. He became a member of the Commission of Codification after the Russo-Turkish War and in March, 1901, entered the cabinet as Minister of Education and the Interior.

He was Prime Minister and Minister of Foreign Affairs from January, 1902, to May, 1903, heading a Tzankovist (anti-Stamboulovist) cabinet and floating a foreign loan. In January, 1910, he was sent to Constantinople and secured momentary relief from the outrages of the Young Turks in Macedonia. In March, 1911, he formed a cabinet which survived only a few days. Then, when Gueshoff's ministry, a coalition of the Progressive and Nationalist parties, came into power, Daneff became President of the Chamber (Sobranje). He was one of the three Bulgarians delegated in November, 1912, to carry on the negotiations with Turkey over the armistice and one of the three sent in December to London for the Balkan-Turkish Peace Conference, in which he and Venezelos of Greece were the leading figures. On May 30, 1913, he signed for Bulgaria the Peace of London between Turkey and the Balkan allies. In June of the same year he formed a new cabinet in Bulgaria.

**DANEGELD**, dān'gēld, or **DANEGOLD**, dān'gōld' (AS. *Dene*, Danes + *geld*, *gild*, payment. Goth. *gild*, tax, OHG. *gelt*, Ger. *Geld*, money). A tax of two shillings upon each hide of land, first levied by the Witan under the Saxon King Ethelred the Unready, in 991. It was probably the first money taxation imposed in England and was used as tribute money to buy off the Danes. The tax was collected five times within 21 years. Edward the Confessor abolished the impost, but William the Conqueror revived it and, in 1084, demanded from each hide of land, not held by himself in demesne, or by his barons, a sum of six shillings, or three times the old rate. Stephen (1135-64) promised to abolish Danegeld, but it was not repealed till Henry II's time (1163). A similar tax on land, however, was still levied under another name. See *CARL'GATE*.

**DANELAW**, or **DANELAGH**, dān'lā' (AS. *Dene*, Danes + *lagu*, Eng. *law*). The name

applied to that part of England which by the provisions of the Treaty of Wedmore or Chippenham, in 878, was ceded to the Danes by Alfred the Great. It included Northumbria, East Anglia, Essex, and the northeastern part of Mercia, the boundary line being constituted partly by the rivers Thames, Lea, and Ouse and by the ancient Roman road of Watling Street. Within this region the laws and customs of the Danes were distinctly recognized and were later enumerated by Canute. The term "Danelaw" is used in contradistinction to Mercian and West Saxon law until after the reign of Stephen (1135-54).

**DANENHOWER**, JOHN WILSON (1849-87). An American Arctic explorer, born in Chicago. He graduated at the United States Naval Academy in 1870, served for a time in the line and on the coast survey, and in 1878 joined the *Jeannette* expedition for polar research, commanded by Lieutenant De Long, U. S. N. The ship was crushed in the ice, June, 1881, in lat. 77°, long. 157° E. Traveling by sleds, the crew reached Bennett's Island, July 27, whence they embarked in three whaleboats for the Siberian coast. The one containing Lieutenant Danenhower and 10 others, in command of Chief Engineer G. W. Melville, arrived at the Lena delta in September. Danenhower reached New York in June, 1882, and was compelled by an affection of the eyes to desist from further explorations. He published *Narrative of the Jeannette* (1882).

**DANES ISLAND**. A small island off the northwest coast of Spitzbergen (Map: Arctic Region, G 4). Andrée started from here for the North Pole, July 11, 1897.

**DANEWORT**. See *ELDER*.

**DANFORTH**, MOSELEY ISAAC (1800-62). An American engraver, born in Hartford, Conn. He was one of the founders of the New York Drawing Association (1825) and of the National Academy of Design (1826). He lived in London for 10 years, during which time he executed some well-known drawings of the Elgin Marbles and many of his best plates, among which are the "Sentry Box," "Don Quixote," and portraits of Washington Irving, Walter Scott, after Leslie, and others. On his return to America he worked principally upon bank-note engraving and became vice president of the American Bank-Note Company.

**DANGEAU**, dān'zhō, PHILIPPE DE COURCILLON, MARQUIS DE (1638-1720). A French courtier. After commanding the King's regiment he became aid-de-camp to Louis XIV, and in this capacity took part in the principal campaigns of the period. In 1667 he was appointed Governor of Touraine. He was a favorite at Versailles, enjoyed the fullest confidence of the King, and was the patron of Boileau, who addressed to him the well-known satire on the nobility. He was frequently sent on diplomatic missions, and he encouraged the marriage between Mary of Este (Modena) and James II of England. The *Journal* of Dangeau, a diary from 1684 to his death, is a dull but valuable historical document; the best edition is in 19 vols. (Paris, 1854-60).

**D'ANGOULÈME**, dān'gō'lam'. See *ANGOU-LÈME*.

**DANHAUSER**, dān'hōu-zēr, JOSEPH (1805-45). An Austrian historical and genre painter. He was born in Vienna, studied at the Vienna Academy under Peter Kraft, and first appeared

as an historical painter with scenes from the *Rudolph von Habsburg* (Vienna, 1824) of Johann Ladislaus Pyrker. At Pyrker's invitation he went to Venice, where he studied the great Venetian masters. On his return he determined to attempt genre subjects, in which he was very successful. He had abundant humor and fancy and chose his subjects generally from the life of the upper bourgeoisie in old Vienna. He introduced into his pictures a personal note, hitherto lacking in that style of painting, which with their fine and delicate color distinguishes them from those of his contemporaries. He also painted religious pictures, including "The Martyrdom of St. John" (1834), in the cathedral of Erlau; "Hagar and Ishmael" (1835), in the Vienna Museum. Among his genre pictures are "The Gourmand" (1836), "The Grandmother" (1843), both in the Vienna Museum, and "Liszt at the Piano" (1840).

**DANICAN**, da'né'kän', FRANÇOIS ANDRÉ. See PHILIDOR, FRANÇOIS ANDRÉ DANICAN.

**DANIČIĆ**, da'né-čhich, GUTRO (1825-82). A Serbian philologist, born in Neusatz. He studied at Pesh and Vienna, became librarian of the National Library at Belgrade, and afterward professor of the history of literature in the University there. In 1877, under commission of the Academy of Sciences at Agram, he began the compilation of the Serbian-Croatian Dictionary, of which he finished but three parts. His works further include a Serbian grammar (1863; 8th ed., 1892), a concordance to old Serbian literature (1863; 3d ed., 1864), and a history of the Serbian and Croatian languages (1874).

**DANIEL** (Heb., God is my judge). In the Book of Ezekiel (xiv. 14, 20, and xxviii. 3) a personage with this name is introduced between Noah and Job as a well-known type of wisdom and righteousness. If these passages were written by Ezekiel, they would seem to show that Daniel was already, before the fall of Jerusalem in 586, regarded as an ancient hero, but some scholars consider them as late interpolations based on acquaintance with the Book of Daniel. There is a reference to Daniel's experience in the lions' den in 1 Mace. ii. 60, but this book was not written before c.100 B.C., and it is held by many interpreters that the speech of Mattathias is the work of the author or has at least been edited by him. Daniel is not mentioned among the famous men whose praise is sung in Eccles. xiv. ff. It is not necessary, however, to suppose that the author was ignorant of Daniel, as in the case of Ezra, he may have had reasons for leaving him out. In the book that bears his name Daniel is represented as a Jewish captive carried to Babylon in the third year of Jehoiakim (i.e., 606 B.C.), who through his supernaturally imparted wisdom rose to a position as ruler of the Province of Babylon and chief of the wise men of Babylon in the time of Nebuchadnezzar (ii. 48), and as one of the three presidents who were set over the satraps in the reign of Darius the Mede (vi. 2). According to i. 21 his career extended until the first year of Cyrus; according to x. 1 he is said to have had visions as late as the third year of Cyrus, but the oldest Greek version has the first year of Cyrus, and the editorial superscriptions may be late. In Matt. xxiv. 15 and Mark xiii. 14 he is called "Daniel the Prophet." Many scholars entertain grave doubts as to the historic existence of Daniel

because of the character of the book that forms our only source. See DANIEL, BOOK OF.

**DANIEL, BOOK OF.** One of the canonical books of the Old Testament. In the Hebrew Bible it is not counted among the Prophets, but has its place among the Writings, or Hagiographa. (See BIBLE.) This is in harmony with the rabbinic arrangement of the triple canon at the end of the second century A.D., which is preserved in *Baba bathra*, 13 b. 14 a. On the other hand, the Greek version places the book after Ezekiel, and in the Latin Vulgate and all modern translations (except those made by Jews and some recently produced by Christian scholars, who follow the order in the Hebrew Bible) it appears as one of the four *propheta majores*. In all probability, this is more original, as Daniel is counted by Josephus as among the Prophets, and the New Testament refers to "Daniel the Prophet." The influence of the book in fanning the Messianic hope which led to so many disenchancements and its use in Christian apologetics naturally account for its relegation to the third canon. There is no reason to believe that any Jewish scholars of the tannaitic period looked upon it as later than the time of Ezra and therefore excluded it from the prophetic canon.

The book consists of 12 chapters: chaps. i-vi contain stories concerning Daniel and (chap. iii) his friends, vii-xii visions told by Daniel himself. The first chapter relates how Daniel was brought to Babylon by Nebuchadnezzar in the third year of Jehoiakim (606 B.C.). With Daniel are three other youths of noble descent—Hananiah, Mishaël, and Azariah. Babylonian names are given to them in place of their Hebrew ones, Daniel being called Belteshazzar, while the other three are called Shadrach, Meshach, and Abednego. They are portrayed as being in the royal service, but also as steadfast in their fidelity to their God, declining to partake of the food provided for them for fear of polluting themselves. God rewards them for this, and when brought before the King they are found 10 times superior to the Babylonian magicians, Daniel excelling every one in the matter of visions and dreams. In the second chapter proofs are given of Daniel's supernatural wisdom, he saves the lives of the magicians as well as his own by his ability not only to interpret Nebuchadnezzar's dream, but also to tell him what the dream was. The King had seen a great image with its head of gold, and other parts of the body of silver, brass, and iron. The gold is interpreted to refer to the Babylonian Empire, the other three metals to the kingdoms that are to follow the Babylonian. The image is destroyed by a stone quarried without human intervention out of a mountain, and this destruction symbolizes the disappearance of all the kingdoms. The third chapter tells of the fiery furnace into which the three friends of Daniel are thrown because of their refusal to worship the golden image which Nebuchadnezzar had set up and how they came out of the furnace unscathed. In the fourth chapter Nebuchadnezzar issues a proclamation to all peoples of the world, declaring, in consequence of Daniel's success in interpreting another of his dreams, his intention of glorifying the King of Heaven. The dream itself consists of a vision of the uprooting of a great tree with its numerous branches, under which all birds have shelter and which feeds all mankind. The vision, as interpreted by Daniel, forebodes the downfall of the kingdom, and the

King himself is humbled by being bereft for a time of his reason and conducting himself like an animal. The fifth chapter recounts a great feast arranged by Belshazzar (q.v.), during which the mysterious writing appears on the wall as a punishment for the King's desecration of the sacred vessels of Jerusalem, which Nebuchadnezzar had brought to Babylon (i. 2). Daniel succeeds in reading and interpreting the handwriting, which predicts the overthrow of Belshazzar, who indeed is slain that very night. The crown passes to Darius the Mede. The sixth chapter introduces King Darius, who, at the instance of his nobles, issued a decree forbidding any one for the space of a month to pray to or ask a petition from any one except Darius. Daniel, as a pious Jew, accustomed to pray thrice daily, disobeys and is thrown into a den of lions. By divine protection Daniel escapes the fate of being torn to pieces. He is taken out of the den, and his accusers are thrown into it and at once are torn to pieces by the lions. The first of Daniel's visions (chap. vii) is of four beasts, the last having 10 horns, from each of which in turn supremacy is taken away, until it is finally given to one like a man, probably the angel Michael as the celestial representative of the Jewish people. In the second vision (chap. viii) he sees a ram pushing in all directions with its two horns, which are eventually broken through a he-goat with a notable horn between its eyes. In time the kingdom of the he-goat is broken, and in its place four other horns arise, and out of one of these comes forth a little horn which exalts itself even against the host of heaven and against God Himself, destroying His sanctuary and interrupting the daily service for 2300 evenings and mornings. In the third vision (chap. ix) the angel Gabriel appears to Daniel and explains that the 70 years of desolation prophesied by Jeremiah (xxv. 11; xxxix. 10) will be 70 weeks (of years), after which the guilt of the people will be atoned for. In the last vision, which comes to him in the third year of Cyrus (chaps. x-xii), an angel reveals to Daniel glimpses of the future. Under veiled names the doings and fate of various kings are described. After the last of these has disappeared, the end comes when the heavenly kingdom is established, and the dead are raised—some to eternal glory, others to eternal shame. But Daniel is bidden to seal the vision until this time, and to go to his rest.

The book is written in two languages: chaps. i. 1-ii. 4a, viii-xii, are in Hebrew, while ii. 4b-vii are in Aramaic. The Aramaic is not of the Mesopotamian or Babylonian type, but is the Judaean dialect. Many theories have been propounded to account for the two languages. Some scholars have thought that the author began his work in Hebrew, but was led by his desire to reproduce the words of the Chaldeans accurately to change into the Aramaic, which they spoke, and then returned in chap. viii to the Hebrew in order to conceal from outsiders in the sacred tongue the allusions in the visions which were meant only for the wise men of his own people. A modified form of this view makes him wrongly suppose that the Chaldeans spoke Aramaic and were ignorant of the distinction between East and West Aramaic. Quite a number of scholars have suggested that the whole work was originally written in Hebrew, but that, some chapters having been lost through an accident, they were replaced by the Aramaic targum. Some think that the Hebrew text was still ex-

tant when the earliest Greek version was made which, in their opinion, represents it. Huet, Bertholdt, Marti, Wright, and Charles supposed that the entire book was written in Aramaic, but the beginning and the end translated into Hebrew in order to give it a place among the sacred books written in that language. The first suggestion of a diversity of origin as furnishing an explanation of the difference of language seems to have been made by Spinoza, who regarded the stories in ii-vi as having been drawn from Chaldean chronicles. Eichhorn maintained that ii. 4b-vii. 28 came from an earlier Aramaic work, while the Hebrew portion was written by an author living in the Maccabæan period. This view has been revived by Meinhold, Strack, Dalman, Torrey, and Sellin. These scholars regard i. 1-ii. 4a as having been translated from the Aramaic into the Hebrew, and vii as an Aramaic version of a Hebrew original, and they suggest that these translations were made to give the impression of unity and conceal the difference of origin. But if the author or editor sought to secure for his work canonical recognition, which is altogether improbable (see BIBLE, Canon), and deemed it necessary for this purpose that the Hebrew language should be used, it is strange that he should have translated so much and yet not all; and the evidence adduced to prove a translation one way or the other is not very convincing. A simpler theory would be that the storybook from which ii. 4b-vi comes was written in Aramaic, that vii was a later addition in the same language, that viii-xii formed an appendix written in Hebrew, and that an editor wrote i. 1-ii. 4a as an introduction to take the place of some other exordium in the storybook. Kennicott found a Hebrew text of the Aramaic parts in Codd. 240 and 512 and printed it in his Hebrew Bible from Cod. 240, but this is unquestionably a later translation from the Aramaic.

The early versions differ from the Masoretic text in that they combine also the Song of the Three Holy Children, the story of Susanna, and the stories of Bel and the Dragon. Besides, there is a very marked divergence between the earliest Greek version and Theodotion's translation which took its place in the Greek Bible, notably in chaps. iii-vi. It is found in Codex Chisianus, published in 1772, and in the Hexaplaric Syriac published in 1866. Already Eichhorn pointed out the superiority of its readings; while even this version clearly represents an annotated text, especially in iv, it is, in the judgment of some scholars, free from many accretions, both in iv and in v and vi, that disfigure the Masoretic text. On the longer additions found already in this version, which manifestly were translated from an Aramaic original, see DEUTEROCANONICAL BOOKS.

According to Jewish and Christian tradition, all parts of the book were written by Daniel. This tradition was rejected in the third century A.D. by the Neoplatonist philosopher Porphyry, who in the twelfth of his 15 books against Christianity maintained that the work was written in the time of Antiochus IV. His arguments have been in part preserved by Jerome, who attempted to refute them (Com. ad Danieleml). The same opinion has been held by some of the Anabaptists, Uriel d'Acosta, Anthony Collins, Corrodi, Eichhorn, and the majority of Protestant exegetes since. Hitzig and Farrar supposed on insufficient grounds that Onias IV was the author.

That the visions in viii-xii point with special emphasis to the situation in the early Maccabean period is the opinion of a vast majority of scholars, Catholic and Protestant. Among the latter it is generally held that they were also written at that time. The fourth kingdom in chap. vii is regarded by many Catholic and some Protestant interpreters as referring to the Roman Empire, and Legarde held that it was written c.70 A.D., in which he has recently been followed by Hertlein; but the majority of Protestant scholars assign this chapter also to the Maccabean period. There is less agreement as to the age of the stories in i-vi. While König, Behrmann, and Driver deem it sufficient to assume that they had long been current in Jewish folklore before they were written down together with the rest of the book, a separate origin in written form has long been suspected. Spinoza, Newton, and Beausobre thought of a distinct authorship for the Aramaic section. Eichhorn assigned the visions to the Maccabean age and the stories to an earlier period. Bertholdt, assuming that the whole book was originally written in Hebrew, divided it among 10 authors, and Barton, to some extent following along his lines, has suggested three or four. Lagarde thought of the different sections as political pamphlets. Meinhold assigned to the stories the date of c.300 B.C. More convincing are the arguments of Torrey to prove that chap. ii cannot have been written before or after the reign of Ptolemy III Euergetes (247-223 B.C.), and that therefore the Aramaic storybook was composed at that time. Cornely and Torrey have from different standpoints summed up the objections to the current assumption that Nebuchadnezzar, Belshazzar, and Darius are simply meant to symbolize the great persecutor Antiochus Epiphanes. On the other hand, a date in the middle of the third century is sufficiently late to account for the ignorance of the author concerning the period in which his hero was supposed to have lived. Nebuchadnezzar did not capture Jerusalem in the third year of Jehoiakim (606 B.C.): there was no interregnum of seven years in his reign (604-562); he had no son by the name of Belshazzar; there were no satraps in his reign. Bilsharurur was the son of Nabunaid, the last King of Babylon (556-539), who was not a descendant of Nebuchadnezzar: the last King of Babylon did not lose his kingdom to Darius the Mede, but to Cyrus: there was no Median Kingdom succeeding the Babylonian in Babylon, and history knows of no Darius the Mede. It has been indeed suggested that Nebuchadnezzar's "coming" to Jerusalem means his "starting" for Jerusalem in 606, which he reached in 597: that "son" and "father" mean "successor" and even distant "predecessor": that Belshazzar was another name for Evil Merodach or Nabunaid, and that Darius was another name for Cyaxares II, Gobryas, or Cambysees. But it can scarcely be claimed that any of these attempts to explain the difficulties is either ingenious or ingenuous. Many stumbling blocks may be removed by the textual criticism, but figures of Belshazzar and Darius the Mede are likely to belong to the original form of the stories, as well as the conception of these kings.

Clermont Ganneau's interpretation of the famous *Mene, Mene, Tekel, Upharsin* as names of weights "a mina, a shekel, and two half-minas" (*Journal Asiatique*, 1886, pp. 36 ff.), though ingenious and widely adopted, will have to be

abandoned, as the original text read *mene, shekel, peres*, and "tekel" does not mean "shekel" in Aramaic. The addition to the Aramaic storybook of a vision told by Daniel himself in the first person in the same language (chap. vii) is likely to have suggested the style of the Hebrew book which forms the appendix (chaps. viii-xii). In spite of Lagarde this vision probably was written in the year 165 B.C., though earlier than the visions in Hebrew, which seem to come from the end of November or the beginning of December of that year. The suggestion of Schmidt, that the one "like a son of man" (vii. 13) here, as elsewhere where a man-like being is spoken of, refers to an angel and in this case the angel Michael, taking the place in Jewish folklore of the god Marduk, has been adopted by Marti, Bertholet, and others. Chap. xi gives an historic sketch in the guise of prophecy, which shows a growth of accurate knowledge as the author advances towards the end of the year 165; but while a little help has come through Mattathias and Judas, the temple has not yet been recovered and dedicated, Baal Shamen (the Heaven God, Zeus Olympios) being still worshipped there. Bertholet and others have shown that much of the apocalyptic material of the book has a foreign origin, in Babylonian and Persian mythology. But its deep religious significance lies in the conception of a succession of world empires permitted to rule by divine providence until the time set for them to be followed by the Kingdom of the Saints of the Most High, and in the encouragement it gave to the maintenance of religious ideas that were threatened with obliteration through the influence of Hellenistic thought and customs.

**DANIEL, JUDGMENT OF.** See SUSANNA, HISTORY OF.

**DANIEL**, dá'nyel', ANTONY (1601-48). A French Jesuit missionary in America, born at Dieppe. He became a Jesuit in 1621, came to Quebec with Samuel de Champlain in 1633, began his labors among the savages of Cape

Breton, and in 1634 was transferred to the Huron mission. In 1636 he returned to Quebec to teach in a seminary. Afterward he went back again to St. Joseph, or Teanustayé, one of the largest Huron towns. On July 4, 1648, he had just concluded mass when the town was attacked by a band of the hostile Iroquois. He roused such defense as was possible and urged all that could to escape. As he came from the church and confronted the enemy, he overawed them by his calmly majestic bearing. A moment later, pierced by a bullet, he fell, and his body was burnt with his church. Consult Parkman, *The Jesuits in North America* (Boston, 1867).

**DANIEL, ARNAUT.** A celebrated French troubadour of the twelfth century, styled by Petrarch "Il gran maestro d'Amore" ('the great master of love'). He was born at Ribérac, Dordogne, was a jongleur at the court of Richard Cœur de Lion, and is said to have been acquainted with several distinguished troubadours, such as Bertrand de Born. He was the author of a number of amatory poems, which, although technically masterpieces of versification, are frequently characterized by an artificial straining after effects. Dante was indebted to him for several of his stanzas, and ranks Daniel far above Giraud de Bornel. An edition of his works was published by Canello under the title *La vita e le opere del trovatore Arnaldo Daniel* (Halle, 1883).

**DANIEL, DÉNÉL, ERNST VON** (1843- ). A Hungarian politician, born at Ellemér, County of Torontál. He studied law at Budapest, became judge lateral in 1868, and in 1870 a Liberal member of the Hungarian Parliament. From 1895 to 1899 he was Minister of Commerce, and from 1896 to 1899 he was a member of the Table of Magnates.

**DANIEL, GEORGE** (1616-57). A Cavalier poet, about whom very little is known. Some of his best verse is represented in *Scattered Fancies*, composed in 1645-46. The beautiful manuscript copy of his poems was printed (in a limited edition) by Grosart (4 vols., Blackburn, Lancashire, 1878).

**DANIEL, HERMANN ADALBERT** (1812-71). A German geographer and theologian. He was born at Cöthen, studied theology at Halle in 1830-34, and was from 1834 to 1870 instructor and professor at the Pädagogium there. He was one of the most eminent followers of the geographer Ritter, and by the attractive style of his various geographical writings greatly contributed towards arousing an increased interest in the study of geography in the schools and among the educated generally. Of these works the following deserve especial mention: *Lehrbuch der Geographie für höhere Unterrichtsanstalten* (76th ed., 1895), *Leitfaden für den Unterricht in der Geographie* (201st ed., 1896), *Handbuch der Geographie* (6th ed., 4 vols., 1894-96), all of which were translated into several European languages.

**DANIEL, JOHN MONCREU** (1825-65). An American editor, born in Stafford Co., Va. He was privately educated, studied law, and in 1845 became librarian of a small public library in Richmond. In 1847 he joined the staff of the *Richmond Examiner*, the organ of the radical wing of the Democratic party, and as the result of expressions contained therein was compelled to fight several duels. He was a friend of Theodore Parker, whose famous sermon on Webster he published in the *Examiner*, and of

Poe, a sketch of whom he wrote for the *Southern Literary Messenger*. In 1853 he was appointed Minister to the court of Victor Emmanuel. By demanding for some Italians naturalized in the United States and visiting Sardinia rights equal to those of other Americans, he nearly brought about a rupture in the diplomatic relations of Italy and the United States, and afterward, by a breach of social etiquette at Turin, he greatly lessened his influence at the Italian court. Upon the outbreak of the Civil War he was appointed to the staff of Gen. A. P. Hill. His arm having been shattered, he resumed the *Examiner*; and for attacks upon Jefferson Davis and Elmore, the Treasurer of the Confederacy, was challenged by the latter to a duel, in which he was wounded. Consult his *Writings*, with a memoir by his brother (New York, 1868); also George W. Bagby's *John M. Daniel's Latch Key* (Lynchburg, Va., 1868).

**DANIEL, JOHN WARWICK** (1842-1910). A United States senator, born in Lynchburg, Va. After the Civil War, in which he fought on the Confederate side and became major and chief of staff to Gen. Jubal A. Early, he studied law and became active in politics. He was a member of the Virginia House of Delegates in 1869-72, and of the State Senate in 1875-81. In 1884 he was elected to the Lower House of Congress, as a Democrat, and thereafter was sent to the Senate for the successive terms from 1887 to 1911. His writings include: *The Character of Stonecall Jackson* (1868); *Attachments under the Code of Virginia* (1869); *Negotiable Instruments* (1876; 5th ed., 1903). A collection of his *Speeches and Orations* was published in 1911.

**DANIEL, SAMUEL** (1562-1619). An English poet, born near Taunton, Somersetshire. He entered Magdalen Hall, Oxford, in 1579, but left without a degree and visited Italy. In 1590 he became tutor to William Herbert at Wilton and wrote masques for the court of James I. Later he retired to a farm near Beckington, in Wiltshire, where he died in October, 1619. Daniel's principal works are a series of sonnets to Delia (1592), unsurpassed in their time by any except Shakespeare's; the beautiful *Complaynt of Rosamond* (1592); a long historical poem in eight books, entitled *The Ciuill Warres between the Houses of York and Lancaster* (1595-1609); two tragedies in the style of Seneca; and a prose history of England. Daniel's verse has been praised for its grace and purity by a long succession of critics. His works were collected in 1823. Consult *Complete Works*, ed. by Grosart (5 vols., London, 1885-96).

**DANIEL DERONDA.** A novel by George Eliot published serially in 1876 and in book form in 1877. It is a study of race feeling and tradition, the title character being a Jew.

**DANIELL, JOHN FREDERICK** (1790-1845). An English physicist, born in London. He was elected a fellow of the Royal Society in 1814, and in 1816, in connection with Professor Brande, established the *Quarterly Journal of Science and Art*. From this period he devoted almost all of his time to the subjects of chemistry and meteorology. In 1824 the Horticultural Society awarded him their silver medal for his *Essay on Artificial Climate*. He was appointed professor of chemistry in King's College, London, in 1831, and in 1839 published his *Introduction to Chemical Philosophy*. He is the only person who ever obtained all of the three

medals in the gift of the Royal Society. His *Meteorological Essays* (1823; 3d ed., 1845) contain the first scientific account of the known phenomena of the atmosphere. He made the first precise determinations of atmospheric moisture by the use of the hygrometer of his invention and invented the *Daniell cell*, an electric battery furnishing a tolerably constant current. (See *VOLTAIC CELL*.) Besides the works mentioned he wrote a large number of papers for the Royal Society.

**DANIELL, MOSES GRANT** (1836-1909). An American educator. He was born in Boston, Mass., graduated at Harvard in 1863, and for 32 years was prominent in secondary-school work, being master of the Everett School in Dorchester for three years and of the Roxbury Latin School for 17 years, and then principal of the Chauncy Hall School in Boston for 12 years. He was later connected with the editorial department of Ginn & Co., an educational publishing house of Boston. He was prominent in Boston musical circles, being long treasurer of the Boston Handel and Haydn Society. His textbooks for the early study of Latin—some written with William C. Collar—are widely used in American secondary schools.

**DANIELL, THOMAS** (1749-1840). An English painter and etcher, born at Kingston-on-Thames. He was a pupil of the Royal Academy and was elected an R.A. in 1799. Accompanied by his nephew William, he went to India in 1784 and remained in the East 10 years. The fruit of these travels was the remarkable collection "Oriental Scenery" (1808, 144 aquatints). Besides these he published "Antiquities of India" (24 plates, 1800); "Hindu Excavations at El-lora" (24 plates, 1804); and *Picturesque Voyage to China by Way of India* (London, 1810, 50 plates). Many of his drawings and water colors are in the British and South Kensington museums.

**DANIELS, FRED HARRIS** (1853-1913). An American mechanical engineer, born at Hanover Centre, N. H. He was educated at the Worcester Polytechnic Institute and later made a special study of iron and steel manufactures in Europe. He entered the employ of the Washburn & Moen Co. in 1873 and was for a time general superintendent and chief engineer. In 1899, when the firm's business was acquired by the American Steel & Wire Co., he was retained as chief engineer, and in 1902 he also became a director. When, in turn, the United States Steel Corporation obtained control of the American Steel & Wire Co. (1901), Daniels was chosen chairman of their board of engineers. More than 150 patents, principally relating to the manufacture of wire rods, represent his contribution to the iron and steel industry.

**DANIELS, JOSEPHUS** (1862- ). An American newspaper man and public official, born in Washington, N. C. He was educated at Wilson Collegiate Institute and in 1880 became editor of the *Advance* of Wilson, N. C. He studied law and was admitted to the bar in 1885, but did not practice, instead taking the editorship of the *State Chronicle* of Raleigh, N. C., which he merged in 1894 in the *News and Observer*, with a weekly edition called the *North Carolinian*. He was State printer in 1887-93 and chief clerk of the Federal Department of the Interior in 1893-95. Long prominent in State and national politics as a Bryan Democrat, in 1912 he had charge of the publicity department

in Woodrow Wilson's preconvention campaign, and in the actual campaign was not merely a member of the national committee (which he had been on since 1896) but of the special directing committee. In President Wilson's cabinet he received the post of Secretary of the Navy, an office in which he did much for the general efficiency of the service and particularly for the enlisted men.

**DANIELS, WINTHROP MORE** (1867- ). An American political economist, born at Dayton, Ohio. He graduated in 1888 at Princeton University, studied at Leipzig, and in 1892 was appointed professor of political economy at Princeton. In 1911 he became a member of the Board of Public Utility Commissioners of New Jersey for the term ending 1917 and in 1914 he was appointed a member of the Interstate Commerce Commission. His publications include: *Revision and Continuation of Alexander Johnston's History of the United States* (1897); *Elements of Public Finance* (1899); *Continuation of Alexander Johnston's History of American Politics* (1902).

**DANIELSON**. A borough in Windham Co., Conn., 25 miles north by east of Norwich, on the New York, New Haven, and Hartford Railroad, and on the Quinebaug River (Map: Connecticut, H 2). The chief industry is the manufacture of cotton. Pop. 1900, 2823, 1910, 2934.

**DANILO**, dan't-ló, I, or **DANILO PETROVITCH NIEGOSH** (1826-60). A prince of Montenegro. He was educated at Vienna and succeeded his uncle, Peter II, in 1851, dispensing, however, with the customary title of prince bishop. In 1852 he became involved in a war with Turkey, the Porte claiming jurisdiction in Montenegro, and the boundaries between the two countries were not defined until 1858. Danilo devoted himself steadfastly to the achievement of Montenegrin independence and the furtherance of civilization throughout the land. He introduced financial reforms, organized a military service, and issued a legal code. He was assassinated by a personal enemy, Aug. 12, 1860. His nephew, Prince Nicholas, succeeded him.

**DANISH LANGUAGE AND LITERATURE**.—Language. The history of the Danish language begins properly about the year 1000 A.D., when the different Scandinavian dialects, which until that time had formed one speech, developed into separate languages. (For an account of the earliest Scandinavian monuments, see *RUNES*.) The Danish and Swedish formed together the East Northern group, the Icelandic and Norwegian, with the Faroese, the West Northern. The oldest specifically Danish records are runic inscriptions and a few names in Latin manuscripts. About 1300 appeared several collections of laws which show the existence of at least three distinct dialects, there being at that time no standard form for literary use. The leveling of inflections, which is as marked a feature of Danish as of English, had already begun, although many forms were still retained. The vocabulary is still in the main Northern, with very few foreign elements. Between 1350 and 1500 the loss of inflections and of other grammatical distinctions increases rapidly, and the language approaches more and more its present form. A striking feature of the vocabulary is the introduction of foreign words, especially those from the French, Latin, and Low German. High German words being sparingly borrowed. The syntax, too, is affected

by Latinisms in consequence of the wide use of Latin by Danes. As a result of the publication of the first modern Danish translation of the Bible, that of Christian III (1550), the vocabulary became fairly fixed, receiving practically its present character. The relation of the Danish Bible to the Danish language is very similar to that of the English Bible to the English language. After 1537 Danish became the official language of Norway, the Norwegian language remaining as a collection of dialects spoken chiefly in the country districts. (For the relation of these dialects to Danish, see NORWEGIAN LANGUAGE.) In the following century, on the other hand, Denmark suffered a loss by the cession to Sweden of the Province of Skåne, or Schonen, and within a generation the Swedish took the place of the original Danish.

The principal grammatical changes between the Reformation and 1700 are the partial substitution of the natural for the grammatical gender and the simplification of the inflections. The vocabulary shows a generous borrowing of French and German words. The different dialects are still used for literary expression, and it was not until Holberg (1684-1754) that a standard literary Danish may be said to have existed. During the last half of the eighteenth century German and Danish were used side by side in Denmark, very much as Latin and Danish had been used earlier, and so great was the German influence that the Danish State Calendar was published in that language until the first year of the nineteenth century. During the last 30 years, mainly as a result of the war with Germany, the vocabulary has become more and more pure. Whole classes of German words have been replaced by Danish equivalents, and no new German words have been borrowed.

Danish differs in general from its nearest Scandinavian neighbor, Swedish, by a greater leveling of inflections and by less archaic sounds. The most striking single feature of the spoken language is the glottal "catch," called in Danish *Stød* (literally, a push or thrust). It occurs after certain consonant sounds and consists of a momentary closure of the glottis. It has been compared in its effect upon foreigners to a hiccup. The glottal catch is not found in Dano-Norwegian, and it is lacking in some of the dialects in Denmark, while Jutish occasionally employs the catch where it is not found in the Zealand dialect. The cultivated standard speech is characterized by a marked tendency to slurring, the enunciation being much less distinct than that of Swedish or of the Danish spoken in Norway. There is also much less vocal inflection. In Danish, as in German, the pronunciation of the stage is very different from that of social intercourse.

The principal Danish dialects are the Zealand, including the slightly differing uses of the neighboring smaller islands, and with a distinct type for Copenhagen, the Jutish, including the speech of Schleswig, and the Bornholmsk, which latter is the sole remnant of the East Danish dialects. The Dano-Norwegian will be considered in connection with the Norwegian (q.v.). Mention should be made of the Danish spoken in the United States, which really constitutes a modern dialect. It differs from the home tongue in pronunciation, apparently as a result mainly of English influence, and in vocabulary. Danish-American newspapers contain many English

words not recognized in Denmark, and the speech of our Danish citizens is even more mixed, the English influence extending to the syntax as well as to the vocabulary. As the subject has never been scientifically investigated, it is impossible to determine how far the original dialectic peculiarities are preserved.

Danish orthography is in an even more unsettled state than the English. There are several distinct systems of spelling in use in Denmark, and at least two others in Norway. The official system is employed in all school books and government publications, but is generally disregarded by writers, whose system in turn is scorned by philologists. As in German, both the so-called Gothic and Roman type are in use, and substantives are sometimes uniformly spelled with initial capitals, sometimes not. There is, however, a decided tendency in recent times towards simplification of spelling, and in time uniformity will probably be reached.

**Bibliography.** DICTIONARIES: Molbech, *Dansk-Ordbog* (Copenhagen, 1854-59), despite its date still the standard dictionary in Danish; Larsen, *A Dictionary of the Dano-Norwegian and English Languages* (3d ed., London, 1897); Rosing, *English-Danish Dictionary* (7th ed., Copenhagen, 1899); Brynildsen, *English-Dano-Norwegian Dictionary*, 2 vols. (Christiania, 1900-07), the best Danish and Norwegian international dictionary. There is a good etymological dictionary by Falk and Torp, *Norwegisch-Danisches Etymol. Wörterbuch* (Heidelberg, 1910-11). For the old period of the Danish language, consult Kalkar, *Ordbog til det Aeldre Danske Sprog* (Copenhagen, 1881-1905), which is now being revised. There are also several dictionaries of foreign words in Danish, and dictionaries giving simply the forms of words. Pronouncing dictionaries are very little used. GRAMMARS: Groth, *Danish and Dano-Norwegian Grammar* (Boston, 1894), especially strong in the treatment of the Dano-Norwegian. There is no good treatment in English of Danish grammar. The best grammars in Danish are Jessen's and Mikkelsen's. The best recent history of the language in Danish is Verner Dahlerup's (Copenhagen, 1896). There is a short survey by Ludvig Wimmer, translated by Lentzner, in *Modern Language Notes* (Baltimore, 1895). The oldest period is treated technically by Noreen in Paul, *Grundriss der germanischen Philologie*, vol. i (Strassburg, 1896).

**Literature.** The first Danish book is a treatise on medicine by Henrik Harpenstreng, who died in 1244. The first Danish law dates from 1386, but the first distinctly literary writings in the language are the chivalric ballads, *Kjæmpeviser*, which must have been composed from 1300 to 1500, though they survive only in sixteenth-century form, best edited by Gruntvig (8 vols., unfinished; continued by H. Olrik, Copenhagen, 1895) and by Abrahamson, Nyerup, and Rahbek (5 vols., 1812-14). Of these there are some 500, partly historical, partly mythical, but wholly popular in origin. The first Danish book was printed in 1495, and sequential literary history begins with Christian Pedersen, who translated the Bible (1550) and gave to his people the legends of Charlemagne and Ogier in their final form. Vedel (1542-1616) stimulated national literature by publishing 100 of the *Kjæmpeviser* (1591) and translating Saxo Grammaticus (1575). *Reynard the Fox* had been translated into Danish in 1555. Hvitfeldt gave Denmark its first history (1595) and

Rauch its first drama (about 1600). Clausen's translation of the Icelandic *Heimskringla* appeared in 1633, and Arrebo's (1587-1637) *Hæmæron*, the first Danish epic, in 1641. Hymn writing was soon after inaugurated by Kingo (1634-1703) and Brorson (1694-1764). But these beginnings were all overshadowed by the genius of Holberg (q.v.), the first Dane whose work is still an actuality in Danish culture. All branches of learning and art felt his stimulating influence, the University was reopened (1742), the Society of Sciences founded, and the Society for the Improvement of the Danish Language. Then Klopstock, who had settled at Copenhagen, though his direct influence was bad, fostered the founding of the Society of the Fine Arts, and Frederick V patronized all.

Under these influences, or the spirit that prepared for them, many poets were born (1742-49)—Johannes Ewald, Wessel, Brun, Frimann, Fastang, Pram, Storm—who brought about a lyric and dramatic revival in the last quarter of the century. The first, Ewald (q.v.), aided the revival of interest in Scandinavian mythology; Wessel helped to emancipate the Danish stage from French bondage; the others, Norwegians by birth, gave the language a richer imagery. The only prose writer of importance till near the close of the eighteenth century was the philosopher Treschow (1751-1833); and poetry, after the passing of the group just named, sank into a mechanical insignificance, from which Baggesen (q.v.) and romanticism revived it.

The literary births from 1758 to 1777 are mainly of prose writers—Rahbek (1760-1830), a good novelist, catholic-spirited critic, and editor of older poets. Heiberg the elder (1758-1841), a political and æsthetic critic. Malte-Brun (1775-1826) and Olufsen (1764-1827), geographers. Nyerup (1759-1829), a diligent literary compiler; Engelstoft (1774-1850), an historian; Mynster (1775-1854), a theologian; and the great and genial scientist Oersted (1777-1851), are the most prominent names for two decades, where the only poet of distinction is Baggesen (1764-1826), an erratic exception to prove the rule that an "age of enlightenment is not an age of song."

The romantic movement in Denmark centres around Oehlenschläger (q.v.) and dates from 1802. His more important assistants in fostering national individualism in literature were Blicher (q.v.), novelist and poet. Grundvig, scholar, antiquarian, poet, politician. Ingemann (q.v.), the historical novelist: Hauch (q.v.), a dramatist and novelist; Countess Gyldenbourg-Ehrensward (q.v.), the greatest woman writer of Denmark, and mother of J. L. Heiberg (q.v.), critic, poet, dramatist, and, on the whole, the most important figure of the generation. These writers were born between 1779 and 1791. To the second generation of the Romantics, born between 1798 and 1809, belong Hertz (q.v.), the poet; Andersen, of the world-famed *Fairy Tales*; Bagger (1807-46), who died, like Keats, with unmatched promise unfulfilled, and Paludan-Müller (1809-76), a dramatic and epic philosophic poet of much power.

Aside from poetry the romantic period was not fruitful. One may note the antiquarians Rask (1787-1832), Rafn (1795-1864, q.v.), and Petersen (1791-1862); the lexicographer Molbech (1783-1857); the botanist Schouw (1789-1852); and the philosopher Sibbern (1785-1872), succeeded by the brilliantly subtle

Kierkegaard (1813-55). The period counts no significant novelist or dramatist who was not primarily a poet, though writing perhaps like Andersen in prose.

The 30 odd years that separate the birth of Paludan-Müller from that of Georg Brandes (q.v.) are singularly unproductive of Danish literary genius. The most prominent names are those of the poet Ploug (1813-94), the novelist Goldschmidt (1819-87), and Herman Ewald (1821-1908). Politics absorbed popular interest after 1848. Romanticism seemed bankrupt, but the Danes were slow in attuning themselves to the modern spirit of realism. That they have done so at all, through political distractions, national humiliation and dismemberment, is largely the work of Brandes, supplemented by the example of Björnson and Ibsen. Of the new school the most distinguished are Drachmann (q.v.), Richardt (q.v.), and Christiansen (q.v.). One may record also the names of Bergsøe (1835-1911, q.v.), Jacobsen (1847-85), Skram (1847-1905); Edward Brandes (1847- ), Bang (1858-1912), Gjellerup (1857- ), Pontoppidan (1857- ), Karl Larsen (1860- ), and Esmann (1860-1904); but on the whole there seems little promise in this generation.

Aside from literature proper, Denmark has seen, in the nineteenth century, a host of thinkers and scholars. To name a few of them: the philosopher Hoffding (1843- ); the theologian Martensen (1808-84); the philologists Madvig (1804-86), V. Thomsen (1842- ), Westergaard (1815-78), Fausbøll (1821-1909), Nyrop (1858- ), Jespersen (1860- ), Holger Petersen (1867- ); archaeologists like Sophus Müller (1846- ). There is also an important group of historians, such as N. M. Petersen (1791-1862), K. F. Allen (1811-71), Edward Holm (1833- ), A. D. Jørgensen (1840-97), Troels Lund (1840- ), J. Steenstrup (1844- ), Schjern (1846-82), Erslev (1852- ). Among the writers on æsthetics we may mention Høyen (1798-1870), J. Lange (1833-96), and C. Lange (1834-1900). In the realm of the exact sciences, too, a number of Danes achieved noted distinction; to enumerate them here is, however, out of place as with the nineteenth century science and literature have entirely different goals and methods.

**Bibliography.** Consult the writings of Nyrop, Rahbek, Molbech, Overskou, and, in addition, the following: Horn, *Den danske Litteraturs Historie* (Copenhagen, 1879); trans. by Andersen, *History of the Literature of the Scandinavian North* (Chicago, 1884), with bibliography; Hansen, *Nordiske Digtere i vort Aarhundrede* (Copenhagen, 1879); id., *Illustreret dansk Litteraturhistorie* (ib., 1900); N. M. Petersen, *Bidrag til den Danske Litteratur Historie* (ib., 2d ed., 1867-71); Rönning, *Den danske Litteraturs Historie i Grundriss* (ib., 1890); id., *Rationalismens Tidsalder* (ib., 1886-90); Rosenberg, *Nordboernes Aandsliv fra Oldtiden til vore Dage* (ib., 1878-85), incomplete, but highly important; Arentzen, *Baggesen og Oehlenschläger* (ib., 1870-78); id., *Danske Digtere i det 19de Aarhundrede* (ib., 1864); Vedel, *Studier over Guldalderen i dansk Digtning* (ib., 1890); Paludan, *Renaissancebevægelsen i Danmarks Litteratur især i det 18de Aarhundrede* (ib., 1887); Schück, *"Schwedisch-dänische Litteratur,"* in Paul, *Grundriss der germanischen Philologie*

(Strassburg, 1900 et seq.; 2d ed.); Strödtmann, *Das geistige Leben in Dänemark* (Berlin, 1873); Schweitzer, *Geschichte der skandinavischen Literatur* (Leipzig, 1886-87); Hansson, *Das junge Skandinavien* (Dresden, 1891); Schwanenflugel, "Danish Literature," in Weitemeyer, *Denmark* (London, 1890); Gosse, *Studies in the Literature of Northern Europe* (ib., 1879); Farley, *Scandinavian Influence in the English Romantic Movement* (Boston, 1903); Carlsen, Olrik and Starcke, *Danmarks Cultur ved Aar 1900* (Copenhagen, 1900); Bricka, *Dansk biografisk leksikon* (19 vols.; ib., 1887-1905). For the drama consult: Overskou, *Danske Skueplade* (Copenhagen, 1854-56; continued by Collin, ib., 1873-76); Brandes, *Dansk Skuespilkunst* (ib., 1880); Birckel Smith, *Studier paa det gamle danske Skuespels Omraade* (ib., 1883); Hansen, *Den danske Skueplade* (ib., 1907).

**DANISH POLITICAL PARTIES.** See POLITICAL PARTIES, Denmark.

**DANISH WEST INDIES.** See WEST INDIES, DANISH.

**DANITES**, or DESTROYING ANGELS. In American history, a name given to members of a secret society connected either officially or unofficially with the Mormon church, which was organized about 1837 for the purpose, as alleged, of "dealing as avengers of blood with Gentiles." Many crimes were attributed to the society. The Mormons themselves either disavow any connection with it or flatly deny its existence. Other names by which the society was known are Daughters of Zion, Big Fan, Daughters of Gideon, and Flying Angels. The term "Danites," or "Sons of Dan," is said to have owed its origin to Gen. xlix. 17. During the political campaign of 1858 in Illinois, which has become famous because of the contest between Lincoln and Douglas for the United States senatorship, the term "Danites" was applied as a nickname to the anti-Douglas Democrats. Consult Ferris, *Utah and the Mormons* (New York, 1854), and Whitney, *History of Utah* (3 vols., Salt Lake City, 1892-98).

**DANJURO**, dān'jō'rō', ICHIKAWA (1837-c.1910). A Japanese actor, born in Tokyo and educated in the Chinese classics and in Japanese literature, history, and painting of the Tosa school. He was the ninth of his name, the first Danjuro having been a dramatic actor near the close of the seventeenth century. He was a member of his father's company when only six years old, and later he succeeded his brother, the eighth Danjuro, at his death as the bearer of the family name. To the repertory of the famous 18 pieces inherited by each generation of his family he added 18 new pieces, including the *Kasuganatsuhone*.

**DAN'NAT**, WILLIAM T. (1853- ). An American painter, born in New York City. He studied in Munich and under Carolus-Duran and Munkacsy in Paris, where, after a journey in Spain, he afterward took up his residence and became a teacher at the Ecole des Beaux-Arts. Munkacsy's influence is strong in his early works, of which "The Quartette" (1884), now in the Metropolitan Museum, New York City, is a fine example. It shows the technical ability, the daring style, the solid, broad painting, and absence of conventionality characteristic of all his work. Towards the end of the eighties he abruptly changed his method and under the influence of Japanese art began to occupy himself with color problems. Among the many

Spanish subjects done at this time are a "Sacrifice in Arragon" (1888), in the Chicago Art Museum, and "A Café Chantant" (Munich, 1892), which was the sensation of the exhibition. For sheer bravura, this startling, masterly study of artificial light has been equalled by no other American artist and by few foreigners. His "Lady in Red," a one-color scheme, is in the Luxembourg. The difficulties presented by such a subject as this one are managed with consummate ease. Something in the same manner is his "Lady in White." Among the portraits that have made him at once criticized and praised are that of "Madame E." (1895), the three-quarter length of a woman almost colorless except for the vivid red of her lips, and that of the dancer Otéro (1895). Since that time Dannat has exhibited very little and predominantly portraits. He was president of the Society of American Artists, a member of the Société Nationale des Beaux-Arts and of the International Art Jury in 1889, in which year he received the cross of the Legion of Honor. Consult Isham, *History of American Painting* (New York, 1905), and Dayot, in *Art et Décoration*, vol. i (Paris, 1904).

**DANNECKER**, dān'nēk-ēr, JOHANN HEINRICH VON (1758-1841). A German sculptor, born in Stuttgart, Oct. 15, 1758. His father, a groom of the Duke of Württemberg, first wished him to be a ballet dancer, but through the favor of the Duke the lad was educated in the Karlschule at Ludwigsburg, where he formed his lifelong friendship with Schiller. He afterward studied drawing and sculpture under Le Jeune, Guibal, and others, and in 1777 he obtained the prize for the best model of "Milo of Croton Destroyed by the Lions." In 1783 he studied in Paris under Pajou and soon afterward went to Rome, where he remained until 1790. At Rome he met Goethe, Herder, and Canova. The latter befriended him and gave him instruction in sculpture. Here he executed his first marble statues, of "Ceres" and "Bacchus." On his return to Germany he was appointed professor of sculpture in the Military Academy of Stuttgart and remained in that city until his death, Dec. 8, 1841. Dannecker was one of the greatest sculptors of the classic school. His art is midway between that of Canova and Thorvaldsen and shows a continual struggle between the classic style and the naturalistic. His chief forte lies in expressing individual characteristics. This gives great value to his busts, among the best of which are those of Schiller at Weimar, of Lavater in the Public Library of Zurich, and of the kings Frederick and William of Württemberg. His earlier works are chiefly pagan in subjects, while his later ones are Christian and are pervaded by a sensitive idealism. Among the former are his "Sappho" (Stuttgart Museum), "Psyche," and his best-known work, the "Ariadne," in Frankfurt—a figure larger than life, reclining on the back of a panther. His most ambitious work, however, is his colossal "Christ." The original is in Tzarskoye-Selo, but the sculptor executed a replica, which is now at Regensburg. Consult Grüneisen and Wagner, *Dannecker's Werke in einer Auswahl* (Hamburg, 1841), and Spemann, *Dannecker* (Stuttgart, 1909).

**DANNEMORA PRISON.** See CLINTON STATE PRISON.

**DANNENBERG**, dān'nēn-bērk, HERMANN (1824-1905). A German numismatist, born in

Berlin. He became president of the Numismatic Society in that city and is an authority on mediæval coins, on which subject he published the standard work entitled *Die deutschen Münzen der sächsischen und fränkischen Kaiserzeit* (3 vols., 1876-98). He wrote also *Grundzüge der Münzkunde* (2d ed., 1899) and *Münzgeschichte Pommerns in Mittelalter* (1893; 2d ed., 1896).

**DANNEVIRKE**, dän'ne-vēr'ke, or **DANNEWERK** (Dan., Danes' work). A wall or intrenchment, built by the Danes about the end of the eighth century and strengthened by Harold Bluetooth in the tenth century. The Dannevirke extended from the Schlei to the Treene, a distance of over 10 miles, and protected the Danes from the incursions of the Saxons and Wends. In 974 Otho II attacked the Dannevirke and finally burned and destroyed a part of it. Waldemar the Great rebuilt a section with brick and stone about 1180. During the Schleswig-Holstein wars the Dannevirke fell into the hands of the Prussians. April 23, 1848, and, when attacked by the Austrians and Prussians in 1864, was abandoned by the Danes. It has since been leveled. Consult Philippsen and Sinksen, *Führer durch das Dannewerk* (Hamburg, 1903).

**DANNREUTHER**, dän'roi-tēr, EDWARD GEORGE (1844-1905). An English pianist and writer on music. He was born at Strassburg, Nov. 4, 1844, but grew up in Cincinnati, where F. L. Ritter was his first teacher. In 1859-63 he studied at the Conservatory of Leipzig. The success of his first public appearance as a pianist in London in 1863, when he played Chopin's concerto in F minor for the first time in England, was such that it determined him to settle permanently in London. He soon rose to great prominence as a teacher, writer, and lecturer, and became one of the most zealous champions of Wagner and musical progress. In 1872 he founded the London Wagner Society, directing its concerts for the first two seasons, and was chiefly instrumental in arranging the great Wagner festival of 1877, when the master was his guest during his stay in England. He translated several of Wagner's prose works into English, wrote for several musical journals, and was an important contributor to Grove's Dictionary. His very valuable articles on Wagner, published originally in the *Monthly Record* in 1872, were reprinted separately in 1904 in book form as *Richard Wagner and the Reform of the Opera*. His book on *Musical Ornamentation* (2 vols., London, 1893-95) is a standard work. For the *Oxford History of Music* he wrote the sixth volume, "The Romantic Period" (London, 1905). In 1895 he was appointed professor of pianoforte at the Royal College of Music. He also holds the distinction of having first introduced into England the piano concertos of Grieg (A minor), Liszt (A), and Tchaikowski (B flat minor).

**DAN RIVER**. A river rising in the Blue Ridge Mountains (q.v.), in Patrick Co., Va., and flowing southeast into North Carolina. After crossing and recrossing the boundary between these States four times, it combines with the Staunton River in southern Virginia to form the Roanoke River (q.v.) (Map: North Carolina, C 1). It is 186 miles long, draining an area of 3700 square miles. Between 1881 and 1888 the United States government expended about \$50,000 in making the channel navigable

for bateaux and boats of light draft, as far as Madison, in Rockingham County. The river furnishes extensive water power at several points.

**DANSVILLE**. A village in Livingston Co., N. Y., 76 miles east-southeast of Buffalo, on the Delaware, Lackawanna, and Western and the Dansville and Mount Morris railroads (Map: New York, C 6). The Jackson Health Resort, three parks, the high-school building, and the village library are noteworthy features. Shoes, machinery, and paper are manufactured, and there are important nursery interests. The water works are owned by the municipality. Dansville was settled in 1795 and was incorporated as a village in 1845. It is governed by a mayor and a council. Pop., 1900, 3633; 1910, 3938.

**DANTAN**, dān'tān'. A family of French artists.—ANTOINE LAURENT (1798-1878), called the elder, was born at Saint-Cloud. He was a pupil of his father, a wood carver, and of Bosio and Brion. Having won the Roman prize in 1828, he continued his studies in Rome and after his return acquired reputation by important public monuments, like the statues of Admiral Duquesne at Dieppe, François Malherbe at Caen, and "The Archangel Raphael" in the Madeleine, Paris, and by his eminently characteristic portrait busts of celebrated contemporaries, such as Beethoven, Rossini, and the actress Rachel (Théâtre Français), the Marshal de Villars and Duc de Berwick (Versailles). Among his ideal works are "Young Bather Playing with his Dog" (1835) and "Neapolitan Tambourine Girl." His work is characterized by purity of line.—JEAN PIERRE (1800-69), his younger brother, also a sculptor, was born in Paris, studied under Bosio, and confined himself almost exclusively to portrait busts and statues. His works include such celebrities as Cherubini (Palais de l'Institut), Rossini (Opera House, Paris), Baron de Rothschild, Victor Hugo, Meyerbeer, Beethoven, Verdi, and Rosa Bonheur. He is especially known for clever caricature busts and statuettes in terra cotta of all the notabilities of the time, a large collection of which is in the Musée Carnavalet, Paris. He may be said to have created modern caricature in sculpture.—His son JOSEPH EDOUARD (1848-97), a painter, was born in Paris and studied under Pils and Henri Leberman at the Ecole des Beaux-Arts. He painted portraits, religious, mythological, and genre scenes, among the best of which are "Studio Interior" (Luxembourg) and "Entracte during a First Night" (Théâtre Français). His drawing is correct, his execution smooth, his color pleasing.

**DANTAS**, JULIO (1876- ). A Portuguese dramatist. He practiced medicine in Lisbon, was director of the Conservatório, and there produced revivals of classic Portuguese comedies, notably Camoens, but he was best known for his own dramas. These include: *O que morreu d'amor* (1899), *O viriato tragico* (1900), *A severa* and *Os crucificados*, these two being especially popular in Portugal and Brazil, and *A ceia dos cordeiros*, which was played in Germany in a version by Louise Ey as *Das Nachtmal der Kardinal* (1905). In 1912 *Roses all the Year Round*, a version of a one-act play by Dantas, was given successfully in London.

**DANTE ALIGHIERI**, Ital. pron. dān'tā a'lē-gyā'rē (1265-1321). An Italian poet, au-

DANTE  
FROM A PORTRAIT BY GIOTTO, IN THE NATIONAL GALLERY, FLORENCE

obstructive to the other and both acting as agents of God's will and goodness. This limitation of the Pope's prerogatives led to the condemnation of this work.

But no one of these productions adequately foreshadows the greatness of that miracle of human achievement we have in the *Comedy*, which later critics called *Divine*. Here we have a complete mastery of life by Dante's intelligence. The universe spreads out before him—material, intellectual, spiritual. His mind grapples with its manifold problems—scientific, philosophical, ethical—and does not rest till it has found an answer. Dante's fundamental preoccupation is the moral one: he studies how man, endowed with various faculties, intelligence, and soul, may utilize the materials of knowledge and experience the world affords to attain the vision of reality, of God. What he strives for preeminently is a conscious rise to salvation. Keenly aware of the limits of human intellect, he is equally alive to the danger of unguided faith. He seeks, then, so to employ the intelligence that the soul may be brought to an attitude of receptivity towards divine revelation, that alone imparts ultimate truth. Love, which originally came to him as simple experience of sex psychology and which he universalized in the *Vita nuova*, is the guiding principle of this evolution. It is the impulse that creates a desire for truth, it is the touchstone for measuring the attainment of it. In the *Comedy* Vergil symbolizes human reason or intellect; Beatrice, divine revelation. Vergil can interpret human experience of sin and virtue, while the mysteries of beatitude, of the divine vision, can be unfolded only by the higher power. We find in the *Inferno* three categories of sin—incontinence (lust, gluttony, avarice, prodigality, anger), violence (heresy, homicide, suicide, squandering, blasphemy, sodomy, usury); fraud (pandering, seduction, flattery, simony, soothsaying, swindling, hypocrisy, thieving, evil counsel, creation of schism, alchemy, impersonation, counterfeiting, falsehood, treason). In this order sins descend through the abyss of Hell, covered at the top by the continent of the Northern Hemisphere, and descending cone-shaped to the central point of the earth. Dante's geography held that the Southern Hemisphere was covered by the vast ocean, out of which rose the mount of Purgatory. At its base are the negligent (excommunicated, procrastinators, victims of sudden death, those distracted from repentance by public affairs), whose indolence prevents them from beginning at once the cleansing ascent. Above, on seven ascending terraces, are those to be purged of pride, envy, wrath, sloth, avarice, prodigality, gluttony, and lust. The torments of Hell symbolize the consequences of sin; in Purgatory the sinners are forced to act the opposite of their shortcomings, sustained by examples of the opposite virtues. At the summit of the mount of Purgatory is the Earthly Paradise—all that man can attain through reason and human virtue unilluminated by grace. Thence we ascend to Paradise. Dante's heaven is that of the Ptolemaic system: around the earth's globe are nine concentric spheres, one for each of the seven planets, one for the fixed stars, beyond which come the Crystalline Heaven (*primum mobile*) and finally the empyrean where is God. With God dwell the souls of all the blessed; but

they cast projections back upon the spheres according to the intensity of their love, which determines the degree of their beatitude: in the sphere of the Moon, ruled by the angels, are the inconstant, of incipient charity; in Mercury, ruled by the archangels, are the ambitious of proficient charity of deed; Venus, ruled by the Principalities, reflects the sensuous, of proficient charity of will; the Sun, ruled by the Powers, teachers, of proficient charity of intellect; Mars, ruled by the Virtues, militant Christians, of perfect charity of deed; Jupiter, ruled by the Dominations, just rulers, of perfect charity of will; Saturn, ruled by the Thrones, contemplative spirits, of perfect charity of intellect. In the sphere of the Fixed Stars appear the apostles, of divine wisdom, ruled by the Cherubim, in the Crystalline Heaven appear only the Seraphim reflecting divine love.

Dante's moral system was derived largely from St. Thomas; and he owed much to St. Augustine and the Neoplatonics. But his own mastery of the science and speculation of his time was such that his contemporaries and immediate followers regarded the *Comedy* as a book of divine wisdom. They studied it and commented upon it as such. But few works in all literature have so deeply entered into the consciousness of mankind. It is true that, owing to its peculiar view of life, the *Comedy* was for a time, even in Italy, dimmed, as a work of art, by such productions as those of Petrarch and Boccaccio. Since the end of the eighteenth century, however, its preëminence has been undisputed. For, even if philosophy and science have profoundly changed since Dante's time, the *Comedy* created figures that are immortal possessions of humanity, and it exhaustively portrayed states of mind that are common to all ages and races of men. In Dante's Francesca da Rimini all that the world has felt concerning love and death is objectified, brought near to every reader, just as in his Ugolino we have an unsurpassable expression of pathos and outraged sense of justice. The insignificance of man in the presence of the immensity of the universe was never more impressively described than in his Ulysses. In every picture of the *Inferno* there is the pictorial vividness of a Giotto, while in the *Purgatorio* we find the manifold emotions of hope and confidence, as in the *Paradiso* the highest imaginings of ecstatic vision.

Dante literature itself is one of the great phenomena of modern culture. We can outline only a few instruments that an English-speaking reader would find indispensable or useful at the beginning of Dante study: 1. BIBLIOGRAPHY: fundamental is Koch's *Dante Catalogue* (Ithaca, 1900); for current bibliography since that time, consult the files of the *Giornale Dantesco* (Florence) and of the *Giornale Storico della letteratura italiana* (Torino). 2. EDITIONS AND TRANSLATIONS of the works: Moore, *Tutte le opere di D. A.* (Oxford). Of the *Comedy*: annotated ed. of Grandgent (Boston, 1913); trans. by Longfellow (ib., 1887); by Norton (ib., 1893); with text opposite by Okey ("Temple Classics"). Of *Vita nuova*: ed. by Scherillo (Milano, 1911); trans. by Norton (Boston, 1893); by Rossetti (Portland, Me., 1898). Translation of *Convito* (London 1908). Of *De Monarchia* by Church (ib., 1879) Crit. ed. of *De Vultgari Eloquentia*: by Rajs

(Florence, 1896); trans. by Howell (London, 1890). Trans. of *Letters* by Latham-Carpenter (Boston, 1891). Of *Quæstio de aqua et terra* (doubtful authenticity) by Bromby (London, 1897). Of *Canzoniere*, with text opposite, by Wicksteed ("Temple Classics"). 3. CRITICAL WORKS, BIOGRAPHY, ETC.: Early biographies of Dante collected by Zanichelli (Bologna, n. d.); trans. in *Yale Studies* (New York, 1901); Moore, *Dante Studies* (Oxford, 1898); Wicksteed, *Dante and Aquinas* (London, 1913); Reade, *The Moral System of Dante's Inferno* (ib., 1909); D'Ovidio, *Il purgatorio e il suo preludio* (Turin, 1906); Busnelli, *Il concetto e l'ordine del Paradiso dantesco* (Florence, 1911-12); K. Vossler, *Die göttliche Komödie* (Leipzig, 1907-10); Flamini, *Introduction to the Study of Dante* (trans. Josslyn, Boston, 1912); Toynebee, *Dante Dictionary* (London, 1900); Scartazzini, *Encyclopædia dantesca* (Milan, 1896-99); Sheldon-White, *Concordanza delle opere di D. A.* (Oxford, 1905); Rand-Wilkins, *D. A. Operum Latinorum Concordantæ* (ib., 1912). Farinelli, *Dante e la Francia* (Turin, 1908); Toynebee, *Dante in English Literature* (New York, 1909); Sanvienti, *I primi influssi di Dante del Petrarca e del Boccaccio sulla letteratura spagnuola* (Milan, 1902); De Sanctis, *Storia della letteratura italiana*, vol. 1 (Bari, 1913), and *Nuovi saggi critici* (Naples, 1898). Fletcher, *Dante Alighieri* ("Home Library", New York, 1914); Santayana, *Three Philosophical Poets* (Boston, 1912).

**DANTÈS**, dān'tās', EDMOND. The Count in Dumas's romance *The Count of Monte Cristo*.

**DANTON**, dān'ton', GEORGES JACQUES (1759-94). A great popular leader in the French Revolution. He was born, Oct. 28, 1759, at Arcis-sur-Aube, of a bourgeois family. Though his parents wished him to become a priest, Danton preferred the law, and, after being educated in his native town and at Troyes, he went to Paris. A born orator, Danton quickly rose in his profession, and as early as 1785 he was known as a successful practitioner before the Parlement of Paris. In 1787 he married, purchased, at a cost of 80,000 livres, a position as advocate of the Royal Council, and was soon earning an income of 25,000 livres a year. At this time he is described as a forcible and eloquent speaker, a man of liberal tastes, fond of books, and happy in his domestic life. He saw the Revolution approaching and as early as 1787 said to his patron, M. de Barentin, "Moderate reforms are no longer possible; do you not see the avalanche soon to descend?" It is said that Mirabeau, perceiving Danton's genius, sought to attach him to himself. In the early revolutionary outbreaks Danton took no prominent part, but early in 1790 he was threatened with arrest for protesting in violent terms against Marat's arrest, and in June of the same year he appears as one of the chief founders of the club of the Cordeliers, or ultra-Jacobins, while in the autumn he was chosen to be commander of the National Guard of his district. The next year he appeared as the advocate of the extremists of Paris and publicly attacked the antirevolutionary leaders. His utterances having exposed him to arrest, he fled to England and remained there some six weeks, during which time he had conferences with the chief leaders of the Whig opposition. On returning to Paris he was elected to office in the commune and probably was largely instrumental in

citing and bringing to a successful issue the insurrection of Aug. 9 and 10, 1792. After the taking of the Tuileries and the suspension of the royal power, Danton became Minister of Justice, and in this capacity entered the provisional government and became a member of the executive.

The strongest personality of them all, Danton at once assumed the leadership. He took active measures to free the country of its foreign invaders. His eloquence thrilled the people, and when, on September 2, he made his wonderful speech before the Assembly and cried *Pour les vaincre, pour les atterir, que faut-il? De l'audace, encore de l'audace, et toujours de l'audace* ('To vanquish them, to crush them down, what is necessary? To dare, to dare again, and always to dare'), France responded by placing 14 armies in the field. In October, 1792, partly by force and partly by diplomacy, the foes had been expelled. In the fearful days of the September massacres, when political prisoners were taken out and butchered by hundreds, Danton would not let the government leave Paris. Of the atrocities that took place he was presumably not guilty, but he certainly acquiesced in and condoned the deeds of his associates. In September, 1792, he resigned as Minister of Justice and was elected to the Convention. There he successfully repelled a venomous attack made on him by the Girondists and, later, on his return from his mission to Dumouriez, answered Marat's insinuations that he had been privy to the treachery of that general. Danton was among those who voted for the death of the King (January, 1793). After being elected president of the Jacobin Club Danton, in March, 1793, became a member of the Committee of Public Safety and later its president. This was the period of his greatest services to France, when he organized her defenses and directed her foreign policy. The irreconcilable attitude of the Girondists forced him to take active measures for their suppression (June 2, 1793), for he felt that they were not true revolutionists. In his revolutionary enthusiasm, however, Danton called up a force that was destined to crush him. After the fall of the Girondists he advocated the formation of a new and more powerful Committee of Public Safety, endowed with unlimited authority and ample resources. He himself ceded his right to a seat on this tribunal, an error of judgment which cost him his life. Danton's aim at this time was undoubtedly the conciliation of the various republican and revolutionary factions in France into a stable and peaceful government, the aim of the committee was to make its own power supreme over all others. Robespierre began to emerge as its leader, supported by Saint-Just, Billaud-Varennes, and Couthon. While Danton, with his friend and ally, Camille Desmoulins (q.v.), the inspirer and chief author of the *Vieux Cordeliers* papers, was advocating moderation, the followers of Robespierre were preparing to strike. The first of their opponents to fall were the fanatical Hébertists, in March, 1794; after them came the turn of the Dantonists. Their leader seemed no longer to care for the turmoil of politics, but pursued a policy of inaction and awaited the attack. For a short time Danton retired to his home at Arcis-sur-Aube, having recently married a second wife. His enemies were active, and, after some show of hesitation, Robespierre yielded to Billaud-Varennes (q.v.),

and the fate of the Dantonists was sealed. On March 30, 1794, Danton, Camille Desmoulins, and others of the party were seized and imprisoned.

Before the revolutionary tribunal the strength of Danton's character shone forth. Questioned by the president as to his name and dwelling, he replied: "My name? It is Danton: a name tolerably well known in the Revolution. My dwelling? It will soon be annihilation; but my name will live in the pantheon of history." His trial was a farce, the formal charge being that of conspiring to restore the monarchy. The eloquence of the man was so great that Paris thrilled as he hurled defiance at his accusers, and there was danger of a popular revolt in his favor. The Convention eagerly seized on the infamous suggestion of Saint-Just, that disrespect for justice merited summary conviction, and, with 14 of his supporters, Danton was at once condemned to the guillotine. Almost his last words were inspired by the treachery of Robespierre. "I could have saved him," he said; "I leave it all in a frightful welter: not a man of them has any idea of government. Robespierre will follow me; he is dragged down by me." On April 5, 1794, Danton mounted the scaffold with calm courage. A moment he stood erect, facing the mob, then, turning to the executioner, said, "Show the people my head: it is worth seeing." Danton was extremely large and extremely ugly, his face roughly corrugated by pockmarks, his nose crushed by an early accident, his eyes small and deep-set. He was rough in word and overquick in action. His speeches were always extemporaneous, the hot, passionate declamations of the moment, as, e.g., those on the trial of the King; his acts, such as the law of the 40 sous, equally hot-headed and ill-considered. But the accusations of venality, of dissolute conduct, of bloodthirsty ferociousness, so often made against Danton, have been long since disproved.

**Bibliography.** Following the lead of Comte, the French Positivists have sought with considerable success to redeem the reputation of Danton and to establish his claim to rank as a patriot. The biographies of him that are of any value represent this tendency. His chief biographer has been Dr. Robinet, whose studies are supported by an ample array of documents and *pièces justificatives*. These are *Danton, mémoire sur la vie privée* (Paris, 1865); *Le procès des Dantonistes—documents avec introduction historique* (ib., 1879); *Danton émigré, recherches sur la diplomatie de la République, 1793* (ib., 1887); and *Danton, homme d'état* (ib., 1889), the most important of the series, published on the revolutionary centenary. All recent writers have relied largely upon the researches of Robinet. Other important works are: Bougeart, *Danton* (ib., 1861); Dubost, *Danton et la politique contemporaine* (ib., 1880), a study of Danton's influence on French republicanism, which the author regards as permanent, and *Danton et les massacres de Septembre* (ib., 1886); Beesly, *Life of Danton* (London, 1889). Belloc, *Danton: A Study* (ib., 1899), is a well-written book by a strong admirer. Danton's works have been collected and edited by Vermorel, *Œuvres de Danton* (Paris, 1886). An admirable selection of significant extracts from his important speeches will be found, preceded by a useful introduction, in H. Morse-Stephens, *Orators of the French Revolution* (Oxford,

1892). Consult also: Aulard, *Notes sur l'éloquence de Danton* (Paris, 1882); *Les orateurs de la législative et de la convention* (ib., 1885-86), and *Les grands Français* (ib., 1887); Warwick, *Danton and the French Revolution*; Gibbs, *Men and Women of the French Revolution* (Philadelphia, 1906).

**D'ANTRAIGUES**, dān'trag'. See ANTRAIGUES.

**DANTZIC**, dān'tsik. See DANZIG.

**DANUBE** (Ger. *Donau*, Hung. *Duna*, Lat. *Danuvius*, OChurch Slav. *Dunavŭ*, *Dunay*; connected with OHG. *tuonawara*, foreign). The second of European rivers, inferior only to the Volga. It has its origin in the Brege and Brigach, two mountain streams rising in the eastern part of the Black Forest, in Baden, at an elevation of 2200 feet above sea level, in lat. 48° 6' N. and in long. 8° 9' E. (Map: Europe, E 4). The total length of the Danube is about 1750 miles. The area which it drains is estimated at about 315,000 square miles, comprising countries differing widely in climate and productions, including southern Germany, a great part of Austria-Hungary, Bosnia, Servia, Bulgaria, and Rumania. The Danube is joined in its course by 60 navigable rivers, whose waters, with those of many lesser streams, it conveys into the Black Sea. From its source it flows in an easterly and then in a northeasterly direction through Baden, Hohenzollern, Württemberg, and Bavaria. Passing Ulm, near which it receives the Iller, and at which point the river becomes navigable for small steamboats, it receives from the south the Lech and flows past Ingolstadt and Regensburg (Ratisbon), between which two towns it is joined by the Altmühl from the left; then, altering its course to the southeast, it receives the waters of the Isar and the Inn from the south, the latter joining it at Passau. It then traverses Upper and Lower Austria from west to east, passing Linz and Vienna, and about 40 miles beyond the latter city it enters Hungary near the town of Pressburg. Between Passau and Pressburg it receives from the south the Enns, and from the north the March, in a country rich in minerals, well peopled, and highly cultivated. Below Pressburg it divides, inclosing the low-lying islands called the Great and Little Schütt. Between Pressburg and Budapest, in which part of its course it passes the famous fortress of Komorn and the town of Gran (Esztergom), it receives from the north the Waag, the Neutra, the Gran, and the Eipel, and from the south the Raab. A few miles above Budapest it turns directly south and enters the great Hungarian plain, in which it is continually forcing new channels and silting up old ones, sometimes sweeping away towns, or capriciously removing its channel to a distance of several miles from those formerly upon its banks. Here it receives from the west the Drave. After this the river turns towards the southeast and, joined by the waters of the Theiss from the north and the Save from the west, sweeps past Belgrade, forming the boundary between Servia and Hungary and receiving the Morava from the south. From Belgrade to Orsova, where it reaches the borders of Wallachia, the Danube pursues an easterly course.

Leaving Orsova, the Danube passes the famous "Iron Gate," where the river formerly rushed over a broad plateau of rock 1400 yards wide. This rapid, which was followed by a series of

whirlpools, eddies, and shallow falls, formed an effectual bar to the upward progress of vessels, no craft drawing more than 2½ feet of water being able to pass it. In 1847-49, however, the obstruction formed by the Iron Gate was to some extent removed by blasting, and since then further improvements have been made in this part of the course, the Austrian government in 1890 having begun works for making the river constantly navigable at this point. The new passage was formally opened Sept. 27, 1896. The work of improvement cost \$10,000,000, and to meet the cost of maintenance and the annual interest, tolls are exacted at this point. For a short distance below this the river flows south between Wallachia and Servia and then, turning eastward, traverses a vast plain, in which it forms the boundary between Wallachia and Bulgaria. From the Carpathians it receives the Shil and the Aluta and Veda, and from the Balkan Mountains the Isker, the Osma, and the Yantra. Increased by these rivers and by numerous lesser streams, it progresses through a poorly cultivated and thinly peopled but fertile district, occasionally broadening like a sea, as at Hirsova, and encircling many islands. After being joined by the Sereth and the Pruth from the north, and about 50 miles from the Black Sea, it divides into several branches, forming a great delta with an area of about 4000 square miles. The principal channel mouth is the Sulina, through which the greater number of ships pass. This has been deepened by means of jetties, so as to admit vessels of 20 feet draft. The other principal mouths are the Kilja and St. George, which, although useless for navigation, discharge a large proportion of the water. The Danube is the chief natural highway for central European commerce. Communication has been established between it and the Rhine by the construction of the Ludwigs-Kanal in Bavaria, connecting the Altmühl with the Regnitz, an affluent of the Main. At the Peace of Paris in 1856 the navigation of the Danube was declared free to all nations, and its management was intrusted to two commissions—one representing the European Powers, another named by the states on the banks of the river. At the Berlin Congress of 1878 it was stipulated that no ships of war should navigate the Danube below the Iron Gate. The Austrian government has executed great works for the improvement of the navigation of the river at Vienna and for the regulation of its flow, so as to avert disastrous inundations. The Danube Steam Navigation Company has done much to increase the commerce. In the five years ending with 1890 this company handled 1,263,000 tons of traffic, while in the single year 1900, after improvements had been made, it handled 1,503,000 tons. Since 1900 it has steadily increased and now reaches 2,000,000 tons.

**DANUBIAN PRINCIPALITIES.** See MOLDAVIA; WALLACHIA; RUMANIA.

**DANUM.** See DONCASTER (end).

**DANVERS.** A town, including several villages in Essex Co., Mass., 4 miles northwest of Salem, on the Boston and Maine Railroad (Map: Massachusetts, F 2). It contains St. John's Preparatory College (Roman Catholic), the Danvers State Hospital, Peabody Institute Library, Essex County Agricultural College, and Danvers Historical Society. The manufactures include shoes, leather, morocco, brick, electric

lamps, iron, rubber, soap, etc. The government is administered by town meetings. The water works and electric-light plant are owned by the municipality. Pop., 1890, 7454; 1900, 8542; 1910, 9407.

Until 1752, when it was incorporated as a separate town, Danvers was part of Salem. In 1855 the town was divided—the southern part becoming South Danvers, afterward Peabody, the northern keeping its original name. Here the witchcraft delusion of 1692 first appeared, and 10 of the inhabitants within this district were convicted and hanged, many more being arrested and acquitted. Danvers has many places of historic interest, notably the birthplace of Israel Putnam; Oak Knoll, the home of Whittier; and Mount Burnett, a favorite haunt of Hawthorne. Consult: Hudson, *History of the Town of Danvers* (Danvers, 1848); Hurd, *History of Essex County* (Philadelphia, 1888); Hines, *Historic Danvers; Celebration of the One Hundred and Fiftieth Anniversary of Danvers* (1902).

**D'ANVILLE, dān'vél.** See ANVILLE.

**DANVILLE.** A city and the county seat of Vermilion Co., Ill., 125 miles by rail south of Chicago, on the Vermilion River, and on the Wabash, the Chicago, Indiana, and Southern, the Illinois Traction, the Chicago and Eastern Illinois, and the Cleveland, Cincinnati, Chicago, and St. Louis railroads (Map: Illinois, E 3). Among the features of interest are the Danville Branch National Soldiers' Home, Carnegie library, government building, Elks' Home, and five fine parks. Danville has coal-mining interests, machine shops and foundries, and manufactures zinc, handles, tools, boxes, glass, and clay products. Settled about 1830, the city was incorporated in 1867. It is governed by a mayor, elected biennially, and a council which selects the city engineer and confirms the executive's appointments to the police and fire departments and public library board. Other administrative officials are chosen by popular election. Pop., 1900, 16,354. Between 1900 and 1906 several suburbs were annexed. The population of the city in 1910 was 27,871; 1914 (U. S. est.), 30,847.

**DANVILLE.** A town and the county seat of Hendricks Co., Ind., 20 miles west of Indianapolis, on the Cleveland, Cincinnati, Chicago, and St. Louis Railroad (Map: Indiana, C 3). It is the seat of the Central Normal College, and contains a fine courthouse and Carnegie library. There are manufactories of flour, lumber products, canned goods, etc. The water works are owned by the municipality. Pop., 1910, 1640.

**DANVILLE.** A city and the county seat of Boyle Co., Ky., 117 miles south by west of Cincinnati, Ohio, on the Queen and Crescent and the Southern railroads (Map: Kentucky, F 4). The city is the seat of the Kentucky School for Deaf Mutes; Central University of Kentucky (Presbyterian), opened in 1822; and Kentucky College for Women (Presbyterian), founded in 1860. It has a park named in honor of Dr. Ephraim McDowell. Danville is in a stock-raising and agricultural region and carries on a large trade in tobacco and hemp. It is governed by a mayor, elected every four years, and a unicameral city council. The water works are owned and operated by the city. Here in 1785, 1786, 1787, and 1792 important conventions were held, the first State constitution for Kentucky being drawn up in 1792. Danville was the birthplace and early home of James G. Birney. The settlement was

first incorporated in 1789. Pop., 1890, 3766; 1900, 4285; 1910, 5420.

**DANVILLE.** A borough and the county seat of Montour Co., Pa., on the north branch of the Susquehanna River, 12 miles from its intersection with the West Branch, and on the Lackawanna, the Philadelphia and Reading, and the Pennsylvania railroads (Map: Pennsylvania, H 5). It has a large hospital, opera house, public library, and is the seat of a State hospital for the insane. There are deposits of limestone in the vicinity, and the borough has iron and steel works, silk and knitting mills, rolling mills, stove works, etc. The government is vested in a burgess, elected every three years, and a borough council. The water works and electric-light plant are owned and operated by the municipality. Pop., 1900, 8042; 1910, 7517.

**DANVILLE.** An independent city of Virginia, 141 miles by rail southwest of Richmond, on the Dan River and on the Southern Railroad (Map: Virginia, E 5). Situated in the Piedmont section of Virginia, amid picturesque mountain scenery, Danville rises from the river, which furnishes splendid water power, to an altitude of from 400 to 600 feet above tide. Its streets are paved with brick and Belgian blocks and are well shaded. The surrounding region is adapted to the cultivation of tobacco, grain, fruits, and other produce. The city is the seat of Roanoke Institute (Baptist), established in 1859; Randolph Macon Institute (Methodist), 1897; Danville School for Boys; and contains a general hospital, orphanage, Elks' Home, several parks, and a public library. Danville has an extensive tobacco trade and many tobacco warehouses and factories, a cheroot factory, several large cotton mills, furniture factories, flour mills, elevator works, knitting mills, and pants and overall factory. The government is administered, under the charter of 1890, by a mayor, chosen for two years, and a city council which controls the appointments to the important administrative offices: the sergeant, attorney, treasurer, and the clerk of the court being elected by the people. The water works and electric-light and gas plants are owned and operated by the city. Danville was incorporated as a town in 1792. It was for a short time the seat of government of the Southern Confederacy during its last days. Pop., 1900, 16,520; 1910, 19,020.

**DANZIG,** *dän'tsik*, in English commonly written **DANTZIC** (Pol. *Gdansk*, Lat. *Gedanum*). An important seaport, manufacturing centre, and fortress, capital of the Province of West Prussia, on the left bank of the western branch of the Vistula, about 3 miles from its mouth in the Baltic, 253 miles northeast of Berlin by rail, and in 54° 21' N. lat. and 18° 41' E. long. (Map: Prussia, H 1). The strong fortifications and moats which formerly surrounded the city were removed on the north and west sides in 1895-96, and the area thus secured was laid out in streets and public gardens. On the east and south sides the defenses remain, strengthened by 20 bastions. To the east is a chain of forts which extend north along the Vistula to its mouth at Neufahrwasser. In addition, the garrison possesses the means of laying the surrounding country under water on three sides. The former, which flows through the city in two branches, divides the older sections of the Altstadt, Rechtstadt, and Vorstadt from the newer Niederstadt and Langgarten. The Radaune, which enters the town through an artificial channel, separates

the Altstadt from the Rechtstadt. Between the two branches of the Mottlau is the Speicherinsel, an island on which enormous granaries have been erected for the accommodation of the vast stores of grain exported from Danzig. The rivers and canals are crossed by about 50 bridges. The Lange Brücke, a quay extending along the bank of the Mottlau, opposite the island, is one of the picturesque sights of the town. The city is generally very medieval in aspect, successive old styles of its buildings having been well preserved, including in the residences the countless gable facades and a peculiar feature known as *Beischläge*—elevated, open-air landings. Many of the streets of Danzig are narrow and crooked, but the principal streets, Lange Gasse and Langer Markt, intersecting it from east to west, abound in fine specimens of antique architecture and have a most picturesque appearance. Among the most noteworthy buildings are the church of St. Mary, a fine structure, commenced in 1343, but not finished until 1503, and containing, besides a fine high altar by Michael and other interesting objects of art, a celebrated picture of the "Last Judgment," generally attributed to Memling; the church of St. Catharine; Trinity Church; the fine fourteenth-century Gothic Rathaus, surmounted by a graceful spire; the Artushof, or Junkerhof, the former merchants' guild, now used as the exchange; and the old Franciscan monastery, restored in 1871, containing the municipal museum.

Danzig is the seat of the provincial government and of a provincial court. The city's affairs are administered by a municipal council of 63 and an executive board of 23 members. It has exhibited an enterprising spirit in the matter of municipal undertakings. It has excellently organized fire and street-cleaning departments. Two large aqueducts supply it with water, and a modern system of sewers connected with sewage farms on the Baltic gives the town a satisfactory drainage. The municipality maintains gas works, an electric-light plant, slaughterhouses, and a market hall. Danzig is well provided with educational institutions, which include two gymnasias, a realgymnasium, two real-schulen, a navigation school, military school, industrial trade and music schools, a municipal library (over 100,000 volumes), and a theatre. Its charitable institutions include two municipal hospitals as well as numerous other institutions.

Danzig has advantageous connections by rail, river, and sea. It maintains a large trade in lumber and grain, serving as a clearing place for the agricultural products of eastern Prussia and the whole of the Vistula region, which embraces a considerable part of Russian Poland. The imports include coal, iron, petroleum, machinery, spices, and other agricultural products of tropical countries, whereas the exports, as already stated, consist largely of lumber, grain, and a few other agricultural products. The growth of Danzig's sea trade has been interfered with by the competition of Stettin and of the Russian ports on the Baltic, and it is losing its relative importance as a port. The manufactures of Danzig are developing rapidly. There are large ship-building yards, breweries, distilleries, and factories for the production of firearms, machinery, and other ironware, paper, glass, soap and candles, flour, sugar, etc. Danzig is the seat of a United States consular agency. Pop., 1900,

141,000; 1910, 170,337. The environs are very attractive.

Danzig is mentioned in 997, when Christianity was first preached there. Its possession was contended for by the Danes, Swedes, Pomeranians, and Teutonic Knights, of whom the last became masters of the town in 1310. Under their rule Danzig prospered exceedingly; about 1358 it joined the Hanseatic League. In 1466 the town declared itself a free city, under the protection of Poland. The wars of the seventeenth and eighteenth centuries destroyed its prosperity, and though it was left a free city on the first partition of Poland, in 1772, its trade ceased almost entirely. In 1793 it became Prussian. Taken by the French Marshal Lefebvre (who received the title of Duke of Danzig) in 1807, it was retaken by the Allies in 1814 and restored to Prussia. Consult: Prutz, *Danzig, das nordische Venedig* (Leipzig, 1868); Wistulanus, *Geschichte der Stadt Danzig* (Danzig, 1891); Puttner, *Danzig* (ib., 1899).

**DANZIG, DUKE OF.** See LEFEBVRE, FRANÇOIS JOSEPH.

**DAPHNE**, dāf'ně (Lat., from Gk. Δάφνη, laurel). The personification of the laurel, Apollo's sacred plant. According to the legend, Daphne was a nymph, beloved and pursued by Apollo. On crying to her mother, Earth, for help, she was transformed into a laurel, which Apollo chose as his favorite plant.

**DAPHNE.** A magnificent grove and sanctuary of Apollo, near Antioch (q.v.), on the Orontes. It was founded by Seleucus Nicator, who localized here the story of the transformation of the nymph. The temple of Apollo, containing a statue of the god by Bryaxis (q.v.), stood in a grove of cypress and bay trees and was surrounded by baths, porticoes, and gardens. The beauty of the surroundings made it a favorite place of resort for the luxurious, and it has been described as a scene of continual vice. With the growth of Christianity the worship of Apollo fell into neglect, and shortly after the attempt by the Emperor Julian (q.v.) to revive its splendors the temple was burned and the site gradually abandoned. The probable site of Daphne is now called Bēt el-Mā and still shows luxuriant vegetation, though the ancient remains are scanty.

**DAPHNE.** A genus of plants of the family Thymelacaceae, containing about 80 species of European or Asiatic shrubs or small trees, some of which have deciduous and some evergreen leaves, and all more or less acid in all their parts, which makes some of them even caustic. The berries are poisonous, but the flowers of some are deliciously fragrant. To this genus belongs the *Daphne mezereum*, well known both for the fragrance of its flowers and for its medicinal uses, naturalized in some places in England and escaped in Canada and the United States. The garou bush (*Daphne gnidium*), a native of the south of Europe, less hardy than *D. mezereum*, has the same medicinal properties. The spurge laurel (*Daphne laureola*), a native of Great Britain, is an evergreen shrub 3 to 4 feet high, with obovate-lanceolate leaves, which grow in tufts at the end of the branches and give it a remarkable appearance. It grows well under the shade of trees. *Daphne odora*, a species introduced from Japan, has lemon-scented leaves. Of species in cultivation, *Daphne mezereum* is the only one hardy as far north as New York. The evergreen species are, as a rule, less hardy, though *Daphne cneorum* is fairly resistant. (For

illustration, see Plate of MOUNTAIN PLANTS.) From the bark of some species of *Daphne* and of the most nearly allied genera paper is made in different parts of the East, particularly Nepal paper, from that of *Daphne cammabina*. Slips of the inner bark are boiled in a lye of wood ashes for half an hour, till quite soft; are then reduced to a homogeneous pulp by beating with a wooden mallet in a mortar, churned with water into a thin paste, and poured through a coarse sieve upon a cloth stretched on a frame. The paper is subsequently polished by friction, with a shell or a piece of hard wood, and is remarkable for its toughness, smoothness, and durability. Most of the paper used in Tibet is made from the bark of different species of *Daphne* and allied genera, particularly of *Edgeworthia gardneri*, a beautiful shrub, with globes of waxy, cowslip-colored, deliciously fragrant flowers, growing on the Himalaya, at an elevation of 6000 to 7000 feet. The bark of *Lasiosiphon madagascariensis* is made into paper and ropes in Madagascar.

**DAPHNEPHORIA**, dāf'ně-fō'ri-a. See GREEK FESTIVALS.

**DAPHNIN**, dāf'nin (from *Daphne*), C<sub>15</sub>H<sub>18</sub>O<sub>8</sub>+2H<sub>2</sub>O. A glucoside found by Vauquelin in the *Daphne alpina* and by Gmelin and De Baer in the *Daphne mezereum* and readily decomposed into sugar and a substance called *daphnetin*, which, like the *æsculetin* obtained from the glucoside *æsculin*, has the composition represented by the molecular formula C<sub>15</sub>H<sub>10</sub>O<sub>8</sub>. *Daphnetin* has also been prepared artificially.

**DAPHNIS**, dāf'nis (Lat., from Gk. Δάφνις). A favorite character in the bucolic poetry of the ancients, reputed inventor of such poetry. The first certain appearance of the story in literature is in the early part of the third century B.C., in Theophrastus and Theocritus. In its earliest form it seems a Sicilian folk tale. The herdsman Daphnis, son of Hermes and a nymph, was beloved by a nymph, who made him promise never to love a mortal. Under the influence of wine he was seduced by a Sicilian princess; thereupon the nymph punished him with blindness or petrification. The bucolic poets altered the details of this very common folk tale to suit themselves, and Daphnis became merely a conventional figure. Late writers indeed made him the inventor of the Sicilian herdsman's song, which was regarded as the original bucolic poetry. Consult Prescott, "A Study of the Daphnis Myth," in *Harvard Studies in Classical Philology*, vol. x (Boston, 1899). See CHLOE; DAPHNIS AND CHLOE.

**DAPHNIS AND CHLOE**, klō'ě (Gk. Δάφνις καὶ Χλόη, *Daphnis kai Chloë*). The title of an exquisite Greek pastoral love story by Longus (q.v.). It is the source of Tasso's *Aminta*, Bernardin de Saint-Pierre's *Paul et Virginie*, and Ramsay's *Gentle Shepherd*, through the rendering into French by Amyot (1559).

**DAPONTES**, dā-pōn'tēs, CONSTANTINOS (c. 1714-84). A Greek monk and poet. He was attached to the court of the Hospodar of Moldavia, Mavrocordatos, and frequently came into conflict with the Mohammedan authorities. He was the most distinguished of the modern poets of the Greek church, and several of his works, such as the *Garden of Mercy*, are still read. He died in a monastery on Mount Athos. One of his works has been translated into French by E. Legrand under the title *Ephémérides Daces, ou chronique de la guerre de quatre ans, 1736-39* (1880-88). Consult the biographical sketch in vol. iii of Legrand's work.

**DAPPLE**. In Cervantes' *Don Quixote*, the ass ridden by Sancho Panza.

**DAQIQI**, dâ-ke'kâ. The name of a Persian poet, one of the predecessors of Firdausi. See FIRDÂUSI; PERSIAN LITERATURE.

**DARAB**, dâ-râb', or **DARABGHERD**, -gêrd' (Pers., city of Darius, from *Dârâ*, OPers. *Dârayavansh*, Gk. *Δαρείος*, *Dareios*, Darius + *gird*, OPers. *cardana*, city: connected with Lat. *urbs*, city). A town of Persia in the Province of Fars, situated on a small river, about 140 miles southeast of Shiraz (Map: Persia, E 6). It has some tanneries and exports dates, oranges, and lemons. About 3 miles south of the town is situated a caravansary hewn in rock, and also a relief commemorating the victory of Shahpur I over Valerian (260 A.D.). It is claimed Darius founded the town. The population is estimated at from 4000 to 12,000.

**DARAGA**, dâ-râ'gâ. A town of Luzon, Philippines. See CAGSAC.

**DAREHANGA**, dūr-būn'gâ. The capital of a district of the same name in the Patna division, Bihar and Orissa, India (Map India, E 3), on the Little Baghmati River, 68 miles northeast of Patna. Its chief building is the maharajah's palace, with noteworthy menagerie and library. It has a large market place, important bazars, and a hospital. Its chief exports are oil seeds, ghi and timber, and a considerable trade is carried on in the agricultural and mineral products of the region. Pop., 1891, 73,561; 1901, 66,244; 1911, 62,628.

**D'ARBLAY**, dâr'blâ', FRANCES BURNBY (1752-1840). An English novelist. She was a daughter of Charles Burney, a musician, and was born at King's Lynn, June 13, 1752. Eight years later the Burneys removed to London. At the famous musical assemblies given by her father Miss Burney saw, from the outside, fashionable life, and this she depicted with spirit and humor in her first novel, *Evelina* (1778). No novel since *Clarissa Harlowe* attracted more notice. It was read by Burke, Reynolds, and Johnson, and lavishly praised. This brilliant success was followed by *Cecilia* (1782), which, though not so fresh as *Evelina* and a little heavy, had a large sale. In 1786 Miss Burney was appointed second keeper of the robes to Queen Charlotte. Disliking the service, she resigned her position five years later. While visiting her sister at Mickleham, she became acquainted with a French refugee, General D'Arblay, whom she married in 1793. The rest of her life was passed partly in England and partly in France. She published two other novels, *Camilla* (1796) and *The Wanderer* (1814), neither of which is readable. A play of hers, *Edwy and Elvina*, was performed in 1795 and was unsuccessful, though Mrs. Siddons and Kemble took the leading parts. She also published memoirs of her father (1832), written in an affected style resembling her last novels. In 1842-46 appeared her interesting *Letters and Diaries*. A new edition in six volumes was published in London in 1904-05. The *Early Diary, 1768-1778* (2 vols., New York, 1907) was edited by A. R. Ellis. Consult: Macaulay, *Essays*; Dobson, *Fanny Burney, Madame D'Arblay* (New York, 1903); C. Hill, *Fanny Burney at the Court of Queen Charlotte* (New York, 1912).

**DARBOUX**, dâr'bôô', JEAN GASTON (1842- ). A French geometer, born at Nîmes. He studied at the Ecole Normale, was appointed senior professor of geometry in the faculty of

sciences there, and in 1887 became dean of that faculty. His *Mémoire sur les solutions singulières des équations aux dérivées partielles* was in 1876 awarded the mathematical grand prize by the Academy of Sciences. In 1904 he delivered an address before the section of geometry of the International Congress of Arts and Sciences on "A Survey of the Development of Geometric Methods" (published, 1904). His works include: *Sur les théorèmes d'Ivory relatifs aux surfaces homofocales du second degré* (1872); *Mémoire sur l'équilibre astatique* (1877); *Leçons sur la théorie générale des surfaces et les applications géométriques du calcul infinitésimal* (1887-96; 2d ed., Paris, 1914). Consult E. Lebon, *Gaston Darboux: Biographie, Bibliographie*, etc. (Paris, 1910).

**DARBOY**, dâr'bôô', GEORGES (1813-71). A French prelate, born near Langres. He was educated at the Seminary of Langres and became professor there in 1840, having been ordained priest in 1836. He went to Paris in 1845, became almoner of the Collège Henri IV in 1846, and titular vicar of Paris in 1855. He was in high favor at the court of Napoleon III, was made Bishop of Nancy in 1859, Archbishop of Paris in 1863, and afterward grand almoner to the Emperor, and Senator. He stoutly opposed the declaration of the dogma of papal infallibility at the Vatican Council. When it was declared, he submitted, yet in his diocese continued to disregard papal interference. Decidedly at variance with the Jesuits, he incurred the displeasure of Pius IX. During the siege of Paris in 1870-71 he was indefatigable in his care for the sick and wounded soldiers and could not be induced to leave his post or to seek safety in flight. He was seized as a hostage by the Communists, and while the combat raged in the streets of Paris after the entry of the Versailles troops, he was shot, with several of his priests, in the court of La Roquette Prison. Among his writings worthy of mention are: *Saint Thomas Becket, sa vie et ses lettres* (1859); *Les femmes de la Bible* (8th ed., 1876); *Les saintes femmes* (4th ed., 1877). For his biography, consult Foulon (Paris, 1889).

**DARBY**. A borough in Delaware Co., Pa., 5 miles southwest of Philadelphia, on the Baltimore and Ohio and the Philadelphia, Baltimore and Washington railroads, and on Darby River (Map: Philadelphia and Vicinity, C 6). It has a public library, erected in 1743, and a Friends Meeting House and burying ground more than 200 years old. There are woolen, silk, cotton, and worsted mills, and manufactories of water filters, wooden tanks, augurs, and bits. Darby was settled about 1660. Pop., 1900, 3429; 1910, 6305.

**DARBY**, JOHN NELSON. See PLYMOUTH BRETHREN.

**DARBY AND JO'AN**. The hero and heroine of an eighteenth-century ballad which first appeared in the *Gentleman's Magazine*, March, 1735, under the title *The Joys of Love Never Forgot: A Song*. Its author was Henry Woodfall, a London printer. In his youth Woodfall had been apprenticed to the printer John Darby, of Bartholomew Close; and he took Darby and his wife as the subject of this popular song.

**D'ARCEIN**, CHEVALIER DE. See ARMOR PLATE. **DARCET**, dâr'sâ', JEAN (1725-1801). A French chemist, director of the porcelain works at Sevres. He was one of the first to manufacture porcelain in France. He devoted himself

chiefly to applied chemistry and made valuable contributions to that science. In 1774 he was appointed professor of chemistry in the Collège de France and in 1795 he became a member of the Institute. His publications include: *Sur l'action d'un feu égal sur un grand nombre de terres* (1766-71); *Expériences sur plusieurs diamants et pierres précieuses* (1772); *Rapport sur l'électricité dans les maladies nerveuses* (1783).

**DARCET, JEAN PIERRE JOSEPH** (1777-1844). A French industrial chemist, son of Jean Darcet (q.v.). He introduced important improvements in the manufacture of soap, soda, alum, sulphuric acid, etc., and contributed a number of important papers to the *Annales de chimie et de physique*.

**DARDANELLES**, dār'dā-nel'z' (named after the Greek city *Dardanus*, on the eastern side; the ancient Hellespont). A narrow channel separating southeast Europe from southwest Asia and uniting the Sea of Marmora with the Ægean Sea (Map: Turkey in Europe, B 2). It extends from northeast to southwest, between lat. 40° and 40° 30' N. and long. 26° 10' and 26° 40' E., having a length of about 42.3 miles and a breadth varying from 1 to 5 miles. The average depth of the channel is 180 feet. From the Sea of Marmora a strong current runs through the strait to the Grecian Archipelago, except in the presence of a strong southwesterly wind, but there is an undercurrent in the opposite direction.

The European shores are steep and sterile, while the Asiatic shores are sloping and clad with beautiful forests. To prevent an attack on Constantinople by water from the Ægean, the Dardanelles is strongly fortified on both sides with many guns of large calibre. The narrow and meandering course of the strait lends itself admirably to render the Dardanelles a formidable natural fortress. A treaty concluded between the five Great Powers and Turkey in 1841 arranged that no ship of war belonging to any nation save Turkey should pass the Dardanelles without the express consent of Turkey. All merchant ships are still required to show their papers to the Ottoman authorities as they pass the narrow. These provisions were confirmed at London in 1871 and at Berlin in 1878, but in 1891, by an agreement with the Porte, Russia secured for her "volunteer fleet" the right of passage through the Dardanelles. The Dardanelles is celebrated in ancient history on account of Xerxes and Alexander having crossed it, the former in 480 B.C. to enter Europe, and the latter in 334 B.C. to enter Asia. The point at which Xerxes crossed was in the neighborhood of Abydos, on the Asiatic shore, opposite to Sestos, where the strait is 6500 feet wide. Alexander crossed at nearly the same place, and here also, in the ancient legend, young Leander nightly swam across to visit Hero—a feat performed in modern times by Lord Byron. The Asiatic coast of the Dardanelles is known for its gold mines. Numerous old workings are found at Astrya and Osmanlar, but operations have not been carried on in modern times.

**DARDANI**. In Greek legend, a people living in the heart of the Troad, descendants of Dardanus (q.v.), adjoining the territory of Ilium. Under the leadership of Æneas (q.v.) they were allies of the Trojans and were so closely identified with them that their name was often used, particularly by Roman poets, as equivalent to Trojan. Consult Leaf, *Troy: A Study in Homeric Geography*, pp. 176-180 (London, 1912).

The name "Dardani" was borne also by a sturdy people of Upper Mæsia.

**DAR/DANUS** (Lat., from Gk. *Δάρδανος*). The mythical ruler of the Dardanians, son of Zeus and Electra, the daughter of Atlas. In some legends he is closely connected with Arcadia and Samothrace and is celebrated as introducing the Samothracian mysteries and the worship of Cybele into Asia Minor. At Troy he married the daughter of Teucer (q.v.). In Roman story he was said to have come to Phrygia from Italy, so that Æneas, who was his descendant through Tros, Assaracus, and Anchises, really returned to the home of his ancestors. See DARDANI.

**DARDS** (Skt. *Darada*, Gk. *Δάρδαι*, *Dardai*, *Δαρδάροι*, *Dardaroi*, or *Δέρπαι*, *Derdai*). The natives of what is known as Dardistan, a region of Asia between Kafiristan and Balistan, to the northwest of Kashmir. The Dards (Dardi, Dardu) belong by language to the Aryan stock. Physically they are of the short-statured dolichocephalic (or mesocephalic) variety of the white race, rather dark-skinned and black-haired, but presenting also a number of taller and lighter individuals. Among the chief divisions of the Dards are the Chins and the Veshkuns. The religion of the Dards is now Islamism, which only recently has superseded Buddhism among them. Surrounded by Asiatics, these Aryans seem to have preserved some of the primitive social characteristics of their remote ancestors, and in spite of Mongoloid intermixture they have never been completely Orientalized. Since Leitner's *Languages and Races of Dardistan* (1867-73), the more recent literature of the subject includes Biddulph's *Tribes of the Hindoo Koosh* (1880); De Ujfalvy's *Aus dem westlichen Himalaya* (1884); Leitner's *Hunza and Nagar Handbook* (1893).

**DARE**. See DACE.

**DARE, VIRGINIA** (1587-?). The first child born in America of English parents. She was born on Roanoke Island, Va. (now North Carolina), and was the granddaughter of John White, who was sent out by Sir Walter Raleigh as Governor of the Colony, which, during the founder's absence in England, disappeared without leaving a trace.

**DAR-EL-BEIDA**, dār'el-bā'dā, or CASA-BLANCA (Ar., white house). The largest seaport of Morocco, north Africa, handling over one-fourth of the entire trade of the country, situated on the west coast (Map: Africa, D 1). It is surrounded by walls and has a deep but unprotected roadstead. Its population is estimated at 25,000, including about 5000 Christians. Wool and leather are the principal exports. The town was founded in 1468 by the Portuguese. It was the centre of the revolt against the assumed control of Moroccan ports by the French in 1907, and its neighborhood was the scene of numerous engagements. See MOROCCO.

**DARES**, dā'rēz (Lat., from Gk. *Δάρης*). A Trojan priest of Hephæstus, mentioned in the *Iliad*, v. 9. To him was attributed an account of the destruction of Troy, extant only in a Latin version. It is doubtful whether the Latin work had a Greek original; if it had, that original cannot have been older than the Hellenistic period. In the Middle Ages the Latin version, then much read, was ascribed to Cornelius Nepos, but in reality it belongs to the fifth century A.D.; it is quoted by Isidorus. Together with the work

of Dictys (q.v.) of Crete, it was the basis of a famous romance written by Guido delle Colonne (q.v.) in the thirteenth century. The best edition is by Meister (Leipzig, 1873). On the various late versions, consult: Dunger, *Die Sage vom trojanischen Kriege in den Bearbeitungen des Mittelalters* (Dresden, 1869); Körtling, *Dictys und Dares* (Halle, 1874); Von Fleschenberg, *Daresstudien* (1908).

**DAR-ES-SALAAM**, dār'es-sā-lām'. A rapidly growing city, the capital of German East Africa (q.v.), situated on the coast a few miles south of Zanzibar (Map: Congo Free State, G 4). It has a good harbor and a number of churches, schools, and public buildings, government and customs offices, the governor's residence, state hospital, and barracks. In the botanical gardens it has a collection of African flora. There is telegraph connection with Zanzibar, Tanga, Kilwa, and other important centres in the colony. Principal exports are ivory, rubber, and copal. Its population is about 24,000, including about 500 Europeans and 480 Arabs.

**DARESTE DE LA CHAVANNE**, dā'rēst' de là shā'van', ANTOINE ELISABETH (LÉOPHAS (1820-82). A French historian, born in Paris. He occupied the chair of history successively at the Collège de Rennes, the Collège Stanislas in Paris, the University of Grenoble, and that of Lyons, with which he remained associated in that capacity for more than 20 years. His partiality to the Catholic interests, however, compelled his resignation, in 1878. His principal publication is the *Histoire de France* (2d ed., 7 vols. and suppl., 1879), a work distinguished by remarkable accuracy and profound scholarship, but now superseded by Lavisse. Consult the biographical sketch (Lyons, 1883) by Heinrich.

**DARÉT, JACQUES**. See FLEMMALLE, MAÎTRE DE.

**DAR FERTIT**, dār fēr-tēt'. A region in the Anglo-Egyptian Sudan, situated south of Darfur, in the upper part of the basin of the Bahr-el-Ghazal (Map: Congo, D 1). It is a country rich in ivory and rubber, but very thinly populated. It was once well peopled, but as the slave trade drew on it at the beginning of the nineteenth century, the old race stocks died out. The population is extremely heterogeneous, consisting of a number of negro tribes.

**DARFUR**, dār'fūr (Ar., House of the Furs, a negro tribe of the region). A region with undefined boundaries in central Africa, under British control. It lies between Wadai, Kordofan, the Libyan Desert, and the Bahr-el-Ghazal region, covering an area of about 150,000 square miles (Map: Africa, G 3). It is traversed through the centre in a direction from northeast to southwest by the volcanic mountain range Marrah, whose extinguished craters rise above 5000 feet. On the east and west it is generally flat and sandy. Among the mountain chains there are numerous fertile valleys growing wheat, cotton, sesame, tobacco, etc. During the rainy season, which lasts from June to September, the lower portions of the country are frequently covered with water, which produces a rich vegetation. Cattle raising is carried on by the natives on a large scale. The manufacturing industries are insignificant and are chiefly confined to weaving and the manufacturing of small metal products. In some parts of the country copper and iron ores are found. The population is variously estimated, 750,000 being commonly given. It consists of Arabs and Furs, all pro-

fessing Islam. Capital, El Fasher. Prior to the revolt of the Mahdi, Darfur was a great centre of the caravan trade. It was annexed to Egypt in 1874-75, but was surrendered to dervish rule after the Mahdi's revolt in 1883. In 1890-91 the greater part was acknowledged by Germany and Italy to be within the British sphere of influence. In 1898 it became a part of the Anglo-Egyptian Sudan. The management of its internal affairs is left to its hereditary sultan.

**D'ARGENS, dār'zhān'**. See ARGENS.

**DARGOMYZHSKY**, dār'gō-mīzh'skē, ALEXANDER SERGEYEVICH (1813-69). A famous Russian composer; founder, with Glinka, of the Russian National School of Music. He was the son of a wealthy nobleman in the Government of Tula. Speechless to his sixth year, he early exhibited fondness for music and was taught the piano at six and violin at eight; his teachers, later, were Schöberlechner, a pupil of Hummel, in piano, and Zeibich in musical theory and singing. At St. Petersburg in 1833 he met Glinka, who lent Dargomyzhsky his copy of Delius's lectures on musical theory, which "he studied through in five months." Orchestration and composition he learned practically by assisting Glinka in the production of his *Life of the Czar* and by organizing various aquatic serenades on the Neva River, with private orchestras. He had by this time acquired a reputation as a song writer, pianist, and quartet violinist, and he decided to embrace music as a career. Later, in 1843, he gave up his governmental clerkship. He selected Hugo's *Lucrezia Borgia* for an opera, but, on the advice of Zhukovsky (q.v.), abandoned it in favor of *Esmeralda*, based on the *Hunchback of Notre Dame*. In 1839 the finished opera was translated into Russian, but was not produced till 1847, at Moscow. In 1840 he began a cantata, *The Triumph of Bacchus*, but, owing to the delays of *Esmeralda*, he stopped work on it and did not finish it till 1848, as an opera ballet, first produced in 1868. In 1844-45 he traveled, meeting Halévy and also Pétis, who made him known to western Europe. The delays of his opera "deadened his inspiration," but his personal success in 1853 at a charitable concert encouraged him, and in 1855 the opera *Rusalka* ('The Mermaid') was ready. Its production at St. Petersburg (1856) left much to be desired, and the public received it coldly; the Halévy-Meyerbeer style of *Esmeralda* gave way to powerful dramatic recitatives, pronounced characterization, especially in comic scenes, and a strong national element. Only 10 years later the opera, when revived, achieved an unheard-of success. During this decade Dargomyzhsky became more and more retired. He spent his time giving vocal instruction to gifted amateurs and in a measure trained a new generation of singers. He wrote three orchestral works—*Kazachok* (Cossack dance), *Finnish Fantaisie*, and *Baba-Yaga*—and while in Brussels (1864-65) won high praise with the *Kazachok* and the overture to *Rusalka*. His songs (he wrote about 100 in all) of this period possess more than ordinary merit. Among the members of the Young Russian school he found the moral support he so sadly needed, and in 1868 he undertook to embody his new theories by setting to music Pushkin's dramatic sketch *The Stone Guest*, a variant of the Don Juan story. Even during his final illness he worked unceasingly and so successfully that after his death only 10½ lines had to be completed by Cui. The orchestration was finished by Rimsky-

Korsakoff. The work was produced in 1872, but had little success. Beginning in the style of the Italian opera, Dargomyzhsky gradually changed his views of dramatic music and in his last work carried Wagner's theories to such extremes that he practically sacrificed the music to the drama. Of a fourth opera, *Rogdana*, he had sketched several scenes. Consult: Cui, *La musique en Russie* (Paris, 1880); Pougin, *Essai historique sur la musique en Russie* (Turin, 1897); Fétis, *Biographie universelle des musiciens* (Paris, 1862).

**DARIC** (Gk. *dapeukós*, *dareikos*; supposed by the Greeks to be derived from *Δαρείος*, *Dareios*, OPers. *Dārāya-va[h]uš*, Darius, but probably really from Babylonian *dariku*, weight, measure). A gold coin of ancient Persia, used also in Greece. On the obverse is the figure of a crowned archer kneeling, holding in one hand a spear, and in the other a bow, and on the reverse an irregular oblong stamp. It contained about 125 grains of gold, an amount of gold worth now \$5.40.

**DARIEL**. A transverse gorge in the main chain of the Caucasus Mountains, at an altitude of 4122 feet. It is traversed by the main road, known as the Georgian Military Road, from Viadikavkaz to Tiflis, which ascends to the Pass of the Cross, 8015 feet, and is the *Porta Caucasica* of Strabo and the *Darillian* of Oriental authors. The Darial Gorge has served as a strategic point for the successive mountain tribes which overran Georgia, and which completely dominated the defile before it came under Russian power.

**DARIEN'**. An open-mouthed gulf of the Caribbean Sea on the western part of the north coast of South America, separating the Republic of Panama and the Colombian Department of Bolívar (Map: Colombia, B 2). Its southern extension, called Gulf of Urabá (a name originally given to the Gulf of Darien), affords good anchorage. The rainy coastland is hilly and thickly overgrown. The chief affluent is the Atrato (q.v.). The name "Darien" was also applied to the Isthmus of Panama (q.v.) and to a province in the Republic of New Granada, corresponding to the present Republic of Panama. One of the earliest Spanish settlements on the mainland was in Darien, the region being then also called by the Spaniards *Castilla de Oro* ('the Golden Castile') and forming the best-known part of their *Tierra Firme*. In 1513 Balboa, Governor of the Darien settlement, crossed the isthmus with 290 men and on September 25 first caught sight of the Pacific. Consult Dr. C. L. G. Anderson, *Old Panama and Castilla del Oro*.

**DARIEŒ**. A residential town in Fairfield Co., Conn., 5 miles northeast of Stamford, on the New York, New Haven, and Hartford Railroad (Map: Connecticut, B 5). In 1913, on the shore of Gorham's Pond, an elaborate and beautiful pageant was held, depicting the history, life, and problems of the town. Pop., 1900, 3116; 1910, 3046.

**DARIEN**. A city and port of entry, and the county seat of McIntosh Co., Ga., 63 miles south by west of Savannah, on the Altamaha River, 12 miles from the ocean, and on the Georgia Coast and Piedmont Railroad (Map: Georgia, E 4). It exports large quantities of pine lumber, crossties, handles, rice, fish, and garden produce. Settled in 1736, Darien was incorporated as a town in 1816 and was char-

tered as a city in 1818. It is governed by a board of five aldermen selected by the grand jury, one of these five being chosen mayor. The water works are owned by the city. Pop., 1910, 1391.

**DARIEN' SCHEME**. A scheme projected by William Paterson (q.v.) in 1695, for the purpose of forming a settlement on the Isthmus of Darien for controlling the trade between the Eastern and Western hemispheres. It was one of the most disastrous commercial speculations in history. Nine hundred thousand pounds were quickly subscribed, a large part of it by Scottish merchants, though only a little more than half of the subscriptions are said to have ever been paid up. In 1698, 1200 colonists, recruited in Scotland, proceeded to the isthmus to lay the foundations for their prospective commercial centre, "New Caledonia." Their number was rapidly reduced, however, by starvation and disease, and in June, 1699, the survivors returned. Soon afterward the Scotch sent out another company, of 1300, but this likewise was soon forced to return, and a third company, which arrived in February, 1700, was almost immediately driven away by the Spaniards. For a brief account of the enterprise, consult H. H. Bancroft, *History of Central America*, vol. ii (San Francisco, 1883).

**DA RIMINI**, da re'mè-nè, FRANCESCA (?-1288). A woman of extraordinary beauty, daughter of Guido da Polenta, Lord of Ravenna. She was married to Gianciotto Malatesta of Rimini, a cripple, who detecting her in criminal relations with his brother, Paolo, killed them both. The story forms the basis of one of the most famous episodes of Dante's *Divina Commedia* (*Inf.*, v. 73-142), for which consult De Sanctis, "Francesca da Rimini," in *Nuovi Saggi critici* (Naples, 1898). Leigh Hunt wrote a poem, the *Story of Rimini* (1819), Silvio Pellico, G. H. Boker, and D'Annunzio have each found in the tale the subject of a tragedy, and so also has the English poet Stephen Phillips (q.v.) in his *Paolo and Francesca*. It also inspired a famous painting by Fuseli. Consult bibliography in Koch's *Dante Catalogue* (Ithaca, 1900).

**DARIUS**. The name of several Persian kings, and, like the Egyptian Pharaoh, *titular* and not *personal*. According to Herodotus (vi, 98), *Δαρείος* signifies 'one who restrains'; but the old Persian form, *Dārāya-va(h)uš* shows that it signifies 'upholding what is good.'—The most famous of the name is called Darius I, or DARIUS HYSTASPES, from his father's name. (See HYSTASPES.) He was born 558 B.C., and was a Persian and of the Achaemenian line. On the death of Cambyses (522 B.C.) he leagued himself with six other nobles to murder Smerdis the Magian, who had usurped the throne. The conspirators were successful in their plot, and Darius was chosen King. An account of these occurrences is given in the great Behistun inscription, which serves to supplement or correct the narrative of Herodotus. His position at first was very insecure, but his caution, skill, and energy enabled him to govern his vast dominions for 36 years. To strengthen himself, he married the daughter of Otanes, and likewise took three wives from the royal household, viz., two daughters of Cyrus and one of Cyrus's son, Smerdis. He then divided his empire into 20 satrapies and determined the

exact amount of the taxation to be borne by each. In some of the remoter provinces great confusion seems to have prevailed after the death of Smerdis the Magian; and a proof of how little Darius could effect at first is afforded by the conduct of Orontes, the Governor of Sardis, who for some time was quite defiant of his authority. The inscriptions of Darius contain the account of no fewer than 9 or 10 rebellions against his sway. Babylon also revolted, and Darius besieged the city unsuccessfully for two years. At last, however, it was taken by an extraordinary stratagem of his general, Zopyrus (516). It is more likely, however, that the account of the conquest of Babylon, as given by Herodotus (iii, 150), belongs to the first siege of the city. In the year 514 B.C. Darius is thought to have begun the great rock inscription of Behistun, which records the events of his reign. In 513 Darius, with an army of 700,000 (though this figure, given by Herodotus, is in all probability absurdly exaggerated), crossed the Bosphorus by a bridge of boats, marched to the mouths of the Danube, crossed the river, and advanced against the Scythians. The expedition proved a failure. Darius retreated, but detached from his main force an army of 80,000 men, under Megabyzus, to conquer Thrace, while he himself returned to Asia, whence he extended his authority in the east as far as the Indus. About 501 B.C. the Ionian cities rose in revolt against Persian dominion. They were unsuccessful, the final victory of the Persians being achieved in the naval battle at Lade and the taking of Miletus (494). The assistance given by the Athenians and Eretrians to the Ionians, and the part which they had taken in the burning of Sardis, determined Darius, who was also influenced thereto by the banished Hippias, to attempt the subjugation of the whole of Greece. In 492 he sent Mardonius with an army into Thrace and Macedonia, and at the same time dispatched a fleet against the islands. The former was routed by the Brygi in Thrace, the latter was shattered and dispersed by a storm when rounding the promontory of Mount Athos. In 490 he renewed his attempt. His fleet committed great ravages in the Cyclades, but his army was entirely defeated at Marathon by the Athenians, under Miltiades, the tyrant of the Chersonese. In the midst of his preparations for a third expedition Darius died, about 486 B.C., and was succeeded by his son Xerxes. His tomb is still to be seen at Naksh-e Rostam. Darius was an able ruler, and he organized and wisely administered the kingdom which Cyrus had founded. His liberality to the Jews in connection with the rebuilding of the temple at Jerusalem is referred to in the Bible. For the inscriptions of Darius, consult: Rawlinson, *Journal of the Royal Asiatic Society of Great Britain*, vol. x (London, 1847); Spiegel, *Alt-persische Keilschriften* (Leipzig, 1882); Weissbach and Bang, *Alt-pers. Keil.* (ib., 1893); Tolman, *Old Persian Inscriptions* (New York, 1893); *The Behistun Inscription of King Darius* (Nashville, 1908), with translation and critical notes; Justi, in *Grundriss der iranischen Philologie* (Strassburg, 1897); Strassmaier, "Inschriften von den Thontafeln des Britischen Museums copirt und autographirt," in *Babylonische Texte*, vols. x-xii (Leipzig, 1892-97). See ACHÆMENES; CAMBYSES; CYRUS, PERSIA.

DARIUS II, called, before his accession to the throne, Ochus, and after his succession *Nothus*, the Bastard. He was one of the 17 bastard sons of Artaxerxes I Longimanus. When Sogdianus, another of the bastards, had murdered the rightful King, Xerxes II, and assumed for himself the regal power, Ochus declared war against him, slew him, and secured the diadem for himself (424-423 B.C.). He now called himself Darius. His reign was ignoble. He showed himself to be completely under the control of his eunuchs and his cruel step-sister and spouse, Parysatis. Rebellions were constantly breaking out among his satraps, all of which, however, were crushed except that of Amyrtæus, Satrap of Egypt, who made himself independent in 414. It was during the life of Darius, and chiefly through the craft of Tissaphernes, Satrap of Asia Minor, and of his successor, Cyrus the Younger, son of the King, that the Persians exercised so great an influence over the affairs of Greece in the last years of the Peloponnesian War. Darius died 405-404 B.C.

DARIUS III, called before his accession *Codomannus*. A monarch noted for his mild disposition, handsome person, and courageous spirit. He was great-grandson of Darius II and was raised to the throne through the help of the eunuch Bagoas, after the murder of Artaxerxes III in 338 B.C. and of his son Arses in 336 B.C. But in spite of his superior qualities he could offer no solid opposition to the advance of the Macedonians. At the battle of Issus, in 333, his mother, wife, and three children fell into the hands of Alexander: the victory of Gaugamela, near Arbela (q.v.), in 331, opened to the latter the way to Susa and Persia proper. Darius now fled to Ecbatana, in Media, and, on the approach of his opponent, fled from there to the northern provinces, where he was seized by Bessus, Satrap of Bactria. Alexander, in a fit of generosity, hurried to deliver Darius. Bessus then prepared for flight; but Darius, refusing to follow, was stabbed by the barbarian and left. The scouts of Alexander's cavalry found Darius dying and administered to his last necessities. Thanking the Grecian King for his magnanimity and commending his family to his care, he expired (330). Alexander sent the dead body to Sisymbria, mother of Darius, to be interred in the tomb of the Persian kings. With him the Achaemenian line and the Persian Empire, that had so long dominated Asia, came to a close. Consult Justi, *Grundriss der iranischen Philologie* (Strassburg, 1897).

DARIUS THE MEDE. The son of Ahasuerus, and conqueror of Babylon, according to the biblical narrative of the Prophet Daniel (Dan. v. 31; vi. 28; ix. 1; xi. 1). His age is given as 62 years at the time of the taking of the city. There is great difficulty in identifying this ruler, whom Daniel speaks of as "Darius the son of Ahasuerus, of the seed of the Medes, which was made king over the realm of the Chaldeans" (Dan. ix. 1). Some scholars have suggested an identity with Cyaxares II (q.v.), or more likely with Gobyras, Governor of Gutium, who actually took the city of Babylon as chief in command for Cyrus. (See CYRUS THE GREAT.) But much uncertainty on the whole subject prevails. Some suggestions may be gained from Horner, *Daniel, Darius the Median, Cyrus the Great* (Pittsburgh, 1901).

**DARJEELING**, dār-jel'ing (Tib. *Dar-rgyas-glin*, land of the diamond thunderbolt, i.e., of the Lama's sceptre). A popular sanitary station of Bengal, British India, capital of a district of the same name, in the Sikkim Himalayas (Map: India, E 3). The average height of the town is 7200 feet above sea level, on the side of a great hollow or basin, in which flows the Rangit, a branch of the Tista. It is the summer residence of the Governor of the Bengal Presidency. It commands a magnificent view of the Himalayas to the north and west. The mean annual temperature is 54° F. Darjeeling has good bazars, a fine sanitarium, beautiful botanical gardens, two Anglican churches, an excellent water supply, and is, especially during October, the fashionable Indian health resort. It has a number of schools for Europeans. Tea growing is the principal industry of the district. One hundred and fifty thousand acres are devoted to its cultivation, and as much as 12,000,000 pounds has been produced annually. It was obtained by the British government from the Rajah of Sikkim in 1835, in order to be made a sanitary station. Pop., including the adjacent cantonment, 1911, 17,053; of district, 250,000.

**DARK AGES.** A name formerly applied either to the whole or the earlier part of the Middle Ages (q.v.).

**DARK AND BLOODY GROUND, THE.** A name given to the State of Kentucky as the scene of frequent Indian warfare in the days of the early settlers. The phrase has also been said to be a translation of the Indian word "Kentucky."

**DARK DAY.** Any day in which the sunlight appears to be remarkably dim or altogether absent. In New England the term is specifically applied to May 19, 1780, also known as Black Friday; but many similar dark days are also on record in other parts of the world. Other notable dark days in the United States were those of Oct. 21, 1716, and Oct. 19, 1762. Stygian darkness often prevails during eruptions of ashes from volcanoes. In recent years the months of August and September, 1881, were remarkable in the eastern part of the United States for a long series of days in which artificial light was oftentimes necessary at midday and business was generally very much interrupted. In this case the darkness is known to have been the result of a combination of ordinary cloudiness with the smoke from forest and prairie fires, and it is presumable that the same conditions must have obtained during the historical dark days of the previous century. The *United States Monthly Weather Review*, for September, 1881, p. 27, says: "The foggy or smoky condition of the atmosphere became quite general from the first to the tenth of this month over that portion of the United States between the meridians of 67° and 87° W. and the parallels of 40° and 45° N. It reached an unusual culmination in density in the eastern portion of the Middle Atlantic States and throughout New England, where it interrupted the prosecution of business and compelled the use of artificial light. The destructive violence of prairie and forest fires throughout northern Michigan and portions of Canada has perhaps never been exceeded, and the intensity of the accompanying smoke was simply dreadful. On September 6 southwesterly winds prevailed from Tennessee northward to Lake Superior, and thence eastward to the Canadian maritime provinces, and

smoke was reported as far south as Knoxville, westward to Milwaukee, northward to Rockliffe, Canada, and eastward to New Brunswick. To show the progress eastward of this condition in the atmosphere it is necessary to trace the movement of low-pressure areas over Canada and northern New England, and watch the accompanying change in wind directions." The darkness of the dark day of May, 1780, covered very much the same area, with southwest winds and occasional light rains, and was undoubtedly of the same nature, although in both cases it was attributed by the superstitious to supernatural causes. On the plains of Tibet, according to Marco Polo and other travelers, dark days are sometimes caused by clouds of dust so fine and light that it is carried to a great distance by the wind. Similar days of darkness have been caused by clouds of mingled vapor, smoke, and dust emanating from volcanic eruptions, although such clouds do not usually extend to the great distances reached by clouds of smoke from forest fires. Cases of such volcanic clouds occurred in connection with the eruption of Mont Pelée and La Soufrière in the West Indies in May, 1902, and Katmai, Alaska, in June, 1912.

**DARKE, WILLIAM (1736-1801).** An American soldier, born in Philadelphia, but taken by his parents to Virginia in 1740. He served under Braddock, rose to the rank of colonel in the American army during the Revolutionary War, and in 1791 commanded the left wing of St. Clair's army, which on November 4 was defeated by the Miami Indians. He was a member of the Virginia Legislature and of the Convention of 1788, in which he voted for the Federal Constitution.

**DARK HORSE.** A term familiarly used in the vocabulary of American politics and applied to a comparatively unknown man brought forth in a nominating convention at the supreme moment as a candidate for office in the place of a prominent rival candidate of his own party whose nomination would incur the risk of a divided vote. James K. Polk and Franklin Pierce were typical "dark horses" of the Democratic party, Rutherford B. Hayes and James A. Garfield of the Republican.

**DARK LADY, THE.** In Shakespeare's *Sonnets*, the woman thought, by those who maintain that William Herbert is the dedicatee, to be Mary Fitton, one of Elizabeth's maids of honor. It is certain that Herbert and she created a scandal. Another suggestion, with fewer supporters, is Penelope Devereux, Lady Rich, the "Stella" of Sidney's sonnets. See also the theory advanced in the *Comtesse de Chambrun's The Sonnets of Wm. Shakespeare* (London and New York, 1913).

**DARLSTON.** A town in Staffordshire, England, 4 miles southeast of Wolverhampton. It has extensive mines of iron and coal and manufactures of hardware. Pop., 1901, 15,395; 1911, 17,107.

**DARLEY, FELIX OCTAVIUS CARR (1822-88).** An American painter in water color and illustrator. He was born in Philadelphia and was practically self-taught. He illustrated the works of Irving, Cooper, Longfellow, Hawthorne, Dickens, and Shakespeare, and made 500 drawings for Lossing's *History of the United States*. Among his lithographic illustrations are those for the *Legend of Sleepy Hollow*, *Rip Van Winkle*, and scenes in Indian life. The swing and vigor of his style, his facility and versa-

tility and the high average merit of his numerous works, make him one of the most noteworthy of American illustrators. In 1868 he published, after a visit to Europe, *Sketches Abroad with Pen and Pencil*. His water-color paintings of incidents in American history are full of spirit and his bank-note vignettes are also worthy of mention. Consult F. Weitenkamp, *American Graphic Art* (New York, 1912).

**DARLEY, GEORGE** (1795-1846). An English poet. He was born in Dublin in 1795, was graduated from Trinity College, Dublin, in 1820, and went to London, where he wrote critical papers for the magazines, and about 1830 joined the staff of the *Athenæum*, becoming famous for his caustic reviews. He died Nov. 23, 1846. Under the inspiration of the Elizabethans Darley produced several lyrical dramas containing passages of great beauty—*Sylvia*, or *the May Queen* (1827; 2d ed., 1892), and the inferior *Thomas à Becket* (1840) and *Ethelstan* (1841). As early as 1822 he had published *The Errors of Ecstasie*, a melodious poem in blank verse, followed by *Lilian of the Vale* (1826), a thrilling tale, and his best poem, *Nepenthe* (1835; republished in 1897). In 1840 he edited the works of Beaumont and Fletcher. He also wrote several treatises on mathematics, which were praised by Carlyle. For specimens of his verse, consult: Stedman, *Victorian Anthology* (New York, 1895); Stratfield, *Selections from the Poems of George Darley* (1904); also the edition of Colles in the *Muses' Library* (1906).

**DARLING.** A mountain range of Western Australia, extending north and south for about 250 miles, parallel with the coast and from 20 to 70 miles distant (Map: Western Australia, B 9). It ends near Point d'Entrecasteaux. Its highest summit reaches 3500 feet.

**DARLING, GRACE HORSLEY** (1815-42). An English heroine. She was born in Bamfborough, Northumberland, the daughter of William Darling, lighthouse keeper on Longstone, one of the Farne Islands. On the morning of Sept. 7, 1838, the steamer *Forfarshire* was wrecked near the lighthouse, and all but nine of the 63 passengers perished. In spite of the danger of such an undertaking the father and daughter made a trip to where the survivors lay and rescued four men and a woman in the first trip, and William Darling and two of the rescued men returned and brought off the four others. News of the exploit was received with great enthusiasm by the English people, and by popular subscription the sum of £750 was raised for the heroine and £270 for the father. Both father and daughter were rewarded with gold medals. Consult *Grace Darling: Her True Story, from Unpublished Papers in the Possession of the Family* (1880), and *Mable, Heroine that Every Child Should Know* (New York, 1908).

**DARLING RIVER** (named in honor of Sir Ralph Darling, Governor of New South Wales, 1825-31), or **BARLOW RIVER**. An Australian stream, the most important tributary of the Murray (Map: New South Wales, B 2). It rises in southeastern Queensland, flows through New South Wales, and joins the Murray on the Victorian border, its length being 1160 miles. The area of its basin is about 200,000 square miles. During the dry season its course is marked by a succession of pools or small lakes; but during the winter, when it is subject to sudden floods, it is navigable by light-draft steamers for over 600 miles to Bourke, the ter-

minus of the Great Western Railway, from Sydney. Most of the region of the Darling is but a desert in the dry season.

**DARLINGTON.** A parliamentary and municipal borough and market town in Durham Co., England, on the Skerne, near its junction with the Tees, 8 miles south of Durham City (Map: England, E 2). The town is laid out in wide and regular streets and has a spacious market place. The parish church of St. Cuthbert, a handsome Early English edifice, was founded about 1160 by Bishop Pudsey. It is built in the form of a cross. It received its charter of incorporation in 1867, has owned its gas and water works since 1854, and maintains public baths and markets. Its principal manufactures are iron, worsteds, carpets, bricks, stone, bridge material, gun castings, and shells, and there are extensive locomotive works belonging to the Northeastern Railway. The first passenger railway in England operated by steam was opened in 1825 between Darlington and Stockton. Pop., 1891, 38,000; 1901, 44,511; 1911, 55,631. At Oxen-le-field, 3 miles from Darlington, are curious cavities of unknown origin, called Hell Kettles. From Anglo-Saxon times till 1867 Darlington was under the authority of the Bishop of Durham. Consult Longstaffe, *History and Antiquities of Darlington* (London, 1854).

**DARLINGTON.** A town and the county seat of Darlington Co., S. C., 70 miles (direct) east-northeast of Columbia, on the Atlantic Coast Line and the South Carolina Western railroads (Map: South Carolina, E 2). It carries on a considerable trade in cotton, tobacco, and grain, the principal products of the surrounding agricultural region, and manufactures cottonseed oil, cotton goods, and fertilizers. Pop., 1900, 3028; 1910, 3780.

**DARLINGTON, JAMES HENRY** (1836- ). An American bishop, born in Brooklyn, N. Y. He was educated at New York and Princeton universities and at Princeton Theological Seminary. In 1882 he was ordained a priest in the Protestant Episcopal church. Thereafter he was assistant (1882-83) and rector (1883-1905) of Christ Church, Brooklyn, and archdeacon of Brooklyn (1896-98); and in 1905 he was elected first Bishop of Harrisburg. In 1902-03 he lectured at New York University and in 1910-11 he served as chaplain of the Masonic Grand Lodge of Pennsylvania. He edited *The Hymnal of the Church* and wrote *Pastor and People* (1902).

**DARLINGTON, WILLIAM** (1782-1863). An American botanist, born at Birmingham, Pa. In 1806 he went to India, and on returning published an account of his voyage. He was a member of Congress in 1815-17 and again in 1819-23. At Westchester, Pa., he founded an atheneum, an academy, and a society of natural history. Among his publications are: *Mutual Influence of Habits and Disease* (1804); *Agricultural Chemistry*; *Agricultural Botany* (1847); *Memorial of John Bartram* (1849). The California pitcher plant was named *Darlingtonia californica* for him.

**DARMESTER, AGNES MARY FRANCES.** See ROBINSON, AGNES MARY FRANCES.

**DARMESTER, dârm'ste-târ', JAMES** (1849-94). A French Orientalist, whose eminence was achieved especially in the field of Iranian scholarship. He was born, of Jewish parentage, at Chateau-Salins, in Lorraine. He was educated at the Lycée Bonaparte, Paris, from which he grad-

uated with the highest honors in 1867, when he began to devote himself to Oriental philology, chiefly under the guidance of the gifted Michel Bréal. In 1877 he was appointed assistant professor of Zend at the École des Hautes Études and in 1885 was advanced to the professorship of Iranian languages and literature at the Collège de France. In 1886 he visited India, to make special philological researches in connection with the sacred books of the Parsis, and was afterward honored by an appointment as fellow of Bombay University. After the death of Renan he became secretary of the Société Asiatique de Paris and was likewise busily engaged as an editor of a leading political and literary periodical, *La Revue de Paris*, during the last years of his life. His writings in the field of Avestan philology and Zoroastrianism are of prime importance, even if his theories, which are often very radical, cannot always be accepted. Among his works may be mentioned: *Haurvatât et Ameretât, Essai sur la mythologie de l'Avesta* (1875); *Ormazd et Ahriman, leurs origines et leur histoire* (1877); *Études iraniennes* (2 vols., 1883); *Essai orientaux* (1883); *Chants populaires des Afghans* (1888-90); *Les prophètes d'Israël* (1892); and his most important work, *Le Zend-Avesta; Traduction nouvelle* (3 vols., 1892-93). Besides his Oriental work, he wrote a volume of *Essais de littérature anglaise* (1883), and a volume on Shakespeare (1889) for the *Collection des Classiques populaires*. A number of his literary essays have been translated into English by Helen Jastrow (Boston, 1895) and by his wife (London, 1896). Consult Bréal, "James Darmesteter," in the *Annuaire de l'école des hautes études* (Paris, 1895).

**DARMSTADT**, därm'stât (Ger., city of the Darm. the river near which the city lies). The capital of the Grand Duchy of Hesse (and of Starkenburg Province), Germany, and residence of the Grand Duke, about midway between the Rhine and the Main, at the northwestern extremity of the Odenwald, and 17 miles south of Frankfurt-on-the-Main (Map: Germany, C 4). It consists of an old and new town, the streets of the former being narrow and crooked, but those of the latter broad and handsome, exhibiting many imposing specimens of architecture. Its principal square, the Luisenplatz, adorned with a lofty column, surmounted by a bronze statue of Grand Duke Louis I, who founded the new town, contains the post office, the government building, and the old palace. The Luisenplatz is crossed by the Rheinstrasse, the most important street in Darmstadt. The grand-ducal palace, surrounded by pleasant gardens, was begun in the fifteenth century, but practically rebuilt in the early part of the eighteenth. It contains a valuable library of over 564,000 volumes, an archaeological collection, and a picture gallery with some good examples of the early German and Dutch masters. The chef-d'œuvre is the "Madonna of the Burgo-master Meyer," by Holbein the Younger. Prominent among numerous churches are the Stadtkirche, with the handsome monument of Landgrave George I, and the Roman Catholic church built after the Pantheon at Rome, with a lofty dome supported by 28 columns. Other notable features include the new palace, the palace of Prince Henry, the old and new town halls, theatre, and the Herrngarten, a fine public garden and park. The town's affairs are administered by a municipal council of 42, and an exec-

utive board of 3 members. It owns its water supply and operates gas works and an electric-light plant. Its educational institutions include a technical high school (1392 students in 1913), two gymnasia, an artisans' school, and a school of agriculture. Among its charitable institutions are a municipal hospital and the Alice and provincial hospitals.

Darmstadt is a manufacturing town of growing importance. The chief articles of manufacture are machinery, carpets, hats, tobacco, chemicals, scientific instruments, playing cards, and beer. Darmstadt is an important railway centre. An electric street railway accommodates internal traffic. The famous chemist Justus von Liebig was a native of the town, and the composer Flotow died here. To the east of the town is the palace of Rosenhöhe, with the grand-ducal mausoleum, containing the tombs of the Grand Duke Louis IV and his wife, Princess Alice, daughter of Queen Victoria of England. Pop., 1890, 56,000; 1900, 72,381; 1910, 87,089.

Darmstadt appears as Darmundstadt in the eleventh century. It acquired municipal rights in 1330 and became in 1567 the capital of Hesse-Darmstadt. It was burned by the French in 1688 and 1693, but attained great prosperity towards the end of the eighteenth century. Consult Zernin and Wörner, *Darmstadt und seine Umgebung* (Zurich, 1890).

**DARNEL** (Fr. dial. *darnelle*; probably from OF. *darne*, stupid, Dan. *daare*, fool, so called from its supposed stupefying power), *Lolium temulentum*. A grass of the same genus with the valuable rye grass (q.v.), an annual, common in grain fields in England and in many parts of continental Europe, and introduced in some parts of the United States. This grass has from ancient times been reputed to have a narcotic, poisonous seed, to which many bad effects were ascribed. Lindley, in his *Medical and Economical Botany*, published in 1849, ascribes narcotic and acrid qualities to darnel seed. Recent investigations have shown the presence of a fungus in the grain of this grass, and to it the poisonous qualities are attributed. The fungus seems to be almost always present in the seed of this species and less frequent in the other species of the genus.

**DAR-NELL**, HENRY FAULKNER (1831- ). An English Protestant Episcopal clergyman, born in London and educated at Dublin and Cambridge. He was principal of Hellmuth Ladies' College at London, Ontario, in 1874-83, and rector of a church at Avon, N. Y., in 1883-1904, and of St. Mary's, Detroit, in 1904-07. His publications include: *Philip Haelebrook* (1887); *The Craze of Christian Englehart* (1890); *Songs of the Season* (1895).

**DARNETAL**, därm'nä'täl'. The capital of a canton in the Department of Seine-Inférieure, France, at the confluence of the Aubette and Robec, a suburb of Rouen (Map: France, N., G 3). Its noteworthy buildings are the Gothic church of Long-Paon, a fine early sixteenth-century belfry, and the town hall. The town commands a good view of Rouen. It has important manufactures of woollens, calico, cotton goods, and cast iron. Pop., 1901, 6826; 1911, 7218.

**DARNING NEEDLE**. A dragon fly, or damselfly; supposed by ignorant folk to be attempting to pierce and "sew up" one's ears or do other mischief as it darts about one's head; hence the term is frequently extended to "devil's darning needle." See DRAGON FLY.

# DARTERS AND SUNFISH

1. SAND DARTER (*Ammocrypta pellucida*).  
 2. BLACK-BANDED SUNFISH (*Mesogonistius chætodon*).  
 3. COMMON SUNFISH OR PUMPKIN-SEED (*Eupomotis gibbosus*).

4. YELLOW-BELLIED SUNFISH (*Lepomis auritus*).  
 5. BLUE OR COPPER-NOSED SUNFISH (*Lepomis palidus*).  
 6. JOHNNY DARTER (*Boleosoma nigrum*).

**DARNLEY, HENRY STEWART, or STUART, LORD** (1545-67). The second husband of Mary, Queen of Scots. The second but eldest surviving son of the Earl of Lennox by Lady Margaret Douglas, niece of Henry VIII, he was born, Dec. 7, 1545, at Temple Newsam, Yorkshire, where he received a private education. He was handsome and of accomplished manners, but destitute of moral and intellectual power. He married Mary on July 29, 1565, but soon disgusted her by intemperance, profligacy, and insolence. As an accessory to the assassination of Rizzio, he intensified Mary's hatred by holding her while the deed was committed in her presence. While recovering from an illness, he met his death in an isolated house which was blown up by the Earl of Bothwell, Feb. 9, 1567. The question of Mary's complicity in the deed will probably always remain one of the problems of history. See **MARY STUART**.

**D'ARREST, dār-rést', HEINRICH LUDWIG** (1822 or 1823-75). A German astronomer. He was born in Berlin and studied astronomy there under Encke. He was subsequently connected with the observatories of Berlin and Leipzig and became in 1852 professor in the Leipzig University. In 1857 he became professor of astronomy in Copenhagen, where he died. His important publications include: *Resultate aus Beobachtungen der Nebelflecke und Sternhaufen* (1857); *Siderum Nebulosorum Observationes Havnenses* (1867); *Untersuchungen über die nebulösen Sterne in Bezug auf ihre spektral-analytischen Eigenschaften* (1872); and numerous astronomical papers in scientific journals. His original observations include discoveries of several comets, and of the planet Freia (1862).

**DART.** See **DACE**.

**DARTER** (so called from the quick motion). One of a group of small fresh-water fishes of the perch family, peculiar to the United States. None is more than 10 inches in length, and the least is only 1½ inches long—the smallest spiny-rayed fish known. All are powerful swimmers and have been spoken of by Forbes as concentrated rather than dwarfed fishes. "They have developed," he says, "an activity and hardihood, a vigor of life, and a glow of high color almost unknown among brook fishes elsewhere." They have been the subject of special study by Dr. D. S. Jordan, who tells us that most of them prefer clear running water, where they lie on the bottom concealed under stones, darting, when frightened or hungry, with great velocity for a short distance, then stopping as suddenly. All are carnivorous and feed chiefly on the larvæ of flies. These beautiful and very interesting little fishes exist in great variety throughout the central and southern United States and are universally known to country boys as "Johnny darters," a name particularly given to a typical species (*Boleosoma nigrum*). A few others of the larger ones have received other names locally, as the sand darter (*Ammocrypta pellucida*), indicating the preference of its genus for sandy bottoms. This fish is very transparent and, when disturbed, plunges into the sand. (See **PLATE OF DARTERS AND SUNFISH**.) Excellent popular accounts will be found in the *American Naturalist* for 1876 and 1880; and a full history of the group in Jordan and Evermann's *Fishes of North America*, pp. 1016-1105 (Washington, 1896).

**DARTER, or SNAKE BIRD.** A name given to certain steganopode birds, nearly allied to cor-

morants, but having a bill longer than the head, perfectly straight, slender, and sharp-pointed; and also remarkable for the great length of the neck, which has obtained for them the name "snake birds." They generally live in pairs near bodies of fresh water. If alarmed while sitting on a branch over a stream or by the edge of a lake, they drop off quietly into the water, sink gently beneath the surface, and disappear; or they may fly upward and circle about like a hawk. They make rude nests upon trees and lay chalky-blue eggs. They eat great quantities of fish, which they kill by a quick, snakelike darting forward of the closed beak, impaling the prey, which is then flung into the

BEAK OF THE DARTER.

air, caught in the mouth, and swallowed entire. Four species are known, constituting the family Anhingidae. One species occurs in Africa, one in southern Asia, one in Australia, and one in tropical and subtropical America. The last (*Anhinga anhinga*) is sometimes called the water turkey and wanders in summer as far north as southern Illinois. It is a handsome bird, about 3 feet long, glossy black, the back marked with numerous silvery-white spots or streaks. See **PLATE OF FISHING BIRDS**, and **Colored Plate of EGGS OF WATER AND GAME BIRDS**.

**DARTFORD** (AS. *Darentford*). A town in Kent, England, 14 miles east-southeast of London Bridge, on the Darent, about 3 miles from its junction with the Thames (Map: London and Vicinity, F 11). It lies in a narrow valley between two steep hills. It has large powder and paper mills, also manufactures of oil, iron, machinery, and chemicals. One of the first paper mills in England was built here by Spielman, jeweler to Queen Elizabeth in 1590. The City of London Lunatic Asylum is situated here, and there are interesting ruins of a nunnery, founded 1355 by Edward III. Wat Tyler's insurrection, in the reign of Richard II, broke out at Dartford in 1381. Pop., 1891, 12,000; 1901, 18,600; 1911, 39,909.

**DARTMOOR** (named from the river Dart, which rises in the region). A granitic tableland in the southwest of Devonshire, England, remarkable for its wild, rugged scenery and cyclopean relics of aboriginal inhabitants (Map: England, C 6). Dartmoor proper (or the ancient forest of that name) and the outlying common lands are about 20 miles square. This moorland region, encircled by a natural rampart and moated by deep valleys, has a considerable elevation above the surrounding country and culminates in Yes Tor, 2077 feet above sea level. Copper is found, and at Wheal, Duchy, and Birch Tor are productive tin mines. The largest kaolin works in England are at Lee Moor, which is also the seat of a meteorological observatory. The soil is composed chiefly of peat, which in the bottoms has accumulated in some places to the depth of 25 feet, and it rests on a subsoil of fine sand. Many of the well-watered dells and ravines are fertile, while the whole moor affords pasturage for cattle, sheep,

and horses. The antiquities include the Gray Wethers, a fine specimen below Sittaford Tor of what is now styled a Druidical temple, the vestiges of a large aboriginal village at Grims-pound, the cromlech at Drewsteigton, logans, stone avenues, dolmens, barrows, cairns, rock pillars, and ancient trackways.

During the long war with Napoleon a prison, now used for convicts, was erected in western Dartmoor for French captives. Prince Town sprang up close by and soon became a thriving place. During the war with the United States (1812-15) many captured Americans were confined at Dartmoor. See DARTMOOR MASSACRE.

The castle, manor, and forest of Dartmoor were granted by Henry III to his brother Richard, Earl of Cornwall, and since 1337 Dartmoor has been, in part, permanently annexed to the Duchy of Cornwall. Dartmoor figures conspicuously in poetry and romance. Consult Rowe, *A Perambulation of the Ancient and Royal Forest of Dartmoor*, etc. (Plymouth and London, 3d ed., 1896), and S. Baring Gould, *Book of Dartmoor* (London, 1900).

**DARTMOOR MASSACRE, THE.** The killing (April 6, 1815) by a company of English soldiers of some American prisoners, who, together with 6000 others, had been confined in the Dartmoor (England) prison for several months after the close of the War of 1812 between England and the United States. To quell what they regarded as a mutiny and to thwart an apparent effort at escape, the prison guard, probably under orders from Capt. T. G. Shortland, their commanding officer, fired upon the prisoners, killing seven and wounding about 60-30 of them dangerously. The Americans at the time regarded this as an act of wanton murder, but it was pronounced justifiable by a joint commission, which, however, acquitted the prisoners of the charge of organizing a mutiny or of planning an escape. The British government soon afterward promoted Shortland, but made liberal provision for the families of those who had been killed or permanently disabled. Consult Andrews, *The Prisoners' Memoirs: or, Dartmoor Prison* (New York, 1852), and Cobb, *A Green Hand's First Cruise, Together with Five Months in Dartmoor* (Boston, 1841).

**DARTMOOR PRISON.** See DARTMOOR, and DARTMOOR MASSACRE.

A DART MOTH (*Agrotis saucia*).

a, Adult moth; b, deposit of eggs; c, caterpillar (a cutworm); d, head of caterpillar.

**DART MOTH.** A noctuid moth of the genus *Agrotis*, whose caterpillars are cutworms, sometimes called "climbing cutworms." A species

very widespread in both Europe and America is *Agrotis saucia*, whose wings expand 1½ inches. The fore wings are grayish brown variegated with black; the hind wings whitish, deepening into brownish towards the margin. The caterpillar is nearly 2 inches long when mature and is of a dull flesh color mottled with brown and black. When ready to pupate, it descends and forms a smooth cavity in the ground for that purpose. These caterpillars feed on the leaves of fruit-bearing trees and shrubs.

**DARTMOUTH**, därt'müth. A town of Halifax Co., Nova Scotia, Canada, situated on Halifax harbor, opposite the city of Halifax, of which it is practically a suburb connected by a 15-minute service of ferries (Map: Nova Scotia, F 4). It is the terminus for the Halifax and Eastern Railway. It contains handsome residences, the provincial asylum for lunatics, and a park. The manufactured products include sugar, lumber, spice, soap, chocolate, cordage, corn meal, beer, skates, and bolts. There are also boiler works, rolling mills, and a marine railway. Dartmouth, founded in 1749, was destroyed by Indians in 1751. Fort Clarence, below the town, commands the narrow and dangerous eastern passage, which was considered impassable for large vessels until 1862, when the Confederate steamer *Tallahassee* escaped through it. Pop., 1901, 4806; 1911, 5058.

**DARTMOUTH.** A town and seaport of Devonshire, England, built in terraces on a steep slope 300 to 400 feet high on the river Dart, 27 miles east of Plymouth, and not far from the sea (Map: England, C 6). The streets are narrow, and many of the houses have the old-style overhanging stories, projecting gables, and wood carvings. In St. Saviour's Church, of the fourteenth century, are a richly sculptured stone pulpit, a highly ornamented, painted, and gilt interior, a carved rood loft, and interesting monuments. A battery and the remains of a castle built during the reign of Henry VII stand at the entrance to the excellent harbor. In the river above the town is anchored the cadet training ship *Britannia*. The commerce and shipping trade of Dartmouth are of considerable importance. Its fisheries are extensive, it is a coaling station for the south coast, and has shipyards, paint factories, breweries, and engineering works. It has a resident United States consular agent. Pop., 1901, 6579; 1911, 7005. Sir Humphrey Gilbert, the Newfoundland explorer, was born near the town. At Dartmouth, in 1190, the Crusaders, under Richard Cœur de Lion, embarked for the Holy Land. Its earliest-known charter dates from 1342. The French burned the town in the time of Richard II, but were repulsed in another attack on it in 1404. In the Civil War of the seventeenth century it was captured by the Royalists under Prince Maurice and retaken by the Parliamentarians under Fairfax.

**DARTMOUTH.** A town in Bristol Co., Mass., about 5 miles south of New Bedford, on the Paskamansett River (Map: Massachusetts, F 6). It is in a region of summer resorts and contains three public libraries. There are poultry and dairying interests and manufactories of box boards. Pop., 1900, 3669; 1910, 4378.

**DARTMOUTH COLLEGE.** An institution for higher education situated at Hanover, N. H. Dartmouth originated in Moor's Indian Charity School, organized about 1750 at Lebanon, Conn., by the Rev. Eleazar Wheelock, and receiving

its name and first endowment from Joshua Moor, or More, in 1755. Support for the school came from gifts made chiefly by the general courts of Massachusetts Bay and New Hampshire and by persons in England interested in the project of educating the Indians. This interest was fostered by Sampson Oocom, an Indian preacher and pupil of Dr. Wheelock, who toured England and Scotland in 1766-67, raising funds for the school. The proceeds, some £10,000, were intrusted to a board of trustees, of whom the Earl of Dartmouth was chairman. Encouraged by this success, plans were made for the enlargement of the school, so that both whites and Indians might be taught, and for placing it upon a legal and permanent basis. Largely through the influence of John Wentworth, Governor of New Hampshire, large tracts of land were given by that province on the present site of the college, and in 1769 George III granted a royal charter to "Dartmouth College"—named in honor of its patron, the Earl. At the same time Moor's School was made a separate institution, though under the control of the same trustees as those of the college. This school was maintained until 1849 and still retains a legal if fictional existence under the title "The President of Moor's Charity School." Dr. Wheelock was made the first president of the college and retained office until 1779, when he was succeeded by his son John. In 1816, a religious controversy having arisen, the Legislature of New Hampshire passed acts intended to deprive the trustees of authority and to take to itself the control of the institution. These acts were sustained by the State court, but were, in 1819, upon argument by Daniel Webster (q.v.), invalidated by the Supreme Court of the United States, which declared the original charter to constitute an inviolable private trust. (See DARTMOUTH COLLEGE CASE.) Dartmouth comprises the College; the Medical School, founded in 1798; the Thayer School of Civil Engineering, founded in 1867; and the Amos Tuck School of Administration and Finance, founded in 1900. The Chandler School of Arts and Sciences, founded in 1851, was merged into the college in 1893 as the Chandler Scientific Course. In 1866 the New Hampshire College of Agriculture and Mechanic Arts was established by the State in connection with Dartmouth, but was separated from the college in 1893 and moved to Durham, N. H. The course of the Medical School was reduced in 1913 to two years of preparatory medical work in conjunction with undergraduate courses leading to the bachelor's degree. Dartmouth thus offers no degree in medicine, but makes possible a ready transition from college to advanced standing in metropolitan professional schools which offer unusual clinical facilities. The courses of the Thayer and Amos Tuck schools are two years; but the first year in any of the graduate schools may, under certain restrictions, be credited also as the last year in the undergraduate school.

Degrees are conferred in arts, science, civil engineering, and commercial science. The college buildings, numbering some 40, include laboratories, an observatory, two medical buildings, dormitories, a large dining hall, and commons. There is, besides, the Mary Hitchcock Memorial Hospital, having lecture and clinic facilities at the disposal of the Medical School. The library represents the accumulations of a century and

a quarter and consists of over 125,000 volumes and 20,000 pamphlets. The student enrollment in 1913 was 1320, of whom 21 were in the Medical School, 37 in the Thayer School, and 64 in the Amos Tuck School. The presidents of the college have been: Eleazer Wheelock, 1769-79; John Wheelock, 1779-1815; Francis Brown, 1815-20; Daniel Dana, 1820-21; Bennett Tyler, 1821-28; Nathan Lord, 1828-63; Asa Dodge Smith, 1863-77; Samuel Colcord Bartlett, 1877-92; William Jewett Tucker, 1893-1909; Ernest Fox Nichols, 1909-.

**DARTMOUTH COLLEGE CASE.** One of the most important and far-reaching decisions in constitutional law ever decided by the United States Supreme Court. The charter of Dartmouth College was granted by the British crown in 1769, incorporating 12 persons by the name of the Trustees of Dartmouth College, and giving them full power to govern the college and to fill all vacancies in their body. In 1816 the Legislature of New Hampshire passed an act amending the original charter, providing for the appointment of 11 new trustees by the Governor of the State, and for a board of overseers to inspect and control the conduct of the trustees. The old trustees refused to accept the amended charter, and brought suit against the officers of the new board who had obtained possession of the college property. The Supreme Court of New Hampshire upheld the constitutionality of the statute, and the case was then taken on writ of error to the Supreme Court of the United States. For the plaintiffs the main argument was made by Daniel Webster (q.v.), and for the defendants by William Wirt (q.v.), Attorney-General of the United States. In its decision, handed down in 1819, and in which all but one of the justices concurred, the court held, through Chief Justice Marshall, that the acts of the New Hampshire Legislature in question were unconstitutional and void. The college was declared to be a private and not a public corporation; the charter of such a corporation was declared to be a contract between the crown (to whose obligations the State of New Hampshire had succeeded) and the corporators and their successors, and the State statute which attempted to change the charter without the consent of the corporation was held to be within the prohibition of the Federal Constitution, that "no State shall . . . pass any . . . law impairing the obligation of contracts." The consequences of this decision have been very far-reaching, both in securing the inviolability of private trusts and in limiting State sovereignty and extending, through the Federal courts, the authority of the Federal Constitution. The principles of the decision have been repeatedly applied, and in some important respects limited, both by Federal and State courts. The case is reported in 1 *New Hampshire Reports*, 111, and 4 *Wheaton (United States) Reports*, 518. For favorable comments on the decision, consult: Kent, *Commentaries on American Law*, vol. i (Boston, 1884), Lect. xix; Story, *Commentaries on the Constitution of the United States*, vol. ii (ib., 1891); Pomeroy, *Introduction to the Constitutional Law of the United States* (9th ed., Boston, 1886); Maine, *Popular Government* (London, 1885). For a searching criticism of the case, consult Shirley, *The Dartmouth College Cases* (St. Louis, 1879), and Walker, *The Dartmouth College Case*.

**DARTON, NELSON HORATIO** (1865- ).

An American geologist, born in Brooklyn, N. Y., and educated in the public schools. He was a chemist for four years and in 1886 became geologist to the United States Geological Survey, from which in 1910 he was transferred to the post of geologist to the Bureau of Mines of the Geological Survey. His studies in water analysis when he was a young chemist led to the condemnation of many insanitary wells, and much of his later work was in government reports on artesian waters and structural materials. He edited the Survey's first bibliography of North American geology, from 1732 to 1891, in *Survey Bulletin* 127 (1896).

**DARU, d'ar', PIERRE ANTOINE NOËL BRUNO** (1767-1829). A French historian, poet, and statesman, born at Montpellier, Jan. 12, 1767. He entered the army in 1783, was imprisoned (1792-93) on a charge of treason to the Republic for 18 months, during which he produced a creditable translation of Horace. One of Napoleon's most trusted lieutenants, owing to his undisputed probity and signal administrative qualities, he held some of the most exalted positions in the Empire, such as Councillor of State, intendant général de la maison militaire, Secretary of State, and Minister of War. He was in charge of the Commissary Department of the Grand Army during the campaign of 1812 and also during the retreat through Russia. During the Restoration he was made intendant général by Louis XVIII in 1814. At the second Restoration he retired for a time (1815-19) to private life and study, but was made member of the Chamber of Peers in 1819 and became a distinguished defender of constitutional liberty. He wrote some important pamphlets on free speech and even defended the educational theories of Rousseau. In spite of his military and political activity, his literary production was of such excellence that he was elected to the Académie Française and later named its president. He died on his estate, near Meulan, Sept. 5, 1829. His *Histoire de la république de Venise* and *Histoire des ducs de Bretagne* (1826) are impartial, erudite, and accurate. Sainte-Beuve devotes three articles to him in the *Causeries* (vol. ix.). A *Life* by Viennet is prefixed to the fourth edition of *Histoire de la république de Venise* (Paris, 1853).

**D'ARUSMONT, d'ar'us'môn', FRANCES.** See WRIGHT, FANNY.

**DAR'WEN.** A town of Lancashire, England, on the river Darwen, situated amid moorland hills, 3½ miles south of Blackburn and 18 miles northwest of Manchester (Map: England, D 3). The town is irregularly built and unattractive. It owes its importance to a trade with India and China in calicoes, for which it employs a large number of spindles and looms. The India Mill, one of the finest in the country, covers an area of 31,000 square feet and runs 160,000 spindles. The town also contains paper-staining works, paper manufactories, calico-printing establishments, works for the manufacture of fire bricks, stained paper, tiles, and sanitary tubes, iron and brass founding, bleaching, machine and reed making. Coal mines and stone quarries also find employment for a considerable number of the inhabitants. It has numerous places of worship, large and commodious schools for elementary education, technical schools, and a co-operative public hall. The municipality owns gas, water, electric light supply, tramways, slaughterhouses, markets, public baths, free li-

brary, technical school, cemetery, artisans' dwellings, and lodging house, and a modern system of sewage disposal for fertilizing purposes. The place was known as Over Darwen from the reign of Henry II and with several hamlets was incorporated in 1878 as the municipal borough of Darwen. Pop., 1851, 11,702; 1891, 34,192; 1901, 38,212; 1911, 40,344. Consult Shaw, *History of Darwen* (London, 1891).

**DAR'WIN, CHARLES ROBERT** (1809-82). The greatest English naturalist of the nineteenth century. He was born at Shrewsbury, Feb. 12, 1809, the son of Dr. Robert W. Darwin, F.R.S., and grandson of Erasmus Darwin (q.v.). His mother was a daughter of Josiah Wedgwood, the famous manufacturer of pottery. After attending a public school at Shrewsbury for some years, he studied at Edinburgh University for two sessions, and then at Christ's College, Cambridge, where he took his degree of B.A. in 1831. His father had originally intended him for the Church, but hereditary tendencies towards natural history led him in another direction. Shortly after graduation he seized an opportunity to go around the world as naturalist in H. M. S. *Beagle*, commanded by Captain Fitzroy, R.N. This expedition which continued from Dec. 27, 1831, to Oct. 2, 1836, and spent much time in making surveys of southern South America, afforded Darwin a great opportunity for making original observations and for contemplation. It was, indeed, his studies on the fauna of the Galapagos Islands that planted the germ of his evolutionary theories. The account of his voyage, finally (1860) entitled *Voyage of a Naturalist on H. M. S. Beagle*, which has passed through many editions, is a classic work and shows a degree of intelligence in the author that promised great things for his future. This voyage had a marked effect on Darwin's health, leaving him with a tendency towards nausea which during life permitted of only a limited amount of work each day. In the seclusion of his country place at Down the great thinker was able by steady application, despite his disability, to produce his great works.

The scientific outcome of his voyage was a series of important books. In 1839 was published his first *Journal of Researches*; in 1840-43 the *Zoology of the Voyage of H. M. S. Beagle*, published by the government and edited by Darwin; in 1842, *The Structure and Distribution of Coral Reefs*, in which was proposed the theory of the origin of coral reefs that is most generally held to-day; in 1844, *Geological Observations on Volcanic Islands*; and in 1846, his *Geological Observations on South America*. Darwin's valuable *Monograph of the Cirripedia* (1851-55) was the immediate outcome of his voyage and remains to-day the standard systematic work on this group.

It had long been known to a number of scientific friends that Darwin was working on a theory of evolution when, in 1858, he received from A. R. Wallace, then in the East Indies, the manuscript of a paper containing precisely the same explanation of adaptation that Darwin had hit upon. Darwin was naturally much embarrassed, but seemed willing to throw aside the work of years and give precedence to his friend's paper. On the advice of friends, however, his paper and Wallace's were read at the same meeting of the Linnean Society of London and were published in their *Transactions* for 1858. In

*Ch. Darwin*

1859 Darwin's book, *The Origin of Species by Means of Natural Selection, or the Preservation of Favored Races in the Struggle for Life*, appeared. It at once created the greatest interest, and, largely through the extraordinarily able championship of Huxley, its ideas soon gained widespread acceptance. Although Darwin's theory of natural selection is primarily only an explanation of adaptation, yet adaptation is of such fundamental importance that its explanation paved the way for the acceptance of the general theory of evolution; for Darwin contributed a mechanical or natural explanation of what had before required a supernatural explanation. Development by natural law took the place of the special-creation hypothesis. Darwin's mechanical theory is that of the struggle for existence, the annihilation of the unfit, and the consequent "survival of the fittest." It rests upon the evident fact that every species of animal produces more young than will develop to maturity and breed; for if all the young produced by any species bred the world would soon become filled with that species to the exclusion of every other. The vast number of individuals that are killed off are, on the whole, below the average of those that survive. The latter have been preserved on account of a certain, perhaps slightly, greater fitness to their environment, which may protect them from their enemies or give them greater power in gaining food or reproducing their kind. Their slight advantage will be inherited, and so the next generation will start from a fitter plane, and, by a continuance of the selective process in successive generations, perfect adaptation will result. The theory of natural selection has been subjected to the most rigorous criticism, but it still remains a useful explanation of certain phenomena. See NATURAL SELECTION; EVOLUTION

The importance of the change wrought by Darwin's book cannot be overestimated. First, it revolutionized the method of work and the aims of natural history. The aims of zoological investigation were thenceforth the retracing of zoological history, determining the stages through which plants and animals have passed in their development. Before Darwin's time systematic work was the mere enumeration of species; since, it has been the study of relationships. Before Darwin embryology was the description of the earlier stages of development; since, it has been the reading of the phylogeny in ontogeny. Before Darwin comparative anatomy was the comparison of types; since then it has become the study of the effect of function and environment in molding the bodily form.

But the influence of Darwinism was by no means confined to natural history. Darwin himself early extended his general theory to man, especially in *The Descent of Man and Selection in Relation to Sex* (1871). Thus extended, Darwin's theory came into opposition to the Bible, literally and narrowly interpreted, and so it aroused a vast storm of opposition from Church officials. In fullness of time not only ecclesiastics but philosophers of every sort have come to base their teachings and doctrines on evolution. Darwin taught that the mind of man in its lowest stages was essentially an animal mind, and the upward progress of man is viewed as effected by natural causes, chief among which is the action of natural selection. He does not inquire into the exact way in which the mental

and bodily are connected. He simply assumes that, just as the bodily organism is capable of varying in an indefinite number of ways, so may the mental faculties vary indefinitely in correspondence with certain physical changes. In this way he seeks to account for all the higher mental powers, as the use of language and reason, the sentiment of beauty, and conscience. Finally, Darwin seeks to give a practical and ethical turn to his doctrine, since he defines the general good—the proper object of man's action—as "the rearing of the greatest number of individuals in full health and vigor, and with all their faculties perfect under the conditions to which they are subject." It is well to observe that if Darwinism confined itself to a strict following of the great investigator, it might involve less of philosophic and metaphysical theory than has become popularly associated with it, for much of which Darwin is not to be held responsible. For further exposition of Darwin's views, see EVOLUTION and NATURAL SELECTION, and the discussion of special phases of his doctrine and investigations under other titles there indicated.

Darwin's later life was devoted to the demonstration of his theory by a series of studies, the results of which appeared chiefly in the following books: *Fertilization of Orchids* (1862); *Variation of Animals and Plants under Domestication* (1868); *Expression of the Emotions in Man and Animals* (1872); *Insectivorous Plants* (1875); *Climbing Plants* (1875); *The Effects of Cross and Self Fertilization in the Vegetable Kingdom* (1876); *Different Forms of Flowers in Plants of the Same Species* (1877); *The Power of Movement in Plants* (1880); and *On the Formation of Mold by the Action of Earthworms* (1881).

Personally Darwin was characterized by a kind disposition, gentle manners, and brilliant conversational qualities. His warm-heartedness, added to his genius, made for him strong friends, many of whom were of great assistance to him in gaining an acceptance of his theories. His methods of study were interesting. He was a voluminous gatherer of notes on topics which interested him; in experimentation he was quick in his movements and accurate. As in the case of many other leaders of science, his brain was fertile in hypotheses, which were readily rejected when experiment had shown them to be faulty. Although his correspondence was voluminous, he attended to it all with scrupulous care, replying courteously even to a request from a young man who was preparing a lyceum lecture for an abbreviated statement of his views, as the writer had no time to read his books. He died April 19, 1882, full of years and honors. He was awarded the Prussian order *Pour le Mérite* (1871), and was made a member of the French Academy in 1878.

The centenary of the birth of Charles Darwin and the fiftieth anniversary of the publication of the *Origin of Species*, which was celebrated in 1909, was the occasion of the publication of many important volumes. The most significant of these concerned the relation of modern trends of thought to the original "Darwinism." Among these volumes may be mentioned: Francis Darwin (ed.), *The Foundations of the "Origin of Species"* (Cambridge, 1909); essays by various American authors, *Fifty Years of Darwinism* (New York, 1909); essays by various foreign authors, *Darwin and Modern Science* (Cam-

bridge, 1909); J. A. Thomson, *Darwinism and Human Life* (New York, 1910).

Consult also: *Life and Letters of Charles Darwin* (3 vols., London, 1887; reprinted in 2 vols., New York, 1893); *More Letters of C. Darwin* (1903); Pauly, *Darwinismus und Lamarckismus* (Munich, 1905).

**DARWIN, ERASMUS** (1731-1802). An English physician and naturalist, the grandfather of Charles Darwin. He was born at Elton. He was a keen and philosophic observer of nature and embodied much of his observations and thoughts in didactic verse, which form several long poems, whose style is stilted and fancifully elaborate. The principal of these is *The Botanic Garden* (1789), of which the second part, entitled "The Loves of the Plants," became famous and was translated into French and Italian. It contained many suggestions as to "protective mimicry" and other features afterward a part of the elaborated doctrine of the evolution of plants. In 1794-96 was published his *Zoonomia*, in prose, which was primarily a medical work, but contained many more general reflections, and received wide notice. Its ideas were so novel and revolutionary that, according to Samuel Butler, Paley's *Natural Theology* was aimed at it and extinguished for a time its influence. Charles Darwin wrote of it, in his *Origin of Species*: "It is curious how largely my grandfather anticipated the views and erroneous grounds of opinion of Lamarck"; and modern students see also that he anticipated much that Charles Darwin himself advanced to acceptance. Erasmus Darwin's views on evolution include the belief that all animals have originated from a single living "filament"; that changes are produced by differences of climate; that all animals undergo constant changes and that many of their acquirements are transmitted to their posterity; that the contests of the males for the possession of the females lead to such results as were afterward stated under the name of "sexual selection"; that many structures have been acquired as a means of security in a struggle for existence; and that a vast length of time has elapsed since these modifications began. The debt which Charles Darwin, Lamarck, and other exponents of the doctrines of organic evolution owe to Erasmus Darwin has been carefully considered by Packard in his biography of Lamarck (New York, 1901), and by Krause in *The Scientific Works of Erasmus Darwin* (1879); also by Butler, *Evolution, Old and New* (London, 1879). A meagre biography by Anna Seward was published in London in 1804. Dr. Darwin's last work was *Phytologia, or the Philosophy of Agriculture and Gardening* (1799), in which he expresses a belief that plants have sensation and volition. He died at Derby. See EVOLUTION.

**DARWIN, FRANCIS** (1848- ). An English botanist, a son of Charles Robert Darwin, born at Down, Kent. He received his education at Trinity College, Cambridge, studied medicine at St. George's Hospital in London, assisted Charles Darwin at Down, in 1888 was made reader in botany at the University of Cambridge, and in 1903 became foreign secretary of the Royal Society, and president of the British Association in 1908. His publications include: *Life and Letters of Charles Darwin* (1887); *Charles Darwin* (1892); *Practical Physiology of Plants*, jointly with Acton (1894); *Elements of Botany* (1895); *More Letters of Darwin*, with

A. C. Seward (1903); *Foundation of the Origin of Species* (1909). Charles Darwin's *Power of Movement in Plants* was prepared with the son's aid.

**DARWIN, GEORGE HOWARD** (1845-1912). An English geologist, son of Charles Robert Darwin. He was born at Down, Kent, and after graduating at Trinity College (1868), where he was later a fellow (1868-78), he was admitted to the bar; he did not practice, however, but devoted his entire attention to mathematical science and particularly to experimental investigation on the pressure of loose sands, changes in the level of the earth's surface, and minor earthquakes. His publications include papers on *The Harmonic Analysis of Tidal Observations* (1883); *The Effects of Tidal Friction on the Earth and Moon*; *Periodical Orbits* (1896); *Tides and Kindred Phenomena* (1898). In 1882 he assisted Sir William Thomson in the preparation of a new edition of Thomson and Tait's *Natural Philosophy*. A year later he was appointed Plumian professor of astronomy and experimental philosophy at Cambridge. He was a member of the Royal Society and a member of the council of the Meteorological Office (1885-1905), and was elected president of the Royal Astronomical Society in 1899 and president of the British Association a short time before his death.

**DARWIN, MOUNT.** A mountain of Tierra del Fuego, South America, 6890 feet in altitude (Map: Chile, D 14). It is named after Charles Darwin.

**DARWINISM.** See DARWIN, CHARLES; EVOLUTION; NATURAL SELECTION.

**DASE, dā'ze, JOHANN MARTIN ZACHARIAS** (1824-61). A mathematical prodigy, born in Hamburg. When a boy, he gave public exhibitions as an expert calculator. One of his feats was the rapid multiplication of a series of 50 figures or more by another series of equal length, and he is said to have been equally expert in extracting the cubic root of numbers containing from 80 to 100 figures—a task he frequently performed in less than an hour. He published *Tafeln der natürlichen Logarithmen der Zahlen* (1850) and *Factoren-Tafeln für alle Zahlen der siebensten Milthen, oder genauer von 6,000,001 bis 7,002,000 mit den darin vorkommenden Primzahlen* (1862-65).

**DASENT, dā'sent, SIR GEORGE WEBBE** (1817-96). An English scholar and author, born at St. Vincent, West Indies. He was educated at Oxford, was appointed civil-service commissioner in 1870, and in the following year assumed the editorship of *Fraser's Magazine*. He was also associated for some time with the London Times and edited the *Icelandic-English Dictionary* (1874). In addition to a translation of *The Younger Edda* (1842), he wrote the following: *The Norsemen in Ireland* (1855); *The Story of Burnt Njal* (1861); *Selection of Norse Tales* (1862); *The Vikings of the Baltic* (1875); *Heroes of Iceland* (1905). His *Annals of an Eventful Life* passed through five editions (latest ed., 3 vols., 1870).

**DASHEEN',** A tuberous-rooted species of *Colocasia*, of the family Araceæ, extensively cultivated in the West Indies, where it is known under a variety of names, such as coco, eddo, taniel, malanga, etc. It has often been confused with the yautia (*Xanthosoma sagittifolium*), but it is much more closely allied to the taro (*Colocasia esculenta*) of the Pacific islands. The

tubers form a substitute for potatoes, the young leaves are used as a potherb, and the young shoots may be substituted for asparagus. The cultivation of dasheens has been undertaken with some success in the South Atlantic and Gulf States, large yields of tubers being reported.

**DASHKOFF**, dāsh'kōf, EKATERINA ROMANOVNA, PRINCESS (1743-1810). A prominent figure in Russian political and literary circles during the latter half of the eighteenth century. She was the daughter of Count Vorontsoff. At the age of 15 she was married to Prince Dashkoff, an officer of the Imperial Guard. As an intimate friend of the Grand Duchess Catharine, the Princess appears to have taken an active part in the conspiracy of 1762, which placed her mistress on the throne as Catharine II (q.v.). Prince Dashkoff died in 1761, and his widow gave herself up to her children, to literature, and to politics. A coldness between herself and the Empress now ended in a quarrel and in her retirement from the court. After an extended tour through Europe the Princess returned to Russia in 1782, and was at once restored to Imperial favor. She was appointed director of the Russian Academy of Science and in 1783 became first president of the Russian Academy, which was established through her efforts. On the death of Catharine II, in 1796, she was deprived of her offices and ordered by Paul I to retire to her estates at Novgorod. Later on she was allowed to reside in Moscow, where she died. The Princess wrote several comedies and was mainly instrumental in inducing the Russian Academy to draw up a dictionary of the Russian language. The work was completed under her direction and was in part written by her. Her memoirs have been edited by Mrs. W. Bradford (London, 1840). Consult Souvorine, *La Princesse Dashkov* (St. Petersburg, 1888, Russian).

**DASHORST**, ANTONIS MOR VAN. See MOR VAN DASHORST.

**DASHT**, dāsh't, or **DESHT**, dēsh't. A river of Baluchistan, Asia, running through the southwestern portion of the country and falling into the Arabian Sea (Map: Persia, H 7). Its northern branch, the Nihing, forms a part of the boundary between Baluchistan and Persia. The combined rivers are 175 miles long.

**DASKAM**, dās'kam, JOSEPHINE DODGE (Mrs. Selden Bacon) (1876- ). An American author. She was born in Stamford, Conn., and graduated at Smith College in 1898. Her first book was *Smith College Stories* (1900), but she first excited general interest by *The Madness of Philip* (1902), a volume presenting with much humor and common sense some elements of modern primary education. Her later works include *Memoirs of a Baby* (1904); *The Domestic Adventures* (1907); *Biography of a Boy* (1910); *The Inheritance* (1912); *The Luck o' Lady Joan* (1913); *To-Day's Daughter* (1914).

**DASS**, dās, PETER (1647-1708). The father of modern Norwegian poetry. He was born at Nord-Herø, the son of an immigrant Scottish merchant and a Norse woman of good breeding. He attained in the Church a position of dignity, responsibility, and some danger, on the north coast of Norway, where with brief intermissions he lived peacefully and wrote unremittingly verses and a garrulous *Autobiography*. His work circulated in manuscript, but little was printed in his lifetime, and the first collection of his *Works* was by Eriksen (Christiania,

1873-77). *The Northland's Trumpet*, his most famous poem, was not printed till 1739. This rhyming description of land and people, quaint, witty, fanciful, and in an unforgettable lilting measure, is known by heart throughout northern Norway. Noteworthy, too, are the *Valley Song* (1696) and *Spiritual Pastime* (1711), a collection of religious verse.

**DAS'IE**, or **DASSY** (South African). A familiar diminutive in Cape Colony of the local Dutch name *Klip-das* for the South African hyrax (*Procavia capensis*); also called rock rabbit by English colonists. See **HYRAX**.

**DASTRE**, das'tr', FRANK ALBERT (1844- ). A French physiologist, born in Paris. He studied at the Ecole Normale Supérieure, of which he became fellow, and was appointed professor of natural history at the Lycée Louis-le-Grand. In 1887 he was called to the chair of physiology at the Sorbonne. He translated S. Weir Mitchell's *Injuries of Nerves, and their Consequences* (1872), as *Des lésions des nerfs et de leur conséquence* (1873), and wrote: *Rôle physiologique du sucre de lait* (1882); *Recherches expérimentales sur le système vasomoteur* (with Morat, 1884). *Les anesthésiques: physiologie et applications chirurgicales* (1890); *La vie et la mort* (1903-11; Eng. trans., *Life and Death*, by W. J. Greenstreet, 1911); and other scientific works.

**DASYPÆDES**, dās't-pē'dēz. See subtitle *Plumage*, in the article **BIRD**.

**DASYURUS**. See **ARMADILLO**.

**DASYURÆ**, dās't-ūr (from Gk. *δασύς*, *dasy*, shaggy + *οὐρά*, *oura*, tail). A marsupial of the family Dasyuridae, which includes various highly generalized carnivorous and insectivorous forms of Australasia allied to the opossums, and closely representative of Tertiary forms found fossil in South America and elsewhere. Eventually it

DENTITION OF DASYURÆ.

a, Tasmanian wolf (*Thylacinus*); b, Tasmanian devil (*Sarcophilus*)

appears certain that this group will be split into several families based on such important characters as a varying number of premolars and the presence or absence of epipubic bones, but at present they may be kept under the one heading. Their hind and fore limbs are approximately equal, and the toes (of which the second and

third of the hind feet are entirely free) are well developed and clawed; their tails are long, hairy, curling, and not prehensile; their dentition is carnassial, the canines often being large tusks, and there are eight large incisors in the upper jaw; and a caecum is lacking. Many of the dasyures are strong, fierce, catlike beasts of prey, scattered over Australia, New Guinea, and especially prevalent in Tasmania, where, as also in southeastern Australia, they have become rare owing to the war made upon them by the colonists. All are mainly terrestrial and live in burrows.

Prominent among these beasts is the thylacine, or Tasmanian zebra wolf or pouched dog (*Thylacinus cynocephalus*). It is very wolflike in appearance, but somewhat smaller than the common wolf, with shorter hair, a long terete, comparatively smooth tail, and more rounded ears. Its color is grayish brown, with the hinder part of the back and root of the tail barred with blackish stripes diminishing to points on the flanks. It dwells in rocky dens, seeks its prey at night, and until reduced in numbers was a destructive pest to the flocks of sheep.

Another is the ferocious Tasmanian devil (*Sarcophilus ursinus*), which is a heavy, powerful, long-furred, almost black animal resembling a bear, but only about the size of a badger, and having a long thick tail. It also is decidedly nocturnal, sleeping by day in some dark lair or burrow, and attacking sheep and lesser prey by night, nothing being safe from its strength and ferocity; but this pest is now nearly exterminated.

On the continent of Australia several very catlike or civet-like dasyures occur, of which the handsomest is the spotted "native cat," nearly as large as a house cat, but some of this genus (*Dasyurus*) are much smaller. To the genera *Phascogale* and its allies belong a variety of small insect-eating dasyures greatly resembling rats and mice in their appearance and living mainly on insects, birds' eggs, etc.; and another now very rare form (*Antechinomys laniger*) has much the form and appearance of a jerboa. Finally, there must be mentioned the banded anteater (*Myrmecobius fasciatus*), "which derives its special interest from the circumstance that it comes closer to some of the extinct marsupials of the Secondary rocks of Europe than does any other living type." This animal is about the size of a squirrel, but has a viverrine form and long, somewhat bushy, tail. In many of the dasyures the pouch is rudimentary, but here the female has no pouch, "the young, when first born, being merely concealed by the long hair of the belly as they cling to the teats (four in number)." Its teeth are all small and adapted to eating the insects that constitute its fare—mainly ants and termites, which are gathered by the long and protrusile tongue. Hence it is found chiefly in the sandy plains of southern and western Australia, where it dwells in the hollows of ant hills and similar retreats. Its general hue is white beneath, and on the upper part dark chestnut red marked by broad transverse bars of white. See *MARSUPIALIA*; and *Plate of PHALANGS*.

**DATE.** See *CALENDAR*; *CHRONOLOGY*.

**DATE AND DATE PALM** (OF. *date*, *datil*, *datille*, Fr. *datte*, from Lat. *dactylus*, Gk. *δάκτυλος*, *daktylos*, finger, date; so called from the shape). The common date of commerce is the fruit of the date palm (*Phoenix dactylifera*).

Besides this there are several other species which bear fruits of more or less value, but none rank in importance with *Phoenix dactylifera*. This plant is a native of the southwest of Asia and the northern half of Africa, finding its most congenial home and most extensive cultivation in Arabia and the oases of Africa. The plant is also cultivated in China, in France, Italy, and sparingly in the United States. California and Arizona, however, promise to become commercial date-producing sections.

The date is borne on one of the tree palms, although many of the representatives of the genus *Phoenix* are low-growing plants. The date palm is a tree ranging from 40 to 80 feet in height, bearing a dense head of pinnated leaves several feet in length. The plant is dioecious, the staminate flowers being borne on one plant, while the pistillate ones are borne by another individual. This peculiarity is well understood by the natives, who cut off the staminate flower clusters and place them in the pistillate trees to insure fertilization. Since each tree reproduces its sex in the sprouts or suckers from its base, date orchards or plantations are made up of the young plants taken from the roots of bearing trees, with only a sufficient number of staminate plants to insure fertilization. The date enjoys a hot, bright, sunny situation, thrives on soils too alkaline for other vegetation, but must have water within reach of its roots. The bearing age is reached in about eight years, and as the plants are long-lived and frequently bear as much as 300 to 500 pounds of fruit in a season when at full bearing, they become enormously profitable: in fact, the date is the chief source of wealth for Arabia, and is used as the staple food by caravans crossing the great desert. The fruit possesses a high food value, being chiefly composed of sugar, together with pectin, gum, and proteids. The fruits are eaten both fresh and dried, and there are two kinds—soft dates, the ones usually seen at confectioners, and dry dates, which are the ones most commonly grown and used in their native habitats. Both kinds vary in size, color, and quality. The seeds when roasted form a substitute for coffee, and when ground yield a valuable oil as well as a pomace used as a cattle food. Besides these products the tree itself yields in its leaves materials for baskets and wickerwork; the trunk yields a fibre from which twine and rope can be made; an edible bud known as "palm cabbage" is produced at the crown of the tree, and the wood is used for fencing and for the construction of light shelter. Besides these economic uses, the date palm has long figured conspicuously in religious services among Jews and Christians as well as among pagans. The *palm tree* of the Scripture is *Phoenix dactylifera*, and Christ's triumphal entry into Jerusalem is to this day celebrated on Palm Sunday. It has other symbolic meanings; to the Hebrews and Hellenes it stood as the symbol of beauty and of victory. See *Plate of MONOCOTYLEDONS*.

**DATE LINE.** See *INTERNATIONAL DATE LINE*.

**DATE PLUM.** See *PERSIMMON*.

**DATE SHELL, or DATE FISH** (so named from its shape). 1. A shell of a small bivalve mollusk or date fish of the genus *Lithodomus* (or *Lithophagus*), closely allied to the horse mussel (*Modiolus*), which burrows deeply into calcareous rocks, the shells of larger mollusks, etc. One species (*Lithodomus lithophagus*)

abounds in the Mediterranean and is of interest mainly because of its perforations of certain columns of the ancient temple of Serapis at Pozzuoli (ancient Puteoli), a few miles west of Naples, Italy. These columns are of African marble and several centuries ago were carried by the sinking of the ground below the level of the sea, which overflowed the site of the ruins and submerged the pillars to the height of 13 feet, exposing them to attack by these mollusks, which burrowed into them in large numbers. Subsequently they were slowly elevated and have since been above the water. The method of boring rocks is not thoroughly understood, but is thought to be mainly by abrasive movements of the foot. 2. In California, an edible bivalve mollusk (*Zurphaea crispata*) related to the piddock (q.v.).

**DATHOLITE.** See DATOLITE.

**DATI**, dā'tā, CARLO ROBERTO (1619-75). An Italian philologist and writer, born in Florence. His *Discorso dell' obbligo di ben parlare la propria lingua* (1657) is an important document in the campaign for linguistic purism based on classic imitation. In this work, and as professor of the Grand Duke in Florence, Dati was supported by the Crusca Academy, praised by Fontanini (*Biblioteca dell' eloquenza italiana*, annotated by Apostolo Zeno, Venice, 1753, and *Elogio*, Florence, 1794) and opposed by Daniello Bartoli (q.v.). Consult Trabalza, *Storia della grammatica ital* (Milano, 1908).

**DATIA**, dāt'ā. The capital of the principality of the same name in Central India, 280 miles west of Benares (Map: India, D 4). It stands on a rocky height surrounded by a stone wall and is well built, with an unusual number of stone houses. The chief of the Datia State dwells here. West of the town rises a palace of immense size and remarkable beauty, one of the best pieces of Hindu architecture in India, and there are interesting Jain temples, 4 miles distant. Pop., 1901, 24,071; 1911, 17,329.

**DATIS** (Lat., from Gk. *Δατις*, from Pers. *Dātīrēh*, good according to the law, from *dāt*, OPers. *dāta*, law + *rēh*, Av. *rohu*, good). A Persian general. With Artabanes, he commanded the army of Darius which was defeated at Marathon by Miltiades 490 B.C. Afterward he was killed by the Spartans.

**DATIVE.** See DECLENSION.

**DATO É IRADIER**, dā'tō ā'rā-dyār', EDUARDO (1856- ). A Spanish juriconsult and statesman, born at Coruña, Aug. 12, 1856. After studying law at the University of Madrid he there received his doctorate in jurisprudence in 1875. The following year he attained some prominence through certain articles that he published in the *Revista de los Tribunales*. In 1884 he was elected deputy for the District of Murias de Paredes (León), and again in 1891, 1893, etc. Although originally affiliated with the Conservatives under the leadership of Cánovas, he later withdrew with Silvela. Raised (1887) to a seat on the governing board of the Colegio de Abogados of Madrid, he served (1890-94) as third vice president of the Real Academia Matritense de Jurisprudencia y Legislación, which had previously honored him with election as academicien and professor. Previous to 1890 he had often appeared at congresses of jurists as the exponent of important themes of jurisprudence. Charity also claimed his interest, and in 1899 he became a member of the Provincial Board of Charities. As

Minister of Internal Affairs in Silvela's cabinet, he made in 1900 a trip to Catalonia in order to be able to study on the ground the labor question. With the return of the Conservatives in 1902 (after the fall of the intervening Liberal cabinet), he became Minister of Grace and Justice. The Real Academia de Ciencias Morales y Políticas honored him with election as member in 1905. When the Conservatives again came into power, in 1907, Señor Dato was Mayor of Madrid; and upon the organization of the new Cortes, he was elected President of the Chamber of Deputies. After the fall of the Liberal ministry of the Count of Romanones in 1913, the Conservative Dato was appointed Prime Minister and asked to form a new ministry.

**DATOLITE**, or **DATHOLITE** (Gk. *δατολίτης*, *datoisthai*, to divide + *λίθος*, *lithos*, stone; referring to its granular structure). A boron and calcium orthosilicate that crystallizes in the monoclinic system. It is usually found in the form of glassy, greenish crystals, but sometimes has a yellow or reddish tinge. A compact, massive variety occurring with the copper of Lake Superior is white and opaque and breaks with a conchoidal fracture like porcelain. Datolite usually occurs in veins and cavities in basic eruptive rocks, often with calcite, prehnite, and the zeolites. It is found in Scotland, Norway, Sweden, and various places on the Continent. In the United States it occurs at Bergen Hill and Paterson, N. J., in Connecticut and Massachusetts, and in the Lake Superior region. The crystals take a high polish and have been cut as opaque gems or ornamental stones.

**DATURA.** See STRAMONIUM.

**DATURINE.** See ALKALOIDS; ATROPINE.

**DAUB**, doup, KARL (1765-1836). A German speculative theologian. He was born at Cassel and educated at Marlburg, where he was tutor for a time; became professor of philosophy at Hanau in 1794, and soon afterward of theology at Heidelberg, where he remained until his death. He was one of the leaders of a school which attempted to reconcile theology and philosophy. His writings, based on the philosophies, successively, of Kant, Fichte, Schelling, and Hegel, were once important for their argumentative method, but are no longer much read. The principal ones are: *Lehrbuch der Katechetik* (1801); *Theologumena* (1806); *Einführung in das Studium der Dogmatik* (1810); *Die dogmatische Theologie jetziger Zeit oder die Selbstsucht in der Wissenschaft des Glaubens* (1833).

**DAUBAN**, dō'bān', JULES JOSEPH (1822-1908). A French painter. He was born in Paris and studied there under Auguste Debay. He became director of the School of Fine Arts at Angers in 1850 and was made a member of the Legion of Honor in 1868. Among his works are "Trappists Receiving a Stranger" (1864), in the Luxembourg; "Trappists Exchanging the Kiss of Peace" (1865), in the Angers Museum; and "Fra Angelico da Fiesole" (1873). He produced several decorative paintings in the theatre and hospital at Angers, and in the church of Saint-Louis-en-l'Isle, Paris. Despite a certain coldness of color, his compositions are dignified and impressive. His last important work was six decorative compositions for the church of Quintin (*côtes du Nord*).

**DAUBENTON**, dō'bān'tōn', LOUIS JEAN MARIE (1716-99). A French naturalist, born at Montbard, May 29, 1716. In 1742 he became associated in Paris with Buffon in the prepara-

tion of the latter's great *Histoire naturelle*, for which he furnished the anatomical descriptions relating to mammals. In 1745 Daubenton became curator and demonstrator of the cabinet of natural history of the Académie des Sciences and in 1778 professor in the Collège de France. He wrote voluminously, and has been especially influential in the science of herpetology. He died in Paris, Dec. 31, 1799.

**DAUBER**, dâb'ër, or MUD DAUBER. See MUD WASP.

**D'AUBIGNÉ**, dô'bè'nyâ'. See MERLE D'AUBIGNÉ.

**D'AUBIGNÉ**, THÉODORE AGRIPPA (1552-1630). A Protestant historian, poet, and soldier, born near Pons in Saintonge, France, Feb. 8, 1552. He was educated at Geneva. Latin, Greek, and Hebrew were familiar to him from his earliest youth, and at seven years of age he is said to have made a translation of Plato's *Crito*. His father had inspired him with an enthusiasm for the Huguenot cause, and he was present at the siege of Orléans in 1563, when the elder D'Aubigné was slain. The son played a prominent part in the religious wars preceding the accession of Henry of Navarre. Though opposed to that prince's conversion, he consented to serve him and was made vice admiral of Guienne and Brittany. D'Aubigné was famous for his rough wit and frank speech, and he did not hesitate to use the most outspoken sarcasm against the King and other members of the royal family. The assassination of Henry IV. in 1610, caused D'Aubigné to retire to his estates, and later he took up his residence at Geneva. There he employed himself in literary work and in furthering the cause of Protestantism in every way possible. His last years were embittered by the conduct of his son Constant, who betrayed the trust reposed in him by the Huguenots. This son was the father of the Duchesse de Noailles and of Madame de Maintenon. D'Aubigné died April 29, 1630, leaving as his literary legacy a number of works, of which the following deserve mention: *Histoire universelle, 1550-1601*; *Confession catholique du Sieur de Sancy*; *Aventures du baron de Forneste: histoire secrète écrite par lui-même*. They are very outspoken and free in their criticism of the men and measures of the times, so much so that the third volume of the *Histoire universelle* was ordered to be burnt by the common hangman in Paris. These, above mentioned, with others of less importance, will be found in *Œuvres complètes de Th. d'Aubigné*, edited by MM. Réaume and de Caussade, which also contains *Na vie et ses enfants*, the best biography. Consult also Réaume, *Etude historique et littéraire sur A. d'Aubigné* (Paris, 1883), and Rocheblave, *Agrippa d'Aubigné* (Paris, 1910); id., *La vie d'un héros* (Paris, 1913).

**DAUBIGNY**, dô'bè'nyé', CHARLES FRANÇOIS (1817-78). A French landscape painter and etcher, one of the chief masters of the Barbizon. He was born in Paris, Feb. 15, 1817. His father was a teacher of drawing and a painter who occasionally exhibited at the Salon. Charles François was brought up by an old nurse at Valman-dois, near Ile-Adam, where he remained until his tenth year. In this, his childhood home, to which he frequently returned and where he finally settled, he imbibed his great love for nature. On his return to Paris he studied under his father and uncle, a miniature painter, and helped support the family by painting articles like fans,

snuffboxes, and even business signs. In his seventeenth year he went to Italy with a friend and fellow artist, traveling on foot. He remained there for a year, but was not much influenced by his sojourn. In 1840 he entered the studio of Delaroche, with a view to competing for the Prix de Rome, but, having been disqualified, he was thrown upon his own resources. He turned to nature and was thenceforth a landscape painter. With the exception of the years 1842-46, he exhibited every year in the Salon. He received first-class medals in 1853, 1857, and 1859, and in 1857 he was made Chevalier of the Legion of Honor. Gratified with his success in painting river scenery, he built a house at Auvers on the Oise, near his childhood home. He constructed a curious boat, the *Botin*, at the same time a house and a studio, in which, accompanied by his son Karl, he navigated at will, sketching river scenery. In 1876 he visited Normandy, bringing back with him many sketches of the sea and the shores of the channel. During the latter part of his life he suffered much from rheumatism contracted on his river trips. He died in Paris on Feb. 19, 1878.

Daubigny was the youngest of the five great landscape painters of the Barbizon school. The rest were perhaps greater discoverers than he. They painted nature with figures as a subordinate incident of the scene and only adding to the artistic sentiment they wished to express. Daubigny painted the country, that is to say, nature as affected by man, although men do not usually appear in his scenes. There are certain kinds of landscapes which he may be said to have discovered and which are indissolubly linked with his name. He is the great painter of river scenery of central France, on the Seine, the Marne, and the Oise; of orchards, full of white blossoms or laden with ripe fruit, and of the fields; of the sea and of the shores of the Channel. His favorite light was at dusk, in the cool of the evening, or the pale light of the moon. A delicate shade of vaporous air pervades his paintings; his values are just, and the colors are properly juxtaposed. His paintings do not always present distinctness of outline, for drawing was not his strong point, but the handling is massive and powerful. In his early period he paid more attention to detail, but he increasingly adopted greater breadth of treatment, and his last works may almost be called impressionist.

Among his chief works are the "Valley of Optevoz," which took the gold medal in 1853. In the Louvre are his "Springtime," in which one can fairly smell the apple blossoms and see the green grass grow, the "Lock of the Optevoz," and the "Vintage." Other important works are the "Beach at Villerville" (1859); "Moonrise" (1861); "The Sheepfold" (1866); and the "Apple Orchard" (1876), an autumnal scene in which the prevailing tone is a dark, rich green, with apples ripe for the pickers. The chief public galleries of America are well supplied with his works, as are also some of the private collections. Daubigny unfortunately sold to art dealers a large number of works which are little more than sketches. These are frequently met with in picture collections, but no adequate conception of his work can be formed from them. Besides being a great painter, Daubigny was an etcher of repute, especially in the period after his return from Italy.

Consult his biography by Hustin, in *Les artistes célèbres*; Tryon, in *Van Dyke's Modern*

*French Masters* (New York, 1896); Henriot (Paris, 1878); Bourges (ib., 1900); and his biography by Laran (ib., 1913). See also the bibliography of BARRIZON, THE PAINTERS OF.

**DAUBIGNY, KARL PIERRE** (1846-86). A French landscape painter and etcher. He was born in Paris, the son and pupil of Charles François Daubigny (q.v.), whom he accompanied on his famous houseboat voyages on the rivers of France. His pictures, the subjects of which were mostly chosen from the valleys of the Seine and Oise, the coasts of Brittany and Normandy, and the Forest of Fontainebleau, were at first painted in his father's style, but his later works bear the impress of his own individuality. Among them may be mentioned: "Return from Fishing" (Aix Museum), "The Thames Near Chelsea," "Road from Paris to Fontainebleau," "The Farm of St. Simeon Near Honfleur," and "Moonrise at Sunset" (1886), his last, and also one of his best, efforts.

**DAUBRÉE, dō'brā', GABRIEL AUGUSTE** (1814-96). A French geologist and mineralogist. He was born at Metz and was educated at the Ecole Polytechnique in Paris. At the age of 20 he had qualified as a mining engineer: in 1838 he was appointed to take charge of the mines in the Bas-Rhin (Alsace) and was also given a chair at Strassburg. In 1861 he became a member of the Academy of Sciences in Paris, where he held professorships at the Museum of Natural History and at the School of Mines, of which latter he became director in 1872. Besides a very large number of original papers, Daubrée's published works include: *Etudes et expériences synthétiques sur le métamorphisme et sur la formation des roches cristallines* (1860); *Etudes synthétiques de géologie expérimentale* (1879); *Les météorites et la constitution du globe terrestre* (1886); *Les eaux souterraines* (3 vols., 1877). His researches resulted in valuable contributions to our knowledge of the mode of formation of various mineral substances and of crystalline rocks.

**DAUCUS.** See CARROT.

**DAUDET, dō'dā', ALPHONSE** (1840-97). A French humorist and satirist, remarkable for the grace of his style and the keenness of his observations. Born in Provence, of which he was typical in the warmth of his imagination, he lived for a time at Lyons and later migrated to Paris, where he came in contact with the literary Bohemians of the capital. He held a sinecure secretaryship on the staff of the Duc de Morny in 1861-65, and had an opportunity to study the life of the aristocrats and higher politicians of the Second Empire. At the age of 27 he married Mlle. Julia Allard, an ideal helpmeet, also a writer, whose inspiring though practical mind guided his impulsive and impracticable nature.

In *Tartarin de Tarascon* (1872), *Tartarin sur les Alpes* (1886), and the inferior *Port Tarascon* (1890), he gave a most good-natured and satirical caricature of his fellow southerners, whom he pictured as the victims of their own wild boastfulness and as the dupes of their exaggerated imaginativeness. The sufferings of his early life, especially of the year when he was usher in a provincial school, are described in his *Le petit chose* (1867) and in *Jack* (1876). With *Froment jeune et Risler aîné* (1874) Daudet began his famous series of "Parisian Dramas" that depict certain types, such as the talentless and selfish comedian, Delobelle, and Sidonie, the

feminine incarnation of evil. Then came *Léonobob* (1877), in which we find a capital portrayal of the Duc de Morny and the aristocracy of the day. *Les rois en exil* (1879) is a picture of Paris as a refuge for dethroned kings. *Numa Roumestan* (1881) is a humorous and kindly satire of Gambetta. *Séraph* (1884), a work of great power and noble purpose, sounds a note of warning against the dangers of illicit liaisons. The realism in the too accurately described scenes of sensual love weakens the ultimate effect of the work. This was due to the temporary influence of the Naturalist school upon Daudet. *L'Immortel* (1888), a cruel and pointless satire of the French Academy, marks the decline of the author's genius, due to the ravages of a chronic nervous trouble. The *Lettres de mon moulin* (1869) and *Contes du lundi* (1873) contain the shorter compositions of Daudet, several of which are now ranked among the greatest classics of the French language.

Literary critics appreciate Daudet for his polished style, his originality, and his insight into the foibles of humanity. His unaffected sympathy, somewhat tinged with a certain melodramatic sentimentality, and his saving sense of humor, probably constitute Daudet's greatest appeal to the average reader. Daudet, better than any other author of his day, reflected the spirit of the south of France, and the life of Paris in many of its most interesting and varied aspects. His reminiscences are embodied in *Trente ans de Paris* (1888) and *Souvenirs d'un homme de lettres* (1889). His works have been translated into English, a complete edition appearing in Boston in 1900. Consult: Ernest Daudet, "Mon frère et moi," included in *Alphonse Daudet*, by Léon Daudet, trans. by Charles DeKay (Boston, 1898); Brunetière, *Le roman naturaliste* (Paris, 1896); Doumic, *Portraits d'Ecrivains* (ib., 1892); L. A. Ashelman, *La société française d'après l'œuvre d'Alphonse Daudet* (ib., 1910); G. A. Ratti, *Les idées morales et littéraires d'Alphonse Daudet d'après ses œuvres* (ib., 1911); Arthur Ransome, *Portraits and Speculations* (London, 1913).

**DAUDET, ERNEST** (1837- ). A French novelist, journalist, and historian, born at Nîmes, May 31, 1837. Of Alphonse Daudet, his brother, he wrote an interesting biographical sketch, *Mon frère et moi* (1882), translated as an appendix to *Alphonse Daudet*, by Léon Daudet (Boston, 1898). Completely overshadowed in fiction by his brother, he devoted his energies to the field of historical research, in which he became known as a prolific and reliable contributor. His most noteworthy works are: *Histoire des conspirateurs royalistes* (1881); *Le roman d'un conventionnel* (1904); *Histoire de l'émigration* (3 vols., 1905-07); *Les récits de temps révolutionnaires* (1908); *Tragédies et comédies de l'histoire* (1912). His *Madame Royale*, in an English translation by Mrs. Rodolphe Stowell, was published in New York (1913). Consult Ernest-Charles, *Les samedis littéraires* (Paris, 1903).

**DAUDET, LÉON** (1869- ). A French novelist, son of Alphonse Daudet. He was born at Paris and studied medicine, but made some mark in literature with his first works, *Germe et poussière* (1891) and *L'Astre noir* (1893), the latter a sharp satire against Victor Hugo, whose granddaughter was Daudet's first wife. His subsequent publications include *Les morticoles* (1894), which was an attack on the medical pro-

session; *Les deux étrennes* (1900); *Les parlemeneurs* (1901); *La déchéance* (1904) and *Le partage de l'enfant* (1905); *Comte de Chamarrande* (1906); *Le lit de Procruste* (1912). In 1908 he founded a Royalist daily, *L'Action Française*. He wrote a *Life of his father* (1898), trans. into English by Charles DeKay. Consult a critique in *Revue de Lille*, August, 1910, by Legigne.

**DA UDINE.** See UDINE.

**DAUGHTERS OF THE AMERICAN REVOLUTION, SOCIETY OF.** A woman's patriotic society, organized in Washington, D. C., Oct. 11, 1890. Its objects are: to perpetuate the memory of the spirit of the men and women who achieved American independence; to promote institutions for the general diffusion of knowledge; to cherish, maintain, and extend the institutions of American freedom; to foster true patriotism and love of country; and to aid in securing for mankind all the blessings of liberty. Membership is restricted to those women of whose ancestors at least one aided in establishing American independence. The society up to 1914 had admitted to membership about 104,000 women, organized into some 1317 local chapters. Delegates from all chapters meet in annual congress in Washington in the week in which April 19 occurs. The society has collected many historical relics, which have been deposited in the United States National Museum in Washington, and it has also a valuable historical and genealogical library at its headquarters. During the Spanish-American War it aided the government by securing nurses of proper character and qualifications. In 1902 the society purchased a site in Washington, and upon this a Memorial Continental Hall was erected. The National Society was incorporated by Act of Congress in 1896 and, in accordance with that act, reports annually to Congress. The society publishes *The American Monthly Magazine* and also a series of lineage books containing the record of the ancestry of each member of the organization.

**DAUGHTERS OF THE CONFEDERACY, UNITED.** See CONFEDERACY, UNITED DAUGHTERS OF THE.

**DAUGHTERS OF THE KING, THE ORDER OF.** An organization of the women of the Protestant Episcopal church, founded in 1885. A distinction should be made between this order and the King's Daughters. The former is the older organization and differs from the latter in many important particulars. It is distinctively an Episcopal and a spiritual organization, and its work is definitely for the "spread of Christ's kingdom among women" and the "active support of the rector's plans in the parish in which the particular chapter may be located." Its constitution is framed as far as it is possible on the terms of the Brotherhood of St. Andrew, the men's organization of the Protestant Episcopal church, to whose purposes and work it closely corresponds. The membership in 1914 was 4500, with 417 senior chapters and 45 junior chapters, with about 400 members. It holds a triennial convention, with headquarters in New York. Its official organ is *The Royal Cross*.

**DAUGHTERS OF THE REVOLUTION, SOCIETY OF.** A women's hereditary patriotic society organized in New York City in 1891. As originally composed, the society consisted largely of those who had withdrawn from the

Society of the Daughters of the American Revolution (q.v.), because that society then admitted to membership women of collateral descent. The patriotic objects of the two societies are similar, but the requirements for admission to the Daughters of the Revolution are the more stringent. They require a member to be the lineal descendant of an ancestor who actively assisted in the establishment of American independence, and who became thereby liable to conviction for treason against the government of Great Britain. The General Society, which meets annually, is composed of national officers and delegates from the following organized State societies: Arizona, Arkansas, Colorado, Delaware, Indiana, Iowa, Kentucky, Maryland, Massachusetts, Minnesota, New Jersey, New York, North Carolina, Pennsylvania, Texas, Utah, Washington, West Virginia, and Wisconsin. The total membership is about 4000.

**DAULATABAD,** dou'lâ-tâ-bâd' (Ar., city of prosperity; Hind. *Deogru*, Skt. *Dēvagrī*, mountain of the gods, from the cliff which commands the town). A strongly fortified town of India, Aurangabad District, State of Hyderabad, near their northwestern frontier, in lat. 19° 57' N. and long. 75° 18' E. (Map: India, C 5). The town is noted for its commanding rock fortress, the scene of many past contentions, which has a height of about 500 feet. The outer wall is 2½ miles in circumference, with three lines of fortifications within it. The town has now a population of less than 1000. The famous cave temples of Ellora are within 7 miles of Daulatabad.

**D'AUMALE.** See AUMALE.

**DAUMAT.** See DOMAT.

**DAUMER,** dou'mër, GEORG FRIEDRICH (1800-75). An eccentric German poet and philosophical writer, known also by his pen name, Eusebius Emmeran. He was born at Nuremberg, studied at the universities of Erlangen and Leipzig, and from 1822 to 1830 was a professor in the Nuremberg Gymnasium. He passed in a few years from violent rationalism to ultra-Romanism. His writings include: *Glorie der heiligen Jungfrau Maria* (1841); *Polydora*, a collection of secular poems (2 vols., 1855); *Die Urgeschichte des Menschengeschlechtes* (1827); *Die Geheimnisse des christlichen Altertums* (2 vols., 1847); *Aphorismen über Tod und Unsterblichkeit* (1865); *Das Wunder* (1874). For somewhat more than a year he was guardian and instructor of the famous founding Kaspar Hauser (q.v.), in regard to whom he published *Mittheilungen über Kaspar Hauser* (1832), *Enthüllungen über Kaspar Hauser* (1859); *Kaspar Hauser, sein Wesen, seine Unschuld* (1873).

**DAUMET,** dô'mâ', PIERRE JÉRÔME HONORÉ (1826-1911). A French architect, born in Paris. He studied at the Ecole des Beaux-Arts and obtained the Prix de Rome in 1855. Afterward he accompanied an archaeological mission to Greece under the directorship of M. Heuzey. After the death of Viollet-le-Duc he was made architect in chief for the rebuilding of the Palais de Justice and completed it. In 1885 he became a member of the Institute and inspector general of civil buildings, and later he was appointed government architect. M. Daumet's name became connected with all the important architectural societies in France, and he was elected an honorary member of the Royal Society of British Architects. For many years he maintained an "unofficial" atelier of the Ecole des

Beaux-Arts, Paris, which won a high reputation. His most notable work is the restoration of the Château de Chantilly for the Duc d'Aumale (1876-81).

**DAUMIER**, dō'myá', HONORÉ (1810-79). A celebrated French caricaturist, painter, and sculptor. He was born at Marseilles, the son of a glass painter of poetic aspirations, who migrated to Paris in 1816. His boyhood was spent in poverty, and after scant and intermittent instruction in drawing he started in 1831 to contribute satirical and political lithographs to the weekly paper. For caricaturing King Louis Philippe as Gargantua, he was imprisoned for six months. Fashion, tittle-tattle, scandal, politics, blemishes of figure, and oddities of character in turn inspired his genius for caricature. Few among his illustrious contemporaries escaped his pencil. His most celebrated work is the series of "Robert Macaire," published in the *Charivari*. The Revolution of 1848 suggested several of his most remarkable political series—"Idylles parlementaires" and "Les représentants représentés." He has left some 3958 lithographs, 200 paintings, and 300 drawings, besides statuettes, busts, and a bas-relief.

Daumier's reputation as a caricaturist eclipsed his ability as a painter, which, though appreciated by fellow artists, has only become generally known since the exhibitions of his work in 1900 and 1901. He is now recognized as one of the most original and important French painters of the nineteenth century. His paintings are small in form and are characterized by excellent modeling, striking treatment of light and shade, and a remarkable facility of execution. Lafontaine's fables, Don Quixote, and Molière's comedies furnished the subjects, which also include popular scenes of all kinds, interiors, religious subjects, and portraits. Good examples are "Christ and the Disciples" (Rijks-Museum, Amsterdam); "The Thieves and the Ass," the portrait of Theodore Rousseau, and a large allegorical canvas, "Republic," all in the Louvre. He is also represented in the museums of Berlin, Bucharest, The Hague (Meadag Museum), Montreal, Reims, and by two pictures in the Metropolitan Museum, New York. Of his sculpture the best known is the statuette "Ratapoil," cast in bronze by the French state; an example is in the Luxembourg. Though appreciated and loved by his greatest contemporaries, such as Victor Hugo, Balzac, Rousseau, Diaz, Corot, Daubigny, Millet, Courbet, he struggled all his life against poverty and lack of popular appreciation. In 1870 he refused the cross of the Legion of Honor. He became blind in 1877, and died, Feb. 10, 1879, at Valmondois (Seine-et-Oise) in a house given him by Corot, who had ere this procured for him a pension from the Third Republic.

**Bibliography.** The most important monographs on Daumier are by Alexandre (Paris, 1890) and Klossowski (Munich, 1914); the complete catalogue of his lithographs by Hazard and Delfteil (Paris, 1904). Consult also Champfleury, *Histoire de la caricature moderne* (ib., 1872); Frantz and Czanne, in the *Studio* (London, 1904), and the brief works on his lithographs by Marcel (Paris, 1906) and Cary (London, 1907).

**DAUN**, doun, LEOPOLD JOSEPH MARIA, COUNT VON (1705-66). An Austrian field marshal and commander in chief of the Austrian forces during the Seven Years' War. He was born Sept.

24, 1705, in Vienna, and entered early upon his military career as an officer in the regiment of his father. In the Turkish campaigns of 1737-39 and in the War of the Austrian Succession he found opportunities for distinction and rose rapidly in rank, being made a field marshal and Privy Councillor after the Peace of Aix-la-Chapelle. He was the first director of the military academy at Wiener-Neustadt and introduced many reforms in the organization of the Austrian army. In 1757 he succeeded to the chief command. He took the field against Frederick the Great in Bohemia and, after a hard-fought battle at Kolin, forced the King to retire from that country. He and Prince Charles of Lorraine were thoroughly beaten by the King of Prussia at Leuthen on December 5 of the same year. On Oct. 14, 1758, he gained another victory over Frederick at Hochkirch, and, but for the late arrival of the Prince of Baden-Durlach with reinforcements, he would probably have annihilated the Prussian army. Again, on Nov. 25, 1759, at Maxen, he compelled the Prussian General Fink to surrender, with 11,000 men. He won no other important victories and was defeated by Frederick at Torgau (1760), where he was wounded for the third time upon the field of battle. He was brave and a skillful strategist, but too deliberate in his movements and no match for his alert antagonist. He won victories without following them up, while Frederick, though losing battles, nearly always derived signal advantages from his campaigns. The Peace of Hubertsburg in 1763 closed Daun's active military career. He died in Vienna, Feb. 5, 1766. Consult *Leben und Thaten des grafen Leopold von Daun* (Frankfort and Leipzig, 1759-60). See SEVEN YEARS' WAR.

**DAUNOU**, dō'nōw', PIERRE CLAUDE FRANÇOIS (1761-1840). A French publicist and statesman. He was born at Boulogne-sur-Mer and entered the Congregation of the Oratory in 1777. In 1792 he became a member of the National Convention for Pas-de-Calais, where he had previously held the position of grand vicar under the bishop of the department. He opposed the execution of Louis XVI, but voted for his deportation until a settlement might be effected; and he refused his support to the law proscribing the Girondists. For these views he was imprisoned and escaped death only by the downfall of Robespierre. Throughout this critical period he was distinguished for his moderate policy. He was elected to the Council of the Five Hundred by more than a score of departments, and was its first President. His programme for study in central schools was adopted in 1795. In 1801 he became librarian at the Panthéon, for which he obtained the valuable collection of Pius VI. In 1807 he was appointed the Archivist of the Empire, and in 1808 he founded the Bibliothèque des Archives Nationales. He was editor of the *Journal des Savants* from 1816 until shortly before his death. His works include *Histoire littéraire de la France*, upon which he was employed for 20 years, and *Essai historique sur la puissance temporelle des papes* (1810). Consult Taillandier, *Documents biographiques sur Daunou* (Paris, 1841).

**DAUPHIN**, dā'fīn; Fr. pron. dō'fān' (OF. *dauphin*, *doſſin*, Fr. *dauphin*, Port. *daſſin*, from Lat. *delphinus*, dolphin, on account of the three dolphins on their family crest). Formerly the title of the eldest son of the French King. It was originally the appellation of the lords of

the Province of Dauphiné (q.v.). The last of these, Humbert II, dying childless (1349), bequeathed his possessions to Charles of Valois, grandson of Philippe VI of France, on condition that the heir apparent to the throne of France should bear the title of Dauphin of Vienne and govern the province. Louis XI conferred on the Dauphin almost sovereign rights; but after his time these were gradually abridged, until Dauphiné was placed under the same laws as the rest of the kingdom, and the title became merely honorary. After the Revolution of 1830 it was abolished altogether. Consult Tricaud, *Histoire des dauphins français* (Paris, 1713), and Prudhomme, "De l'origine et du sens des mots dauphin et dauphine," in *Bibliothèque de l'École des Chartes* (ib., 1893).

**DAUPHIN.** The chief town in the District of Dauphin, Manitoba, Canada, on Vermilion River and the Canadian Northern Railway, 178 miles northwest of Winnipeg by rail (Map: Manitoba, C 2). Among the principal buildings are the opera house, collegiate institute, and hospital. It is situated in a grain-growing district and possesses four grain elevators. The manufacturing establishments include flour and saw mills, machine works, a creamery, sash and door factories and a mineral-water factory. Good fishing is to be had in Lakes Dauphin and Winnipegosis, and good hunting in the Riding Mountain Forest Reserve. The town owns its electric-light system and water works. Pop., 1911, 2815.

**DAUPHINÉ, dō'fē'nā'.** Formerly a frontier province in the southeast of France, comprising the present departments of Drôme, Isère, and Hautes-Alpes. After the fall of the Roman Empire Dauphiné formed the southernmost part of the Kingdom of Burgundy. It then passed under the dominion of the Franks, and after the dismemberment of the Carolingian monarchy it became a portion of the new Burgundian Kingdom of Arles. It then passed into the possession of the German Emperor in 1032, and remained united with Germany till the middle of the fourteenth century, when it was presented to France by the last of the lords of Dauphiné. Governed for a century as a separate state, by the heir to the French throne, it was finally incorporated with France. During the Civil Wars Dauphiné was the stronghold of Protestantism and the scene of many bloody conflicts, in which the Huguenots gained the upper hand. The old rulers of the land bore the title of Dauphin (q.v.), and the name was afterward transferred to the district. Consult Chariot, *Histoire générale du Dauphiné* (Valence, 1883), and Chenavas, *La Révolution de 1788 en Dauphiné* (Grenoble, 1888).

**DAURAT, dō'rā',** or **DO RAT, JEAN,** Latin name AURATUS (c.1500-88). A French poet, born and educated at Limoges. He was appointed preceptor of the pages at the court of Francis I, who took a deep interest in him; became director of the College at Coqueret, and in 1560 was appointed professor of Greek in the Royal College in Paris. He was called the "modern Pindar" and ranked among the "Pleïades," or seven great poets of the age. Report makes him the first organizer of a theatrical clique. His numerous odes and epigrams, written in Latin and published in 1586, do not justify the high estimation in which he was held in the sixteenth century. Consult Marty-Labeaux in *Pleiade française* (Paris, 1875).

**DAUTHENEY, dou'ten-di', MAX** (1867- ). A German poet, born in Würzburg. As a young man he traveled first in Denmark and Sweden, then in Mexico (1897) and Greece (1898), and after extensive travels in North America and in the near and far East, returned to Europe, to live first in Paris and then in Würzburg. He wrote a romance, *Josa Gerth* (1893), but was more successful with his dramas and lyrics, which with occasional affectation and extravagant mannerism are yet vivid, passionate, and beautiful in diction and metre. Among his plays are: *Frau Raufenbarth* (1905); *Ein Schatten fiel über den Tisch* (1907; played in Cologne in 1912); *Maja* (1908); *Die Spielereien einer Kaiserin* (1910; played successfully in Berlin, Munich, Vienna, etc.), which dramatized Catharine I of Russia; *Der Drache Grauls* (1911). Even more characteristic of his mannered and traveled muse are his volumes of verse: *Reliquien* (1895); *Die Ammenballade* (1903); *Der Venusinenreime: Schalkhafteroische Liebesmär* (1904); *Singsangbuch* (1906); *Lieder der langen Nächte* (1908); *Weltspek* (1909); *Die Geflügelte Erde* (1910), which he called "a song of love and wonder about the seven seas," and, like his *Lingam: Asiatische Novellen* and *Die acht Gesichter am Buassee*, was distinctly exotic. There is much autobiographical material in his book, *Der Geist meines Vaters* (Munich, 1912), and in *Gedankengut aus meinen Wanderjahren* (ib., 1914).

**DAUTZENBERG, dou'tsen-bērk, JOHANN MICHAEL** (1808-69). A Flemish poet, born at Heerlen, Netherlands. He is known chiefly through his *Volkseboek* (with Duyse, 1854), his valuable writings on prosody, and his introduction of foreign metres into Dutch poetry, a task in which he succeeded despite the numerous difficulties presented. His valuable poetic works, which include a translation of the *Odes* of Horace, were published at Brussels in 1850, under the title of *Gedichten*. Those written after 1850 were collected by Frans de Cort (q.v.), his son-in-law, in the volume entitled *Verspreide en nagelatene gedichten* (2d ed., 1875). Among his other works are: *Verhalen uit de geschiedenis van België* (1853; 3d ed., 1867). Dautzenberg exercised a most favorable influence upon the development of Flemish poetry and at the same time advocated a closer union with the German.

**DAUVERGNE, HENRI DE LATOUR.** See TURENNE.

**DAUW, dā.** A local name in South Africa for Burchell's zebra, also called by the Dutch there "bonte quagga" and by the Bechuanaas "peteis." See ZEBRA.

**DÁVALOS, dá'válōs,** or **DE ÁVALOS, GIL RAMÍREZ** (c.1506-61). A Spanish soldier, born at Baeza in Castile. He accompanied Antonio de Mendoza to Peru, served as Corregidor of Cuzco, and, after the revolt of Girón, succeeded his brother, Egidio Ramírez Dávalos, as Governor of Quijós (the Land of Cinnamon) on the river Naho. He founded Cuenca (1557) and several other towns, which are now abandoned.

**DAVENANT, dā've-nant, SIR WILLIAM** (1606-1668). An English poet and playwright. He was born at Oxford, where his father kept the Crown Inn. When only 10 years old, the precocious boy composed, on the occasion of Shakespeare's death, an ode to the memory of the great dramatist, and afterward was accustomed to claim that he was, in fact, Shake-

spears's son. In 1628 he began to write for the stage, and nine years after, on the death of Ben Jonson, he was appointed poet laureate. The next year he became manager of the Cockpit, a theatre in Drury Lane; but, entering into the intrigues of the Civil War, he was apprehended. He finally escaped, however, to France, and, returning, distinguished himself so much in the cause of the Royalists that he was knighted by Charles after the battle of Gloucester. Davenant a second time got into difficulties, and was confined in the Tower for two years, when he was released, as is said, on the intercession of Milton. There he continued his epic poem *Gondibert*, begun in France. Once more set free, he set about establishing a theatre. Obtaining at first permission to give dramatic performances at private houses, he reopened the Cockpit in 1658. After the Restoration he was favored by royal patronage, and continued to write and superintend the performance of plays until his death. Davenant was one of the most popular playwrights of his time. Though none of his plays rank high as literature, they seem to have been suitable to the stage. He made some curious adaptations of Shakespeare's plays: e.g., of *Measure for Measure* and, aided by Dryden, of *The Tempest*. In 1656 he introduced opera on the English stage and women to play the female rôles. His epic has some interest in that it was written in a stanza afterward employed by Gray in his famous *Elegy*. Consult Davenant's plays, with memoir, ed. by Laing and Maidment (5 vols., Edinburgh, 1872-74). Two representative plays, *Love and Honor* and *The Siege of Rhodes*, were edited by Tupper, and published in New York (1909).

**DAVENPORT.** An important manufacturing city and the county seat of Scott Co., Iowa, on the west bank of the Mississippi River, 330 miles above St. Louis, Mo., and opposite Rock Island, Ill., with which it is connected by two bridges—an iron railway and carriage bridge, built at a cost of \$1,200,000, and an iron railway bridge, which cost \$800,000 (Map, Iowa, G 3). It is 183 miles by rail west by south of Chicago and is on the Chicago, Rock Island, and Pacific, the Chicago, Milwaukee, and St. Paul, the Chicago, Burlington, and Quincy, the Davenport, Rock Island, and Northwestern, the Iowa and Illinois, the Davenport and Muscatine, and the Rock Island Southern railroads. River packets from St. Louis to St. Paul afford additional transportation facilities. Davenport is situated on the slope of a steep bluff and commands an extensive view. On Rock Island, which is crossed by the great bridge, are the United States arsenal and military headquarters and other government buildings. The city has several fine parks, a large public library, Academy of Natural Sciences, St. Luke's. Mercy, and other hospitals, numerous public and parochial schools, two opera houses, and many other notable buildings, and is the seat of the Academy of the Immaculate Conception, St. Ambrose College, St. Katherine's Hall, and the State Orphan Home. It is an episcopal see of the Protestant Episcopal church and of the Roman Catholic church. The city is in a rich agricultural and coal-mining region, ships large amounts of farm produce, and has extensive manufactures of washing machines, macaroni, locomotives, steel cars, carriages, agricultural implements, machinery, lumber, flour, woolen goods, cordage, glucose and its products,

pottery, cigars, buttons, beer, soap, etc. Founded in 1835 by a company headed by Col. George Davenport. Davenport was incorporated as a town in 1838 and as a city in 1851. The Chicago and Rock Island Railroad was completed in 1854. The government is conducted by a mayor, elected every two years, and a city council, composed of the executive and aldermen, chosen by wards and on a general ticket. The annual income of the city amounted, in 1912, to \$1,367,000, expenditure to \$1,279,000; the principal items of expense being: police department, \$53,000, fire department, \$81,000; schools, \$243,000. Pop., 1890, 26,872; 1900, 35,254; 1910, 43,028; 1914 (U. S. est.), 46,340.

**DAVENPORT, CHARLES BENEDICT** (1868- ). An American zoologist, born at Stamford, Conn. He graduated at the Brooklyn Polytechnic Institute in 1886, at Harvard in 1889, and took the degree of Ph.D. at the latter place in 1892. In 1888 he began to teach at Harvard, where he was instructor in zoology until 1899. In 1904 he became director of the station for experimental evolution at Cold Spring Harbor, L. I., and in 1889-1904 was assistant professor of zoology at the University of Chicago. In 1906 he was president of the American Society of Naturalists. His works include: *Observations on Budding in Paludicella and Some Other Bryozoa* (1891); *On Urnatella Gracilis* (1893); *Experimental Morphology* (1897-99), *Statistical Methods, with Special Reference to Biological Variation* (1899; 2d ed., 1904); *Introduction to Zoology*, with Gertrude Crotty Davenport (1900); *Inheritance in Poultry*, Carnegie Institution Publication, No. 52 (Washington, 1906); *Inheritance of Characteristics in Domestic Fowl*, Carnegie Institution Publication, No. 121 (Washington, 1909); *Heredity of Skin-Color in Negro-White Crosses*, Carnegie Institution Publication, No. 188 (1913); *Heredity in Relation to Eugenics* (1913). He contributed to the first edition of the NEW INTERNATIONAL ENCYCLOPEDIA.

**DAVENPORT, EDWARD LOOMIS** (1816-77). An American actor. He was born in Boston, Mass., and made his first appearance in Providence, R. I., playing a minor part in *Sir Giles Overreach*, with the elder Booth as Sir Giles. Davenport made rapid progress and was soon recognized as a leading artist in tragedy, comedy, and melodrama. He supported Mrs. Mowatt (Ritchie) in a wide range of characters and accompanied her, about 1847, to England, where he also played with Macready and other stars. There, too, in 1849, he married Miss Fanny Vining, an actress, whom he later introduced to the American stage. She died in 1891. Returning in 1854, he traveled over the United States, playing in the principal cities, chiefly in Shakespearean characters and those drawn from Dickens's novels. At different times he was manager of the Howard Athenæum, in Boston, and other theatres. Among his latest conspicuous representations were such widely divergent characters as Brutus in *Julius Cæsar* and Bill Sikes in *Oliver Twist*. His renderings of the part of Sir Giles and of Hamlet were also especially admired. Davenport was highly esteemed for his genial and open-hearted manners. He died at his summer home in Canton, Pa. Consult Edwards, in Matthews and Hutton, *Actors and Actresses of Great Britain and the United States*, vol. iv (New York, 1886), and Montrose J. Moses, *Famous Actor-Families in America* (New York, 1906).

**DAVENPORT, EUGENE (1856- )**. An American educator and agriculturist, born at Woodland, Mich., and educated at Michigan Agricultural College (B.S., 1878). In the Michigan Experiment Station he was assistant botanist in 1888-89 and then superintendent of the farm and professor of practical agriculture. In 1891-92 he was president of the Collegio Agronomico of São Paulo, Brazil. He became dean of the College of Agriculture in the University of Illinois in 1895 and, in addition, director of the Experiment Station and professor of thremmatology in 1896. In Illinois he did particularly important work in investigations on animal breeding. He wrote: *Principles of Breeding* (1907); *Education for Efficiency* (1909); *Domesticated Animals and Plants* (1910).

**DAVENPORT, FANNY LILY GIPSY (1850-98)**. A well-known American actress, the daughter of Edward Loomis Davenport. She was born in London, England, but was brought to America when a child and was educated in the Boston public schools. When seven years old she appeared at the Howard Athenæum in Boston, as the child of Metamora, but her real début was at Niblo's Garden in February, 1862, as King of Spain in *Faint Heart Never Won Fair Lady*. This was followed by a season in soubrette parts in the South. While playing at the Arch Street Theatre, Philadelphia, under the management of Mrs. John Drew, she attracted the attention of Augustine Daly, who promptly gave her a place in his Fifth Avenue Theatre in 1869. Afterward she visited the principal towns and cities of the United States as a star in a wide variety of rôles in both comedy and tragedy. Among her greatest successes were those won in Sardou's *Fédora* (1883), *La Tosca* (1888), and *Croopatra* (1890). In 1897 she produced *The Soldier of France*, a play with Jeanne d'Arc as the heroine. It was a failure, and the chagrin of that is thought to have hastened her final illness. She appeared on the stage for the last time at the Grand Opera House, Chicago, March 25, 1898. Her death occurred at Duxbury, Mass. She was the wife of Mr. Willet Melbourne MacDowell, her second husband, whom she married in 1889. Consult Benton, in McKay and Wingate, *Famous American Actors of To-Day* (New York, 1896), and Montrose J. Moses, *Famous Actor-Families in America*, (ib., 1906).

**DAVENPORT, HOMER CALVIN (1867-1912)**. An American caricaturist. He was born in Silverton, Oreg., received but little education, and never attended an art school. He early became acquainted with the cartoons of Nast, which impressed him deeply, and after being in turn a jockey, a clown, and a printer's devil, he was employed as a cartoonist on the San Francisco *Chronicle*. He attracted the attention of William Randolph Hearst, who brought him to New York in 1895 and employed him on the *Evening Journal*. He had a wide range of subjects, but is best known for his political cartoons. He originated the brutal giant figures of the Trusts and the dollar-marked suit of Senator Hanna, and took an active part in molding public opinion during the silver campaign of 1896, the Spanish-American War, the McKinley and Roosevelt campaigns of 1900, 1904, and 1908. His famous Roosevelt cartoon "He's good enough for me" was drawn in 1904. Though his lack of technical training is sometimes apparent in the crudeness of his draftsmanship, his cartoons are remarkable for their

simplicity, force, and stern satire. His figure of "Uncle Sam" is one of the best ever produced. In 1906 he visited Arabia and drew the only picture ever made of the Sultan of Turkey. He is the author of *The Belle of Silverton and other Stories*, *The Dollar or the Man* (1900), and *The Diary of a Country Boy* (1910).

**DAVENPORT, JOHN (1597-1670)**. An eminent Puritan clergyman, one of the founders of the New Haven Colony in Connecticut. He was born in Coventry, England; studied at Oxford University from 1613 to 1615; acted for about a year as chaplain at Hilton Castle, near Durham; and from 1616 to 1633 was a preacher in London. In 1625 he passed the examinations at Oxford for the degrees of B.D. and M.A. He came into conflict with the ecclesiastical officers, especially with Archbishop Laud on account of his nonconforming tendencies, and in 1633 withdrew from the Established church and removed to Amsterdam, Holland, whence he returned, however, in 1636, after engaging in a controversy with the Dutch classis on the subject of indiscriminate or promiscuous baptism of infants. In 1637, eluding the authorities, he embarked for Massachusetts, whose charter he had assisted in obtaining in 1629, and in June arrived at Boston, where he remained for nine months, during which time he took a prominent part in the famous Ecclesiastical Synod at Cambridge. He cooperated with Theophilus Eaton (q.v.) in founding the Colony of New Haven in April, 1636, and here, as minister and as one of the "seven pillars" of the civil government, he exercised a powerful influence. In 1661 he concealed the regicides Coffe and Whalley (qq.v.) for more than a month in his own house. He opposed the union of the New Haven and Connecticut colonies, which was effected in 1665, and three years later accepted a call to succeed John Wilson, the original pastor, as pastor of the First Church in Boston. Part of the congregation, who opposed his views on the "half-way covenant," seceded and organized the famous Old South Church. He was one of the editors of the works of Dr. John Preston, leader of the Puritan party in England, and published a number of volumes, including: *Discourse About Civil Government in a New Plantation, Whose Design is Religion* (1663); *The Knowledge of Christ Indispensably Required of All Men that Would Be Saved* (1653); *The Power of Congregational Churches Asserted and Vindicated* (1672); *The Saints' Anchor-Hold* (1661); and (with William Hooke) *A Catechism Containing the Chief Heads of Christian Religion* (1659). Consult "A Sketch of the Life and Writings of John Davenport," by Dexter, in the *Papers of the New Haven Colony Historical Society*, vol. ii (New Haven, 1877).

**DAVENPORT, WILLIAM EDWARDS (1862- )**. An American social worker, born at North Stamford, Conn. He was educated at Brooklyn Polytechnic Institute, was from 1881 to 1896 a clerk in the New York post office, and then for three years he studied in Union Theological Seminary. In 1901 he founded the Brooklyn Italian Settlement, which in 1910 was consolidated with other organizations to form the United Neighborhood Guild. He was foreign correspondent in 1902, 1904, and 1909 for the New York *Evening Post* and the Brooklyn *Daily Eagle*. He came to be regarded as an authority on questions relating to Italian immigration. His publications include: *The New Dispensa-*

tion (1884); *Visions of the City* (1884); *The Perpetual Fire* (1886); *Beecher: An Ode* (1891); *The Praise of Plymouth* (1892); *The Poet and his Friends* (1893); *Poetical Sermons* (1896, 1897); *The Beggar Man of Brooklyn Heights* (1904); *More Outcries from Brooklyn Hollow* (1905).

**DAVENPORT BROTHERS, THE.** The name of two Americans professing to be spiritualistic mediums who flourished between 1845 and 1865. They performed a number of remarkable feats which gained them many followers, but were finally exposed as impostors. See SPIRITUALISM.

**DAVID** (Heb., beloved). A king of Judah and Israel (c.1033-993 B.C.). He was the youngest son of Jesse, a Judean, dwelling in Bethlehem. His family was one of the principal ones in the town. The number of Jesse's sons is given by later tradition as seven (1 Chron. ii. 13-15), but as eight in 1 Sam. xvii. 12. The chronology of David's reign is very doubtful, but the traditional date, 1055-1015 B.C., is generally regarded as somewhat too early. It may not be necessary, however, to reduce it more than about 20 years. The duration of his reign is fixed at 40 years (1 Kings ii. 11); but this number, being a round one, is viewed by some scholars with suspicion. David is not referred to in any early documents outside of the Bible. The biblical account is found in (1) 1 Sam. xvi. 1 Kings ii and (2) in 1 Chron. ii, iii, and x-xxix. Of these two sources the first alone can lay claim to historical value. The second, in so far as it is not based on the other (see CHRONICLES), must be used with great caution, and its statements are, as a general thing, to be discarded as unhistorical or untrustworthy, while the picture that it gives of the King, differing considerably from that found in the books of Samuel, is an idealized David, such as he had become by the end of the third century B.C. in the mind of a pious Jew. Coming to the narrative in Samuel and Kings, great difficulties confront the student, due largely to the composite character of the historical documents and in part to the corrupt state of the text. The existence of "doublets," i.e., two accounts of the same event, in the story of David is believed sufficient to show that in the Book of Samuel different documents have been pieced together. Thus we have two accounts of David's introduction to Saul (1 Sam. xvi. 19-23 and xvii. 1-xviii. 5); of the slaying of Goliath (1 Sam. xvii. 1-xviii. 5 and 2 Sam. xxi. 19); of Saul's throwing a spear at David (1 Sam. xviii. 10-11 and xix. 9-10); and more of the same sort. All these doublets, however, are limited to the First Book of Samuel, and from the ninth chapter of the Second Book of Samuel to the end of the twentieth chapter we have a continuous narrative, which is brought to a close in the first two chapters of 1 Kings. Chapters xxi to xxiv of the Second Book of Samuel again represent an addition of a composite character like the first eight chapters of the First Book of Samuel, and in addition to these we have a number of editorial additions and interpolations, of which the two principal ones are 2 Sam. viii. 1-15 and 1 Kings ii. 1-12. Of these authorities, the most authentic, according to many interpreters, is the long, continuous narrative in 2 Sam. ix-xx. This excellent piece of historic writing is regarded by a number of scholars as coming from a contemporary; and Klostermann has adduced many reasons, not

altogether lacking in plausibility, for his view that the author was Ahimaaz, the son of Zadok. The date of the other sections is supposed to be much later. They reveal a tendency to idealize David, which becomes more pronounced as the popular hero recedes into the background of history and becomes a favorite subject for romance, legend, poetical embellishment, and eventually the type of the ideal king and religious poet. In consequence, it is often difficult to pick out the genuinely historical incidents in David's career. Thus the story of David's encounter with the giant Goliath is believed to be a piece of romance (1 Sam. xvii-xviii) and the genuine account of Goliath's death to be found in 2 Sam. xxi. 19, where we learn that Elhanan was the slayer. Similarly, the stories of the friendship of David and Jonathan are romantic, though based on historical facts. On the other hand, there is no reason to question that he acquired musical skill, which, together with his personal charm and the indications that he gave of becoming valorous in war, attracted Saul to him and led to his entering into close relations with the "melancholy" King. He becomes Saul's armor-bearer and among the personal services that he renders is to be reckoned his soothing the King by achievements in minstrelsy. His success in the wars against the Philistines increases his popularity with King and people, and he becomes the son-in-law of the King by marrying Michal.

Soon after, however, a momentous change ensues. Saul, subject to fits of brooding, becomes jealous of David's popularity and entertains suspicion of the latter's fidelity. The story of his actually hurling a javelin at David may be a romantic touch, but it is certain that Saul's jealousy eventually led to David's banishment from the court. David now becomes a freebooter and gathers a retinue of brave but reckless warriors about him. With them he leads the life of a Bedouin chief, attacking defenseless landowners and hiring his services in attacks upon Amalekites (q.v.), and other tribes in the Negeb. The exact course of his wanderings during this period can no longer be followed. After first trying his fortunes at Nob, he is obliged to seek refuge from Saul at Adullam. We find him next in the wild and desert country south of Judaea, and he passes at times as far east as the Dead Sea, but after taking up his abode for a time at Engedi, Saul's pursuit drives him to Gath, where he offers his services to Achish, King of the Philistines, in an expedition against Amalekites, Ashurites, and other desert tribes. In reward for his services he obtains the town of Ziklag as a possession. Achish prepares an attack upon the Israelites and calls upon David to join him. The latter consents, but yielding to the protests of his chief men, who feared treachery on David's part, Achish compels David to depart. Upon reaching Ziklag he finds that the Amalekites had raided the town during his absence. In his pursuit he surprises the Amalekites and routs them. At this moment the tidings reach David of the death of Saul and his three eldest sons at Gilboa in an encounter with the Philistines. The opportunity had now come for David's return to his native country. He secures the favor of the inhabitants of Hebron and the surrounding district and is anointed King in Hebron, while still retaining Ziklag. Meanwhile Israel passes into the hands of Ishbaal, Saul's youngest son, who, however, was entirely a tool of Abner, the ambitious and

powerful general. Ishbaal foolishly alienates Abner's interest by reproaching him for taking one of Saul's concubines to himself, an act which may have indicated Abner's intention to seize the throne for himself. Abner enters into secret communication with David, but during a visit to him is murdered by Joab, David's great general. Soon afterward Ishbaal is murdered, and David, being recognized as the natural leader of all Israel, is solemnly anointed King of the whole people at Hebron by an assembly of the elders of the tribes. He is said to have been 37 years old at this time. Seven years, according to the biblical account, had passed since the death of Saul. The accounts of David's reign are quite fragmentary except for occurrences in his immediate family. We learn of successive wars against Moabites, Ammonites, Edomites, Philistines, and Arameans, and, while the accounts of his exploits are portrayed perhaps in too vivid colors, there is no doubt that he succeeded in firmly establishing the independence of Israel and in extending his power to a number of neighboring nations that were incorporated in the empire or made tributary. Of great importance was his selection of Jehu, which becomes known henceforth under its old name, Jerusalem, as the capital of his dominion. He also laid the foundation for its future significance as the centre of the Yahwe cult by removing the sacred ark to this city. After securing peace from his enemies David had to quell opposition which arose in his own household. His eldest son, Amnon, outraged his half-sister Tamar, and in revenge Absalom caused Amnon to be murdered. Subsequently Absalom organized a rebellion against his father, which obliged the King to leave Jerusalem for a time. The uprising is quelled, but not until Absalom has fallen as a victim. Amasa, David's nephew, who had taken part in the rebellion, but had been pardoned by David and promised the chief command in place of Joab, also falls a sacrifice to the latter's jealousy. Once more, as the King stands on the verge of the grave, serious trouble threatens regarding the question of succession. The court was divided between two candidates—Adonijah, the surviving eldest son, and Solomon, the son of David by Bathsheba. Through the influence of the prophet Nathan the King decides in favor of Solomon. David dies at an advanced age and is buried in his capital. These family troubles are looked upon by the Jewish writers as a punishment for David's adulterous act with Bathsheba and his subsequent connivance at the murder of Bathsheba's husband, Uriah. There is no doubt that this act, which took place during the war with the Ammonites, is the most serious charge to be brought against him, and there is no reason to question its authenticity, since it is fully in keeping with the conditions that prevailed at the time. In forming an estimate of David those conditions must be taken into consideration, and no true picture can be obtained of him unless we are willing to recognize his human limitations. That he was a great warrior admits of no doubt. Indeed, he was essentially a soldier, courageous and of boundless energy. He possessed the faculty, moreover, to an extraordinary degree, of gathering men to himself, and as a natural-born leader he overcomes obstacles that would have crushed others. But he also shows traits of cruelty in the treatment of his enemies, connives at treachery, and is willing to make use of underhand measures to accom-

plish his ends. The best evidence of the virility and resourcefulness of his character is the empire he founded. He united under his sceptre Judah and Israel, the tribes of the Negeb (q.v.), Edom, Moab, and Ammon, while the Aramean tribes, Zoba, Beth Rechob, and Beth Maacah, were made tributary. Thus he became the most powerful ruler in southern Syria. His moral sense was not strong, and it is probably due to this defect that he shows such lamentable weakness in dealing with his family affairs. But, with all his faults, he remains one of the most notable figures in Hebrew history, and it is not surprising that the attachment to him should have led to the idealization of him by popular tradition, evidenced by later writers. That he was a poet as well as a musician cannot be doubted. His authorship of the Elegy over Saul and Jonathan (2 Sam. i. 17-27) is generally admitted; and this alone would prove his right to be remembered as "the sweet singer of Israel" (2 Sam. xxiii. 1). But the Psalms, of which 73 are by Jewish tradition ascribed to him, do not belong to his age. They reflect in all but a few cases the religious thought and aspirations of postexilic Judaism. See PSALMS, BOOK OF.

**DAVID.** A favorite subject with the sculptors of the Italian Renaissance, in which the youthful Israelitish shepherd is represented either with sling in hand, or holding Goliath's sword, with his foot upon the giant's head. The most important representations of the subject are the bronzes by Donatello and Verrocchio and the colossal marble statue carved by Michelangelo, which are described in the articles on these sculptors.

**DAVID I** (1084-1153). King of Scotland from 1124 to 1153. He was the youngest son of Malcolm Canmore by his wife, St. Margaret (q.v.). During the fierce struggle for the possession of the Scottish crown which followed the death of his father in 1093, the youthful David found refuge in England, together with his sister Eadgyth, or Matilda, who in 1100 married Henry I, King of England. The residence of David at the English court would appear to have been prolonged for several years, and the assertion of William of Malmesbury may well be credited that "it freed him from the rust of Scottish barbarity." In 1107 his elder brother, Alexander, succeeded to the throne, and David became Prince of Cumbria (q.v.). Together with this great principality he seems to have held lands in Lothian; and by his marriage, in 1113, with Matilda, widow of the Earl of Northampton, he acquired possession of that earldom too. In 1124 he succeeded his brother as King. In 1127 he took an oath, with the other great barons of England, to maintain the rights of his niece, Matilda, as heiress to the English crown, should her father, Henry I, die without male issue. The event thus contemplated came to pass in 1135, and when Stephen mounted the

English throne David took up arms in behalf of Matilda. Peace was restored by the grant of the earldom of Huntingdon and the promise of the earldom of Northumberland to David's son, Henry, then in his twentieth year; but the war was soon resumed, and in 1138 the King of the Scots, deserted by Bruce and others of his Anglo-Norman vassals, was signally defeated in the battle of "the Standard," near Northallerton. In the next year a second peace was concluded between the two kings, when the promised earldom of Northumberland was bestowed on Prince Henry. In 1140 the Scottish King marched into England for the third time to assert the rights of Matilda. He was again defeated and only regained his own country with difficulty.

The rest of his reign was devoted to the introduction of English civilization into Scotland, a task which had been begun by his parents and continued by his brothers, King Edgar and King Alexander. He secured the peace and safety of the country by building castles, and by erecting burghs he promoted trade, shipping, and manufactures. He showed his favor for learning by endowing many bishoprics and monasteries. David died at Carlisle on May 24, 1153. His son Henry had died in the previous June, and he was succeeded by his grandson, Malcolm. The remains of David's legislation, including the interesting code of the *Leges Burgorum*, have been carefully collected in the first volume of *The Acts of the Parliament of Scotland* (Edinburgh, 1844). Consult Robertson, *Scotland under her Early Kings* (2 vols., Edinburgh, 1862). See Skene, *Celtic Scotland* (3 vols., Edinburgh, 1876-80).

**DAVID II.** See under BRUCE, ROBERT.

**DAVID, da'vâd', ARMAND** (1826-1900). A French missionary and naturalist, born at Espelette, Basses-Pyrénées. In 1848 he entered the congregation of the Lazarists and in 1862 went as a missionary to China. Here he made valuable collections of animals, plants, and minerals, which he presented to the Museum of Paris. From 1869 to 1871, on behalf of the museum, he made scientific explorations in China and Tibet, discovering many new genera and species of flora and fauna. Subsequently he accomplished a third journey, of which he wrote in the *Journal de mon troisième voyage d'exploration dans l'empire chinois* (2 vols., with maps, 1875). The results of his previous travels are to be found in the *Nouvelles Archives du Muséum d'Histoire Naturelle* (1866, 1868-70). His *Les oiseaux de la Chine* (with 24 plates, 1877) is an important work.

**DAVID, CHRISTIAN** (1690-1751). A Moravian missionary, born at Seftleben, Dec. 31, 1690. Brought up a Roman Catholic, he embraced Lutheran views and then Moravian (1717) and founded the Moravian colony of Herrnhut (1722) and was elected the first of the 12 elders. Henceforth he was a missionary in Europe and even went to Greenland, where he founded the first mission (1747). Consult Thompson, *Moravian Missions* (New York, 1882). See MORAVIANS.

**DAVID, da'vâd', EDWARD.** A Flemish buccaner of the latter part of the seventeenth century. He early became one of the "Brethren of the Coast," as the West Indian pirates styled themselves, achieved prominence in that organization, and in 1683 sailed as leader of an expedition of three ships for the Pacific. Reinforced by French filibusters with two vessels and a fire

ship, he devastated the coasts of Chile and Peru. A fleet of three galleons and two fire ships was sent against him by the Viceroy of Peru, but after an indecisive battle he succeeded in making his escape. Subsequently he returned to the coast of Peru, pillaging towns, slaughtering, and exacting ransoms in true piratical fashion. He then transferred his depredations to Central America and Mexico. In 1688, under a general amnesty granted by King James II, he betook himself to England, where he lived for many years in undisturbed possession of his plunder.

**DAVID, da'vâd', FÉLICIEN CÉSAR** (1810-76). A distinguished French composer. He was born at Cadenet, Vaucluse, April 13, 1810. At first a chorister and later chaplainmaster in the cathedral at Aix, he entered at 20 the Paris Conservatory, where he studied with Benoist (organ), Fétis (composition), and Reber (harmony). His uncle cut off his paltry monthly allowance of 50 francs, and David had to give lessons. He joined the Saint-Simonists, but their commune broke up at Ménil-Montant in 1833; with a number of fellow dreamers he went to the East—Turkey, Egypt, and Syria. After two years of hardship and suffering he returned to France, rich in novel experiences. The fruit of his journeys, *Mémoires orientales*, received scant notice, and David retired for more serious study and composition, but his first symphony (1838) had a like fate. In 1844 his "symphonic ode," *Le désert*, was performed at the Conservatory amid tumults of applause, which continued day after day at the successive performances of the work. His next productions, the oratorio *Mosé au Sinaï* (1846), the symphonic ode *Christophe Colomb* (1847), and the mystery *L'Eden* (1848), had little success. But he was now a recognized master; even his earliest compositions found a hearing, and the doors of every theatre were open for his new works, chiefly operas. *La perle du Brésil* (1851) was received with acclamation, and a national prize of 20,000 francs was awarded (in 1867) to his *Herculeanum*, produced at the Grand Opéra in 1850. *Lalla Roukh* (1862) was equally successful, but *Le Saphir* (1865) found less favor. *La captive* was withdrawn by the composer before it was performed. In 1862 he was appointed an officer of the Legion of Honor, and in 1869 elected to succeed Berlioz at the Institute and as a librarian of the Conservatoire de Musique in Paris. His compositions include also chamber music, songs, and pieces for solo instruments. David, the "musical Orientalist," occupies a singular position in the history of music: he inaugurated a new movement. During his long years of wandering in the East he absorbed the quaint and weird Oriental melodies, and to express these in the most gorgeous orchestral colors that a rich fancy could think of was his task. It was the easier as Berlioz (q.v.) had already worked out orchestral effects that glowed and blazed, and it remained only to give them an Oriental setting, which David did in *Le désert* and subsequent works. His followers were numerous, and among them the most famous—Bizet (*Djamileh*; *Les pêcheurs de perles*), Massenet (*Roi de Lahore*), and Delibes (*Lakmé*)—were the most directly influenced. He died at Saint-Germain-en-Laye, Aug. 29, 1876. Consult A. Azevedo, *Félicien David* (Paris, 1863), and R. Brancour, *Félicien David* (ib., 1908).

**DAVID, da'vâd', FERDINAND** (1810-73). A German violinist, born in Hamburg, June 19,

DAVID  
THE CORONATION OF JOSEPHINE, FROM THE PAINTING IN THE LOUVRE, PARIS

DAVID  
THE CORONATION OF JOSEPHINE, FROM THE PAINTING IN THE LOUVRE, PARIS

He was born in Paris, Aug. 30, 1748. On the advice of Boucher (q.v.), who greatly influenced his early art, he studied under Vien and entered the schools of the Academy. In 1774 he took the first Prix de Rome with "Antiochus and Stratonice" (Ecole des Beaux-Arts, Paris) and went to Rome with Vien shortly after. A five years' sojourn devoted to the diligent study of classic antiquity brought about a complete change in style, which he himself compares to an operation for cataract. Returning to Paris in 1780, he achieved celebrity with "Blind Belshazzar Asking Alms" (1781, Lille Museum) and "Andromache Bemoaning the Corpse of Hector" (Ecole des Beaux-Arts), which caused his election to the Academy.

More than any other painter of his time, David, with his classical tendencies, represented the spirit of the age—the reaction against the frivolity of monarchical France and the return to the stern virtues of antiquity. His "Oath of the Horatii" (1784) and "Brutus Condemning his Sons to Death" (1789, both in the Louvre) were hailed with universal applause. Entering politics he became the great painter of the Revolution and presented to the Convention, of which he was a leading spirit, the "Deathbed of Lepelletier," the first martyr of liberty. When Marat was killed, he was called by the Assembly to memorialize his death, and he responded with a painting in which the murdered man is portrayed with great naturalistic strength. Twice imprisoned during the Revolution, he narrowly escaped the guillotine and renounced politics. Those of his works which represent what he himself lived and experienced are painted in this manner. The same is true of his portraits of the Revolutionary epoch, like those of Madame Récamier (Louvre), of Barrère, and especially of the young Bonaparte, whose follower he became (Versailles), etc. When Napoleon became Emperor, he was appointed court painter. His chief masterpiece in this capacity was the colossal picture of the "Coronation of Napoleon I" (finished 1807, and now at Versailles). This is a stately composition, noble in color, and with a tender, quivering light, justifying Muther's encomium of being the best historical painting of the past century. His portraits of this period, as, e.g., those of the Emperor, the Pope, and Murat, are all of the highest naturalistic merit. Upon the restoration of the Bourbons he was exiled to Brussels, where he died on the 29th of December, 1825. During his exile he painted nothing of real merit except his portraits, which include the double likenesses of the daughter of Joseph Bonaparte (Toulon Museum), Abbé Sicéys, and the "Three Ladies of Ghent" (Louvre), all depicted with keen realism and great pictorial strength. All of these works show a realistic talent of the first order, with high powers as a draftsman and a colorist.

But the best known and most influential side of David's art is his large canvases representing antique subjects. While these paintings show great excellence of drawing, they are cold in composition and color, exaggerated and theatrical in action. Besides those mentioned above, the "Death of Socrates," "Leonidas at Thermopylae" (1814, Louvre), the "Rape of the Sabines" (1799, Louvre), are among the chief of this class. These were the works which had the greatest influence upon the pupils of his large atelier. Throughout the Revolution and under

the Empire he was the supreme dictator of art in France, and his influence upon its development was very great. While he rescued it from the trivialities of the followers of Watteau, he established a despotism of classicism which had to be broken before there could be real progress. Nevertheless, he was in a way the regenerator of modern French art, and the accuracy of his drawing exercised a salutary influence upon its development.

**DAVID**, dā'vĕt, JOHANNES BAPTISTA (1801-66). A Flemish philologist, born at Lier. For more than 30 years he held the chair of Belgian history and Flemish literature at the Catholic University of Louvain. He was one of the greatest Flemish scholars of the century and a very prolific writer. His principal work is the famous *Vaderlandsche historie* (10 vols., 1842-64; 4th ed., 1885 et seq.), a history of Belgium which was never completed. The most important of his linguistic works is entitled *Eccrte beginselen der nederdutsche sproekkunst* (10th ed., 1858).

**DAVID**, dā'vĕd', LAURENT OLIVIER (1840-). A Canadian journalist and statesman, born at Sault au Recllet, Quebec Province. He was educated at the College of Sainte Thérèse, and was called to the bar in 1864. From 1870 to 1884 he was editor of *L'Opinion Publique*, but the paper was discontinued owing to his criticisms of the Catholic clergy for alleged political interference in elections. At different times he was also connected with *Le Bien Public* and *La Tribune*. He was for a short period a translator for the House of Commons, but resigned in 1878 and practiced his profession in Montreal, of which he was appointed city clerk in 1892. Originally a Conservative in politics, he afterward joined the Liberals, and was a member of the Quebec Legislature during 1886-90. In 1887-88 he was president of the Saint Jean Baptiste Society of Montreal. He did much to promote a patriotic national spirit among French-Canadians, though without favoring revolutionary and separatist projects. In 1888 he was a delegate to the French-Canadian National Convention at Nashua, N. H.; in 1898 he assisted in preparing a new city charter for Montreal; and in 1903 he was appointed to the Senate. His writings are distinguished for lucidity and beauty of style. His publications include: *Biographies and Portraits* (1876); *Les héros de Chateauguay* (1883); *Les patriotes de 1837-38* (1884); *Mes contemporains* (1894); *Les deux Papineau* (1896); *Le clergé canadien: sa mission et son œuvre* (1896), a work which reproves certain Roman Catholics for intervention in political affairs and was condemned by the Congregation of the Index at Rome; *L'Union des deux Canadas, 1841-1867* (1898); *Le drapeau de Carillon*, a drama (1901); *Laurier et son temps* (1905); *Vingt biographies* (1910); *Souvenirs et biographies* (1910). See CANADIAN LITERATURE.

**DAVID**, or DEWI, SAINT (?-1601). The patron saint of Wales. He was, according to tradition (probably worthless), the grandson of

Ceredig, King of Cardiganshire. He was educated by monks and later went through Wales on a preaching tour. He also founded monasteries, especially that one at Menevia, now called St. David's, in Pembrokeshire, and there he became abbot, which office was equivalent to bishop, and its holder was so designated. As bishop, he presided at the synods of Breff and "Victory." His shrine became a favorite place of pilgrimage, and he was canonized in 1120; his festival is held on March 1. He was celebrated for his eloquence and success in conversion. Several works have been ascribed to him, but these are no longer extant. His life was written by Rice, Bishop of St. David's, who died about the year 1090, reprinted in W. J. Rees, *Lives of the Cambro-British Saints of the Fifth and Immediately Succeeding Centuries* (London, 1853). Consult Rice Rees, *An Essay on the Welsh Saints* (ib., 1836).

**DAVID AP GWILYM**, dā'vəd āp gwē'lim (c.1300-70). The greatest of mediæval Welsh poets. He was born either in Cardiganshire or Glamorganshire, and was the son of Gwilymsam. He was a man of considerable education, and his knowledge of Latin and Italian literatures has given rise to the belief that he was educated in Italy. His tendency to satirize his neighbors, as well as his numerous love affairs, brought him into frequent difficulties. He has been compared to Shakespeare, Burns, Ovid, and Petrarca, and addressed to Morrydd, who may be called his Laura, more than 147 poems that form a kind of *ars amandi*. Morrydd was the daughter of Madog Lawgain, and her marriage to a wealthy suitor was soon followed by her elopement with the poet. They are said to have escaped to France, but a lawsuit was brought against David by the outraged husband, to whom damages were adjudged in a large sum. Unable to pay it, the poet might have languished in prison had not the people of Glamorgan generously remitted the obligation. In gratitude for this the poet dedicated two of his principal poems to Glamorgan. Most of his poems were written in the metre called *cyrydd*, consisting of seven-syllable lines rhyming in couplets. His frequent use of this metre led his contemporaries to call him *Dafydd gwydd gwin*, 'David of the sweet wine cywydd.' Because of the lustre that he gave to this verse, it has become the most frequent genre used by Welsh poets from his time to the present day. Though love forms the main theme of his poems, he is probably better known for his treatment of nature, for which he shows a love that is unequalled in any literature of that period. Two hundred and sixty-two of his poems were edited by Owen Jones (Myfyr) and William Owen-Pughe (London, 1789), and more have been lately discovered in the Mostyn Library and British Museum. An admirable English version of the poems was published by Arthur James Jones (1834). Consult L. C. Stern, "Dafydd ab Gwilym," in the *Zeitschrift für celtische Philologie*, vol. vii, pp. 1-265 (Halle, 1910). See WELSH LITERATURE.

**DAVID CITY.** A city and the county seat of Butler Co., Neb., 90 miles (direct) west of Omaha; on the Union Pacific, the Burlington and Missouri River, and the Chicago and Northwestern railroads (Map: Nebraska, G 3). The city contains a public library, park, and Chautauqua grounds. It is the centre of an agricultural and stock-raising region and has manu-

factories of bricks. The water works and electric-light plant are owned by the city. Pop., 1900, 1845; 1910, 2177.

**DAVID COPPERFIELD.** A novel by Dickens, published serially, beginning May, 1849. It was the author's favorite book and is said to be partly autobiographical.

**DAVID D'ANGERS**, dā'vəd' dān'zhā', properly PIERRE JEAN DAVID, so called to distinguish him from David the painter (1788-1856). A French sculptor of the early nineteenth century. He was born at Angers March 12, 1788, the son of a wood carver. Overcoming his father's opposition, he went to Paris in 1808. After a bitter struggle with poverty he entered, in 1810, the atelier of the sculptor Rolland, at the same time studying drawing with Jacques Louis David, who befriended him. The Prix de Rome enabled him to spend five years (1811-16) in the Eternal City, where he came under Canova's influence, without, however, relinquishing his naturalism. He then studied the Parthenon statues in London, and on his return to Paris he received his first important commission. This was the monument to Le Grand Condé, now in the Court of Honor, Versailles. During the revolution of 1830 David, an ardent Republican, fought in the ranks, and after its successful termination he received the commission for his masterpiece—the sculptures of the pediment of the Panthéon. Under the inscription, "Aux grands hommes la patrie reconnaissant," "France" bestows crowns, placed in her hand by "Liberty," upon her illustrious sons, among whom the figures of Mirabeau, Carnot, David the painter, Voltaire, Rousseau, Bonaparte, and the "Trumpeter of Arcola" are prominent. He participated also in the revolution of 1848 and was a member of the Constituent Assembly. After the coup d'état by Napoleon III he went into exile to Greece, but soon returned, broken in health, to France. He died in Paris, Jan. 5, 1856. His patriotism and ideal devotion to the cause of liberty were only equalled by a lovable character, which endeared him to all classes of men.

David D'Angers is an epoch-making figure in the history of French sculpture. Notwithstanding his classical training, which is often evident in his work, he rendered nature with freedom and truth. He is most eminent in portrait sculpture, in which he was the first to insist upon contemporary costume; but he also excelled in reliefs and especially in medallions. He has left behind no less than 55 statues, 150 busts, 70 bas-reliefs, 20 statuettes, and over 500 medallions. He is represented in the national collections of the Louvre, Versailles, and Sèvres, in almost all the important provincial museums, and in his native town there is a museum devoted entirely to his works. His two most important works, besides the pediment of the Panthéon, are the tomb of General Gobert (Père Lachaise), and his "Philopœmen" (Louvre), a colossal heroic type in classic garb. Among the best of his portrait statues are those of Gutenberg at Strassburg, Talma at Montpellier, Cornille at Rouen, Fénelon at Cambrai, Lafayette and Thomas Jefferson at Washington. He himself most prized his statue of "Barra," a drummer boy killed in the war of La Vendée, and the beautiful Greek female figure of the monument to the Greek hero Marco Bozzaris. In his portrait busts and medallions he has left us faithful and characteristic likenesses of most of the French celebrities of his day, and of many Eng-

lish and German notables, which he modeled during repeated visits to these countries. Among his principal busts are those of Goethe (Ducal library, Weimar), the sculptor Rauch, Washington, etc.; among the medallions are those of Napoleon and Madame David. Consult the monographs by Maillard (Angers, 1839); Lomenie (Paris, 1844); Saint-Amour (Dunkerque, 1845); Halévy (ib., 1857); Karcher (London, 1865); Jouin (Paris, 1878). Consult also Brownell, *History of French Art* (New York, 1892), and Gonse, *La sculpture française depuis le XIV<sup>e</sup> siècle* (Paris, 1895).

**DAVIDEIS**, da-vid'e-is. A sacred poem on the troubles of David, the chief work of Cowley, published in 1656.

**DAVID GARRICK**. A comedy by Robertson, which appeared in 1864 and is a translation from the French play *Sullaran*. It purports to represent amatory incidents in the life of the famous eighteenth-century English actor and was first produced at the Haymarket with the elder Sothorn in the principal rôle.

**DAVIDGE, WILLIAM PLEATER** (1814-88). An English comedian, who came to the United States in 1850 and became identified with the American stage. He was born April 17, 1814, in London, and appeared as a youthful amateur at Drury Lane in *The Miller's Maid*. Afterward he acted in various English cities, especially in Manchester. His first appearance in America was in August, 1850, as Sir Peter Teazle at the old Broadway Theatre, New York, later he supported many well-known actors in the metropolis and elsewhere, among them Edwin Forrest and Fanny Davenport. Some of his notable parts were Caliban: Eccles, in *Caste*; Dick Deadeye, which he created, in *Pinafore*; Old Hardy, in *The Belle's Stratagem*; and Hardcastle, in *She Stoops to Conquer*. His last engagement was with the Madison Square Company, beginning in 1885. He died at Cheyenne, Wyo., Aug. 7, 1888. He was the author of a volume of autobiographical reminiscences called *Footlight Flashes* (New York, 1866). *The Drama Defended* (ib., 1859); and other works.

His son, **WILLIAM DAVIDGE** (1847-1899), also an actor, was born at Manchester, England, and brought to the United States when a child of three years. During his career he played with William H. Crane (1870-71), Kate Claxton (1877-78), and later for several seasons with Roland Reed. He died in Chicago.

**DAVID HARUM**. A very popular story by Edward Noyes Westcott, which, after rejection by a number of publishers, attained a remarkable success. The character of the shrewd, horse-trading David Harum is distinctively an American type, and was drawn from an original who was a resident of the town of Homer, N. Y. An identification of the characters and scenes has been published by Arthur T. Vance, under the title *The Real David Harum* (New York, 1901).

**DAVIDISTS**. A name used for three Christian sects: 1. Followers of David of Dinant, a teacher in the University of Paris, whose philosophical work was condemned by the Synod of Paris in 1209, and who, in consequence of the ban laid upon him in 1215 by the Pope, had to flee from France. The place and date of his death are unknown. His fundamental idea was that the Deity alone had any real existence, being the *materia prima* of all things. 2. Davidists, or David Georgians, followers of David

George, or Joris, a native of Ghent or Bruges. In 1530 he was whipped, had his tongue bored, and was imprisoned for obstructing a Roman Catholic procession. He founded a sect of his own and in 1542 published his *Book of Wonders*, retelling the visions which he professed to have received. After his death his body was dug up and burned by order of the Senate of Basel, where he had passed the latter part of his life as a merchant under an assumed name, John of Bruges. The sect, under the leadership of Henry Nicholas, became known in Holland and England as the "Familists." They interpreted the whole of Scripture allegorically, and maintained that, as Moses had taught hope and Christ had taught faith, it was their mission to teach love, the service of which was the highest and best of the dispensations. The result was an extreme Antinomianism in practice, which attracted the notice of the authorities in both countries. Early in the seventeenth century the sect was suppressed or absorbed by others. See JORIS, DAVID. 3. The followers of Francis David, who in 1568 began a widespread Unitarian movement in Hungary. See UNITARIANISM.

**DAVIDOFF**, da've-dof, KARL, (1838-89). A Russian violoncellist, born at Goldingen, Courland, March 17, 1838. He was educated at the Moscow University and studied the violoncello under H. Schmitt in Moscow and Schubert in St. Petersburg. He then entered the Leipzig Conservatory, where he continued to study the 'cello under F. Grützner, and also completed a course in composition under Hauptmann. He first appeared at the Gewandhaus, Leipzig, in 1859, and was made first violoncellist in the Gewandhaus orchestra and professor in the Leipzig Conservatory. In 1862 he was appointed solo violoncellist to the Emperor of Russia and professor in the Conservatory of St. Petersburg and was director of the latter from 1876 to 1887. As a virtuoso, he was equalled by few, and won great fame on his concert tours through Europe. Besides four concertos and a number of minor pieces for his instrument, he composed some works for orchestra, pianoforte pieces, and songs. Consult W. Hutor, *Karl Davidoff und seine Art das Violoncell zu behandeln* (Leipzig, 1899).

**DAVIDS**, THOMAS WILLIAM RHYS (1843-). An English Orientalist. He was born at Colchester, was educated at the University of Breslau, entered the civil service in Ceylon, and filled various judicial appointments in that island. He was called to the bar of the Middle Temple in 1877, and was professor of Pali and Buddhist literature at University College, London, from 1882 until 1912. In 1904 he became professor of comparative religion at Manchester. He devoted himself especially to the study of Buddhism. His works include: *Buddhism: A Sketch of the Life and Teachings of Gautama, the Buddha* (1878; 22d ed., 1910); a translation from the *Jātakas*, or *Buddhist Birth Stories*, vol. 1 (1880); *Buddhism: Its History and Literature* (1896, composed from American lectures); *Buddhist India* (1902; 2d ed., 1905); *Early Buddhism* (1908); *Dialogues of the Buddha* (1899; 1910); and with J. E. Carpenter, he edited the Pali text *Digha-nikāya* (3 vols., London, 1890-1911). He was made president of the Pali Text Society, which he founded in 1882.

**DAVID'S DEER**. See ELAPHURE.

**DAVIDS ISLAND**. An island lying in Long

Island Sound, off New Rochelle, N. Y., the nearest railway station, a quarter of a mile north of the boundary between Greater New York and Westchester County (Map: New York City and Vicinity, G 2). It is owned and occupied by the United States government, and is the site of Fort Slocum (q.v.), a recruit depot of the United States army, for which extensive barracks and other buildings are maintained. Its extent is about 100 acres.

**DAVIDSON.** A town in Mecklenburg Co., N. C., 22 miles north of Charlotte, on the Southern Railway (Map: North Carolina, B 2). It has cotton and cottonseed-oil mills, a ginnyery, and a flouring mill. The town is the seat of Davidson College (q.v.), founded in 1837, and of the North Carolina Medical College, established about 1890, connected with which is the Munroe Private Hospital. There is also a Carnegie library. Pop., 1890, 481; 1900, 904; 1910, 1056.

**DAVIDSON, ANDREW BRUCE** (1831-1902). A Scottish biblical scholar. He was born in Aberdeenshire and, after studying at Aberdeen, in 1863 was ordained and was appointed professor of Oriental languages in New College, Edinburgh. He was a member of the Old Testament Revision Committee, being recognized as the foremost British biblical critic of his day. George Adam Smith and W. Robertson Smith were among his pupils. His publications include a *Commentary on Job*, vol. i (1862); *An Introductory Hebrew Grammar* (1874; 9th ed., 1888); primers on *Job*, *Ezekiel*, *Hebrews* (1877); "Isaiah," in *The Temple Bible* (1902); and two volumes of sermons, *The Called of God* (1903) and *Waiting upon God* (1904), with a life by Taylor Innes.

**DAVIDSON, CHARLES** (1862- ). An American scholar. He was born in Streetsboro, Ohio, and was educated at Iowa College and at Yale University. In 1893-94 he was assistant professor of English at Indiana University, in 1894-96, associate professor of English at Adelbert College (Western Reserve University), and in 1906-11 professor of education at the University of Maine. He wrote much for scholarly reviews and these books: *Studies in the English Mystery Plays* (1892); *Motor Work and Formal Studies* (1911).

**DAVIDSON, GEORGE** (1825-1911). An American astronomer. He was born in Nottingham, England, but went to the United States in 1832. He did notable work on the Government Coast and Geodetic Survey (1845-95), but it was in astronomical research that he gained his greatest distinction. He traveled on every continent to make observations, particularly of transits of Venus. He wrote: *The Alaska Boundary* (1903); *The Glaciers of Alaska* (1904); *The Discovery of San Francisco Bay* (1907); *Francis Drake on the Northwest Coast of America* (1908); *Origin and Meaning of the Name California* (1910). In 1895 he became professor of geography in the University of California.

**DAVIDSON, JAMES WOOD** (1829-1905). An American author, born in Newberry District, S. C. He became professor of Greek in South Carolina College, then principal of the high school at Columbia, and, during the Civil War, adjutant of infantry in Jackson's corps of Lee's army. He was literary editor of the *New York Evening Post* (1873), and American correspondent of the London *Standard* from 1873 to 1878. His published works include: *The Living*

*Writers of the South* (1869); *School History of South Carolina* (1869; rev. ed., 1894); *The Correspondent* (1886); *The Poetry of the Future* (1888); *The Florida of To-Day* (1889).

**DAVIDSON, JOHN** (1857-1909). An English poet. He was born at Barrhead, near Glasgow, Scotland; at the age of 13 became assistant in the chemical laboratory of a sugarhouse at Greenock, attended for a short time Edinburgh University, and went to London in 1890. He had already published three plays—*Bruce* (1886); *Smith: A Tragic Farce* (1888); and *Scaramouch in Nawos* (1889)—which contain many striking scenes. His later plays include *Godfrida* (1898) and *Self's the Man* (1901). In 1901 he began the issue of a series of verse pamphlets called *Testaments*, of which have appeared "A Vivisection," "A Man Forbid," and "An Empire Builder." He came to repudiate entirely the past in art, literature, morals, and religion. His philosophy, partly derived from Schopenhauer, is thoroughly pessimistic. In man he sees matter striving through brutal effort towards self-knowledge. Hence his defense of vivisection. He is best known by his ballads, individual in subject and style. His thought and manner are well represented by *Making of a Poet*, *Houndsditch*, and the ballads of "Heaven" and "Hell," in *Ballads and Songs* (1894). Other volumes are *Fleet Street Eclogue* (1st series, 1893; 2d series, 1895); *New Ballads* (1896); *The Last Ballad and Other Poems* (1898); *Testaments* (1901-02); *The Knight of the Maypole* (1902); *A Rosary* (1903); *The Testament of a Prime Minister* (1904); *Selected Poems* (1904); *The Theocrat* (1905); *Holiday and Other Poems* (1906); *Mammon and his Message* (1908); *The Man Forbid and Other Essays* (1910). For critical analysis of his work, consult Archer, *Poets of the Younger Generation* (London and New York, 1902).

**DAVIDSON, JOHN WYNN** (1824-81). An American soldier. He was born in Fairfax Co., Va., graduated at West Point, and was assigned as second lieutenant of dragoons in 1845, and during the Mexican War was with the Army of the West at San Pasqual, the passage of the San Gabriel River, and at Mesa. In 1848 he was promoted to be first lieutenant and was assigned to frontier duty. From 1861 to 1862 he served in the defenses of Washington, D. C., and in the latter year, with rank of major of cavalry, fought in the Army of the Potomac during the Peninsular campaign, becoming brigadier general of volunteers in 1862. He was brevetted colonel after the battle of Golding's Farm (Va.) and in 1865 major general in both the regular and volunteer services. In 1863 he commanded a cavalry division at Brownsville (Ark.) and Ashley's Mills (Ark.) and in the capture of Bayou Metre (Ark.). He was appointed in 1864 chief of cavalry of the division west of the Mississippi and in 1866 became lieutenant colonel of the Tenth United States Cavalry. From 1873 to 1881 he was in command of various posts in the Indian Territory, Texas, and Montana, and in 1879 became colonel of the Second Cavalry.

**DAVIDSON, LUCRETIA MARIA** (1808-25). An American poet, remarkable for her precocity in rhyming. Many of her pieces were lost or destroyed, but nearly 300 were collected and published by S. F. B. Morse under the title *Amir Khan and Other Poems* (1829). Her sis-

ter, **MARGARET MILLER DAVIDSON** (1823-38), was also a precocious writer, and at the age of 10 composed a drama called the *Tragedy of Aletia*. Washington Irving was her patron and supervised the publication of the two sisters' works (1850).

**DAVIDSON, RANDALL THOMAS** (1848- ). A British prelate, Archbishop of Canterbury, born in Edinburgh and educated at Harrow and at Trinity College, Oxford. He was curate of Dartford, Kent, in 1874-77; private secretary and chaplain to Archbishop Tait, whose daughter he married, and (1882-83) to Archbishop Benson; dean of Windsor and domestic chaplain (1883-91) to Queen Victoria, clerk of the closet (1891-1903) to Queen Victoria and to King Edward; and Bishop of Rochester in 1891-95 and of Winchester in 1895-1903. In 1903 he succeeded Temple as Archbishop of Canterbury. He helped to draft the unsuccessful Compromise Education Bill of 1908 and in the same year presided at the Pan-Anglican Congress and the Lambeth Conference. He edited in 1889 *The Lambeth Conferences of 1867, 1878, and 1888*. By 1904 he had visited the United States and Canada. He wrote: *A Life of Archbishop Tait* (1891); with Benham: *The Christian Opportunity* (1904). *Captains and Comrades of the Faith* (1911).

**DAVIDSON, SAMUEL** (1806-98). An Irish biblical critic. He was born at Kellswater and was educated at the Royal College of Belfast, where he became professor of biblical criticism in 1835 after being ordained to the Presbyterian ministry. He entered the Presbyterian ministry and in 1835 was given the chair of biblical criticism in the Royal College of Belfast. Soon afterward he became a Congregationalist, and in 1842 he took the chair of biblical literature and Oriental languages in the Lancashire Independent College at Manchester, which he was forced to resign in 1857. He was one of the Old Testament Revision Committee. His principal works are *Sacred Hermeneutics* (1843); *Text of the Old Testament Considered, with a Treatise on Sacred Interpretation* (1856), written for Horne's *Introduction; The Canon of the Bible* (1877); *The Doctrine of Last Things Contained in the New Testament* (1882). He translated Furst's *Hebrew and Chaldean Lexicon to the Old Testament* (1867; often reprinted) and Gieseler's *Ecclesiastical History* (1846).

**DAVIDSON, THOMAS** (1817-85). An English geologist and paleontologist, born in Edinburgh. He studied on the Continent and at Edinburgh University, made extensive geological tours, and at the suggestion of Leopold von Buch, the German geologist, undertook the study of the Brachiopoda. In 1851-70 he published, under the direction of the Paleontographical Society, his *Monograph on British Brachiopoda* (3 vols.), containing 250 plates drawn by himself. To this work he added (1873-85) three supplementary volumes. His *Memoir on Recent Brachiopoda* was posthumously published by the Linnean Society. In 1852 he was elected fellow of the Geological Society of London and in 1857 fellow of the Royal Society. His splendid collection of recent and fossil brachiopods, together with his books, he presented to the National Museum at South Kensington.

**DAVIDSON, THOMAS** (1840-1900). An American philosopher, born near Tetterangus, Scotland. He graduated in 1860 at the University of Aberdeen, removed in 1866 to Canada,

and in 1867 to the United States, and in 1875 settled at Cambridge, Mass., where he was active as scholar, author, and lecturer. A close student of Thomas Aquinas, he was invited by the Pope to assist the corps of Italian professors in the preparation of a new edition of the works of that philosopher. His *Philosophical System of Antonio Rosmini-Serbati* (1882) was the first introduction of the latter to English readers. For many years he conducted at Keene, in the Adirondacks, a "summer school for culture sciences," and from 1898 a class of Russian Jews in New York City. His personality was large and commanding. His published works include further: a translation of the fragments of Parmenides (1889) and one of Bleek's *Origin of Language* (1889); *A Short Account of the Niobe Group* (1874); *The Parthenon Frieze and Other Essays* (1882); *The Place of Art in Education* (1886); *Giordano Bruno* (1886); *Handbook to Dante* (1887); *Aristotle and Educational Ideals: A History of Education* (1900).

**DAVIDSON, WILLIAM** (1746-81). An American soldier. He was born in Lancaster Co., Pa., was taken when a child to North Carolina, and became a major in one of the first regiments raised in that State for the Revolutionary War. He was in the engagements at Brandywine, Germantown, and Monmouth, and advanced to the rank of a brigadier general of North Carolina militia. In the attempt to check the advance of Cornwallis over the Catawba River at Cowan's Ford, Feb. 1, 1781, he was killed. Davidson College, N. C., was named in his honor.

**DAVIDSON COLLEGE.** An institution for higher education established in 1837 at Davidson, N. C. The college was founded by members of the Presbyterian church and is at present governed by a board of trustees appointed by the presbyteries of North Carolina, South Carolina, Georgia, and Florida (Presbyterian church, South). No theological department, however, is maintained, and the degrees conferred are the academic ones in art and science. The student attendance in 1913 was 353, the endowment of the college was \$250,000, and the total value of the college property, \$360,000. The library contained 23,688 volumes. The president in 1914 was William Joseph Martin.

**DAVID THE PHILOSOPHER** (Arm. *David 'Imasdasar*), or **DAVID THE ARMENIAN** (?-c.500 A.D.). An Armenian scholar, born at Nerken in the Armenian Province of Durnperan. He studied in Greece and wrote learned translations of, and commentaries on, the works of Aristotle. Consult Neumann, *Mémoire sur la vie et les ouvrages de David* (Paris, 1829).

**DAVIE, WILLIAM RICHARDSON** (1756-1820). An American soldier, born in Egremont, England. He came to the United States in 1763, graduated at Princeton in 1776, studied law at Salisbury, N. C., and in 1779 received the commission of a lieutenant of dragoons. His troop was subsequently assigned to Count Pulaski's legion, in which he rose to the rank of major. He resumed the study of law at Salisbury and in 1779 was admitted to the bar of North Carolina. Under the authorization of that State in 1780 he raised at his own expense a troop of dragoons and two mounted infantry companies, with which to assist in the defense of the southwestern districts against British attacks from South Carolina. In 1780 he was promoted to

the command of the State cavalry, with the rank of colonel. At the entry of Lord Cornwallis into Charlotte, N. C., he distinguished himself by his spirited resistance to the repeated charges of Tarleton's famous legion. He was appointed in 1781 to the post of commissary general of the American army in the South. After the Revolution he became a successful lawyer, was a delegate to the Constitutional Convention of 1787, and for a number of years represented the borough of Halifax in the Lower House of the State Legislature. He drew up the Act, passed in 1789, for the establishment of the University of North Carolina; in 1794 was commissioned major general of militia; became Governor of North Carolina in 1799, but resigned in the same year to accept appointment to the embassy which concluded with the French government the Convention of Sept. 30, 1800. Consult the biography by Hubbard, in vol. xxv (Boston, 1848) of *The Library of American Biography*, edited by Jared Sparks. Consult *Peele's Lives of Distinguished North Carolinians* (1898).

**DAVIES, ARTHIUR B.** (1862- ). An American landscape, marine, and figure painter. He was born at Utica, N. Y., and studied under Dwight Williams at Utica, at the Art Institute, Chicago, and in New York, where he began as an illustrator for the magazines. His paintings first attracted attention at an exhibition held in New York in 1899, and after that time, avoiding the customary annual exhibitions, he held other important exhibitions in New York (1901), containing such paintings as "Spring's Renewal" and "The Breath of Light"; at the Pennsylvania Academy of Fine Arts (1908), including "The Girdle of Ares" (acquired by the Metropolitan Museum, New York, 1914), and "Visions of the Sea"; at the Art Institute of Chicago (1911), with subjects like "The Hunter of the Starlands" and "Maya, Mirror of Illusions," which last was purchased by the Institute. In public collections he is best represented in the Brooklyn Museum by four paintings, among which is the charming "Children of Yesteryear." Davies came to be recognized as one of the most original of American painters, and the most prominent representative of those Romantics who seek to escape from the commonplace into the realm of dreams. He has well been called a realist with the temperament of a mystic. He is a master of tonal effects and excels especially in color. He was the leader of the group of artists who organized the remarkably successful International Exhibition, held in New York in 1913, in which so-called Modernists were for the first time introduced to the American public. In his most recent works in the exhibition of Cubists and Futurists at the Montross Gallery, New York, in 1914, he showed pronounced cubist tendencies in a series of paintings, of which the most important was "The Great Mother." Consult Hunker, "Certain Painters," in *The Pathos of Distance* (New York, 1913).

**DAVIES, BEN** (1858- ). An English tenor, born in Swansea, Wales. He studied under Randegger at the Royal Academy of Music (1880-83), where he won numerous prizes. Upon leaving the Academy he joined the Carl Rosa Opera Troupe, appearing in *Faust*, *The Bohemian Girl*, etc.; but he is best known as a concert and oratorio singer. He visited the United States in 1893, 1894, and 1905-06.

**DAVIES, CHARLES** (1798-1876). An American mathematician, born in Washington, Conn. He early removed to St. Lawrence Co., N. Y., and in 1815 graduated at West Point. In 1848 he took the chair of mathematics and natural philosophy in the University of New York, and in 1857 the chair of higher mathematics in Columbia College. His works include among many: *Surveying* (1832); *Trigonometry* (1840); *Elements of Algebra* (1844; rev. ed., 1901); *Logic of Mathematics* (1850); *Mathematical Dictionary and Cyclopaedia of Mathematical Science*, with W. G. Peck (1855); *New Elementary Algebra* (1859); *University Algebra* (2d ed., 1864); *Elements of Analytical Geometry and of the Differential and Integral Calculus* (new ed., 1901); *The Complete Arithmetic* (1877). He also edited, in English, Legendre's *Geometry* (1828), and Bourdon's *Algebra* (1832).

**DAVIES, HENRY EUGENE, JR.** (1836-94). An American soldier, born in New York. He was educated at Harvard, Williams, and Columbia, and was admitted to the bar in 1857. At the outbreak of the Civil War he entered the United States Volunteers as captain, and became brigadier general in September, 1863. He served with distinction in the Cavalry Corps, Army of the Potomac, became one of Sheridan's most trusted lieutenants, and by 1865 had risen to the rank of major general of volunteers. He resigned in 1866 and afterward became a prominent New York lawyer and held several public offices. He was the author of *General Sheridan* (1895), in the "Great Commander Series."

**DAVIES, HUBERT HENRY.** A British dramatist, born at Woodley, Cheshire, England. He went to San Francisco in 1893, where he was employed as a journalist and in the production of vaudeville sketches. In 1901 he returned to England. He is author of the following plays: *Cousin Kate* (1903); *Cynthia* (1904); *Captain Drew on Leave* (1905); *The Mollusc* (1907); *Lady Epping's Lawsuit* (1908); *Bevis* (1909); *A Single Man* (1910); *Mrs. Gorringer's Necklace* (1910); *Doormats* (1913).

**DAVIES, JOHN, OF HEREFORD** (c.1565-1618). An English poet, not to be confounded with Sir John Davies (q.v.). At Oxford and elsewhere he was famous as a writing master. He wrote many curious philosophical poems, epigrams, satires, and sonnets. Among these are: *Microcosmos* (1603); *Triumph of Death* (1605), descriptive of the plague; *Wit's Pilgrimage* (c. 1610), containing sonnets, etc.; *The Scourge of Folly* (c.1611), containing epigrams, etc., one of which is addressed to Shakespeare under the name "our English Terence"; and *The Muse's Sacrifice, or Divine Meditations* (1612). Consult *Complete Works*, ed. by Grosart (2 vols., Blackburn, 1873).

**DAVIES, SIR JOHN** (1569-1626). An English poet and statesman. He was born at Tisbury, Wiltshire, educated at Oxford, studied law at the Middle Temple, and was called to the bar in 1595. In 1603 he was sent by James I as Solicitor-General to Ireland. Three years later he became Attorney-General and was raised to the rank of sergeant at law. Elected to the Irish Parliament in 1613, he was chosen Speaker of the Lower House. The next year he took his seat in the English Parliament as member for Newcastle-under-Lyme. He died just after being nominated Chief Justice. Davies was a faithful public servant and a man of great talent

and learning. His two works connected with his Irish career are *A Discovery of the True Causes why Ireland was Never Subdued, etc.* (1612), and *Reports of Cases Adjudged in the King's Courts in Ireland* (1615) and several masterly state papers. As a poet, he belonged to a group of late Elizabethans who, in reaction from the earlier love poetry, turned to moral themes. In 1596 he published *Orchestra, or a Poem of Dancing*, in which he fancifully maintains that all motion is music; to him the heavens move in "spondees, solemn, grave, and low." Still more fanciful are his acrostics, called *Hymns to Astraea* (1599). The poem by which he is best known is *Nosce Teipsum* (1599). It is written in the four-line stanza, afterward employed by Davenant, Dryden, and Gray. Consult *Complete Works*, with memoir ed. by Grosart (3 vols., Blackburn, 1869-76).

**DAVIES, SIR LOUIS HENRY** (1845- ). A Canadian statesman and jurist. He was born at Charlottetown, Prince Edward Island, was educated at Prince of Wales's College, Charlottetown, and in 1866 was called to the bar. In 1876 he became Premier and Attorney-General of Prince Edward Island, and he was returned as a Liberal to the Dominion House of Commons from 1882 to 1901. Before entering Dominion politics he was one of the British counsel before the International Fisheries Commission at Halifax in 1877. (See *FISHING LAWS*.) As counsel for the tenantry before the Prince Edward Island Land Commission in 1875-76, he did much to settle the land question of that province, and during his provincial premiership the Free Schools Act was passed. In 1896, upon the incoming of the Laurier administration, he was appointed Minister of Marine and Fisheries. The same year he was a delegate to Washington in behalf of trade reciprocity, and in 1897 he was a delegate to London in connection with the Bering Sea seal controversy, internal Canadian fisheries, and the Belgian and German trade treaties. In 1901 he was appointed a judge of the Supreme Court of Canada. In 1897 he was knighted.

**DAVIES, SAMUEL** (1724-61). An American clergyman and educator. He was born near Summit Ridge, Newcastle Co., Del., was educated at the seminary of the Rev. Samuel Blair, Fogg's Manor, Chester Co., Pa., and in 1746 was licensed to preach by the Newcastle Presbytery. In 1747 he was sent as an evangelist to Hanover Co., Va., where by 1748 he was conducting worship in seven churches. He later argued against Peyton Randolph, the Royal Attorney-General, before the General Court at Williamsburg, that the Act of Toleration extended to Virginia. In 1753, with Gilbert Tennent, he visited England to obtain funds for the College of New Jersey (now Princeton University), and at this time secured a ruling that Virginia was under the Act of Toleration. His sermon, "Religion and Patriotism," preached in Hanover County, 1755, refers to the martial spirit aroused by the French and Indian War, and he adds in a footnote: "As a remarkable instance of this, I may point out to the public that heroic youth, Colonel Washington, whom I cannot but hope Providence has hitherto preserved in so signal a manner for some important service to his country." In 1759 he succeeded Jonathan Edwards as president of the College of New Jersey. His collected sermons appeared in London in 1767-71. Consult the memoir by

Barnes in the *Complete Works* (New York, 1851). One or two of his hymns are still found in Presbyterian hymnals.

**DAVIES, THOMAS** (c.1712-85). A Scottish bookseller and author. He studied at the University of Edinburgh and was for several years (1736-85) on the stage; but having been ridiculed by Churchill in *The Rascals* he gave up acting and opened a bookshop in Covent Garden. It was here that in 1763 he introduced Boswell to Dr. Johnson, who was his intimate friend and to whom he dedicated his edition of the works of Massinger. He wrote a *Life of Garrick* (1780), which soon passed through four editions and brought him considerable money and repute, and *Dramatic Miscellanies* (3 vols., 1785).

**DAVIES, THOMAS FREDERICK** (1872- ). An American bishop, born in Philadelphia. He was educated at Yale University and at General Theological Seminary, New York City. Ordained a deacon in 1897 and a priest in 1898 in the Protestant Episcopal church, he served in succession as assistant at the church of the Incarnation, New York (1897-1900), rector of Christ Church, Norwich, Conn. (1901-03), and rector of All Saint's Church, Worcester, Mass. (1903-11). In 1911 he was elected Bishop of Western Massachusetts.

**DAVIES, T. WITTON** (1851- ). A British Baptist theologian and Orientalist, born in Nantyglo, Monmouth. He was educated in the Baptist colleges at Pontypool and Regent's Park and at University College, London, and took graduate courses at Berlin, Leipzig, and Strassburg. Subsequently he was pastor of a Baptist church in Merthyr Tydfil (1878-80); taught at Haverfordwest Baptist College until 1891; was principal of Midland College, Nottingham (1892-99); and taught Arabic and Syriac at University College, Nottingham (1897-99). At Bangor he was connected first with the department of Hebrew and Old Testament literature (1899-1906), and then with that of Semitic languages. Besides articles for theological periodicals and for reference books he wrote: *Oriental Studies in Great Britain* (1892); *Magic, Divination, and Ormonology among the Hebrews* (1898); *The Scriptures of the Old Testament* (1900); *Henrich Ewald, Orientalist and Theologian* (1903); commentaries on "Psalms" (1906) and "Ezra, Nehemiah, and Esther" (1909), in the *Century Bible*, and on "Bel and the Dragon" (1913), in the *Oxford Apocrypha*.

**DAVIESS, dā'vīs, JOSEPH HAMILTON** (1774-1811). An American lawyer. He was born in Bedford Co., Va.; was taken to Kentucky by his parents when a child, was educated there, and soon became well known in the West for his eccentricities as well as for his skill as a lawyer. He was United States district attorney for Kentucky, and as such attempted to bring Aaron Burr (q.v.) to trial for treason (1806), but was unsuccessful and gained only personal unpopularity. Having entered the army, he fought as major under Gen. W. H. Harrison at Tippecanoe, where he was killed while leading a cavalry charge against the savages. Daviess married a sister of Chief Justice John Marshall.

**DÁVILA, dā'vé-lá, or DE ÁVILA, ALONSO** (c.1540-66). A Spanish soldier, born in the city of Mexico. In 1566 he was accused of

complicity in a plot to overturn the government and place Martín Cortés on the throne of New Spain. He was subsequently condemned and executed at Mexico. That he had any share in the plot, if such there were, is now considered extremely doubtful.

**DAVILA**, dā'vê-lâ, ENRICO CATERINO (1576-1631). An Italian historian, born at Piove di Sacco, near Padua. His father was the constable of Cyprus and after the Turkish victories was obliged to take refuge in France, where Enrico was brought up as page to Henry III. Afterward he fought in the religious wars, distinguishing himself at Honfleur (1594) and Amiens (1597). Returning to Venice in 1599, he served as Governor in Candia, in Friuli, and in Dalmatia, and was murdered as Governor of Crema in 1631. His *Historia delle guerre civili di Francia* (Paris, 1644) has gone through 200 editions; Eng. trans. by Cotterell-Aylesbury (London, 1647). Consult biographies by A. Zeno (Venice, 1733), Ciscato (Vicenza, 1885), the article by Pavanello (Padova, 1892), and the *Discourse on Davila* by President John Adams (1805).

**DÁVILA**, GIL GONZÁLEZ. See GONZÁLEZ DÁVILA, or DE ÁVILA, GIL.

**DÁVILA**, PEDRARIAS. See PEDRARIAS DÁVILA.

**DÁVILA Y PADILLA**, dā'vê-lâ é pá-dê'lyâ, AGUSTÍN (1562-1604). A Mexican historian. He was born in the city of Mexico, where he entered the Dominican Order in 1579. He was friar of the Convent Puebla de los Angeles in Tlascala, and lecturer on philosophy and theology at the colleges of Puebla and Mexico. He was one of the chief officers of the highest chapter in his province, and in 1596 was sent as ambassador of the order to Rome and Madrid, where two years later he became court preacher. As a prominent officer of the Inquisition, he caused to be burned several hundred copies of a Spanish translation of the Bible which had been supplied with annotations by Protestants. He was one of the most zealous members of his order and also one of the most learned and eloquent, for which reason the title "Chronicler of the Indies" was bestowed upon him. His principal work, written by order of the government, was published under the respective titles: *Historia de la fundación de la provincia de Santiago de Méjico, de la orden de predicadores* (Madrid, 1596; 2d ed., Brussels, 1625), both these editions in quarto, and *Varia historia de la Nueva España y Florida* (Valladolid, 1634), in folio.

**DAVIN**, NICHOLAS FLOOD (1843-1901). A Canadian journalist and legislator. He was born at Killybane, County Limerick, Ireland, and was educated privately and at Queen's (now University) College, Cork. He studied law and was called to the bar at the Middle Temple, London, in 1868. Relinquishing law for journalism, he became a reporter in the House of Commons gallery, and subsequently was war correspondent for the Irish Times and the London Standard during the Franco-Prussian War, in which he was wounded. In 1872 he went to Toronto, Canada, and was successively an editorial writer on the Globe and the Mail. He was called to the Ontario bar in 1874 and afterward actively supported the Conservative protectionist policy which was successful in 1878. In 1883 he went to the Northwest and settled at Regina, where

he established and became editor of the Leader. In 1887 he was elected a member of the House of Commons, and in 1895 he strove unsuccessfully to pass a parliamentary resolution granting the franchise to women. He published: *The Irishman in Canada; Culture and Practical Power; Eos, an Epic of the Dawn; British vs. American Civilization; Ireland and the Empire; The Earl of Beaconsfield.*

**DA VINCI**, dā-vên'chê, LEONARDO. See VINCI, LEONARDO DA.

**DAVIOUD**, dā'vê'ô', GABRIEL JEAN ANTOINE (1823-81). A French architect. He was born in Paris and studied at the Ecole des Beaux-Arts where he carried off a number of prizes. He acquired great reputation, as inspector of gardens and public squares, by the important part he took in the embellishment of the Bois de Boulogne, the Champs Elysées, and various public squares (1850-62). He designed the Lyrique and Châtelet theatres, the magnificent Fontaine St. Michel, and, in collaboration with Bourdais, the Palace of the Trocadéro, for the World's Exposition in 1878. He published *Le bois de Boulogne architectural* (1880).

**DAVIS**. A town in Tucker Co., W. Va., 83 miles southwest of Cumberland, Md., on the Western Maryland Railroad and on the Black Water River (Map: West Virginia, E 3). It is in a productive timber and coal region and has a large tannery, a box factory, pulp and lumber mills. The water works are owned by the town. Pop., 1900, 2391; 1910, 2615.

**DAVIS**, ANDREW JACKSON (1826-1910). An American lecturer and writer on spiritualism, born in Orange Co., N. Y. His first book, *The Principles of Nature*, he dictated in 1845 after a trance of 16 hours, during which time he claimed to have received his inspiration from communion with inhabitants of the spirit world. Some of his other works are: *The Great Harmonia* (6 vols., 1850-61), *The Penetrabilia* (1856); *The Magic Staff* (1857), an autobiography; *Arabula, or the Divine Guest* (1867); *Mental Diseases and Disorders of the Brain* (1871); *Autobiography* (1885). Most of his books are plentifully supplied with allusions to personal experiences with spirit revelation, which must be received without verification.

**DAVIS**, ARTHUR POWELL (1861- ). An American civil engineer, born at Decatur, Ill. He graduated from the State Normal School at Emporia, Kans., and from Columbian (now George Washington) University in 1888. From 1884 to 1894, as topographer of the United States Geological Survey, he had charge of surveying and exploring expeditions in Arizona, New Mexico, and California; later, as hydrographer, he had charge for two years of all the government stream measurements, and he conducted the hydrographic examination of the Nicaragua and Panama canal routes (1898-1901). In 1906 he was appointed chief engineer of the United States Reclamation Service and in 1909 consulting engineer of the Panama Canal. Besides preparing numerous articles and bulletins, he published *Elevation and Stadial Tables* (1901).

**DAVIS**, BRADLEY MOORE (1871- ). An American botanist, born in Chicago. After graduating from Leland Stanford Junior University, in 1892, he studied at Harvard, Bonn, and Naples. For 11 years he taught at the University of Chicago, from 1902 to 1906 as assistant professor of plant morphology; from

1897 to 1905 he also had charge of the botanical department of the Marine Biological Laboratory, Woods Hole, Mass., and there from 1904 to 1909 he was head of the botanical section of the biological survey of the Bureau of Fisheries. In 1911 he became assistant professor of botany at the University of Pennsylvania. He was secretary of the American Society of Naturalists in 1914. Besides special articles on the morphology and cytology of algae, fungi, and liverworts, and studies in the Cnetharia, he is co-author with Joseph Young Bergen of *Principles of Botany* (1906) and *Laboratory and Field Manual of Botany* (1907).

**DAVIS, CHARLES HAROLD** (1856- ). An American landscape painter, born at Amesbury, Mass. He studied with Grondman in Boston, and afterward under Boulanger and Lefebvre at the Julian Academy in Paris. He lived 10 years in France and on his return, in 1890, took up his residence at Mystic, Conn. He obtained the Palmer prize for landscape at the Chicago Exposition of 1890, the \$2000 prize given by the American Art Association in 1887, and medals at Paris in 1900, at Buffalo in 1901, and at St. Louis in 1904. In 1906 he was elected to the National Academy of Design. Davis paints chiefly evening effects, and his landscapes are characterized by direct vision and simple workmanship. Among the more notable are: "The Brook," in the Philadelphia Academy; "Late Afternoon," at the Union League Club, in New York City; "Evening" and "August," in the Metropolitan Museum, New York; "The Deepening Shadows" (Corcoran Gallery, Washington); "Summer" (National Gallery, Washington); "Close of Day" and "Twilight" (Art Institute, Chicago); "Moonrise at Twilight" (Carnegie Institute, Pittsburgh); "Landscape" (Boston Art Museum).

**DAVIS, CHARLES HENRY** (1807-77). An American naval officer, born in Boston. He entered the navy in 1823 as midshipman and was stationed on different vessels and on the coast survey until 1861, when, with the rank of captain, he was a member of the board which examined the defenses of Southern ports. In the expedition against Port Royal, S. C. (q.v.), he was fleet captain and chief of staff. He became flag officer of the Mississippi flotilla early in 1862 and on May 10 engaged a Confederate fleet of eight ironclads (four of them rams) off Fort Pillow (q.v.). Later (June 6) he defeated the fleet decisively in an engagement near Memphis, captured or destroyed all but one of the vessels, and received also the surrender of Memphis. He then joined Farragut in the operations at Vicksburg. Davis attained the rank of rear admiral in 1863, and spent most of his remaining service as superintendent of the Naval Observatory at Washington, and commander of the Norfolk Navy Yard. He wrote: *The Law of Deposit of the Flood Tide: Its Geological Action and Office* (1852); *Memoir Upon the Geological Action of Tidal and Other Currents of the Ocean* (1849). He translated Gauss's *Theoria Motus Corporum Coelestium* (1858), and he was superintendent of the *American Nautical Almanac* in 1849-56 and 1859-61.

**DAVIS, CHARLES HENRY** (1845- ). An American naval officer, born in Cambridge, Mass. Graduating from the United States Naval Academy in 1864, he rose through the grades to be captain in 1898 and rear admiral in 1904. Between 1897 and 1902 he was super-

intendent of the Naval Observatory, and he commanded the auxiliary cruiser *Dirie* in 1898, the *Alabama* in 1902, and was a division commander of the battleship squadron in 1904-05. In 1904-05 also he was United States commissioner to the International Commission of Inquiry on the North Sea Incident. He was retired in 1907. He is author of *Chronometer Rates as Affected by Temperature and Other Causes* (1877), and a biography of his father, *Charles Henry Davis, Rear Admiral, 1807-1877* (1899).

**DAVIS, CUSHMAN KELLOGG** (1838-1900). An American statesman. He was born in Henderson, N. Y., graduated at the University of Michigan in 1857, studied law, and in the Civil War served in the Federal army until 1864. In 1867 he was a member of the Minnesota Legislature and from 1868 to 1873 was United States district attorney. In 1874-76 he was Governor of his State. In 1887 he was elected to the United States Senate. He succeeded John Sherman as chairman of the Committee on Foreign Relations in 1897 and in 1898 was appointed one of the United States commissioners to negotiate the Treaty of Paris terminating the Spanish-American War. His influence was important in securing the consent of the Senate to this treaty. He published *The Larc in Shakespeare* (new ed., 1900).

**DAVIS, DAVID** (1815-86). An American jurist, born in Cecil Co., Md. He graduated at Kenyon College, Ohio, in 1832, and was admitted to the Illinois bar. He was afterward a member of the State Legislature and of the State Constitutional Convention of 1847, was a judge of the State Circuit Court from 1848 to 1862, and was a justice of the United States Supreme Court from 1862 to 1877. In 1872 he accepted the presidential nomination from the National Labor Reform party, but afterward withdrew his name. From 1877 to 1883 he was a United States Senator and succeeded Chester A. Arthur as President of that body, serving until 1883. In politics he was an independent, but usually acted with the Democratic party.

**DAVIS, E. F. C.** (1847-95). An American mechanical engineer, born at Chestertown, Md. (graduating from Washington College (Md.) in 1866. He served an apprenticeship in the hydraulic works of Brinton and Henderson, and after a few years was made superintendent of the Colliery Iron Works at Pottsville, Pa. Between 1878 and 1890 he was connected with the Philadelphia and Reading Coal and Iron Co., as mechanical draftsman, superintendent of the company's shops at Pottsville, Pa., and mechanical engineer in charge of all the shops and machinery of the corporation. In 1890 he became general manager of the Richmond Locomotive and Machine Works, and at the time of his death he was manager of the C. W. Hunt Company of New York. He was president (1895) of the American Society of Mechanical Engineers.

**DAVIS, GEORGE BRECKENRIDGE** (1847-1914). An American soldier, born at Ware, Mass. He served in the Civil War, graduated from the United States Military Academy in 1871, and was appointed major judge advocate in 1888. Continuing in his judicial office he was promoted through the grades to be brigadier general and judge-advocate-general in 1901 and in 1911 he was retired with the rank of major general. He received the degree of LL.B. from Columbian (now George Washington) University. He was a delegate to the Geneva Conference in 1906 and

to the Second Peace Conference at The Hague in 1907. His publications include: *Elements of International Law* (1887; 3d ed., 1908); *Elements of Law* (1897); *Military Law* (1898); *Military Laws of the United States* (1907; 3d ed., 1913); *The Second Peace Conference* (1907).

**DAVIS, GEORGE ROYAL** (1840-99). An American soldier and politician, born at Three Rivers, Mass., and educated at Williston Seminary. He served throughout the Civil War and rose to be colonel of the Third Rhode Island Volunteer Cavalry. He became a manufacturer in Chicago. From 1879 to 1885 he was a Republican member of Congress from Illinois, and in 1884 and 1888 was a delegate to the Republican National Convention. He was director general of the Columbian Exposition of 1893.

**DAVIS, GEORGE WHITEFIELD** (1839- ). An American soldier, born at Thompson, Conn. He enlisted in the Eleventh Connecticut Infantry in 1861 and by 1865 had received the brevet rank of major of volunteers. He was commissioned captain in the Fourteenth United States Infantry in 1867 and retired in 1903 with the rank of major general. He became military governor of Porto Rico in 1899, provost marshal general of the Philippines in 1901, and commander of the Division of the Philippines in 1902. In 1900-03 he was manager and vice president of the Nicaragua Canal Construction Company. He was appointed a member of the Isthmian Canal Commission in 1904 and was Governor of the Canal Zone in 1904-05. In 1905-06 he was chairman of the Board of Consulting Engineers on the type of the canal. He wrote reports on the military governments of Porto Rico and Manila, and in 1904-06 was president of the board of publication of the official records of the Civil War.

**DAVIS, HENRY GASSAWAY** (1823-1916). An American capitalist and Democratic politician, born in Woodstock, Md. Having to become self-supporting in his teens, he worked on a plantation and then on the Baltimore and Ohio Railroad. He soon became largely interested in West Virginia lumber trade and coal mines and built the West Virginia Central and Pittsburgh Railway (which he sold in 1902 to the Wabash) and the Coal and Coke Railway of West Virginia. He was a power in the Democratic party in the State (as was his son-in-law S. B. Elkins in the Republican party) and served in the State Legislature (Lower House, 1865; Senate, 1868-71) and was United States Senator in 1871-83. In 1904 he was the Democratic nominee for the vice presidency of the United States. He gave from his great wealth to local charities and educational institutions.

**DAVIS, HENRY WILLIAM BANKS** (1833-1914). An English animal painter and sculptor. He was born at Finchley and studied at the Royal Academy and later for several years at Boulogne-sur-Mer. Davis is one of the most important British animal painters. The landscapes in his pictures represent either the French coast, central England, north Wales, or the Scottish Highlands. He paints in the style of the Barbizon masters, with much versatility of atmospheric treatment and delicate feeling. Among his best pictures are: "A Panic" (Font-hill House); "Summer Afternoon" (Sheffield Gallery); "Contentment" and "After Sundown" (National Gallery, London); "Return to the Stall" (Tate Gallery, London). He often

exhibited on the Continent, and was made a member of the Paris Société Nationale des Beaux-Arts. His sculptures, dating chiefly from his early period, include portrait busts and statues, and a "Galloping Bull," for which he was elected associate of the Royal Academy (1872).

**DAVIS, HENRY WILLIAM CARLESS** (1874- ). An English historian. He was educated at Weymouth College and at Balliol College, Oxford, of which he was scholar in 1891-95 and became fellow in 1902 (after being fellow of All Souls from 1895 to 1902). Taking as his special field mediæval history, particularly Norman and Angevin England, he contributed to the *English Historical Review*, the *Cambridge Modern History*, the English edition of Helmholtz, and Mowbray's *Dictionary of Church History* (1912); and he published a *History of Balliol College* (1899), *Charlemagne* (1900), *England under the Normans and Angevins* (1905), a manual on *Mediæval Europe* (1911), *Regesta Regum Anglo-Normannorum* (1913), and a new edition (1913) of Stubbs's *Select Charters*.

**DAVIS, HENRY WINTER** (1817-65). An American legislator. He was born in Annapolis, Md., graduated at Kenyon College in 1837, and studied law at the University of Virginia. In 1850, after practicing for several years in Alexandria, he settled in Baltimore. He was a member of Congress from 1855 to 1861 and again from 1863 to 1865, first as a Whig, then as a Know-Nothing or American, and finally as a Republican, and made himself conspicuous by his devotion to the Union and his advocacy of the emancipation of the slaves. In 1860 he refused the offer of the vice-presidential nomination on the Republican ticket. During his latter term in Congress he was chairman of the Committee on Foreign Affairs. He published *The War of Ormuzd and Ahriman in the Nineteenth Century* (1853), an attack on the tenet that slavery was a divine institution. For the Wade-Davis Manifesto and Davis's attitude on reconstruction, see WADE, BENJAMIN F. His speeches, edited by Cresswell, were published in New York in 1867.

**DAVIS, JAMES.** See HALL, OWEN.

**DAVIS, JEFF** (1862-1913). An American lawyer and legislator, born in Little River Co., Ark. He graduated from the law department of Vanderbilt University in 1884, served as prosecuting attorney of the fifth judicial district of Arkansas (1892) and as attorney-general of Arkansas (1898), and made a record by being elected Governor of his native State for three consecutive terms (1901-1907). He served in the United States Senate from 1907 to 1913 and was reelected, but died at the beginning of his second term. Consult L. S. Dunaway, *Jeff Davis, Governor of Arkansas and United States Senator: His Life and Speeches, with Personal Reminiscences* (Little Rock, Ark., 1913).

**DAVIS, JEFFERSON** (1808-89). A soldier, statesman, and the President of the Confederate States of America. He was born in Christian, now Todd, Co., Ky., June 3, 1808, the chief strains in his blood being Welsh and Scottish-Irish. His family removed during his infancy to Mississippi, with which State his fame has always been connected. He received a gentle rearing, although his education was at first limited, owing to the conditions of the country. After a year or two at a Roman Catholic school in Kentucky, and a short period at a college in

Mississippi, he entered Transylvania University at Lexington, Ky., an institution which seems to have done good work for those times. Here he received the elements of a classical education; but in 1824, before graduation, he was transferred to West Point. He graduated rather low in his class, but he had given evidence of soldierly qualities and had won the regard of his classmates. Entering the army at once, in 1828, with the usual brevet of second lieutenant, he served seven years on the northwestern frontier, manifesting capacity to command, to perform arduous duties, and to win confidence and affection. In 1835, falling ill, he resigned from the army, in which he had risen to the rank of first lieutenant, and in the same year married a daughter of Zachary Taylor. The young wife died, however, in a few months, and Davis sought restoration for his shattered health in Cuba. After a short stay in Washington, where he began his friendship with Franklin Pierce, he returned to Mississippi and devoted himself to planting and study. This period from 1837 to 1845 was spent in an almost hermit-like seclusion, and Davis, who as early as 1833, when the Nullification controversy was at its height, had made up his mind that it was unconstitutional to coerce a State, now gained fluency and logical consistency in advocating the States' rights doctrines held by Calhoun. In 1844 he was chosen as a presidential elector on the Polk and Dallas ticket. After some little participation in local politics he was elected to Congress in 1845, where he favored the annexation of Texas. He was a ready and dignified speaker and an ardent but by no means servile follower of Calhoun. The next year, on the outbreak of the Mexican War, he was elected colonel of the First Mississippi Volunteers and distinguished himself at Monterey and Buena Vista, his famous formation of the reëntering angle at the latter engagement being a gallant exploit. On his retirement from the war with a severe wound the Governor of Mississippi in 1847 appointed him to fill a vacancy in the United States Senate, and in 1848 the Legislature elected him for the remainder of the term; in 1850 he was re-elected for a full term of six years. In the debates relative to the introduction of slavery into the Territories Davis was zealous for the institution and for a strict construction of the Constitution. He strongly opposed the Compromise Measure of 1850. In 1851 he resigned in order to make the contest for the governorship against the Unionist candidate. Davis made a vigorous canvass, but was defeated by a small majority. In March, 1853, he became Secretary of War under President Pierce and made an efficient official, improving the service in various ways. He sent out surveying parties to find and survey a practicable railroad route from the Mississippi to the Pacific, having previously advocated in the Senate the construction of a transcontinental railroad. In the matter of the Kansas-Nebraska legislation he proved a bad adviser to the President, but he was thoroughly conscientious. When he reëntered the Senate in 1857, he was the acknowledged leader of the Southerners, becoming the most determined, though not the most radical, of the States' rights men in the stormy days just before the war. In 1860 he offered in the Senate a series of resolutions which were adopted, to the effect that the States had formally accepted the Constitution as independent

sovereigns, delegating to the general government a portion of their power for the sake of security; that the intermeddling on the part of any one of them with the domestic institutions of another was not only insulting, but dangerous to the domestic peace and tending to destroy the Union; that negro slavery was legal, and that neither Congress nor territorial legislation had the right to interfere with it. In a speech delivered in the Senate, Jan. 10, 1861, he maintained the constitutional right of secession and declared the South could no longer remain in the Union without being degraded. Yet Davis was devoted to the Union, and when on the secession of Mississippi in 1861 he left the Senate, it was with real sadness that he set forth his principles in a farewell speech to which a crowded audience listened with deep attention.

On Feb. 9, 1861, Davis was elected President of the provisional government of the Confederacy by the Congress assembled at Montgomery, Ala. He was chosen because his course throughout had been marked by consistency and moderation in comparison with the other secession leaders. The choice was made without intriguing and was eminently popular. The inauguration took place Feb. 18, 1861. At the expiration of the first year of the provisional government a new Congress was elected, and on Feb. 22, 1862, Davis was again inaugurated, entering upon a term which was set for six years by the Constitution. His career as President takes in nearly all of Confederate history, his side of the matter being given ably and fully in his *Rise and Fall of the Confederate Government* (2 vols., 1881). The military training which he had made him desire a close control over his generals, and he seems in consequence to have made not a few mistakes. The unanimity with which he and General Lee worked would have been impossible had not the latter been so void of selfish ambition. Davis's statesmanship was rather doctrinaire, and when he had actually to assume almost a dictatorship as the war progressed, he was not found well fitted for the eminently executive task of financing and controlling the Confederacy. He was not a great manager of men, and he often acted without tact. He strove earnestly to inspire his people, he set his face against barbarity in the conduct of the war, he tried to alleviate the sufferings of prisoners; and, on the whole, he maintained his dignity and self-respect under ordeals that would have crushed a man less resolute or less sincere.

After the surrender of Lee and of Johnston, Davis, with a few friends who volunteered as an escort, started for Washington, Ga., for the purpose of making his way to the trans-Mississippi region. A report that his wife was in danger led him to change his course to join her, and on May 10, 1865, he was captured at Irwinville, Ga. The story of his assuming woman's dress as a disguise has been shown to be untrue. He was confined in Fortress Monroe and subjected to the useless degradation of manacles. He earnestly desired a public trial and feared that he would die before refuting the charge of complicity in the assassination of Lincoln. An indictment was found against him for treason, but he was admitted to bail in May, 1867, Horace Greeley, Gerrit Smith, and other prominent Northerners going on his bond. An attempt made by his counsel to quash the indictment on

which he was brought to trial failed. He was released by an order of *nolle prosequi* in February, 1869. After his release he visited Canada and England and went into business at Memphis, Tenn. In 1879 he finally retired to Beauvoir, near Biloxi in Mississippi, resuming all inducements to reënter politics and devoting his time to writing and study. He retained the confidence of most of the Southern people, and his conduct during his retirement was dignified and consistent. He died of a congestive chill on Dec. 6, 1889, and was buried with imposing ceremonies at New Orleans. In 1893 the body was removed to Richmond. A full and valuable biography of Mr. Davis was written by his second wife, a Miss Howell, whom he married in 1845. She died in 1906. Consult also a brief autobiographical article published in *Belford's Magazine* for January, 1890, and W. P. Trent's *Southern Statesmen of the Old Régime* (1897). The earlier biographies by Alfriend and Pollard are respectively eulogistic and condemnatory. For full accounts of Davis's period, consult Rhodes, *History of the United States from the Compromise of 1850* (New York, 1892 et seq.), and Dodd, *Jefferson Davis* (Philadelphia, 1905).

**DAVIS, JEFFERSON C.** (1828-79). An American soldier, born in Indiana. He served as a volunteer in the Mexican War, subsequently becoming lieutenant in the regular army, and was stationed at Fort Sumter during the bombardment of April 12-13, 1861. During the Civil War he commanded a brigade, played an important part in the battle of Pea Ridge, the siege of Corinth, the battle of Stone River, and Sherman's Atlanta campaign, and was made brigadier general of volunteers in 1861. He was brevetted major general United States army in 1865 and became a colonel in the regular service in the following year. In 1873, after the murder of General Canby, he suppressed the Modoc uprising in northern California.

**DAVIS, or DAVYS, JOHN** (c.1550-1605). An English navigator, born at Sandridge, near Dartmouth. He is distinguished for having, between 1585 and 1588, undertaken three voyages to the northern seas in search of a northwest passage. In the first of these he discovered the strait which bears his name; in the last he sailed up this strait as far as 72° 12' N. His voyages extended along the West Greenland coast as far as what is now Upernavik, and along the coast of the American side of the strait from Cape Dyer to southern Labrador. He afterward made five voyages to the East Indies, in the last of which he was killed in a fight with Japanese pirates off Bintang, near Sumatra. He wrote *The World's Hydrographical Description* (1595) and *The Seaman's Secrets* (1594), which were republished by the Hakluyt Society in 1880. He is often confounded with John Davis of Limehouse, another navigator and author.

**DAVIS, JOHN CHANDLER BANCROFT** (1822-1907). An American diplomatist. He was born in Worcester, Mass., graduated at Harvard in 1840, studied law, and practiced in New York. He was secretary of the United States Legation in London from 1849 to 1852, was the American correspondent of the London *Times* from 1854 to 1861, was Assistant Secretary of State in 1869-71 and again in 1873-74 after being secretary of the commission which concluded the Treaty of Washington, and United States agent

at the Geneva Court of Arbitration. (See *ALABAMA CLAIMS*.) From 1874 to 1877 he was United States Minister to Germany, and from 1878 to 1881 was a judge in the United States Court of Claims. He became reporter of the United States Supreme Court in 1883. Among his publications, in addition to the reports of Supreme Court decisions, are: *The Massachusetts Justice* (1847); *The Case of the United States Laid before the Tribunal of Arbitration at Geneva* (1871); *Treaties of the United States, with Notes* (new ed., 1873).

**DAVIS, JOHN D.** (1854- ). An American Orientalist and biblical scholar. He was born at Pittsburgh, Pa., and was educated at the College of New Jersey and at the Universities of Bonn and Leipzig, afterward becoming professor of Oriental and Old Testament literature at Princeton Theological Seminary. In addition to frequent contributions to theological magazines, he published *Genesis and Semitic Tradition* (1894) and *A Dictionary of the Bible* (1898).

**DAVIS, SIR JOHN FRANCIS** (1795-1890). An English diplomat and Sinologist, born in London. He was a son of Samuel Davis, director of the East India Company from 1810 to 1819. He accompanied Lord Amherst to Peking in 1816, and rose rapidly in the service of the East India Company, in the employ of which he had been since his boyhood. After serving for two years as the chief representative of the company at Canton, he was appointed joint commissioner in China with Lord Napier in 1834 and in 1844 became British plenipotentiary in China. In his capacity as Governor of the British colony at Hongkong he contributed greatly to the development of British trade at that centre. It was under his administration that the Bogue forts were reduced, and the annoyances to which British residents had been subjected at the hands of the mandarins were ended. Although he may in some respects be said to have laid the basis of British power at Hongkong, the treaty whereby the city was to be opened to foreigners, which Davis had arranged with the Chinese government, was disapproved by England, and, mortified at his lack of recognition, he resigned his position in 1848. Of his works relating to China and Chinese life, the following are especially noteworthy: *Chinese Novels Translated from the Originals* (1822); *Hien Wun Shoo, Chinese Moral Maxims, with a Free and Verbal Translation* (1823); *The Fortunate Union* (trans. from the Chinese, 1829); *The Chinese: A General Description of China and its Inhabitants* (2 vols., 1836); *Chinese Miscellanies* (1865).

**DAVIS, KATHARINE BEMENT** (1861- ). An American penologist and public official, born in Buffalo, N. Y. She graduated from Vassar College in 1892 and studied also at the University of Chicago, where she received the degree of Ph.D. in 1900. Mt. Holyoke College conferred on her the degree of LL.D. in 1912. In 1892-97 she had charge of the college settlement in Philadelphia, and from 1901 to 1913 she was superintendent of the Bedford Reformatory, which she opened with one girl inmate, and which under her direction became famous among penologists. Miss Davis applied laboratory methods in studying the causes of delinquency among girls and women. In 1914 Mayor John Purroy Mitchel of New York City appointed her commissioner of correction, she being the

first woman to head a department of government in that city.

**DAVIS, MATTHEW L.** (1766-1850). An American author, born in New York. He was long the Washington correspondent of the *New York Courier and Enquirer*, over the pen name "The Spy in Washington." He also wrote under the names "The Genevese Traveler," "Marcus," and "Philo-Cato." In 1797 he conducted a short-lived literary enterprise at New York, known as the *Timepiece and Literary Companion*. As the friend of Aaron Burr during a period of 40 years, he published the *Memoirs of Aaron Burr, with Miscellaneous Selections from his Correspondence* (2 vols., 1836-37), and also edited *The Private Journal of Aaron Burr during his Residence in Europe* (1838).

**DAVIS, NATHAN** (1812-82). An English traveler and archaeologist. He edited the *Hebrew Christian Magazine* in 1852, subsequently was a Nonconformist clergyman, and in 1856-58 conducted at Utica and Carthage excavations for the British Museum: at Carthage the excavations were made on the supposed site of the Odeum. In 1858 he sent to the museum 51 cases of antiquities. Other cases were sent in 1857 and 1860. He published, besides other works, *Tunis* (1841); *Arabic Reading Lessons* (with B. Davidson, 1854); *Evenings in my Tent* (2 vols., 1854); *Carthage and her Remains* (1861); *Ruined Cities within Numidian and Carthaginian Territories* (1862).

**DAVIS, NATHAN SMITH** (1817-1904). An American physician. He was born at Greene, N. Y., and was educated in Cazenovia Seminary and in the College of Physicians and Surgeons of the western district of New York, from which he graduated in 1837. He helped to found the American Medical Association, of which he was president in 1864-65. He practiced at Binghamton, N. Y., 1837-47; New York City, 1847-49, during which time he was editor of the *Annalist*. He was professor of physiology and pathology, Rush Medical College, Chicago, 1849-59, and professor of practice of medicine, 1850-59. He organized the *Northwestern Medical Journal* in 1855 and was its editor till 1875; organized the *Medical Examiner* in 1860 and edited it till 1873. He was professor of principles and practice of medicine, Chicago Medical College, from 1859 to 1886, when he became emeritus professor. He organized the *Journal of the American Medical Association* in 1883 and edited it till 1889. He was a founder of the Northwestern University, of the Chicago Academy of Sciences, the Chicago Historical Society, the Illinois State Microscopical Society, the Union College of Law (in which he was for many years professor of medical jurisprudence), and the Washington Home for Inebriates. He published, among other books: *A Textbook on Agricultural Chemistry* (1848); *History of Medical Education and Institutions in the United States* (1851); *Effects of Alcoholic Drinks* (1854); *History of the American Medical Association* (1897); *Clinical Lectures* (1884); *Progress of Medical Education in the United States* (1876).

**DAVIS, NOAH** (1818-1902). An American lawyer and judge of distinction. He was born in Haverhill, N. H., removed to Albion, N. Y., with his parents in 1825, was admitted to the New York bar in 1841, and practiced in Buffalo and other western cities in that State. In 1857 he was elected a judge of the New York Supreme

Court but resigned in 1868 to run for Congress. He served only one term in the House of Representatives (1869-70), when he was appointed United States district attorney for the southern district of New York. In 1872 he again became a justice of the State Supreme Court. The famous trials of Edward Stokes and W. M. Tweed were held before him, and he sentenced Tweed to 12 years' imprisonment—a cumulative sentence, which was later disallowed by the Court of Appeals. He was Chief Justice from 1874 until 1887, when he resigned to resume the practice of law. He published *Intemperance and Crime* (1879).

**DAVIS, REBECCA HARDING** (1831-1910). An American novelist and miscellaneous writer, born at Washington, Pa. She was married to L. Clarke Davis, a Philadelphia journalist, in 1863. Her sons, Richard Harding Davis and Charles Belmont Davis, made their mark in contemporary literature while their mother was still an active writer. She wrote, notably: *Dallas Galbraith* (1868); *A Lacr unto Herself* (1878); *Kent Hampden* (1892); *Dr. Warrick's Daughters* (1896); *Frances Waldeau* (1897); *Bits of Gossip* (1904).

**DAVIS, RICHARD HARDING** (1864-1916). An American journalist and popular novelist. He was born in Philadelphia, Pa., a son of Rebecca Harding Davis, and was educated at Lehigh and Johns Hopkins universities. He began his writing as a reporter in Philadelphia. In 1888 he went to New York and gained distinction for noteworthy stories, first printed in the *New York Evening Sun*. For a short time he was managing editor of *Harper's Weekly* (1890). In 1914 he was correspondent for the *New York Tribune* in Mexico during the hostilities between that country and the United States. His novels and short stories are breezy and stirring, full of incident and adventure, and marked by clever and striking, if not deep or subtle, characterization. His sketches and books of travel and description have in generous measure the qualities proper to excellent journalism. Among his books are: *Gallegher and Other Stories* (1891); *Stories for Boys* (1891); *Van Bibber and Others* (1892); *Our English Cousins* (1894); *About Paris* (1895); *The Rulers of the Mediterranean* (1894); *The Exiles* (1895); *Three Gringos in Venezuela and Central America* (1896); *Cuba in War Time* (1898); *The Cuban and Porto Rican Campaign* (1898); *With Both Armies in South Africa* (1900); *The Princess Aline* (1896); *The King's Jackal* (1899); *Soldiers of Fortune* (1897), dramatized and presented with great success in 1902; *Captain Macklin: His Memoirs* (1902); *The Bar Sinister* (1904); *Kits and Outfits* (1905); *Real Soldiers of Fortune* (1907); *The Man Who Could Not Lose* (1911); *The Lost Road* (1913). *The Taming of Helen* (1903), *Ransom's Folly* (1904), *The Dictator* (1904), *The Galloper*, *The Yankee Tourist*, *Vera the Medium*, and *Blackmail*—all plays—appeared between 1903 and 1913.

**DAVIS, THOMAS OSBORNE** (1814-45). An Irish poet. He was born at Mallow, County Cork, was educated at Trinity College, Dublin, and called to the bar in 1838. In 1841 he became associate editor of the *Dublin Morning Register*, and in the following year, in collaboration with Duffy and Dillon, he founded the *Nation*, an organ of Nationalist tendencies, which acquired an immense popularity—due largely to the patriotic ballads contributed to it

by Davis. Notwithstanding his Protestant faith and early Tory affiliations, Davis earnestly endeavored to allay the discords between the Catholic and Protestant elements. He was gifted with a remarkable capacity for work and was universally respected for his sterling integrity and the fidelity with which he adhered to his convictions. One of his noteworthy achievements was his founding of the party known as "Young Ireland." His *Poems* (1846), which include the fine verses entitled "Máire Bhán a Stofr," "The Sack of Baltimore," and "The Flower of Finea," were collected and published after his death in *Duffy's Library of Ireland*; and his *Literary and Historical Essays* appeared in the same year as the poems. Consult Sir C. G. Duffy, *Young Ireland* (London, 1880), and *Treasury of Irish Poetry* (London and New York, 1907), ed. by Brooke and Rolleston.

**DAVIS, VARINA ANNE JEFFERSON**, known as "The Daughter of the Confederacy" (1864-98). An American writer born in Richmond, Va. Her father was President Jefferson Davis of the Confederate States of America. She was educated abroad and was known as a musician, a painter, and as author of a *Sketch of the Life of Robert Emmet* (1888); *The Veiled Doctor* (1895); *A Romance of Summer Neas* (1898).

**DAVIS, WILLIAM MORRIS** (1850- ). An American geographer and geologist. He was born in Philadelphia and was educated at the Lawrence Scientific School of Harvard University. In 1886 he made an observation of a new star, *T. Corona Borealis*, of which at the time only one other astronomical observation was made in the United States. He also rendered valuable service as assistant astronomer in the Argentine National Observatory at Córdoba from 1870 to 1873. He taught astronomy and geology at Harvard for 14 years, in 1890 became professor of physical geography there, and in 1899 was made Sturgis-Hooper professor of geology. His lectures and writings on the development of the physical features of the earth have given him high rank in that branch of study which is known as physiography. In 1911 he was president of the Geological Society of America. His numerous shorter articles have been published in the *American Journal of Science* and other periodicals. Besides these, his works include: *Elementary Meteorology* (1894); *Physical Geography* (1899); *Whirlwinds, Cyclones, and Tornadoes* (1884); "Journey Across Turkestan," in Pampelly's *Explorations in Turkestan* (1905).

**DAVIS, WILLIAM STEARNS** (1877- ). An American university professor and writer, born at Amherst, Mass. He graduated at Harvard University in 1900 and took postgraduate work until 1905. He was lecturer at Radcliffe College (1904-05), instructor at Beloit (Wis.) College (1906-07), and associate professor of medieval and modern European history at Oberlin College (1907-09). In 1909 he became professor of history at the University of Minnesota. His publications, history and historical fiction, include: *A Friend of Caesar* (1900; 2d ed., 1913); "God Wills It" (1901); *Belshazzar*, 1902; *The Saint of the Dragon's Dale* (1903); *Palace of the Blessed Voice* (1904); *A Victor of Satamis* (1907), by which he is most popularly known; *An Outline History of the Roman Empire* (1909); *The Influence of Wealth in Imperial Rome* (1910); *The Friar of Wittenberg*

(1913); *A History of Mediæval and Modern Europe* (1914).

**DAVIS STRAIT.** The sheet of water separating Greenland on the east from Baffin Land on the west, and connecting Baffin's Bay with the Atlantic (Map: America, North, N 3). It is from 180 to 500 miles wide and was discovered in 1585 by John Davis, whence its name. The northern half is navigable only in late summer, when the southerly drifting ice fields, known as the *middle pack*, leave a large open space which is called the *north water*. It has soundings exceeding 5000 feet in the north and south portions, but not reaching 2500 feet in the intervening region. It has two powerful currents—one (of drift ice) on the west, towards the south, and one on the east, towards the north. Consult *Meddelelser om Grønland*, vols. iv, vi, vii.

**DAVITT** (formerly *davitt*, *dauid*, from *David*, the custom of giving implements proper names being a frequent one). A derrick of various forms, depending upon the use to which it is put. *Boat davits* are used in hoisting boats, the *cat davit* in catting the anchor, and the *fish davit* in fishing it. In modern ships of large size all anchor davits are being done away with, the anchor being pulled up into the hawse pipe. Removable davits are frequently placed at small hatches for handling stores, at the sides to support the gangway ladder, etc. On many passenger steamers whose boats are stowed inboard on the boat deck, the Welin davit is used. This consists of a straight steel arm or davit with the lower end bolted to a steel semicircular arc, coggled on its circumference. The cogs of the arm work in a flat rack on the deck as the boats are swung in or out.

**DA'VITT, MICHAEL** (1846-1906). An Irish journalist and political leader, the founder of the Irish Land League. He was born in Straid, County Mayo, where his parents, poor peasants, were evicted from their farm when Davitt was four years of age. While engaged as a boy in a cotton factory at Haslinden, Lancashire, he lost his right arm in the machinery. From the age of 15 to 22 he worked in a printing office and educated himself. He joined the Irish revolutionary movement in 1867 and was present at the attack on Chester Castle. Detected transporting arms into Ireland in 1870, he was sentenced to 15 years' penal servitude, but after serving half the sentence was released on a ticket of leave in 1877 and visited the United States on a lecturing tour. He obtained funds to carry on a crusade against Irish landlordism and on Oct. 21, 1879, at his birthplace, organized the Land League, which spread over Ireland. He again visited America in 1880, to superintend the organization of an American branch of the Land League, but hurried back to England on account of the prosecution of the Land League executive. He was arrested under the Coercion Act and reimprisoned to finish his old sentence. He was leniently treated during 15 months and again released on a ticket of leave. He revisited America to advocate the revival of the Land League and on his return to Ireland organized the National League. In 1883 he was imprisoned for three months for a seditious speech. In 1882, while in prison, he had been elected member of Parliament for Meath, but was disqualified on the grounds of his unexpired ticket of leave. Elected in 1892 to the House of Commons for Westmeath and unseated, he was re-

turned unopposed for North East Cork, but shortly afterward was compelled to vacate through bankruptcy. In 1895 he was returned unopposed for East Kerry and South Mayo, but resigned in 1899. In 1889 he was implicated in the "Parnellism and Crime" prosecution instigated by the London *Times*, and conducted his own defense in an effective speech which received the commendation of the presiding judge. Although a strong Home Ruler, he was opposed to Parnell's land nationalization scheme, and at that leader's deposition in 1890 Davitt became a prominent Anti-Parnellite. After a visit to Australia he published his *Impressions of Australasian Democracy*, in 1898, and the same year wrote letters to the *Times* contending that the dominating English-speaking race in America is largely of Celtic origin and therefore anti-Saxon in feeling. He visited South Africa during the Boer War and investigated the massacre of Kishineff in 1903. Besides a vast number of journalistic articles, including "Prisons Revisited" in the *Daily Chronicle* (1889), his works include: *Leaves from a Prison Diary* (1884), *Defense of the Land League* (1891); *The Boer Fight for Freedom* (1902); *Within the Pale* (1903); *The Fall of Feudalism in Ireland* (1904); *Pageant of London* (1905). Consult Cashman, *Life of Michael Davitt* (Boston, 1881).

**DA VOLTERRA**, DANIELE RICCIARELLI. See VOLTERRA.

**DAVOS**, dā'vós. A Rhetian-Alpine valley in the Canton of Grisons, Switzerland, 5115 feet above sea level; surrounded by five tall peaks, the Schiahorn, the Jakobshorn, Jatzhorn, Tälhorn, and Seehorn (Map: Switzerland, D 2). Stretching about 20 miles from east to southwest, it is traversed by the Davos Landwasser, which flows from Lake Davos; the lake has an area of one-fifth of a square mile and a depth of 175 feet. The sheltered situation and pure, dry air of the valley have made it a favorite winter and summer resort for invalids, especially consumptives. Davos Platz and Davos Dorf, its former villages, are now thriving and fully equipped health resorts, with hotels, sanatoriums, etc. An international skating competition is held in January of each year. Davos Platz (pop., 1900, 8334; 1910, 11,730) is the chief town of the district and in the fifteenth century was the capital of a confederation of ten Grison republics. John Addington Symonds lived and wrote most of his works here. Consult Symonds, *Our Life in the Swiss Highlands* (London, 1892).

**DAVOUT**, dā'voot, LOUIS NICOLAS, DUKE OF AUERSTÄDT and PRINCE OF ECKMÜHL (1770-1823). One of Napoleon's most celebrated marshals. He was born, May 10, 1770, at Annoux, in Burgundy, of a noble provincial family. After being educated at Brienne he entered the army as lieutenant of cavalry in 1788, but his revolutionary leanings led to his dismissal in 1790. He soon reappeared, however, in the Army of National Defense, and during the Revolutionary wars served with distinction under Dumouriez, and after 1793 as brigadier general under Pichegru and Moreau. In 1798, having accompanied his chief, Desaix, to Egypt, he soon attracted the attention of Bonaparte by the skillful way in which he handled his troops at Abukir. On returning to France in 1800 Davout was made a general of division and commanded the cavalry in the Italian campaign of that year. Shortly afterward he became inspector general of cavalry and commander of the Con-

sular Guard. Soon after the Empire was proclaimed he became a marshal of France (1804), a member of the Legion of Honor (1805), and commander of the Third Army Corps. In all of Napoleon's campaigns Marshal Davout distinguished himself. At Auerstädt (1806) his generalship won the day against superior forces. After the Peace of Tilsit Davout was left as Governor of the Grand Duchy of Warsaw. His harsh administration provoked numerous complaints on the part of the inhabitants; but he appears merely to have carried out the instructions of Napoleon, who in 1808 created him Duke of Auerstädt. The brilliant victory won at Eckmühl in 1809 earned for him the further title of Prince. At Wagram (q.v.) he practically won the battle by turning the enemy's left. As commander of the Imperial forces in Germany after 1810 he supported the rigorous enforcement of the continental system along the North Sea littoral, and prepared the army for the Russian campaign of 1812. In this campaign he took a prominent part, gaining a victory at Mohilev and being wounded at Borodino. After the retreat he was made commandant of the Thirty-second Military District, with headquarters at Hamburg; but after defending the city for several months against 80,000 Germans, he surrendered and made his submission to Louis XVIII. His loyalty, however, was not proof against the return of Napoleon, and during the Hundred Days he acted as Minister of War and showed remarkable genius in organizing troops and procuring supplies. After Waterloo he was forced to surrender the command he had assumed under the walls of Paris and for a time was in deep disgrace and deprived of his titles and estates. Nevertheless he protested vigorously against the proscription of 1815 and made praiseworthy efforts to save Ney's life. In 1817 his rank was restored to him, and in 1819 he took a seat in the House of Peers, where he frequently protested his loyalty to the Bourbon line. He died in Paris, June 1, 1823. Consult: Bloqueville, *Le maréchal Davout* (Paris, 1879-80), *Correspondance du maréchal Davout*, ed. Mazade (4 vols., Paris, 1885); Jomini, *Life of Napoleon*, trans. by Halleck (5 vols., New York, 1864); Montégut, *Le Maréchal Davout* (Paris, 1882); Holzhausen, *Davout in Hamburg* (Mülheim-on-the-Ruhr, 1892); Comte Vigier, *Davout, Maréchal d'Empire* (2 vols., Paris, 1898).

**DA'VUS** (Lat., a Dacian). The name of the conventional slave in Latin comedy.

**DA'VY**, SIR HUMPHRY (1778-1829). A celebrated English chemist. He was born at Penzance, in Cornwall, where his father was a carver in wood. At the school of Truro, where he was educated until he was 15, he showed little relish for classical learning, but was distinguished for a highly retentive memory and an early passion for poetry, which never forsook him. In 1795 he became apprenticed to a surgeon and apothecary at Penzance. At the same time he entered upon a course of study all but universal: a system of mathematical study, skeptical philosophy, Scotch metaphysics, and German transcendentalism successively engaged his attention. The study of natural philosophy brought him nearer to that department which was to be his own; but it was not till he had reached his nineteenth year that he entered seriously upon the study of chemistry. He now made the acquaintance of Dr. Beadées, who

had established a pneumatic institution at Bristol and who took him as his assistant. Here Davy carried out a course of experiments on the curative effects of different gases, in which he had more than once nearly sacrificed his life. He thus discovered the singular exhilarating effect of nitrous oxide (laughing gas). The account which he published of his researches established his reputation and led to his appointment, at the age of 22, as lecturer at the Royal Institution of London. He delivered his first lecture in 1801, and his eloquence and the novelty and variety of experiments soon attracted large and brilliant audiences. In 1802 he was made professor of chemistry at the Royal Institution. In 1803 he began researches connected with agriculture and during 10 years lectured before the Board of Agriculture on agricultural chemistry. His lectures were published in 1813, under the title *Elements of Agricultural Chemistry*. The discoveries, however, on which Davy's fame as a chemist chiefly rests took their origin in the views which he developed in 1806 in the Bakerian lecture, *On Some Chemical Agencies of Electricity*. This essay was universally regarded as one of the most valuable contributions ever made to chemical science and obtained the prize of the French Institute. A remarkable view first advanced in this essay is that chemical affinity is nothing but the mutual electrical attraction of the ultimate particles of matter. Davy's electrolytic experiments led to the establishment on a firm scientific basis of Lavoisier's idea that bases are compounds of oxygen with metals, and to the extension of this idea to caustic potash and soda, which Lavoisier had regarded as elements. In 1807 Davy succeeded in decomposing potash. When he first saw the globules of the new metal potassium, his delight is said to have been so ecstatic that it required some time for him to control himself before he was able to continue the experiments. In the following year he decomposed soda, lime, baryta, and strontia, obtaining the metal sodium in the isolated state and the metals calcium, barium, and strontium in the form of alloys with mercury (amalgams). Owing to a delay in Davy's work caused by a severe illness, calcium and barium were independently isolated in 1808 by Berzelius and Pontin. In 1809 Davy demonstrated the elementary nature of chlorine and proved that hydrochloric acid is a compound of chlorine and hydrogen. It thus became clear that oxygen was not by any means an essential constituent of acids.

In 1812 Davy was knighted, married a lady of considerable wealth, and resigned the chemical chair of the Royal Institution. That he might investigate his new theory of volcanic action, he received permission from the French government—though the two countries were then at war—to visit the Continent and was received with the greatest distinction by the scientific men of France. On this visit he was accompanied by his assistant, Michael Faraday. Returning to England, in 1815, Davy entered on the investigation of the nature of fire damp, which is the cause of explosions in coal mines. This resulted in the invention of the safety lamp (q.v.), one of the most valuable presents ever made by science to humanity. On the death of Sir Joseph Banks, in 1820, Sir Humphry Davy was elected president of the Royal Society. His attention was shortly after called to the

important problem of preserving the copper sheathing of vessels from corrosion by the action of sea water. This he effected by means of bands of zinc; but the bottoms of the vessels became so foul from the adhesion of weeds, shells, etc., that the plan had to be abandoned.

Early in 1825 Sir Humphry Davy had begun to complain of the loss of strength, and in 1826 he had a paralytic attack affecting his right side. He made two journeys to the Continent for the recovery of his health, and died at Geneva on May 29, 1829, at the early age of 51. The Genevese government evinced their respect by a public funeral. So widely spread was the reputation of Sir Humphry Davy that he was a member of almost all the scientific institutions in the world. Cuvier, in his *Eloge*, says: "Mr. Davy, not yet 52 years of age, occupied, in the opinion of all that could judge of such labors, the first rank among the chemists of this or of any other age." Besides works already mentioned, and a great number of contributions to the *Philosophical Transactions*, Davy published: *Elements of Chemical Philosophy* (1812), and *Salmonia, or Days of Fly Fishing* (1827). His *Consolations in Travel, or the Last Days of a Philosopher* (3d ed., 1831), appeared after his death. Consult *Memoirs of the Life of Sir Humphry Davy*, by his brother (2 vols., London, 1836), and *The Life of Sir Humphry Davy*, by Dr. Paris (ib., 1831). See also CHEMISTRY; CHEMISTRY, AGRICULTURAL.

**DAVY JONES'S LOCKER.** A common phrase applied to the ocean as the grave of men drowned at sea. Davy Jones is a sailor's familiar name for a malignant sea spirit or for the devil.

**DAVY SAFETY LAMP.** A lamp made especially for use in gaseous coal mines. The flame is completely enveloped in wire gauze to prevent exploding the gas in the mine. See SAFETY LAMP.

**DAW.** See JACKDAW.

**DAWAILA.** A catfish (*Ageneiosus dawaila*) found in the rivers of Guiana and highly esteemed as food. It is sometimes 2½ feet long and has a snout somewhat like that of a pike, but the mouth is furnished only with very minute teeth. The skin is destitute of scales, and the colors have that brightness so often seen in tropical fishes—green, brown, and carmine.

**DAWANT, dā'vān', ALBERT PIERRE** (1852–). A French painter and illustrator, born in Paris. He was a pupil of Laurens (q.v.) and both in color and composition resembles his master. His pictures include "Departure of Emigrants from Havre" (Metropolitan Museum, New York); "A Choir of Boys" (1888, Luxembourg); "The End of the Mass" (1891, Nantes Museum). One of his best historical pictures is "The Emperor Henry IV of Germany before Pope Gregory VII" (1880, Agen Museum). He received a first-class medal at the Paris Exposition in 1889 and was made Officer of the Legion of Honor in 1900. His later works include "Distress" and "Death: Sebastopol" (1904) and "The Review at Bethany" (1905, Versailles Gallery). After 1908 he painted chiefly portraits. His illustrations of the works of Victor Hugo, Alphonse Daudet, and Alfred de Vigny deserve mention.

**DAWES, dās, CHARLES GATES** (1865–). An American civil engineer, lawyer, and politi-

cian, born at Marietta, Ohio. He graduated in 1884 at Marietta College and in 1886 at the Cincinnati Law School, became chief engineer of an Ohio railway, and practiced law at Lincoln, Neb., in 1887-84. He was a leader in the McKinley movement in Illinois which resulted in instructions for McKinley at the Springfield (Ill.) Convention of April, 1896. He was Comptroller of the Currency from 1897 to 1902. About 1894 he became interested in the gas business and built plants at Evanston, Ill., La Crosse, Wis., Seattle, Wash., and other cities. In 1902 he became president of the Central Trust Company of Illinois. He published *The Banking System of the United States* (1892).

**DAWES, HENRY LAURENS** (1816-1903). An American politician, born in Cummington, Mass. He graduated at Yale in 1839, engaged in newspaper work for a time, studied law, and in 1842 was admitted to the bar. He was a member of the Lower House of the Massachusetts Legislature from 1848 to 1852 and was United States district attorney for the western district from 1853 to 1857. He served in Congress from 1857 to 1873 and in the Senate from 1875 to 1893, being active on several committees, particularly on that of Indian Affairs. For the last 10 years of his life he was chairman of the "Dawes" Indian Commission to the Five Civilized Tribes.

**DAWES, RICHARD** (1708-66). An English classical scholar, educated at Cambridge. In 1738-48 he was master of the grammar school at Newcastle-on-Tyne. In 1749 he resigned and retired to Heworth, where he died, in 1766. His last years were clouded by incipient insanity. Dawes is best known for his *Miscellanea Critica* (1745). This is a work of genuine worth, but contains some unfortunate attacks on Bentley. It embraces emendations of Terentianus Maurus, Aristophanes, and the Greek tragedians; discussions of the correct pronunciation of Greek, the use of the subjunctive and optative moods, the digamma, ictus, etc. For "Dawes's Canon," for which he is most famous, see pp. 415-416 of the work by Sandys, named below. Consult Luard, in *Dictionary of National Biography*, vol. xiv (London, 1888). Hodgson, *Archæologia Æliana*, vol. ii (Newcastle, 1832), and *An Account of the Life and Writings of Richard Dawes* (1828). Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

**DAWSON, dā'və-zōn, BOGCMIL** (1818-72). A German actor, born at Warsaw, of Jewish parents. He began his career on the Polish stage in his native city and afterward played at Lemberg. Inspired there by the acting of two distinguished members of the Vienna Court Theatre, he resolved to identify himself henceforth with the German stage, applied himself assiduously to the study of the German language, and soon appeared with success in principal parts of standard dramas. In 1847 he played for the first time in Germany at Hamburg, was invited to Vienna in 1849, and there won great applause, especially in Shakespearean parts. In 1852 he became connected with the Court Theatre at Dresden, where he remained until 1864, interrupting his engagement only by traveling tours to the principal cities of Germany. Through his great talent and by his own exertions he had attained such eminence on the German stage as to be deemed by many the greatest actor of his time. His best-known rôles were Mephistopheles, Hamlet, Richard III,

and King Lear. In 1866 he came to America, where he appeared with great success during two years. Soon after his return to Dresden in 1869 he became insane and never recovered.

**DAWKINS, JOHN**. See **ARTFUL DODGER, THE**.

**DAWKINS, WILLIAM BOYD** (1838- ). An English geologist and paleontologist. He was born at Welshpool, Montgomeryshire, Wales, and after graduating at Jesus College, Oxford (1860), became assistant geologist (1862), and later geologist (1867), to the Geological Survey of Great Britain. He became a lecturer in Owens College in 1870 and a professor in 1872. He was a member of the Channel Tunnel Committee (1882) and, after making a geological survey of the French and English coasts, laid down the line for a tunnel under the Humber (1883-84). He was made examiner at the University of London in 1885. His principal scientific work relates to the investigations of cave faunas. In addition to his papers on fossil mammalia contributed to the *Proceedings* of the Geological, Anthropological, and Royal societies, he published: *Cave-Hunting* (1874); *Researches on the Evidences of Caves Respecting the Early Inhabitants of Europe* (1874); *Early Man in Britain* (1880); *British Pleistocene Mammalia* (1866-87).

**DAWLEY, THOMAS ROBINSON, JR.** (1862- ). An American journalist, born in New York City. He traveled much; in 1896 he was sent by *Harper's Weekly* to Cuba, and he was again there a year later, during the Spanish-American War he was a volunteer aid to General Miles and later to General Shafter, and after the fall of Santiago he tried to publish the *Times of Cuba*, but was forced to return to the United States. Thereafter he represented the Century Company in Spain and the *Outlook* at the Pan-American Congress in Mexico in 1901, traveled (1904) in Santo Domingo and reported to the President on political and social conditions in that island, and in 1907-09 investigated Southern industrial conditions for the United States Bureau of Labor. Besides magazine articles on Spanish-American countries and on Spain, he wrote *The Child that Toileth Not, the Story of a Government Investigation* (1912).

**DAWLISH**. An attractive and popular sea-side resort in Devonshire, England, 12 miles nearly due south of Exeter (Map: England, C 4). It is situated on a cove sheltered by two headlands (one of them, Great Haldon, is 821 feet high) which project into the English Channel and create perfect conditions for sea bathing. Pop., 1901, 4003; 1911, 4009.

**DAWSON**. A city and the county seat of Terrell Co., Ga., 98 miles southwest of Macon, on the Central of Georgia and the Sea Board Air Line systems (Map: Georgia, B 4). It is in a cotton and fruit growing district and has cotton-oil, lumber, and grist mills. The city contains a Carnegie library. Settled about 1855, it was incorporated the following year. Under a revised charter of 1891 the city is governed by a mayor, elected for a term of two years, and a board of aldermen. Dawson owns its electric-light plant and water works. Pop., 1900, 2926; 1910, 3827.

**DAWSON**. A river port, the capital of Yukon Territory, in the northwestern part of Canada. It is situated on the right bank of the Yukon River, at its confluence with the Klom-

dike, in about lat.  $64^{\circ} 5' N.$ , long.  $139^{\circ} 30' W.$ , 360 miles direct north-northwest of Skagway, and about 1500 miles above the mouth of the Yukon River. It lies at an elevation of about 1400 feet above sea level, and near the site of old Fort Reliance (Map: Canada, C 4). It is the distributing and receiving centre of the Klondike gold-mining region and has a United States consulate. There is a railway to Bonanza, 12 miles away. The town dates from shortly after the discovery of gold on Bonanza Creek, Aug. 16, 1896. It is now a busy and well-established business centre. Since 1904 its government has been administered by the Territory. It is connected between June 1 and October 15 by a fleet of river steamers with the posts and stations on both the lower and upper Yukon and with telegraph lines to the coast. In winter the traffic is carried on four-horse sleighs. The industries include electric light and power, sheet-metal making, saw mills, brewing and malting, gold mining, coal mining, garden truck farming. There is a quartz mill. Big game can be had in the vicinity. Perfect order is maintained by the Royal Northwest Mounted Police. Pop., 1901, 9142; 1911, 3015.

**DAWSON, ALEC JOHN** (1872- ). An English novelist. He was born at Wandsworth, London, S. W. After three years at sea he ran away while in Australia and began a life of adventure, traveling in the South Sea Islands, New Zealand, India, Mauritius, South America, West Africa, Morocco, Portugal, California, Canada, and all parts of Europe. He won attention with a collection of West Africa stories entitled *In the Bight of Benue* (1897), which was followed by *African Nights' Entertainments* (1900), a series of fiery stories of love and adventure in northern Africa. Among his other novels are: *Mere Sentiment* (1897); *Middle Greyhens* (1897); *Bismillah, a Romance* (1898); *God's Foundling* (1897); *Story of Ronald Kestrel* (1899); *The Half Caste* (1901); *Evolution and its Bearing on Religions* (1901); *Hidden Manna* (1902); *Things Seen in Morocco* (1904); *The Message* (1907). From 1898 to 1913 he was editor of what he described as "the first British Empire newspaper," the *Standard of Empire*.

**DAWSON, CONINGSBY (WILLIAM)** (1883- ). An Anglo-American author, born at High Wycombe, Buckinghamshire, Eng. He graduated at Merton College, Oxford, in 1905 and in the same year went to America, where he did special work for English newspapers on Canadian subjects, traveling widely during this period. He lived at Taunton, Mass., from 1906 to 1910, when he became literary adviser to the George H. Doran Publishing Company. Besides helping his father, William James Dawson, to edit *The Reader's Library*, he is author of *The Worker and Other Poems* (1906); *The House of Weeping Women* (1908); *Murder Point* (1910); *The Road to Aralon* (1911); *The Garden Without Walls* (1913); *Florence on a Certain Night and Other Poems* (1914).

**DAWSON, GEORGE** (1821-76). A British Nonconformist clergyman, born in London, and educated at Marischal College, Aberdeen, and at the University of Glasgow. He preached in Baptist churches at Rickmansworth and Birmingham in 1843-45, but differences as to creeds led him to separate from all traditional church affiliations. His followers built the church of the Saviour, Birmingham, where, free of all doc-

trinal restrictions, he preached from 1847 until his death. His *Sermons* (4 vols., 1878-82); *Prayers* (2 vols., 1878-83), and *Biographical Lectures* (2 vols., 1886-87) were published posthumously. Consult H. W. Crosskey, *Memoir of George Dawson* (1876).

**DAWSON, GEORGE MERCER** (1849-1901). A Canadian geologist, son of Sir John William Dawson. He was born in Truro, Nova Scotia, and educated at McGill University and at the Royal School of Mines in London. In 1873 he received the appointment of geologist and botanist to the North American Boundary Commission, and subsequently he was on the staff of the Geological Survey of Canada. He was a member of the Bering Sea Commission in 1891. From 1895 until his death he filled the office of director of the Geological Survey of Canada, in which connection he rendered important services to his country. He was president of the Geological Society of America in 1900. His numerous scientific papers were published mostly in the reports of the survey. He was the author of *Descriptive Sketch of the Physical Geography and Geology of Canada* (1884) and of *The Physical and Geological Features of Part of the Rocky Mountains* (1885).

**DAWSON, SIR JOHN WILLIAM** (1820-99). A Canadian geologist and educator, born in Pictou, Nova Scotia. He entered the University of Edinburgh, where for some time he pursued the study of science and, upon returning to Nova Scotia, began active work in geology. In 1841 he assisted Sir Charles Lyell in exploring the geological formations of Nova Scotia, as a result of which he collected much new and valuable material in paleontology. The results of his early investigations were published in *Acadian Geology* (3d ed., 1880) and in American and foreign periodicals. In 1850 he became superintendent of education in Nova Scotia, and in 1855 he was called to McGill University as professor of natural history, afterward becoming vice chancellor. Dawson was recognized as an authority on Canadian geology, a subject to which he gave much study and contributed many valuable works. His name has been associated particularly with the controversy over the supposed fossil "Eozoön," which was found among the earliest rocks in the North American continent. He was also known as one of the ablest opponents of the application of the Darwinian theory to the origin of life forms. Among his important works are the following: *Acadia* (1851); *The Story of the Earth and Man* (1872); *The Dawn of Life* (1875); *The Origin of the World* (1877); *The Change of Life in Geological Time* (1880); *Egypt and Syria* (1885); *Modern Ideas of Evolution* (1890); *Some Salient Points in the Science of the Earth* (1894); *The Meeting Place of Geology and History* (1894). In 1882 he received the Lyell medal of the Geological Society of London, and the same year he was elected president of the American Association for the Advancement of Science. In 1884 he was knighted. In 1886 he was president of the British Association for the Advancement of Science, and in 1893 he was president of the Geological Society of America. He was also an honorary member of many American and European scientific societies.

**DAWSON, MILES MENANDER** (1863- ). An American actuary, born at Viroqua, Wis. He was educated at Kentucky (now Transyl-

vania) University and the New York University Law School. He took up general practice as an insurance lawyer and consulting actuary and in this capacity was called on to serve the Armstrong Investigating Committee in New York and the Canadian Royal Commission on Life Insurance. Later he became expert special agent of the United States Census Bureau and actuary-in-charge of the investigation of fraternal mortality experience. His publications include: *Elements of Life Insurance* (1892; 3d ed., 1911); *American Life Insurance Methods* (1893); *The Effect of Free Surrender and Loan Privileges in Life Insurance* (1894); *Principles of Insurance Legislation* (1896); *Practical Lessons in Actuarial Science* (1897; 1905); *The Function of Insurance in Modern Society* (1898); *Things Agents Should Know* (1900); *Comparative Reserve Tables* (1905, 1908); *Survivorship Annuity Tables* (1910).

**DAWSON, SAMUEL EDWARD** (1833- ). A Canadian author. He was born at Halifax, Nova Scotia, and was educated in Montreal, where he graduated from the Royal Military School in 1865. For many years he was head of a publishing and bookselling house, and he contributed frequently to newspapers and magazines. Worthy of special note were a series of papers in the *Toronto Week* in 1889-90 on "The English Minority in the Province of Quebec," and "Problems of Greater Britain." From 1891 until 1909 he was King's printer at Ottawa. In 1881 he was a delegate to Washington on the question of international copyright and in 1888 vice president of the Canadian Copyright League. In 1893 he was elected fellow, and in 1907 president, of the Royal Society of Canada. In 1906 he was created C.M.G. His principal publications are: *A Study of Lord Tennyson's Poem, The Princess* (1884); *Voyages of the Cabots in 1497 and 1498* (1895-97); *Canada and Newfoundland* (1897); *The St. Lawrence Basin and its Border Lands* (1905); *A Plea for Literature* (1908).

**DAWSON, THOMAS CLELAND** (1865-1912). An American lawyer and diplomat, born in Hudson, Wis. He graduated at Hanover College, Ind., and, being admitted to the Iowa bar in 1886, practiced law in Des Moines and Council Bluffs. He was from 1891 to 1897 Assistant Attorney-General of Iowa and from 1897 to 1904 Secretary of the United States Legation to Brazil; held high diplomatic posts in Santo Domingo in 1904-07; was Minister to Colombia (1907-09), to Chile (1909-10), and—after serving as Chief of the Division of Latin-American Affairs in the State Department—to Panama (1910). Following special service to Nicaragua, Honduras, and the Venezuelan centennial (1911), he became resident diplomatic officer of the Department of State. He wrote *South American Republics* (2 vols., 1903-04).

**DAWSON, WILLIAM BELL** (1854- ). A Canadian civil engineer. He was born at Pictou, Nova Scotia, and was educated at McGill University, Montreal (where he graduated with high honors in 1874) and at the Ecole des Ponts et Chaussées, Paris. He was engaged for some years in railway and other surveys, in 1881 making a partial survey of the Nova Scotia gold fields. Shortly afterward he designed the cantilever bridge over the St. John River; and between 1884 and 1893 he designed many bridges for the Canadian Pacific Railway and its

branch lines. For the arbitrators of the Canadian Pacific-British Columbia dispute regarding the quality of certain sections of railway construction he spent about three years in investigation. In 1894 he entered the service of the Marine and Fisheries' Department, Ottawa, and he did important work as head of the Tidal and Current Survey. He was awarded the Watt gold medal by the Institute of Civil Engineers, London, England (1902), and the Gay prize of 1500 francs by the Academy of Science, Paris (1905).

**DAWSON, WILLIAM HARBUTT** (1860- ). An English publicist, educated at Skipton School, Ermistead, and at Berlin University. He married a German wife and is best known for his sympathetic studies of German economic and industrial life. Dawson was appointed principal clerk of the English National Insurance Commission in 1912. Among his works are: *Social Insurance in Germany* (1883, 1911; 1912); *German Socialism and Ferdinand Lassalle* (1888; 1891); *Prince Bismarck and State Socialism* (1890); *Germany and the Germans* (1894); *Social Switzerland* (1897); *German Life in Town and Country* (1901); *Matthew Arnold and his Relation to the Thought of his Time* (1903); *Protection in Germany* (1904); *The German Workman: A Study in National Efficiency* (1906); *School Doctors in Germany* (1906); *The Uneared Increment* (3d ed., 1910); *Evolution of Modern Germany* (1909); *The Vagrancy Problem* (1910); *Social Insurance in Germany, 1883-1911* (1912); *Industrial Germany* (1913).

**DAWSON, WILLIAM JAMES** (1854- ). An English clergyman and author. He was born at Towchester, Northamptonshire, was educated at Didsbury College, Manchester, and entered the Wesleyan ministry in 1875. He resigned from the Wesleyan ministry and entered the Congregational in 1892. In 1904 he resigned his charge in London to devote himself to evangelistic work. He wrote, notably: *A Vision of Souls* (1884), poems; *Quest and Vision, Essays on Life and Literature* (1886; enlarged, 1892); *The Makers of Modern Poetry* (1890); *The Redemption of Edward Strahan: A Social Story* (1891); *London Idylls* (1895); *The Story of Hannah* (1896); *The House of Dreams* (1897); *Judith Boldero: A Tragic Romance* (1898); *Makers of Modern Prose* (1899); *Navonola: A Drama* (1900); *The Man Christ Jesus* (1901); *Makers of English Fiction* (1905); *The Forgotten Secret* (1906); *The Book of Courage* (1911); *The American Hymnal* (1913).

**DAWSON, WILLIAM WIRT** (1828-93). An American surgeon, born at Dawson's Mills, Berkeley Co., W. Va., and educated at Louisville University and at the Medical College of Ohio, from which he graduated in 1850. He served as professor of anatomy in the Cincinnati College of Medicine and Surgery (1853-56) and in the Medical College of Ohio (1860-64) and as surgeon and clinical lecturer at the Commercial (now Cincinnati) Hospital from 1864 to 1870, when he was appointed to the chair of surgery at the Medical College of Ohio. He was president of the American Medical Association in 1889. He is author of papers on carcinoma, hernia, Graves' disease, and abdominal tumors.

**DAX**, daks. The capital of an arrondissement.

ment in the Department of Landes, southwestern France, on the Adour, 32 miles northeast of Bayonne by rail (Map: France, S., C 5). The principal building is the former cathedral, rebuilt by Louis XIV in the seventeenth century. The site of the ancient Roman walls and moat is now occupied by the Promenade des Ramparts, and the mud baths of St. Pierre. Dax is famous as a health resort, owing to its thermal springs and baths of every description. It manufactures liquor, faience ware, chronometers, leather, and has a considerable trade in agricultural produce and timber. The scientist Charles Borda was born here in 1733. The ancient capital of the Tarbelli, Dax was known to the Romans as Aqua Tarbellicæ, afterward as Civitas Aquensium. It was held by the English from the twelfth to the fifteenth century. Pop., 1901, 10,329; 1911, 11,387.

**DAY** (AS. *dæg*, Icel. *dagr*, Goth.  *dags*, OHG. *tac*, Ger. *Tag*; probably connected with Skt. *dah*, Lith. *dėgti*, to burn, OPruss. *dagas*, summer). Originally the space of time during which it is light, in contrast to the space of darkness or night. It now more usually denotes a complete alternation of light and darkness. It is the earth's rotation that causes these changes of light and darkness. The earth being a globe, only one-half of it can be in the sun's light at once; that half enjoys daylight, while the other half is in its own shadow, or in night; and by the earth's rotation the several portions of the surface have each their turn of light and of darkness.

Astronomers recognize more than one kind of day. If the time is noted when a particular fixed star is exactly south or on the meridian, when the same star comes again to the meridian the next day, the earth has made exactly one rotation, and the time that has elapsed is called a *sidereal day*. This portion of time is always of the same length; for the motion of the earth on its axis is strictly uniform and is perhaps the only strictly uniform motion that nature presents to us. Sidereal time, or star time, from its unvarying uniformity, is much used by astronomers. But the passage of a star across the meridian is not a conspicuous enough event for regulating the movements of men in general. It is not a complete rotation of the earth, but a complete alternation of light and darkness, that constitutes their day. This, which is called the *civil* or *solar day*, is measured between two meridian passages of the sun. On account of the apparent eastward motion of the sun relative to the fixed stars, it is found that when the earth has made one complete turn, so as to bring the meridian of the place to the same position among the stars as at noon the day before, the sun is still nearly one degree east of the meridian, and it takes the earth about four minutes more to move round so as to overtake it. Consequently the solar day is about four minutes longer than the sidereal day. If this eastward motion of the sun were uniform, the length of the solar day would be as simple and as easily determined as that of the sidereal. But the ecliptic or sun's path crosses the earth's equator, and is therefore more oblique to the direction of the earth's rotation at one time than another; and besides, as the earth moves in its orbit with varying speed, the rate of the sun's apparent motion in the ecliptic, which is caused by that of the earth, must also vary.

In consequence, the length of the solar day is constantly fluctuating; and, to get a fixed measure of solar time, astronomers have to imagine a sun moving uniformly in the celestial equator and completing its circuit in the same time as the real sun. The time marked by this imaginary sun is called *mean solar time*; when the imaginary sun is on the meridian, it is *mean noon*; when the real sun is on the meridian, it is *apparent noon*. It is obvious that a sundial must show apparent time, while clocks and watches keep mean time. Only on four days of the year do these two kinds of solar time coincide. In the intervals the sun is always either too fast or too slow; and the difference is called the *equation of time* (q.v.), because, when added to or subtracted from apparent time, it makes it equal to mean time. The mean solar day is divided into 24 hours, each of which is further divided into 60 minutes of 60 seconds each. A sidereal day, we have seen, is shorter; its exact length is 23 hours, 56 minutes, 4 seconds of mean solar or common time. Astronomers divide the sidereal day also into 24 hours, which are of course shorter than common hours. In the course of a civil year of 365 days the earth turns on its axis 366 times, or there are 366 sidereal days. Astronomers reckon the solar day as beginning at noon and count the hours from 0 to 23. The civil day begins at midnight, and the hours are counted in two divisions of 12 each. The ecclesiastical day was formerly reckoned from sunset to sunset. See INTERNATIONAL DATE LINE; TIME.

To find the day of the week for any date, past or future, there are several methods, but the simplest and most easily understood is as follows: First, there is a "constant" for the *style*—for new style it is 0, for old style 4. (In English chronology new style begins 1752, September 14.) Then there is a "constant" for each month—for January, 1 (in leap years, 0); for February, 4 (in leap years, 3); for March, 4; for April, 0, for May, 2; for June, 5; for July, 0, for August, 3; for September, 6; for October, 1; for November, 4; for December, 6. The month constants are the same in both styles. Now (for new style), multiply the number representing the century by 5, and add one-fourth to the product (omitting fractions). Next take the number of the odd years (i.e., the last two figures of the year number), and add one-fourth (omitting fractions); also the day of the month. Then add all these numbers together and finally divide the sum by 7; the remainder will give the day of the week, the remainder 1 showing the first day of the week, or Sunday; the remainder 2, Monday, etc., no remainder showing the seventh day of the week, or Saturday. Example: What is the day of the week for January 1, 1901?

Constant for new style	6
Constant for the month (Jan.).	1
Century number (19) multiplied by 5	95
Add one-fourth of 19	4
Odd years.	1
Add one-fourth of 1	0
Day of the month.	1
<b>Total.</b>	<b>108</b>

Divide 108 by 7, and the remainder is 3; so the year 1901 must begin on the third day of the week, or Tuesday.

For old style the constant is 4, and the number of the century is multiplied by 6, without addi-

tion of the one-fourth. The other numbers are taken as in new style. Example for old style: On what day of the week did Columbus land on his voyage of discovery (Oct. 12, 1492)?

Constant for old style.....	4
Constant for October.....	1
Century number (14) multiplied by 6.....	84
Odd years (92) one-fourth added.....	115
Day of the month.....	12
Total.....	216

Divide by 7, and the remainder is 6; i.e., the required day is the sixth day of the week, or Friday.

For leap years care must be taken in both old and new style to reduce the constants for January and February by one. See CALENDAR.

**DAY.** In law, the period of time between midnight and midnight within which a specified legal act may be performed. This entire period of 24 hours is the "natural" day. The "artificial" or conventional day (*dies artificialis*), or the "legal" day, as it is sometimes called, varies according to the nature of the act to be performed. Coke, referring to the day of the appearance of parties in a suit, described it as extending from sunrise to sunset. For many purposes the legal day is limited to the usual business hours, as of a bank or other business house, and its length is often determined by the hours observed by the community, or artificially determined by the usage of a particular calling. Thus, the day of the stock exchange means the hours (say from 10 A.M. to 3 P.M.) within which deliveries of stock and settlements must be made, in order to avoid forfeiture or other penalty. Usually the legal day is coextensive with the natural day.

**Court days** are those days of the year in which courts may lawfully sit and process issue, though in some parts of the United States the expression is used to describe the days on which the courts actually sit. In England and the United States Sundays and certain holidays are generally not court days (*dies non juridici*), excepting for such acts as are necessary to the preservation of the peace. By a legal fiction a day is for many purposes regarded as a point of time, and a fraction of a day disregarded. See DIES NON; TIME, STANDARD.

**Law day.** The last day in which a mortgage is redeemable at law as distinguished from equity. The date of payment of a mortgage debt is usually fixed, and at common law, if not paid on the day, the mortgage was forfeited and the title of the mortgagee became absolute. In order to avoid the harshness of this rule the courts of equity interposed by permitting the mortgagor to redeem after such forfeiture on paying the amount of the mortgage debt with interest. See EQUITY OF REDEMPTION; MORTGAGE.

**Days of Grace.** The time at which a note is actually due, or at maturity, is in general by mercantile custom three days after the time expressed on the face of it, the additional days being called days of grace. If the third day of grace fall on a Sunday, the note is payable the day before, excepting where by statute it is provided that it shall be payable on Monday. If it fall on a holiday, the note is payable the day after. The uniform Negotiable Instruments Law in force in most of the States abolishes days of grace. See GRACE, DAYS OF.

**DAY, ARTHUR LOUIS** (1869- ). An

American physicist, born at Brookfield, Mass. In 1892 he graduated from Yale University, where he afterward served as instructor in physics (1894-97). From 1897 to 1900 he was a member of the staff of the Physikalisch-Technische Reichsanstalt at Charlottenburg, Germany. He then served for six years as physical geologist on the United States Geological Survey and in 1907 became director of the Geophysical Laboratory of the Carnegie Institution at Washington. He published several physical and geophysical researches at high temperatures, including *High Temperature Gas Thermometry* with Robert B. Sosman (1911).

**DAY, BENJAMIN FRANKLIN** (1841- ). An American naval officer, born in Plymouth, Ohio. He attended the United States Naval Academy in 1858-61, during the Civil War served with the West Gulf (1862-64) and North Atlantic (1864-65) blockading squadrons, and attained the rank of lieutenant commander in 1866. In 1876 he became commander, in 1891 captain, in 1899 rear admiral, and in 1900 was retired from the service. From 1897 to 1900 he was a member of the Naval Examining and Retiring boards.

**DAY, CLIVE** (1871- ). An American university professor and writer on economic history, born at Hartford, Conn. After graduating from Yale University in 1892 he took postgraduate studies there and at the universities of Berlin and Paris, taught history and economics at the University of California for three years and economics at Sheffield Scientific School (Yale) for two years, and in 1907 was appointed professor of economic history in Yale University. He is author of *Policy and Administration of the Dutch in Java* (1904) and *History of Commerce* (1907).

**DAY, GEORGE EDWARD** (1815-1905). An American theologian. He was born in Pittsfield, Mass., graduated at Yale in 1833 and in 1838 at the Yale Divinity School, where he became assistant instructor in sacred literature. From 1840 to 1851 he was pastor of churches in Marlboro and Northampton, Mass.; from 1851 to 1866 he occupied the chair of biblical literature in Lane Theological Seminary; and then that of Hebrew language and biblical theology in Yale Divinity School, where he founded in 1891 the Historical Library of Foreign Missions. From 1863 to 1871 he was editor of the *Theological Eclectic* (afterward merged in the *Bibliotheca Sacra*) and, besides contributions to periodicals, published a translation (1871) of the *Theology of the New Testament* of Van Oosterzee; an American edition (1883) of Oehler's *Theology of the Old Testament*; and other works.

**DAY, HENRY NOBLE** (1808-90). An American author and educator. He was born at Washington, Conn., graduated at Yale College in 1828, at the Yale Divinity School in 1834, and was ordained to the Congregational ministry. He became professor of sacred rhetoric in Western Reserve College in 1840 and was president of the Ohio Female College from 1858 to 1864. Besides numerous contributions to periodical literature, his works include: *The Art of Elocution* (1844); *The Art of Rhetoric* (1850); *Elements of Logic* (1867); *The Art of Discourse* (1867; 1868); *The Science of Esthetics* (1872); *The Science of Thought* (1886); *Elements of Mental Science* (1889); *Science of Education* (1889).

**DAY, HOLMAN FRANCIS** (1865- ). An

American author, born at Vassalboro, Me., and a graduate of Colby College (class of 1887). In 1889-90 he was managing editor of the publications of the Union Publishing Company, Bangor, Me. He was also editor and proprietor of the *Dexter (Me.) Gazette*, a special writer for the *Lewiston (Me.) Journal*, Maine representative of the *Boston Herald*, and managing editor of the *Lewiston Daily Sun*. In 1901-04 he was military secretary to Gov. John F. Hill of Maine. His writings include: *Up in Maine* (1901), verse; *Pine Tree Ballads* (1902); *Kin O'Ktaadn* (1904); *Squire Phin* (1905; 1913), a novel dramatized as *The Circus Man* and produced in Chicago in 1909; *Rainy Day Railroad War* (1906; 1913); *The Eagle Badge* (1908); *King Spruce* (1908); *The Ramrodders* (1910); *The Skipper and the Skipped* (1911); *The Red Lane: A Romance of the Border* (1912).

**DAY, JAMES ROSCOE** (1845- ). An American educator, born at Whitneyville, Me. He studied at Bowdoin, and was in 1872 ordained a minister of the Methodist Episcopal church. He was pastor at Bath, Me., 1872-74; Portland, Me., 1876-78; Boston, 1881-82; New York, 1883-85 and 1889-93; and in 1893 became chancellor of Syracuse University. He was elected Bishop in 1904, but resigned. He is the author of *The Raid on Prosperity* (1907).

**DAY, JEREMIAH** (1773-1867). An American educator, born in New Preston, Conn. He graduated at Yale in 1795, was made professor of mathematics and natural philosophy there in 1801, and was president of the college from 1817 to 1846. He published *An Introduction to Algebra* (1814; 7th ed., 1866); *Navigation and Surveying* (1817); and several works on philosophy.

**DAY, JOHN** (1574-c.1640). An English dramatist. He was born at Cowston, and in 1592 was admitted to Caius College, Cambridge, which he left the next year without a degree—expelled for stealing a book. Between 1598 and 1603, as a playwright, he collaborated with Dekker, Chettle, and others on at least 22 plays, of which only *The Blind Beggar* (acted 1600, published 1609) seems to have been printed. Day is best known for a vivacious comedy, *The Isle of Gulls* (1606), which draws its plot from Sir Philip Sidney's *Arcadia*; and for a dainty masque, *The Parliament of Bees* (1641, but probably written much earlier), upon which he can base his best claim to long remembrance. Consult: *Works*, ed. by Bullen (London, 1881); Swinburne's enthusiastic study in the *Nineteenth Century* (October, 1897); Ward, *History of English Dramatic Literature* (London, 1899), and *Cambridge History of English Literature* vol. vi (Cambridge and New York, 1907-13).

**DAY, STEPHEN.** See DATE, STEPHEN.

**DAY, THOMAS** (1748-89). An English author. He was born in London and was educated at Corpus Christi College, Oxford. He strongly sympathized with the Americans at the time of the Revolutionary War and expressed his views in *The Devoted Legions* (1776) and *The Desolation of America* (1777); but he also strongly denounced American negro slavery in *Reflections on the Present State of England and the Independence of America* (1762) and in his famous poem, *The Dying Negro*. He will be remembered, however, chiefly as the author of the famous *History of Sandford and Merton* (3 vols., 1783-89) and the *History of Little Jack* (1788). He was a character of remarkable nobility and expended almost his entire fortune

in philanthropy. His eccentricities, due to his refusal to compromise with worldliness, and his adherence to the doctrines of Rousseau, led him into many extraordinary experiences. He was killed by being thrown from a fractious colt, while testing a theory that all animals could be managed by kindness. His *Poems* may be found in vol. Ivi (1822) of the *British Poets*. Consult his *Life* by Keir (London, 1791) and that by Blackman (ib., 1862).

**DAY, WILLIAM A.** An American lawyer and capitalist, born at Wilmington, Del. He was Auditor of the United States Treasury Department from 1885 to 1889. As special assistant to the Attorney-General of the United States (1901-03) and as Assistant Attorney-General of the United States (1903-05) he aided and had charge of the prosecution of trust cases under the interstate commerce and antitrust laws. He served as vice president of the Equitable Life Assurance Society of the United States from 1906 to 1911 and thereafter as president. He was also chosen a director of the Mercantile Trust Company, the Lawyer's Title Insurance and Trust Company, and the Equitable Trust Company.

**DAY, WILLIAM RUFUS** (1849- ). An American statesman and jurist. He was born at Ravenna, Ohio, graduated at the University of Michigan in 1870, studied law there, and in 1872 was admitted to the Ohio bar. He was a judge of the Court of Common Pleas from 1886 to 1890. In 1897 he was appointed Assistant Secretary of State and in 1898 Secretary of State, serving from April to September, when he was named chairman of the United States Peace Commission which arranged terms of peace with Spain. From 1899 to 1903 he was judge of the United States Circuit Court (6th circuit) and in February, 1903, was appointed an associate justice of the United States Supreme Court.

**DAYAK.** See DYAK.

**DAYAL,** दि'ल. See DHYAL BIRD.

**DAY BLINDNESS,** or HEMERALOPIA. See SIGHT, DEFECTS OF.

**DAYE,** dā, or **DAY, STEPHEN** (c.1610-68). The first printer in the English colonies in America. He was born in London, was there a printer's apprentice, and in 1639 assumed charge at Cambridge, Mass., of the printing apparatus which the Rev. Jesse Glover had succeeded in obtaining for the Colony. He continued in this post until 1649, when for reasons not ascertainable he was superseded. In 1641 the General Court ordered that he, "being the first that sett upon printing, is graunted three hundred acres of land." His presswork is tolerable, according to Thomas (*History of Printing in America*, 1810), but his composition exceedingly deficient. His first production was a broadside, *The Freeman's Oath*, followed by an *Almanack*. The next was the first book printed in America, *The Whole Book of Psalmes, faithfully translated into English Metre* (1640). For a list of his other publications, consult Thomas, *The History of Printing in America* (Worcester, 1810), and Timperley, *A Dictionary of Printers and Printing* (Manchester, 1839).

**DAYFLY.** See MAY FLY.

**DAY LILY** (so called because the flowers usually last one day), *Hemerocallis*. A genus of plants of the family Liliaceae, with bell-shaped flowers. Several species are cultivated

in flower gardens, especially the fragrant yellow day lily, or lemon lily (*Hemerocallis flava*), a native of Hungary, Siberia, and the north of China. *Hemerocallis fulva*, a native of Europe and temperate Asia, produces more abundant foliage and orange-colored flowers without fragrance. Both species are fibrous-rooted perennials, with linear leaves. Five or six other species are met with in cultivation, forming a group of fine, hardy perennial ornamentals. *Hemerocallis aurantiaca* is said to be the finest of all the day lilies. *Funkia subcordata*, a common Japanese species extensively cultivated, is also known as day lily. It has broad leaves and panicles of white flowers which have an orange-like odor.

**DAY NURSERY.** See NURSERY. *Day Nursery*.

**DAY OF ATONEMENT or EXPIATION.** See ATONEMENT.

**DAY OF BARRICADES.** The name given to an insurrection of the Parisians on May 12, 1888, during the War of the Three Henrys. Henry III had fortified himself in the Louvre, against Henry, Duke of Guise. The city guards failed him, the populace pushed forward barricades, and the Swiss Guards were saved from massacre only by the intervention of the Duke of Guise, and the King had to flee. The insurrection against Mazarin, Aug. 27, 1648, is also known as the Day of the Barricades. Consult Lavisse, *Histoire de France*, vol. vi, part i; vol. vii, part i (Paris, 1904, 1906).

**DAY OF SECTIONS.** The name sometimes given to the insurrection of 13 Vendémiaire, an attempted assault on the Tuileries by the National Guard, on Oct. 4, 1795, in order to compel the Convention to change its measures. The uprising was overcome by Napoleon, who on that occasion received its first appointment. After the first encounter the forces of the Convention disarmed the various sections.

**DAY OWL.** An owl often seen abroad during the day. See HAWK OWL.

**DAYSMAN.** An arbitrator, umpire, or judge. The term is of Anglo-Saxon origin and is still employed in the northern part of England to describe an unofficial judge or arbitrator to whom a matter in dispute is referred. It was in more common use in Wiclif's day, from whom it was taken over into the Authorized Version of the Bible, in the exclamation of Job: "Neither is there any daysman betwixt us, that might lay his hand upon us both" (Job ix. 33). The origin of the term is obscure.

**DAY'S WORK.** In nautical language, the navigation work done every 24 hours. The term is frequently restricted to the operation of making the dead-reckoning computations. See NAVIGATION.

**DAYTON.** A city in Campbell Co., Ky.; on the Ohio River, opposite Cincinnati, Ohio, and on the Chesapeake and Ohio Railroad (Map: Kentucky, F 1). It contains the Speers Memorial Hospital. The city has large plants for the manufacture of watchcases and pianos. Settled in 1849, and incorporated the same year under the name of Jamestown, Dayton is now governed under a charter of 1893, by a mayor, elected every four years, and a city council. Pop., 1800, 6104; 1910, 6979.

**DAYTON.** A city and the county seat of Montgomery Co., Ohio, situated in the rich and populous Miami valley, on both banks of the

Miami River, 50 miles northeast of Cincinnati and 61 miles southwest of Columbus (Map: Ohio, B 6). Its steam railroads are the Erie, the Cincinnati, Hamilton, and Dayton, the Pittsburgh, Cincinnati, Chicago, and St. Louis, and the Dayton and Union. Seven electric traction lines enter the city, giving it quick communication with all parts of the State. The city's area is 17 square miles. The original plat was regularly laid out with broad streets. There are 210 miles of improved streets, of which 75 miles are paved with asphalt, brick, or stone. The city has 105 miles of storm sewers and 195 miles of sanitary sewers. Natural gas is obtained from West Virginia fields and is largely used for domestic and heating purposes. The principal public buildings are the old courthouse, modeled after the Parthenon, the new courthouse, Steele High School, Dayton State Hospital, Miami Valley Hospital, Memorial Hall, Stivers High School, and the Public Library and Museum. The last named, standing in Cooper Park, contains 70,000 volumes and is supplemented by two branch libraries. There are seven national banks, five State banks, two loan and trust companies, and 22 building and loan associations with deposits of over \$25,000,000. The park system is composed of Cooper Park, Van Cleve Park, South Park, Robert's Boulevard, McCabe's Park, McKinley Park, and White City, with access to the grounds of the National Military Home and the private estate of Hills and Dales. The National Military Home accommodates 6000 veterans of the Civil and Spanish-American wars. There are three high, two manual-training, and 22 district schools, with an enrollment of about 18,000. The Catholic church maintains a boys' college, a girls' academy, and 11 parochial schools. Dayton ranks third among Ohio cities in invested manufacturing capital, in value of manufactured product, in workmen employed, and in wages paid. Manufactured articles include cash registers, aeroplanes, carriages, wagons, automobiles, sewing machines, computing scales, railway cars, and boilers. The city government is unique. It is administered by a commission of five, who are elected at large on a nonpartisan ticket. They are the policy-determining body of the city, who in addition to these duties select a city manager, who is personally responsible for the administration of the government. The salaries of the commissioners are nominal, but the manager receives \$12,500 a year. He appoints his subordinates, the heads of the five departments of law, finance, welfare, service, and safety being the most important. This government is in accordance with a home-rule charter. The schools and courts are controlled by State law. Annual income amounts to \$1,125,000 for current operating costs plus \$550,000 for debt service. The city has a bonded debt of \$5,473,000, contracted for public improvements. The schools have an annual income of about \$500,000 and a bonded debt of \$630,000. Surrounding territory is thickly settled. Many of the industrial and professional classes live beyond the city limits. The death rate is 14.2. The water supply, furnished by the Holly system of deep wells and under municipal ownership, is pure and abundant. Pop., 1910, 116,577; 1914 (est.), 123,794.

Dayton was settled in 1796 by a party from Cincinnati. The original town plant was laid

out by Daniel Cooper. In 1805 the town was incorporated and named in honor of Gen. Jonathan Dayton, one of the early settlers. The first city charter was granted in 1841. The city was swept by a disastrous flood on March 25, 1913, in which 84 people lost their lives and a property loss of \$128,000,000 was sustained. Public-spirited citizens raised a fund of \$2,000,000 for flood prevention within two weeks after the waters had receded. A system of vast dry reservoirs costing \$17,000,000 is being built. This will entirely eliminate even minor danger in the entire Miami valley. Consult R. W. Steele, *History of Dayton* (1889), and Mary D. Steele, *History of Dayton* (1896).

**DAYTON.** A city and the county seat of Rhea Co., Tenn., 38 miles northeast of Chattanooga, on the Queen and Crescent Route and on the line of the Tennessee River Navigation Company (Map: Tennessee, F 3). It is in a rich iron and coal mining, cattle-raising, and fruit-growing region, and has manufactories of hosiery, chairs, boxes, brooms, and flour. There are also machine shops, furnaces, brickyards, and canneries. The city has a fine courthouse and owns its water works. Pop., 1890, 2719; 1900, 2004; 1910, 1991.

**DAYTON.** A city and the county seat of Columbia Co., Wash., 30 miles by rail northeast of Walla Walla, on the Touchet River, on the Northern Pacific Railroad, and on the line of the Oregon-Washington Railroad and Navigation Company (Map: Washington, H 3). It lies in a picturesque mountainous country, rich in agricultural products and live stock. There are large flouring mills and other manufacturing plants. The city has good water power. Pop., 1900, 2210; 1910, 2389.

**DAYTON, JAMES HENRY** (1846- ). An American naval officer, born at South Bend, Ind. After graduating from the United States Naval Academy in 1866 he served in the navy in the various grades, becoming captain in 1900 and rear admiral in 1906. He commanded the *Detroit* (1897-99), the naval station at San Juan (1899-1900), and the *Chicago* (1901-03). He was president of the Naval Board of Inspection and Survey in 1904-05. He commanded the Philippine squadron of the Asiatic fleet from 1906 to 1907, when he became commander in chief of the Pacific fleet. He was retired in 1908.

**DAYTON, JONATHAN** (1760-1824). An American soldier and legislator, born in Elizabethtown, N. J. He graduated at Princeton in 1776, was admitted to the bar, was appointed lieutenant in a New Jersey regiment in 1777, served as aid to General Sullivan against the Six Nations, and in 1798 became a brigadier general in the United States army. He was a member of the New Jersey Assembly in 1786-87 and 1790 (being Speaker in 1790) and of the New Jersey Senate in 1789-90, and was a delegate to the Constitutional Convention of 1787. From 1791 to 1799 he was a member of Congress (being Speaker of the House from 1795 to 1799) and from 1799 until 1805 served in the United States Senate. He was accused of conspiracy with Burr, but was not tried. Dayton, Ohio, was named in his honor.

**DAYTON, WILLIAM LEWIS** (1807-64). An American politician, nephew of Jonathan Dayton. He was born in Somerset Co., N. J., graduated at Princeton in 1825, was admitted to the bar five years later, and began the practice

of the law in Trenton. He was a member of the State Council or Senate in 1836-37 and a judge of the State Supreme Court in 1838-41, and in 1842 was appointed to the United States Senate. He was reflected on the expiration of his term and took an active part with the Whigs in opposing the extension of slavery, the annexation of Texas, and the Fugitive Slave Law. In 1856 he was the Republican candidate for Vice President. He was Attorney-General of New Jersey from 1857 to 1861 and from then until his death was United States Minister to France. He became a regent of the Smithsonian Institution in 1861. His son, WILLIAM LOUIS DAYTON (died 1897), was Minister to Holland in 1882-85.

**DAYTONA.** A city in Volusia Co., Fla., 110 miles by rail south of Jacksonville, on the Atlantic Ocean, the Halifax River, the Jacksonville-Miami Canal, the Florida East Coast Railroad, and on the line of the Florida Coastal Island Navigation Company (Map: Florida, E 2). It is a popular summer and winter resort, has many fine homes and hotels, a library, and an Elks Home. The chief industries are orange and strawberry culture, gardening, fishing, and celery growing. The water works are owned by the city. Pop., 1900, 1690; 1910, 3082.

**D'AZEGLIO.** See AZEGLIO, MARCHESE D'.

**DEACON** (A.S. *deacon*, from Lat. *diaconus*, from Gk. *diakonos*, *diakonos*, attendant). A subordinate ecclesiastical officer. In apostolic times, the name was applied to those officials of the Church who had the charge of collecting and distributing the alms of the faithful and taking care of the poor and the sick (Acts vi. 1-8); and these seem to have been considered the characteristic functions of the diaconate as late as the Trullan Council of 692. Thus, we find St. Laurence, Archdeacon of Rome, in the middle of the third century, making the care of the poor and the attendance upon Sixtus, his bishop, at the altar, his principal occupation and his pride, and it was as a deacon that Athanasius attended his bishop at the first general Council of Nicea (325) and defended the faith against Arius. But that the office was not restricted to these functions may be inferred from the fact that immediately after its institution we find deacons teaching and even baptizing (Acts vi. 10; viii. 5, 38). It evidently included in very early times the duties of guarding the sacred assemblies from the presence of unworthy persons, receiving the oblations and bringing them to the priest, reading the epistle and gospel from the *ambo*, and the names of those who were inscribed on the diptychs for commemoration, and assisting in the administration of the holy Communion. In matters of external ministry they had a very wide range, which the Apostolic Constitutions sum up by saying that the deacon must be the ear, eye, mouth, hand, heart, and soul of the bishop. With the development of the subdiaconate and the minor orders, only the more important and honorable offices in and out of the Church were left to the deacon. Owing to their small number (in early times often not more than seven in one place), and to their immediate relations to the bishop, they began to assume considerable importance, and their pretensions had more than once to be restrained. The office of deacon as it existed in the early Church has been preserved in the Eastern churches with little modification. At the present time in the Roman Catholic church the office is practically of no

importance, as it is really nothing more than a step to the priesthood, which is usually administered almost immediately after ordination to the diaconate. The *Pontificale Romanum*, indeed, defines the duties of a deacon as ministering at the altar, baptizing, and preaching; but all duties specially belonging to the offices of deacon and subdeacon, including their special functions in a solemn mass, are in practice nearly always discharged by priests. The special ceremonies of the ordination of a deacon include the putting on of the dalmatic and stole, and the delivery to him of the book of the Gospels, as well as the laying on of the bishop's hands. In the Anglican church the imposition of hands and the delivery of the book of the Gospels are retained. The deacon, who must be 23 years of age, continues a year in the office except in special cases. Besides pastoral work, preaching, and baptizing, he may read a large part of the service; but in England he is not allowed to hold a benefice. In the Methodist Episcopal church the deacon is a member of an order of the ministry next below the elder. The deacons are elected by the annual conference and ordained by the bishop presiding. They may assist in the administration of the Lord's Supper, may administer the rite of baptism, solemnize marriage, and serve as traveling preachers. In the Congregational and Baptist churches one or more deacons are elected by the members of each church to distribute the elements in the Communion, to act as the advisers of the pastor, and as the almoners of the charities of the church. The nature of the office is the same in the Presbyterian church, where the deacons are elected by the congregation and ordained by the minister to assist the body known as the session of the church in the care of the poor and in the general management of the secular affairs of the church. In the Lutheran churches of the United States the deacon is a layman chosen to attend to the charities and temporalities of the congregation. Of recent years there have been introduced into the statute law of a number of the States provisions by which deacons, by virtue of their office, become legal trustees of church property for the congregation, whether incorporated or unincorporated. Consult. Seidl, *Der Diaconat in der katholischen Kirche* (Regensburg, 1884); Hort, *The Christian Ecclesia* (London, 1897); McGiffert, *The Apostolic Age* (New York, 1897); Lindsay, *The Church and the Ministry in the Early Centuries* (London, 1902).

**DEACONESS.** One of an order of women in the Christian churches. Traces of the order appear in apostolic times (Rom. xvi. 1. 1 Tim. v. 9 et seq.), and deaconesses were generally found in the early Christian communities. Their duties were in general to supplement the work of the deacons and perform for members of their own sex such services as could with less propriety be performed by men. They assisted at the administration of baptism, acted as door-keepers on the women's side of the congregation, instructed the female catechumens, took charge of the sick and poor women, and were present at the interviews of the clergy with women. They were set apart for their work by laying on of hands and prayer by the bishop. In the earliest times widows were generally chosen, and it was considered seemly that a deaconess should be of mature years. The Council of Trullo (682) fixed the limit at 40. In the

Western church it was not introduced till the fourth century and always met with opposition, decrees of councils against the order being found as early as the fifth century, and by the eighth it had entirely disappeared. In the East it lingered longer, but the duties became much restricted. The modern development of the institution in the various Protestant churches of Europe and America dates from the third decade of the nineteenth century. In 1833 Pastor Theodor Fliedner of the United Evangelical Church of Prussia founded a deaconesses' home at Kaiserswerth in Rhenish Prussia, which has served as a model for similar institutions in many parts of the world. The inmates of these houses devote themselves to charitable work, but take no vows and are bound to no fixed term of service. Provision is generally made for their instruction and training, and they are under the supervision of an inspector or superior. In the Church of England much of the normal work of deaconesses is done by the various sisterhoods, though deaconesses have also been in existence since 1861. In America an order of deaconesses was established in St. Andrew's Parish, Baltimore, of the Protestant Episcopal church, in 1855. A canon was adopted by the General Convention in 1889, regulating the order and providing that members should have adequate preparation both technical and religious, which should extend over a period of two years. Training schools meeting this requirement are now maintained in New York and Philadelphia. The General Conference of the Methodist Episcopal church in 1888 made provision for the establishment of the order of deaconesses. There are now many homes belonging to that church in the United States. The Lutheran church also has several homes, the first having been organized in New York in 1852. The Presbyterian General Assembly in 1891 sanctioned the order. Consult: Potter, *Sisterhoods and Deaconesses* (New York, 1873); Robinson, *The Ministry of Deaconesses* (London, 1898); *The Church Quarterly Review*, No. 94, pp. 302 et seq. (ib., 1899); Golder, *History of the Deaconess Movement* (Cincinnati, 1903); *Year Book of the New York Training School for Deaconesses* (New York, 1892-1913). For the modern movement, consult *Addresses, Reports, Statements . . . of the United States, 1907* (Boston, 1907); Nutting and Dock, *History of Nursing* (New York, 1907). See **SISTERHOODS**.

**DEAD, BOOK OF THE.** The name given by Lepsius, and since generally applied, to the collection of magical and religious texts which, according to ancient Egyptian belief, formed a sort of guide and protection for the dead in their wanderings through the Lower World. It was placed in or near the coffin or in the arm-pits of the mummy. Hundreds of copies exist, some containing only a few chapters, while other rolls are over 100 feet in length. Some of these copies are very elaborately written and (especially in later times) are ornamented with colored pictures. The Egyptians themselves called the collection the book of 'coming forth in the daytime' (*pi-ret em h(r)ou*), from the opening words of the first chapter, which promise the soul of the deceased the power of visiting the Upper World. This title does as little justice to the varied contents of the collection as that erroneously proposed by Champollion and De Rougé ('the funerary ritual'). A better translation of its name would be 'The Book of the

Coming Forth by Day' (or during the day), or, perhaps still better, as Naville suggests (*The Old Egyptian Faith*, p. 164), 'The Book of the Coming out from the Day.' This strange collection is not to be regarded as a handbook of Egyptian theology; its character is chiefly magical, although some hymns to the gods are incorporated in it. The individual chapters date from various periods, although most of them seem to have come down from the time of the pyramids; some, perhaps, even from the prehistoric age. Specimen titles of the chapters are as follows: "The Chapter of the Coming forth from the Day and of Living again after being Dead," and "The Chapter of Going into and Coming out of the Lower World." A few formed part of the earliest collection of magical funerary texts inscribed on the walls inside the royal pyramids of the sixth dynasty; but the majority belong to a different corpus, which can be seen in process of gradual formation under the twelfth dynasty. At that time these texts were written on the sarcophagi; under the eighteenth dynasty they were written in papyrus, although the selection and order of the chapters fluctuated. A fixed canonical form, limited to about 165 chapters, was established in the twenty-sixth dynasty, though nothing is known in regard to the origin or the formation of the canon. Papyrus of this late date were the first published. (Consult Lepsius, *Das Todtenbuch der Aegypter*, Leipzig, 1849, republished by Davis, 1894, and De Rougé, *Rituel funéraire des anciens Egyptiens*, Paris, 1861-76.) Eventually it became evident that all late manuscripts were very corrupt, and in 1876 E. Naville was appointed by the Congress of Orientalists to prepare a critical edition of the text in use from the eighteenth to the twentieth dynasty. The Prussian government, with characteristic liberality, lent its support to the work. The results of Naville's labor, which appeared in 1886, under the title, *Das ägyptische Todtenbuch der 18ten bis 20ten Dynastie*, show that, even at the period covered by the learned editor's investigations, the texts were hopelessly corrupt and can only be understood by tracing them further back. Many facsimiles of manuscripts with pictures have been published, chiefly by Budge (*Papyrus of Ani*, etc.). The best translation is that of Lepage Renouf, which gives a complete translation, commentary, and notes (London, 1890); those of Birch (ib., 1867), Pierret (Paris, 1882), and Budge (London, 1898; cheaper ed., 1901) are not critical. For a concise statement, consult Naville, *The Old Egyptian Faith*, pp. 159-207 (New York and London, 1909). For a more complete bibliography, consult Steindorff, *Religion of the Ancient Egyptians*, p. 133, note 2.

**DEAD, BURNING OF THE.** See CREMATION OF THE DEAD.

**DEAD, JUDGMENT OF THE** (in ancient Egypt). The *Book of the Dead* contains, in chap. 125, which is one of the longest in the book, a picture representing the judgment which the defunct, before entering into the fields of the blessed, will undergo in the Lower World, in the presence of Osiris and 42 judges of monstrous form, who are at hand to devour the guilty and to drink his blood. Anubis, the god of the dead, and Thoth, the god of wisdom, examine the deceased by weighing his heart in the sacred "balance of justice." The famous "negative confession" enumerates 42 capital sins from which the deceased must be free, or at least

must claim to be free. Should he fail to pass the ordeal, he is either handed over to be devoured by the 42 judges mentioned above or by the monster, part hippopotamus, part crocodile, and part lion, which represents the Egyptian Cerberus, or is thrown into the fiery lake. This judgment scene is frequently represented. Should the deceased be found to be pure in heart, he is allowed to mingle with the spirits and the gods, and is supplied with "food, offerings, drinks . . . and clothes of fine linen." A very confused passage of Diodorus would seem to state that such a judgment was held on earth at the interment of the deceased and that a well-founded accusation could deprive even a king of his sepulture. The underlying truth seems to be that a ceremony, imitating the judgment, with priests in the mask of gods, and with the reading of the negative confession and the following acquittal, may sometimes have formed part of the funerary ritual.

**DEAD COLOR.** In painting, any color that has no gloss or reflecting quality.

**DEAD-LETTER OFFICE.** A division of the Post-Office Department, under the control of the Fourth Assistant Postmaster-General at Washington, D. C., to which unclaimed or undeliverable letters and packages are sent from local post offices. The official record for the year 1913 showed the receipt by this office of 13,214,346 letters and parcels. Nearly 7,000,000 of these letters and parcels were destroyed by the department, either because they did not contain the names of the senders or were of no value. Upward of 945,000 letters, containing money, drafts, checks, notes, money orders, or postage stamps, to the value of \$7,584,478, were returned to their senders, and the department derived as revenue from dead mail matter, which could not be returned, nearly \$32,000. During the year over 12,000 magazines, illustrated papers, picture cards and the like, which could not be returned to the owners, were distributed among the charitable institutions of the District of Columbia.

In the United Kingdom there are many centres for dealing with unclaimed letters. The principal office is in London. Letters containing nothing of value are at once destroyed. In the year 1905-06 over 1,000,000 letters could neither be delivered to the addressees nor returned to the senders.

**DEADLY AG'ARIC.** See FUNGI, EDIBLE AND POISONOUS.

**DEADLY NIGHTSHADE.** See BELLADONNA.

**DEAD NETTLE** (*Lamium*). A genus of plants of the mint family. The name "dead nettle"—popularly in some parts of England and Scotland, "dee nettle"—is also often extended to the genus *Galeopsis*, very similar to *Lamium galeopsis*, and sometimes distinguished by botanists as hemp nettle. *Lamium purpureum*, *Lamium album*, and *Galeopsis tetrahit* are very common weeds. The first two are sometimes boiled as potherbs in Sweden. The name is derived from the popular belief that the hairs of the dead nettle, particularly when the plant is dried, as in haymaking, cause irritation in the hands of persons handling them, which, extending through the system, occasionally terminates in death. They do not, however, seem to possess any poisonous property. Several of the species have become naturalized in various parts of the United States.

**DEAD RECKONING.** The computation of the ship's position from her movements as recorded in the log and without having a recourse to astronomical observations. The chief elements from which the reckoning is made are: the point of departure, i.e., the latitude and longitude sailed from or last determined; the course or direction sailed in (ascertained by the compass); the rate of sailing, measured from time to time by the log (q.v.); and the time elapsed. The various principles or methods followed in arriving at the reckoning from these data are known as *plane sailing*, *middle-latitude sailing*, etc. (See **SAILINGS**.) But the data themselves are liable to numerous uncertainties and errors, owing to currents, leeway (q.v.), fluctuations of the wind, changes in the declination of the compass, etc.; and therefore the results arrived at by the dead reckoning have to be corrected as often as is possible by observation of the heavenly bodies. See **NAVIGATION**; **LATITUDE AND LONGITUDE**; **COMPASS**.

**DEAD SEA** (Heb. *yām*, sea, or *yām ham-melach*, salt sea, Gk. *θάλασσα τῶν ἁλῶν*, *thalassa tōn halōn*, salt sea, *ἀσφαλτίτις λίμνη*, *asphaltitis limnē*, asphalt lake, *Σοδομίτις λίμνη*, *Sodomitis limnē*, lake of Sodom, or *θάλασσα νεκρά*, *thalassa nekra*, Dead Sea, Lat. *mare mortuum*, Dead Sea, Ar. *Bahr Lūt*, sea of Lot). An inland lake, on the southeastern borders of Palestine (Map: Palestine, C 4), in which the course of the Jordan terminates. It forms a part of the deepest chasm on the earth's surface and has no outlet. The Jordan valley begins to sink below the level of the Mediterranean in the neighborhood of Lake Huleh, about 90 miles north of the Dead Sea. The Lake of Gennesaret is 680 feet below sea level, and the Dead Sea about 1202 feet. On the east the high plateau of Moab rises 3100 feet above the Mediterranean, about 4400 feet above the Dead Sea; on the west the plateau of Judea rises about 2000 feet above the sea. The shores are abrupt, in many places precipitous; the formation is chiefly limestone, though on the eastern side sandstone also appears, and except in the deltas formed by larger streams, on the peninsula, and at Engedi, where there is water, there is scarcely any vegetation or animal life. The Dead Sea is fed mainly by the Jordan from the north, draining the larger part of Palestine; several smaller streams also empty into it, chiefly from the east. The quantity of water poured into this closed sea by the various streams is estimated at 6,000,000 tons daily, all of which is carried off by evaporation. The most important are the Wady Zerka Ma'in (the stream of Callirrhoe), Wady Mojib (Arnon, q.v.), Wady-el-Dera'a and Wady-el-Hesa on the east; Wady Tuffeh on the south, Wady-el-Nar (Kedron) on the west. The length of the Dead Sea is 47 miles, its greatest breadth  $9\frac{1}{2}$  miles, and its area 340 square miles. The southern end is a swampy tract covered by water in the rainy season, so that the actual length of the lake varies by 2 or 3 miles according to the time of the year. From the eastern shore a peninsula juts out into the lake and extends towards the north for about 12 miles. De Sauley, De Luyne, and others have called this peninsula *al Lisan*, 'the tongue,' but it is apparently the southern bay to which the expressions *al lisan*, 'the tongue,' and *lisan al bahr*, 'the tongue of the sea,' refer, just as in the case of the corresponding Hebrew words in Josh. xv. 2, 5, xviii. 19, as Schmidt was told on the peninsula. It is formed

of white calcareous marl, salt, and gypsum, and rises 40 to 80 feet above the water, but with a range of hills attaining a height of 900 feet. South of this peninsula the lake is comparatively shallow (10 to 18 feet), while the greatest depth north of it is 1300 feet. In the southwestern corner is Jebel Uadum, or the Mountain of Sodom, over 4 miles in length,  $\frac{1}{2}$  mile wide, and from 400 to 600 feet in height. Inside this mountain there is an interesting grotto in the salt. The level of the water varies considerably with the season; during the last 40 years it seems to have been rising, at least in the northern part of the lake. The water contains at the depth of 1000 feet 27 per cent of solid substances—common salt, chloride of magnesium, chloride of calcium, and many other ingredients. From the chloride of magnesium the water receives its bitter taste, from the chloride of calcium its oily appearance and feeling. The specific gravity is 1.166, and the human body easily floats on the surface. The lake contains no life of any kind, with the exception of a few microbes, and sea fish put into its waters soon die. The Dead Sea has presented substantially the same appearance since the beginning of the Quaternary period. As a result of the elevation of the whole region out of the sea, after the close of the Eocene period, a fault or fracture was produced running the whole distance from the Gulf of Akabah to the base of Mount Hermon. During the Pleiocene and Pleistocene epochs the character of the depression was considerably changed. The large rainfall and the melting of the snows of Mount Lebanon, during the subglacial period, added greatly to the volume of water pouring into the Jordan valley and formed a lake that included Lake Huleh, the Lake of Galilee, and the Dead Sea. There is evidence that the water once stood as much as 1180 feet above its present level. At a subsequent stage it seems to have been only 378 feet higher than now. As the rainfall diminished and the climate grew warmer, evaporation increased. Beds of bituminous marl are found near the lake, and bituminous masses float on its surface, particularly at times when there are seismic disturbances. The region is not, as has been supposed, volcanic. The subsidence of the land in the southern part of the lake may have given rise to the story of the four cities that were overthrown, Sodom, Gomorrah, Admah, and Zeboim (Deut. xxix. 23). The name "Bahr Lūt," or its equivalent, cannot be traced beyond the period of Moslem occupancy. In the Fourth Book of Ezra (v. 7) the lake is called *mare Sodomitum*. This name is also found in the Talmud and in Edrisi (iii. 5). There is no passage in the canonical books of the Bible distinctly connecting the Dead Sea with Sodom and Gomorrah. "The vale of Siddim" is explained in Gen. xiv. 3 as "the Salt Sea." It is held by some scholars that this is a gloss coming from a copyist who erroneously supposed that the lake was once in historic times dry land. By others it is maintained that "The Vale of Siddim" refers to what now is the southern end of the sea, below the peninsula, which appears to have been formed in historic times. But the writer of Gen. xiv. did not think of an inundation as causing the destruction of Sodom and Gomorrah, but of a rain of fire and brimstone from heaven.

There has never been much navigation on the Dead Sea. Strabo (vi. 2) and Diodorus (xix, 25) tell of the floats on which men fished for

bitumen. The Bordeaux pilgrim saw no boat in 334 A.D.; but on the Madaba map (sixth century) there are two. In 1161 Maurice, Duke of Montreal, permitted the Knights of St. John to navigate on the Dead Sea without paying any customs duties. In the sixteenth century floats are mentioned again. Costigan in 1835, Moore and Beke in 1837, Symonds in 1841, and Molyneux in 1847 ventured out in boats, but did not get so far as the peninsula, and Costigan and Molyneux lost their lives in the attempt. Four scientific expeditions—those of Lynch in 1848, De Luynes in 1864, Schmidt in 1905, and Abel in 1911—have visited all parts of the sea, including the southern bay. In the twelfth and thirteenth centuries there were several centres of the sugar industry at the southern end, on the peninsula, between this and the Arnon, and near Jericho. In one of these, north of the peninsula, an aqueduct and the remains of a building, probably going back to Roman times, were discovered by Schmidt. The most fruitful journeys around the lake on land were those of De Sauley in 1861 and Tristram in 1871. It is interesting to observe that the desolation and sterility characteristic of the Dead Sea were regarded as something abnormal, and that prophets predicted a future change to fertility and life through a fountain flowing down from the temple in Jerusalem and healing the waters (Ezek. xlvii. 1-12, Zech. xiv. 8, and perhaps also Joel iii. 18). (1854); Fraas, *Das Todte Meer* (1867); Lynch, *Narrative of the United States Expedition to the Dead Sea* (1849); De Sauley, *Voyage autour de la Mer Morte*, vol. i (1853); De Luynes, *Voyage d'exploration à la Mer Morte* (1874 et seq.); Stoppani, *Il Mare Morto* (1875); Tristram, *The Land of Moab* (2d ed., 1874); Falucci, *Il Mare Morto e la Pentapoli del Giordano* (1881); Guérin, *Description de la Palestine: Samarie* vol. i (1874); Hull, *Mount Seir* (1889); Gautier, *Autour de la Mer Morte* (1901); Schmidt, *Fifth Annual Report of the Director of the American School for Oriental Study and Research* (1905); id., "The River Arnon," in *Journal of Biblical Literature* (1905), and "The East Coast of the Dead Sea and the Ruins in Wadi Suweil," ib. (1906); Abel, *Une croisière autour de la Mer Morte* (1911); Blanckenhorn, *Das Todte Meer* (1898); id., *Naturwissenschaftliche Studien am Toten Meer und im Jordanthal* (1912).

**DEADWOOD.** A city and the county seat of Lawrence Co., S. Dak., in the extreme western part of the State, about 170 miles (direct) west of Pierre, on the Chicago and Northwestern, and the Chicago, Burlington, and Quincy railroads (Map: South Dakota, A 3). It has a United States assay office, where \$8,000,000 in gold is handled annually; the Stilwell Curio Museum; a Carnegie library, and a government building. The city is the distributing and financial centre for the mining region of the Black Hills, yielding gold, lead, silver, and tin. There are smelting and cyanide reduction works, planing mills, machine shops, brewery, a foundry, brick and lime works, and a large sliming plant. Deadwood was settled in 1876. Pop., 1900, 3498; 1910, 3653.

**DEAF-MUTE.** A person who is deaf and dumb. Those who are born deaf or who lose their hearing at a very early age are also dumb,

because they have not learned to speak by hearing others speak. They should not, therefore, be classed with those who cannot articulate words because of defect in the speech centres of the brain or disease of the organs of articulation. Persons who have learned to speak and then become deaf do not become mute, though the quality of voice used is often harsh and unnatural; and if the deprivation of hearing occurred in childhood, the voice often remains childish. Deafness from birth (congenital deafness) is probably due to arrest of development in the embryo. The condition is found in certain instances as a family trait, in families with neurotic inheritances. Alcoholism and insanity are found in such families; and, besides these, parental syphilis is frequently a causal influence in producing congenital deafness. The intermarriage of near relatives who inherit similar disease tendencies has been a large factor in the production of deaf offspring. Boudin, of Paris, asserts that about 25 per cent of the deaf-mutes of France are the offspring of consanguineous marriages. In England Buxton places the figures at 10 per cent in his experience. Bemiss, of Louisville, Ky., records that over 10 per cent of the deaf and dumb throughout the country at large are the offspring of kindred parents. Howe, of Boston, gave similar testimony. Since the educational opportunities and social status of deaf-mutes have been improved, marriages among them are common. Such unions are only slightly less productive than normal marriages. Of 3078 couples 14.1 per cent were without offspring, and the average number of children among them was 2.61 per cent. The principal causes of acquired deafness are noted under DEAFNESS.

In early historical times statesmen, lawyers, and philosophers agreed that deaf-mutes were incapable of being educated. Legally deaf-mutes were then almost everywhere in the same position as idiots and madmen. The Roman law held them to be incapable of consent and consequently unable to enter into a legal obligation or contract. In France deaf-mutes were considered a disgrace to their parents and were kept in seclusion in convents and asylums. Yet examples of considerable capacity on the part of deaf-mutes were not unknown in ancient times and in the Middle Ages. Pliny mentions a successful deaf-mute painter at Rome. The Venerable Bede, about the close of the seventh century, gives an account of a dumb youth who was taught by an early English bishop, St. John of Beverley, to repeat words and sentences after him. Rodolphus Agricola, of Groningen (1442-85), mentions a deaf-mute who had received instruction and could write.

The credit for the first systematic examination of the problem from a philosophical point of view is due to Jerome Cardan (q.v.), whose conclusion was that "written characters and ideas may be connected together without the intervention of sounds." This authoritative declaration had the effect of arousing widespread interest in the problem, and Pedro Ponce de León (1520-84), a Spanish Benedictine monk, undertook to give regular instruction to the deaf and dumb. Pasch, a clergyman of Brandenburg, was the next teacher of note, and he was followed by Juan Pablo Bonet, secretary to the Constable of Castile, Spain, also a Benedictine monk. Bonet published a work in 1620, which is the earliest-known treatise on the sub-

ject and which probably embodied the ideas of Cardan. It contained a manual alphabet differing much from that described by Bede and in the main identical with the single-hand manual in use to-day. The treatise of Dr. John Bulmer, an English physician, followed in 1648; and this was succeeded by the work of Dr. Wallis, an Oxford professor of mathematics. In 1669 Dr. William Holder, rector of Bletchington, published a similar work, and in 1670 George Sibscote put forth another work. A very able and philosophical treatise was published in 1680 by George Dalgarno, of Aberdeen, Scotland, which received high praise from Leibnitz, together with an earlier work, to which Wallis and Wilkins are both said to be indebted. In the first rank among early teachers of deaf-mutes stands John Conrad Amman, a Swiss physician residing in Amsterdam, who in 1692 reduced the methods then known to an exact art, as described in his *Surdus Loquens*. France, late to recognize the possibilities of deaf-mute instruction, furnished many enthusiastic advocates of it, as Père Vanin, Ernaud, Rodriguez Pereira (a Spaniard who settled in France), and the Abbé Deschamps. Pre-eminent stands the Abbé Charles Michel de l'Épée (1712-89), of Paris, who systematized the instruction of deaf-mutes in France in 1760 in his own school. His successor, Sicard, as well as Itard, followed his methods. It was in 1760, also, that Thomas Braidwood established, at Edinburgh, the first private school for deaf-mutes in the British dominions. This school, in which Wallis's plan of instruction was followed, was the model of the earlier British institutions. In 1783 this school was removed to Hackney, London, and probably led to the establishment of the London Asylum in 1792. Dr. Joseph Watson, a nephew and former assistant of Braidwood, was its first principal.

**Institutions.** The first public school for deaf-mutes was established at Leipzig in 1778, under the direction of Samuel Heinicke (1720-90). The systematic instruction of the deaf and dumb, and the intelligent organization of institutions in which to educate them, date from the early part of the nineteenth century. An essay on *Teaching the Deaf to Speak*, by Dr. W. Thornton of Philadelphia, was published in 1793, and in 1811 a grandson of Braidwood tried to establish schools in New York and in Virginia, but failed in both instances. The circumstances which led to the opening of the Connecticut asylum at Hartford, April 15, 1817, are as follows: A deaf-mute little girl in the family of Dr. Cogswell, an eminent physician in Hartford, attracting some attention, it was soon afterward found that there were other deaf-mutes in the country. It was decided to send some one abroad to acquire the art of educating them; and to establish a school for this purpose funds were raised, and the Rev. Thomas H. Gallaudet was selected for this work. He left the United States, May 15, 1816, to execute this mission. The institution was incorporated by the Connecticut Legislature in May, 1816, with an appropriation of \$5000. Dr. Gallaudet returned to America in August of the same year, accompanied by Laurent Clerc, a deaf-mute pupil of the Abbé Sicard, and they immediately began collecting funds to start the school. The enterprise excited general interest; individuals and churches contributed liberally, and the sum of \$12,000

was raised in the course of a few months. Early in 1819 Massachusetts followed the example of Connecticut by providing for the education in the asylum of 20 indigent pupils from that State. The appropriation was afterward enlarged so as to meet the demands of this entire class. New Hampshire made a similar provision in 1821, and Vermont and Maine in 1825. In 1834 South Carolina and Georgia decided to send their indigent deaf-mutes to the asylum, and in 1848 Rhode Island came into the same arrangement. In 1819 Congress made a grant to the institution of 23 acres of wild land, the proceeds of which now form a fund of \$339,000. It was owing to this munificent gift that the name of the school was changed to the "American Asylum." Before the school at Hartford was in operation, efforts had been made to establish a similar institution in the city of New York: a society was formed which was incorporated April 15, 1817, as the "New York Institution for Instruction of the Deaf and Dumb." Watson's book was taken as a guide, and articulation was taught in cases where the scholar appeared to possess the necessary aptitude. But this method did not prove very successful; and in 1827 the Legislature, which had provided since 1822 for the support of 32 pupils, authorized an investigation by the superintendent of common schools of the State, who recommended in his report the introduction into the New York school of the improved methods in use at Hartford and Philadelphia. In consequence of that recommendation, the directors finally succeeded in engaging, in 1831, the permanent services of Harvey P. Peet, then one of the most efficient instructors in the American Asylum. He served as principal from 1831 to 1867 and had a worthy successor in his son, Isaac Lewis Peet. Under the management of these two able teachers the institution has taken a place among the most successful schools for deaf-mutes in the world. Its grounds comprise about 26 acres, upon the banks of the Hudson River at Washington Heights, New York City. The institution has a shoe shop, tailor shop, and carpenter shop, a printing office, garden, and sewing rooms connected with the school, in which the pupils receive competent instruction to prepare them for self-support by manual labor, as in all our large asylums. The Pennsylvania institution was organized at Philadelphia in 1820 by Joseph Seixas, a Portuguese Jew. Laurent Clerc was an instructor in it, as was Lewis Weld, its first principal. The Kentucky Asylum for Deaf-Mutes was incorporated at Danville in 1823. The Ohio institution was opened in Columbus in 1820. Virginia, Indiana, Tennessee, Illinois, North Carolina, Georgia, South Carolina, Missouri, Wisconsin, and Michigan followed the example during the succeeding quarter century, and now every State in the Union has an institution in which deaf-mutes receive the privileges of education "as wards of the commonwealth." In most cases the State institutions are supported by annual legislative appropriations. This public provision includes expenses of transportation to and from the institution and all expenses while there. Most of the State institutions have school years corresponding to those of the public schools, and it is expected that friends or relatives will keep the children during the long summer vacation. The average term of attendance is about five years, but the

legal period of instruction in most States is seven years. The average cost to the State is about \$325 per year. According to the report of the Commissioner of Education for the year ending June 30, 1912, there were in the United States, in 1911-12, 141 schools (both public and private), with 13,690 pupils. The following table gives details regarding these:

	State institutions	Public day schools for the deaf	Private schools
Number of schools....	64	58	19
Male teachers ....	410	10	15
Female teachers ....	930	229	69
Total.....	1,340	239	84
Male pupils .....	6,057	949	217
Female pupils .....	5,187	979	301
Total.....	11,244	1,928	518
Graduates, 1912	130	2	1
Taught by oral method	6,596	1,798	373
Articular method	340	33	18

Public day schools for the deaf now exist in California (4), Illinois (3), Louisiana (1), Massachusetts (1), Michigan (14), Missouri (1), New Jersey (2), New York (2), Ohio (6), Oregon (1), Washington (2), and Wisconsin (21).

Besides those already mentioned, the names of the following Americans should be recorded as especially associated with the education of deaf-mutes: Dr. F. A. P. Barnard, for many years president of Columbia College, New York City; William W. Turner, of Hartford; Abraham R. Walton, of Philadelphia; John A. Jacobs, of Kentucky; Dr. Samuel G. Howe, of Boston; and Thomas and Edward M. Gallaudet, sons of the Rev. Thomas H. Gallaudet.

Some very remarkable examples of acute perception and great proficiency in deaf-mutes have been recorded, notably the cases of Julia Brace, a pupil of Dr. Thomas H. Gallaudet, of Hartford; Laura Bridgman (q.v.), the celebrated blind deaf-mute, a pupil of Dr. Howe, of Boston; and Helen Keller (q.v.), of Boston, a lady of wide information and great intelligence.

**Methods of Instruction.** Two methods of instruction are used in teaching the deaf and dumb—by the *sign language* and by *articulation*. By means of the sign language ideas are communicated to the pupil through posture, gesture, facial expression, and mimic acting by the teacher. Nothing is spelled with the hands in this method, as is erroneously supposed. Putting the hand to the head, as if putting on a cap, is the sign for "man," for example. This is an arbitrary sign. An example of a natural sign is raising the hand to the mouth and then chewing, to express "food." The sign language is easily and speedily acquired and is said to be understood and used by the American Indians. The use of an elaborate sign language was carried to such extremes by the Abbé de l'Épée

and his followers, Abbé Sicard and Abbé Storek, that their pupils relied entirely upon their memory, without any corresponding ideation. They proved to be incapable of composing sentences voluntarily, but simply memorized the gesture of the master. In some schools, after the pupil has become proficient in the sign manual, the use of the alphabet is introduced. The one-handed and two-handed alphabets are shown in the figures. Almost all pupils find the acquisition of *articulation*, or lip reading, easier than that of the manual alphabet. In teaching by articulation the pupil watches the lips and tongue of the teacher and, by imitation of the motions seen, is able to speak. Consonants are taught first, and then the vowels. During the pronunciation of some sounds the pupil grasps the teacher's throat and imitates the vibration and position of the muscles. This method is very slow, and pupils gain more general knowledge and with greater ease by the use of the *sign language*. In the celebrated Clarke school at Northampton, Mass., the old method of articulation was employed for a considerable time,

ONE-HANDED ALPHABET.

but has been displaced by the Bell system. The method of teaching articulation by *visible speech* was invented by A. Melville Bell, professor of vocal physiology in Edinburgh, who introduced it in 1848. It was perfected and first used in the schools of Great Britain in 1869. In 1872 it was introduced into the Northampton school

by A. Graham Bell, the son of the inventor of the method. The Bell system consists of a series of phonetic characters based on the position of the vocal organs when in action. The charac-

TWO-HANDED ALPHABET

ters suggest to the eye the mechanism of speech in the formation of every possible sound that can be uttered. The following explanation of the system and of the characters is taken from Bell's *English Visible Speech in Twelve Lessons* (Washington, D. C., 1895). Dr Bell adds that

- |   |                |   |                    |
|---|----------------|---|--------------------|
| C | Back of tongue | S | Nasal passage open |
| C | Top of tongue  | X | Glottis, closed    |

- |   |                           |   |                     |
|---|---------------------------|---|---------------------|
| U | Point of tongue           |   | Glottis, vocalizing |
| U | Lips                      | O | " open (aspirate)   |
| O | Throat aspirate (whisper) |   |                     |

A curved line means a consonant.

A straight line means a vowel.

A line within a curve means a vocal consonant.

## CONSONANTS

The direction of the curve denotes:

To left (C) formation by back of tongue.

To right (C) formation by lips.

Convex above (C) formation by top of tongue.

Concave above (C) formation by point of tongue.

The varieties of curves denote:

Primary (C) central emission of breath.

Divided (3) side emission of breath.

Mixed (C) central emission of breath. } with modification by two parts of the mouth.

Mixed divided (M) side emission of breath.

Shut (C) oral stoppage of breath with emission through the nose.

Nasal (C) oral stoppage of breath.

## VOWELS

A point or a hook on a straight line denotes the vowel positions of the tongue. Thus:

On left side of line (l) back of mouth.

On right side of line (r) front of mouth.

On both sides of line (T) mixed back and front.

At top of line (T) high.

At bottom of line (l) low.

At both ends of line (l) mid elevation.

A cross bar on a line denotes rounding or contraction of the lips. Thus: f t j

The symbols have the same value in all languages. Consequently, when the meaning of the symbols is known, the sound of any language may be deduced with certainty from their visible speech writing.

these explanations are for teachers only, for learners do not require to know the theory of the system.

Statistics. The number of deaf-mutes bears a certain relation to the population, being far greater in countries wherein squalor, privation,

or medical ignorance and unhygienic conditions prevail. The ratio of deaf-mutes to population is as follows, for the different countries named: Sardinia, 1 to 760; Nova Scotia, 1 to 880; Ireland and Norway, 1 to 970; France, 1 to 1200; Prussia, 1 to 1675; England, 1 to 1970; Holland, 1 to 2000; United States, 1 to 2400.

Gallaudet, *The Combined System of Educating the Deaf* (ib., 1891). The Volta Bureau, Washington, D. C., issues many publications upon the subject, among which may be noted: Fay, *Marriages of the Deaf in America* (1898); Arnold, *Manual for Teaching the Deaf; Histories of American Schools for the Deaf*. Consult also Horne, *Hereditary Deaf-Mutism* (London, 1909), and Winnie, *History and Handbook of Day Schools for the Deaf and Blind* (New York, 1912).

**DEAFNESS**, dēf'nēs (AS. *dēaf*, OHG. *toup*, Ger. *taub*, Goth. *daubs*, deaf; probably originally dull of sense; cf. MHG. *tump*, stupid, OHG. *tumb*, deaf, dumb, Gk. *τυφλός*, *typhlos*, blind). Complete or partial imperfection of hearing that may affect both ears or one, may and may not date from birth, and may be either permanent or temporary. Among the numerous possible causes of deafness the following deserve mention here: (1) wax in the ear touching the drum membrane; (2) swelling of the lining membrane of the Eustachian tubes, the canals that lead from the upper part of the throat to the middle ear, one on each side, (3) perforation of the drum membrane; (4) middle-ear disease, during which exudation accompanying inflammation collects behind the drum membrane or about the ossicles (the small bones of the ear), or during which adhesions form between the ossicles, stiffening their joints so that they cannot move freely against each other; (5) internal-ear disease, either labyrinthine trouble or affection of the eighth nerve; (6) diseases of the brain involving some of the auditory centres; (7) mumps, measles, scarlet fever, and some other diseases, are accompanied by middle-ear disease; (8) quinine and the salicylates cause temporary deafness; (9) sudden concussion sometimes ruptures the drum of the ear, and constant noise, like that in a boiler shop, injures the auditory nerve from overexcitation.

The treatment of deafness depends, naturally, upon its cause. Wax should be removed by syringing or the cautious use of the curette. Closure of the Eustachian tubes is treated by catheterization and local applications. In cases of perforation the drum may grow again, after the cure of middle-ear disease, or may be remedied by the application of a disk of thin gutta-percha tissue. Middle-ear diseases may be cured by treatment through the Eustachian tubes, or purulent cases may require the operation of opening the accessory cavities of the ear situated in the mastoid process of the temporal bone through the skull back of the auricle. The ossicles may be removed in part, leaving the foot plate of the stirrup bone in position, closing the oval window in the labyrinth, and clearing out the remains of the drum membrane; in which case the waves of sound strike the stirrup plate in place of the drum membrane and are conducted to the nerve filaments. Internal-ear disease may be relieved by internal medication, but is gener-

ally permanent. See EAR; DEAF-MUTE; NERVOUS SYSTEM.

**DEÁK**, dē'ák, FERENCZ (FRANCIS) (1803-76). An Hungarian statesman, born at Sőjtör, in the County of Zala. He studied law at Raab, practiced as an advocate in his native county, and soon became noted for his eloquence and enlightened patriotism. Elected in 1832 to the National Diet, Deák, as leader of the Liberal opposition, resisted every attempt of the Imperial government to infringe on the constitutional rights of Hungary. At the same time he labored for its internal improvement, promoting measures for the elevation of the peasantry, and advocated the abolition of exemption from taxes enjoyed by the nobility, of which he was himself a member. His views on the last point displeased a portion of his constituents, and he declined to serve in the Diet of 1843-44, but he continued to direct the policy of the Moderate Liberal party. After the revolution of March, 1848, he became Minister of Justice in the cabinet of Count Batthyányi (q.v.) and formed the project of effecting a general reform in the administration of justice in Hungary, which, however, the revolutionary war rendered impossible. Deák used every effort to ward off the struggle and to arrive at an arrangement with Austria. When the rupture seemed inevitable and the Committee of Defense was formed, with Kossuth at its head, Deák resigned his portfolio. At the close of 1848 he was sent to the camp of the Austrian commander, Windischgrätz, to negotiate for peace, but the attempt failed. Deák was arrested, but was soon released and took up his abode at Pest. Though repeatedly invited to act as mediator between the dynasty and the Hungarian nation, Deák did not return to public life until 1860, when Francis Joseph promised to restore to Hungary its constitutional liberties. Returned by the city of Pest to the Diet in 1861, he became the acknowledged leader in that assembly. In May the Diet appointed him to draw up the address to the Emperor. This address demanded the restoration of the constitution of 1848 and an independent Hungarian ministry. The Emperor thereupon announced the dissolution of the Hungarian Diet. A new effort to reach an agreement was made in 1865, and, after the disastrous issue of the war between Austria and Prussia in 1866, the Emperor found himself compelled to accede to all the demands of Hungary, as formulated by Deák. The Austrian monarchy was reorganized on its present dualistic basis, and Francis Joseph was crowned with great pomp as constitutional King of Hungary in 1867. Deák remained until his death (Jan. 29, 1876) the leader of his party in the Diet. Deák is universally admitted to have been one of the ablest of European statesmen. He was a man of the loftiest character, kindly and simple in his ways. As an orator, he was irresistible by the sheer force of his logic. Consult: Forster, *Francis Deák, Hungarian Statesman* (London, 1880); Laveleye, "Ferencz Deák," in *La Prusse et l'Autriche* (Paris, 1870); Csengery, *Franz Deák*, authorized German translation by Heinrich (Leipzig, 1877-78).

**DEÁ'KIN**, ALFRED (1856- ). An Australian statesman, born in Melbourne. He studied at the university of his native town and was elected to the Victorian Parliament in 1879. In 1883 he was Colonial Minister of Public Works and in 1885 became Solicitor-General. Two years later he represented Victoria in the Imperial

Conference at London and subsequently took active part in the movement for Australian federation. He was Attorney-General in the first Commonwealth ministry (1901-03), and in the latter year succeeded Sir Edmund Barton as Premier and leader of the Protectionist party. His ministry was overthrown in April, 1904, but he formed a new government in July, 1905, serving as Prime Minister in 1905-08 and in 1909-10. He represented Australia at the Imperial Conference (1907), and was leader of the Federal opposition from 1910 to 1913, when he retired from political life. His publications include *Irrigation in Australia* (1893) and *Temple and Tomb* (1894).

**DEAL** (formerly *Dole*, from Icel. *dalr*, Norw. *dæl*, Eng. *dale*). A municipal borough, market town, and sea-bathing place, in Kent, England, on the North Sea, between North and South Foreland, 8 miles north-northeast of Dover (Map: England, H 5). The fine anchorage of the Downs, about 8 miles long by 6 miles wide, formed by the Goodwin Sands, lies off Deal. The town is composed of Lower Deal, on the coast. Middle Deal, and Upper Deal, the original settlement, once on the coast, but now about a mile inland. The chief branches of industry are connected with maritime pursuits, boat building, sail making, "hoveling"—i.e., piloting, the term being perhaps derived from the use of hovels on the shore—victualing, and naval stores. Deal hovelers have long been famous for their skill and fearlessness as seamen and life-savers. Pop., 1901, 10,581; 1911, 11,297. Deal has been one of the Cinque Ports since the thirteenth century. The coast near Deal was formerly defended by four castles: Deal, built by Henry VIII in 1539. Sandown, about a mile to the east, where Colonel Hutchinson, the Puritan soldier, was imprisoned and probably died; Sandgate, and Walmer. Sandown Castle was removed on account of the inroads of the sea. Walmer Castle, in which the Duke of Wellington died in 1852, is now the official residence of the Lord Warden of the Cinque Ports (q.v.). Julius Cæsar, with two legions in 82 ships, is believed by some to have landed at Deal in 55 B.C.

**DEAL** (Dan. *deæl*, Ger. *Diele*, board, plank, AS. *thel*, plank, *thille*, board). The trade name in England for fir boards exceeding 6 feet in length and 7 inches in width. Pieces of smaller section are called battens. Deals are usually 3 inches thick, and when sawed into thinner pieces they are called boards. When a deal is sawed into 12 or more thin planks, they are called leaves. These terms are not used in the United States (except *batten* for a long, narrow, flat strip).

**DEALEY, JAMES QUAYLE** (1861- ). An American university professor and writer on social science. He was born at Manchester, England, but early came to the United States, graduated from Brown University in 1890, and spent five years in advanced work. For several years he taught in Texas and Vermont, but he returned to Brown to be an instructor in Latin from 1893 to 1895, and after that professor of social and political science. His publications include: *Textbook of Sociology* (1905), with Lester F. Ward; *Our State Constitutions* (1907); *The Development of the State* (1909); *Sociology* (1909); *Ethical and Religious Significance of the State* (1910); *The Family in its Sociological Aspects* (1912).

**DEALFISH** (*deal*, a board, plank; refers to

the shape of the fish). A ribbon fish (q.v.), especially of the genus *Trachipterus*.

**DEAMBULATORY** (Lat. *deambulatorium*, a gallery for walking, from *deambulare*, to walk abroad, to promenade). The same as **AMBULATORY** (q.v.).

**DE AMICIS, dā a-mĕ'chĕs, EDMONDO. See AMICIS, EDMONDO DE.**

**DE AMICITIA, dē am'ĭ-shĭ't-a, or LĒ'LIUS.** A treatise by Cicero on friendship, written in 44 B.C., and dedicated to Titus Pomponius Atticus. The time is supposed to be 129 B.C.

**DEAN** (ME. *dean*, OF. *deien*, Fr. *doyen*, from Lat. *decanus*, one set over ten persons, from Lat. *decem*, Gk. *deka*, *deka*, Skt. *dāśa*, ten). The title of certain dignitaries, particularly ecclesiastical and academic. In the ecclesiastical sense the title was originally adapted from the Roman civil administration, in which were officers called deans, mentioned in the codes of Theodosius and Justinian. It was at one time customary in the monasteries to appoint a *decanus* over every 10 monks, to take charge of their discipline. On the introduction of the canonical life (see *CANON*) among the clergy attached to cathedrals, this title was applied in many places to the head of the chapter (q.v.); but as early as the time of St. Jerome it was customary to have a similar officer attached to the bishop's immediate staff under the title of *archipresbyter*. In modern German cathedrals the dean is frequently subordinate to the provost, and has executive and partly secular functions. He is appointed usually by the bishop, but sometimes by the sovereign or the chapter. The deans of English cathedrals are appointed by the crown and required to reside for eight months in the year. The income of the office varies from £3000 in the case of Christ Church, Oxford, down to £500 at Chichester.

In this sense the title is used in a few dioceses of the American Episcopal church, though the functions connected with it are generally rather vaguely defined. There are also in England *deans of peculiars*, the incumbents of certain churches formerly, though not now, collegiate, as of Battle, in Sussex, founded by William the Conqueror, in memory of his conquest; of Bocking, in Essex, and of Croydon, in Surrey. The deans of Westminster and Windsor are also deans of peculiars, the Abbey and St. George's Chapel being exempt from the jurisdiction of the bishops in whose diocese they are situated. There have been also from very ancient times, both in England and on the Continent, *rural deans*, whose duty it is to visit a certain number of parishes and report on their condition to the bishop: the more important and formal part of their functions has, however, been transferred to the archdeacon. Similar officers in America are known as deans of convocations.

In the universities of Oxford and Cambridge the dean is the officer in each college who superintends its discipline, except in the case of Christ Church, Oxford, which is both cathedral and college, and where the dean is head of the college. The title is still sometimes used in America in its earlier sense as designating the presiding or senior officer of an academic faculty. In German universities each faculty elects a dean annually, who presides over its meetings, represents it in external relations, and supervises both teachers and students.

In a special sense the word is applied to the oldest member in length of service of a body of

persons of equal rank, such as a diplomatic corps, or to the president of an incorporated body of lawyers. It is in the latter sense that the chief judicial officer of the Archbishop of Canterbury is called the Dean of the Court of Arches. The dean of the Sacred College is the senior Cardinal Bishop, who always occupies the see of Ostia. He presides at the meetings of the Sacred College in the absence of the Pope. He has the privilege of wearing the *pallium* in all ceremonies pertaining to his office, of consecrating the newly elected Pope in case he should not be already a bishop, and in any case of presiding at the coronation ceremonies. See CARDINAL.

**DEAN** (AS. *denn*, valley), FOREST OF. A hilly tract, 22,000 acres in extent, in the west of Gloucestershire, England, between the Severn and the Wye. It is partly crownland. It was formerly a vast source of timber supply for the British navy, and half of it still remains inclosed for that purpose. It contains oak, beech, and other woods, orchards, stone quarries, and coal and iron mines. The iron shafts have been worked since Roman times. A populous mining district, it gives its name to a parliamentary division which includes nearly all of Gloucestershire west of the Severn.

**DEAN, AMOS** (1803-68). An American lawyer and law writer. He was born in Barnard, Vt., and graduated at Union College in 1822. He soon gained recognition as a lawyer of ability and learning, and his treatises on legal subjects were recognized as authoritative. In 1839 he became professor of medical jurisprudence in the Albany Medical School and in 1851 professor of law in the newly founded law school at Albany. He also served as chancellor and professor of history at the University of Iowa in 1855. His works include: *Lectures on Phrenology* (1835); *Manual of Law* (1838); *Philosophy of Human Life* (1839); *Medical Jurisprudence* (1854); *Bryant and Stratton's Commercial Law* (1861); an unfinished *History of Civilization* (7 vols., 1869-70); *The British Constitution* (1883).

**DEAN, BASHFORD** (1867- ). An American zoölogist, born in New York City and educated at the College of the City of New York, where he graduated in 1886, at Columbia University, and in Munich and Naples. He taught at Columbia after 1891, becoming professor of vertebrate zoölogy in 1904. He also served (1900-01) as biologist of the United States Fish Commission, for which he made special investigations in Europe and Japan. In 1902 he became a member of the advisory board of the New York Aquarium, in 1903 curator of herpetology and ichthyology in the American Museum of Natural History, and in the same year curator of arms and armor in the Metropolitan Museum of Art. Besides papers on paleichthyology and the embryology of fishes, and reports to the United States Fish Commission, he is author of the textbook *Fishes, Living and Fossil* (1895).

**DEANE, CHARLES** (1813-89). An American author. He was born in Biddeford, Me., was educated at Saco, and in 1832 went to Boston, where he was a merchant for 22 years. He early acquired a taste for American history and at the time of his death had accumulated a valuable collection of rare Americana. Among his publications are: *Some Notices of Samuel Gorton* (1850); *Memoir of George Livermore* (1869); *The Forms in Issuing Letters Patent by the Crown of England* (1870). He also edited Bradford's *History of Plymouth Plantation* (1856);

Wingfield's *Discourse of Virginia* (1860), in which was first seriously questioned the authenticity of the famous Pocahontas rescue story; and John Smith's *True Relation* (1866).

**DEANE, JAMES** (1801-58). An American physician and naturalist, born in Coleraine, Mass. He was the discoverer, in 1835, of the fossil footprints in the red sandstone of the Connecticut valley, later more fully investigated by Professor (afterward President) Edward Hitchcock of Amherst College. On this subject he wrote *Ichnographs from the Sandstone of Connecticut River* (1861). He also published many articles on medical subjects.

**DEANE, SILAS** (1737-89). An American diplomatist during the Revolutionary War, who passed the latter part of his life in England. He was born in Groton, Conn., graduated at Yale in 1758, was admitted to the bar in 1761, became an active member of the "patriot" party on the approach of the Revolutionary War, and was a delegate from Connecticut to the first and second Continental Congresses. In February, 1776, largely through the influence of Robert Morris, he was appointed by Congress business agent of the United States at Paris, where he entered upon his duties in July of the same year. Until Franklin's arrival he acted virtually as the official delegate of the United States to the French court and, besides securing and transmitting supplies, induced many French officers—sometimes by lavish and ill-advised promises—to take service in the American army. In December he, with Benjamin Franklin and Arthur Lee, went as commissioner from Congress to France. Soon afterward he was charged indirectly by Arthur Lee (q.v.) with having misappropriated part of the public funds, and towards the close of 1777 Congress sent a summons to him to return, ostensibly to communicate information concerning the attitude of European Powers towards the United States. Before this order reached him, he signed, together with the other commissioners, the treaties of commerce and alliance with France early in 1778. Immediately upon his return he was asked to surrender a detailed account of his financial transactions, but failed to satisfy Congress, which persistently refused to authorize a settlement of his accounts. In America he was defended by John Jay and John Adams. "No proof appears that he had been dishonest," says the historian Hildreth, "or had employed the public money in speculations of his own, as his enemies alleged; but he had occupied the unfortunate position of having large sums of public money pass through his hands before any proper system of vouchers and accountability had been established, and he fell before the same spirit of malignant accusation which presently assailed Wadsworth, Greene, Morris, and even Franklin himself, but which they had better means of warding off" (*History of the United States*, iii, 269). Deane soon returned to France, largely for the purpose of straightening out his accounts, was forced to retire to Holland for a while, and subsequently became convinced that the Revolution was destined to fail and that the United States should again become Colonies of England. Late in 1781 *Rivington's Royal Gazette* (New York) published a series of "intercepted" letters written by him (at the instigation, it has been charged, of George III and Lord North) to prominent Americans, in which he strongly opposed the Declaration of Independence and the French alliance

and urged prompt submission to Great Britain. For this he was considered a traitor by a large element of the patriot party. In 1842 Congress at last adjusted Deane's accounts and paid to his heirs about \$37,000. Dean published, in defense of his conduct, *An Address to the Free and Independent Citizens of the United States* (Hartford and London, 1784). A part of his correspondence in 1774-76 is given in the *Papers of the Connecticut Historical Society*, vol. ii (Hartford, 1891), and much of his diplomatic correspondence, together with a biographical sketch, may be found in Wharton (ed.), *The Revolutionary Diplomatic Correspondence of the United States* (6 vols., Washington, 1889). Consult also *The Deane Papers* (5 vols., New York, 1886-90), published by the New York Historical Society, and *Papers in Relation to the Case of Silas Deane* (Philadelphia, 1835), published by the Seventy-six Society.

**DEAN OF GUILD.** Formerly the head of trade guilds in Scottish towns, now a corporation official.

**DEAN OF THE CHAPEL ROYAL.** An office held by six (formerly three) clergymen of the Established church of Scotland, to which they are appointed by the crown. The benefice of the chapel royal, which was instituted by James V, was richly endowed. The duties of the office used to be merely nominal; but in 1846, on the foundation of a chair of biblical criticism in the University of Edinburgh, it was endowed with one-third of the revenues, the professor becoming one of the three deans. In 1858 the Universities Commission recommended that, when the requisite vacancies occurred, the revenues should be divided into six parts, attached respectively to the chairs of divinity and biblical criticism in Edinburgh University (the latter receiving two-sixths of the whole), biblical criticism in Aberdeen University, biblical criticism in Glasgow University, and church history in St. Andrews University. As a result of this arrangement, the revenues of the chapel royal are divided among the incumbents of the above-mentioned chairs. Besides these five deans, the dean of the Order of the Thistle bears the title of Dean of the Chapel Royal, but draws none of the revenues.

**DEANS, DAVID, EFFIE, and JEANIE.** The family about which centred the plot in Sir Walter Scott's novel *The Heart of Midlothian*.

**DEARBORN, FORT.** See FORT DEARBORN.

**DEARBORN, HENRY** (1751-1829). An American soldier, born in North Hampton, N. H. He studied medicine and became a physician, but left his practice upon receiving the news of Lexington, entered the army as captain in 1775, served throughout the Revolution, and distinguished himself at Quebec (where he was taken prisoner), Saratoga, Monmouth, and Yorktown. After the war he settled in Maine, and was a Democrat Representative in Congress in 1793-97. He was Secretary of War under Jefferson from 1801 to 1809 and at the outbreak of the War of 1812 was appointed senior major general of the army and was assigned to the Northern Department. He captured Toronto (then York) and Fort George, but in July, 1813, was recalled, being charged with political intrigue, and was placed in command at New York. He resigned from the army in 1815. From 1822 to 1824 he was Minister to Portugal. His last years were spent in Roxbury, Mass.

**DEARBORN, JOHN LINCOLN** (1858- ).

An American missionary, born at Webster, Me. After graduating from Colby College in 1884 and from the Newton Theological Institution in 1889 he was ordained to the Baptist ministry and was sent by the American Baptist Missionary Union to Japan. He was president and professor of theology and ethics in the Yokohama Baptist Theological Seminary from 1894 until 1908, when he was appointed general missionary superintendent of the American Baptist Missionary Union for Japan, China, and the Philippines. He also lectured in the United States and in 1909-10 was engaged in the Laymen's Missionary movement. Besides contributions to religious periodicals, he is author of *Outline of Theology* (1895) in Japanese.

**DEARTH, HENRY GOLDEN** (1863- ). An American landscape painter. He was born at Bristol, R. I., and studied at the Ecole des Beaux-Arts under Aimé Morot in Paris, and made New York his residence. He was elected to the National Academy of Design in 1906 and received medals at Paris in 1900, at Buffalo in 1901, and at Berlin in 1910. There is much charm in his carefully painted evening scenes; the color is rich, and he has the quality of atmosphere that gives every subject touched by him individuality. The scenery of Long Island and Connecticut is the theme of many of Dearth's paintings. Among the most important are: "Boulogne Harbor" (Metropolitan Museum); "An Old Church at Montreuil" (National Gallery, Washington); "In the Gloaming" (Detroit Museum); "Road and Canal" and "Gardenias" (Buffalo Academy); "Dreamland" and "Golden Sunset" (both in the Brooklyn Museum).

**DEATH.** The ultimate cause of death is stoppage of the heart and consequent arrest of the circulation. The tissues then die from lack of nourishment. Somatic death, or death of the body as a whole, occurs when the heart stops beating, but this can not be said of the various tissues: molecular death is a gradual process. Indeed Carrell has succeeded in keeping a state of suspended animation in tissues and organs of animals for months and then restored them to life by supplying the circulation. Muscles in dying undergo a remarkable change, namely *rigor mortis*. The phenomenon of *rigor mortis* or cadaveric rigidity is marked by several features. The muscle loses the translucency and elasticity possessed by living muscle and becomes firmer and more resistant to pressure. Chemically there is a large increase in carbonic acid, and the reaction of the muscle becomes acid, instead of alkaline, as in life.

It is not always easy to determine the precise moment when life becomes extinct. The phenomena of syncope, asphyxia, and particularly of the trance state, closely resemble those of death. Many signs and tests of death have been proposed. A common but fallible method is to hold a cold polished mirror before the mouth to determine if respiration has ceased. If it has not, the mirror will become cloudy. A cup of water placed on the chest will enable the observer to detect the slightest respiratory movement.

Richardson summarizes the more important tests of death as (1) absence of the pulsation of the heart, (2) absence of the respiratory murmur, (3) pressure on veins (fillet test), (4) electric test for muscular irritability, (5) the ammonia hypodermic test (Monteverde's sign), (6) coagulation of the blood in the veins, (7)

*rigor mortis*, (8) decomposition. The fillet test consists in applying constriction to the veins in the arm, which if life is present will cause the vein on the distal side to fill. After death no effect is produced. Monteverde's sign is evoked by the injection subcutaneously of a little ammonia solution. In life this will be followed by a port-wine congestion in the surrounding parts, whereas in death no effect is produced.

The more common causes of sudden death, excluding accidents, are cerebral hemorrhage; rupture of a gastric ulcer; valvular disease of the heart; angina pectoris; rupture of an aortic aneurysm; sunstroke; shocks of electricity; mental or physical shocks; diabetic coma; and uremia. See BURIAL; CREMATION; MORTUARY CUSTOMS.

In law, any event which extinguishes the civil rights of a person. This was the ordinary and natural consequence of *natural* death, but at common law it resulted equally from *civil* death. As Blackstone states it, "the civil death commenced if a man was banished or abjured the realm by the process of the common law, or entered into religion; that is, went into a monastery and became there a monk professed; in which cases he was absolutely dead in law, and his next heir should have the estate." A person incurring civil death might, "like other dying men," make his last will and testament and appoint executors to administer his estate. Civil death has been abolished in England and has never in the strict sense of the term been recognized in the United States.

The normal effect of death in law is, as intimated above, to extinguish the civil rights of the deceased. It was, indeed, the right and duty of his personal representative to enforce certain obligations due the deceased, as debts and sums of money due on contract, but tort actions and other actions of a personal nature died with him. Thus while a person injured as the result of another's negligence was entitled to maintain an action therefor, the action abated in the event of the death of the plaintiff; while, if a person died as the result of such an accident, no legal remedy existed. This injustice was remedied by the Act of Parliament, known as Lord Campbell's Act, in 1842 (9 and 10 Vict., c. 93), which gave an action for unlawfully causing the death of a person, to be maintained by the personal representative of the deceased for the benefit of his family. Similar statutes have been enacted in all the United States. See ABATEMENT; CIVIL DEATH; TORT, and the authorities cited under the last-mentioned title.

**DEATH, BRETHREN OF.** The name given to the hermits of the Order of St. Paul, an order formed in the thirteenth century, but suppressed by Pope Urban VIII about 1630. They dressed in a black habit marked with a skull and saluted each other with the words "Remember that you must die."

**DEATH, DANCE OF.** A literary or pictorial representation of the power of death over the life of men. The subject was at first presented as a church play, preceded by an exhortation and ending with an appropriate sermon. (See MIRACLE PLAY; MYSTERY; MORALITY.) Probably because of the importance of the Maccabee brothers and their mother in the earlier representations, the French and other Latin peoples call it the *Danse Macabre*, or some equivalent name. The play consisted of a dialogue between Death and

representatives of the various classes, churchmen and laymen, from the Pope and the Emperor down. Death invited them to follow him, and each unfortunate representative, after long remonstrances, submitted to the call, invoking God's mercy. At first Death was represented in an earnest and solemn manner, but soon his attitude took the character of a dance. Such plays were given in all countries where the Latin church prevailed, and in Italy we find another version of the same subject, rendered popular by Dante and Petrarch, the "Triumph of Death."

It was soon found more efficacious, however, to have the subject portrayed by painters and sculptors upon the walls of the church or the cemetery. The most famous example of the "Triumph of Death" is the fresco of the Campo Santo of Pisa (fourteenth century), wrongly ascribed to Andrea Orcagna. Among the oldest French examples of the "Dance of Death" was that in the cemetery of the Innocents, Paris (1425). Others still exist in France, as well as in England, Germany, and Spain. The subject is often pictorially represented in the manuscripts of the fifteenth and sixteenth centuries and in many woodcuts of the fifteenth and following centuries. The most famous of the latter are the two designed by Holbein—the smaller engraved by Lutzelburger (1520), while the larger appeared in book form in 1538 (at Lyons) and many times since. Episodes of the subject were also represented in painting, particularly by Hans Baldung Grien (Basel Museum). In the nineteenth century the most famous representation was that of Rethel (1848), directed against the French Republic. It has also been admirably treated in music, especially by Saint-Saëns in his *Danse macabre*, and in literature, as, e.g., in Goethe's ballad *Der Totentanz*.

Consult: Douce, *The Dance of Death* (London, 1833); Langlois, *Essai sur les danses des morts* (Rouen, 1851); Kastner, *Les danses des morts* (Paris, 1852); Wackernagel, "Der Totentanz," in *Kleinere Schriften*, 1 (Leipzig, 1874); Vigo, *Le danse macabre in Italia* (Livorno, 1878); Merino, *La danza macabre* (Madrid, 1884); Seelmann, *Die Totentanz des Mittelalters* (Norden, 1893); Kurth, *Reigen der Totentanz 15. bis 19. Jahrhundert* (Berlin, 1900); Wessely, *Die Gestalten des Todes in der darstellenden Kunst* (Leipzig, 1876); Goette, *Holbeins Totentanz und seine Vorbilder* (Strassburg, 1897).

**DEATH ADDER.** Any of several deadly Elapidae, Australasian viviparous snakes, especially the spine-tailed *Acanthophis antarcticus*, which is widely distributed from South Australia to the Moluccas and resembles in form and color an American rattlesnake. The end of the tail "is laterally compressed, beset with a few rows of large imbricating scales, and terminates in a thin, horny spine." Dr. Gadow thinks the use of this peculiar tail "very probably consists in attracting or fixing the attention of small animals; the snake, lying coiled up on a dry and sandy spot, slightly raising and vibrating the tip of the tail." It feeds mainly on frogs and young birds. Another species greatly feared is the larger and more cylindrical purplish arid (*Pseudechis porphyriaceus*), or "black snake," which may reach 7 feet in length, and is purplish black, varying in different specimens to dark olive brown, with carmine sides and red belly, specked with black. A third species, especially dangerous, although smaller, because of its resemblance to the harmless serpents, is

the short death adder (*Holocephalus curius*), also known as the broad-headed, tiger, or brown-banded snake. It is very variable, but the head, which has a peculiarly square outline, is "generally uniform black, the body olive color, with broad brown or black crossbands, the hinder part of the body . . . blackish, and the whole of the under parts light yellow." Its venom is immediately fatal to animals generally, but seems not to be so to itself or other poisonous snakes. Thirty or more young are brought forth annually by a single pair, and the species is common everywhere on the continent. It buries itself in the ground during the cold season. The genus *Holocephalus* has several other species in Australasia and the south seas. One of these, the large-scaled (*Holocephalus superbus*), is the dreaded diamond snake of Tasmania; another is the smaller, broad-headed snake (*Holocephalus variegatus*) of the neighborhood of Sydney; a third (*Holocephalus nigrescens*), of the south-eastern coast of Australia, is remarkable for its white tongue. Consult KREFT, *Snakes of Australia* (Sydney, 1869).

**DEATHBED, LAW OF.** A peculiar doctrine of the Scottish law, derived from the later Roman law, whereby, if any man, while suffering from the disease of which he ultimately died, burdened or conveyed away his heritable estate to the prejudice of his lawful heir, he was presumed to have so acted in consequence of his inability to resist importunity in the state of feebleness to which he was reduced, and his heir was entitled to avoid the deed. Two tests were fixed upon by the law as establishing the existence of a requisite degree of capacity—viz., survival of the donor for 60 days and his going unsupported to kirk or market. It was of no consequence that the object of the visit was neither to worship nor to buy and sell, but simply to evade the law of deathbed. If the individual was in a condition to take part in the service of the church or in the trade of the market, that was sufficient. Extreme old age, accompanied by manifest indications of the approach of death, was held equivalent to disease. But the deed of the oldest or most infirm man, or of the man who was laboring under the most mortal sickness, was not voidable if another disease had supervened of which he died, or if he were killed by accident. See DURESS; UNDUE INFLUENCE.

**DEATH CUP.** See FUNGI, EDIBLE AND POISONOUS.

**DEATH DUTIES.** The comprehensive English term for a variety of specific duties levied under acts of Parliament on the estates of deceased persons. Included under the term are (1) probate duties, (2) account duties, (3) legacy duties, (4) succession duties, (5) estate duties.

The *probate duty* dates back to the year 1694 and was a stamp duty levied as the price of obtaining probate or letters of administration. It has now, since 1894, been superseded by the estate duty. The *account duty* was of later origin and was payable by the beneficiary of a decedent. It has also been superseded by the estate duty. The *legacy duty* was created by Statute 20 Geo. III, c. 28 (1780), and is a stamp tax on receipts given by legatees to executors for their legacies. It varies in amount from 1 to 10 per cent of the legacy, according to the nearness of the relationship of the legatee to the decedent. When the legatee is a lineal descendant or ancestor of the deceased, the duty (1 per

cent) need not be paid if an estate or other death duty has been paid. *Succession duty* was created by Act of Parliament in 1853 (16 and 17 Vict., c. 51), and consists of a tax varying from 1½ to 11½ per cent (according to the degree of consanguinity) levied on the beneficiary of real property, or of personal property not subject to legacy duty, passing by descent or otherwise on the death of another. It is not, however, levied on property passing from husband to wife or wife to husband. The *estate duty* is a recent addition to the list of death duties, having been created in 1894 (57 and 58 Vict., c. 30). It is of a more general character than the earlier duties, being levied on all property, whether real or personal, "which, on the death of any person after Aug. 1, 1894, or at a period ascertainable only by reference to such death, passes either immediately or after an interval, either certainly or contingently," to another. Estates not exceeding £100 are exempt. The rates levied are graduated according to the value of the estate, ranging from 1 per cent on estates of £100 to £500, to 8 per cent on estates exceeding £1,000,000 in value. This tax is in some cases additional to other death duties and in other cases in lieu thereof. Taken together, these several duties constitute a most comprehensive system, which is being imitated in many of its features in the United States. (See INHERITANCE TAX; SUCCESSION.) Consult HANSON, *Death Duties*, and *Encyclopædia of the Laws of England* (2d ed., London, 1907).

**DEATH OF MARLOWE, THE.** A tragedy by R. H. Horne (1837), founded on the dramatic fate of the Elizabethan playwright.

**DEATH RATE.** See VITAL STATISTICS.

**DEATH'S-HEAD CORPS.** See BLACK BRU-SWICKERS

**DEATH'S-HEAD MOTH** (*Acherontia atropos*). A species of hawk moth (q.v.), widely distributed over the Old World. It measures almost 5 inches from tip to tip of the extended wings; is dark in color, the body yellow with black markings, the thorax with pale markings which have some resemblance to a skull, and from which it derives its name: the upper wings mottled with brown, black, and yellow. The caterpillar is greenish yellow, the back speckled with black, with transverse lines partly blue and partly white, and feeds on the potato, tomato, and a variety of other plants. This insect is most frequently seen flying about in autumn and only in the mornings and evenings. It is remarkable for emitting a plaintive squeaking sound, which, with its dark color, and the skull-like mark on the thorax, has led to its being regarded with superstitious dislike, the sudden appearance of large numbers being popularly held ominous of evil; while in Mauritius a notion prevails that it casts a dust from its wings which produces blindness in persons on whom it falls, and its entering an apartment is therefore regarded with dread. The sound is produced by the palpi, the inner faces of which are striated and are rubbed against the proboscis; and it is heard strongly and sharply when the insect is confined in the hand. The death's-head moth is interesting upon still another account, as one of those insects which enter and plunder beehives, feeding upon the honey. Representatives of this moth are found in many countries, as *Acherontia atropos* in India, and everywhere we find it regarded with superstitious apprehension. Consult Kirby, *A Hand-*

book to the Order Lepidoptera, vol. iv, part ii (London, 1897).

**DEATH'S JEST BOOK, or THE FOOL'S TRAGEDY.** A drama by T. L. Beddoes, published posthumously in 1850 and founded on the actual stabbing of a thirteenth-century duke by his jester.

**DEATH VALLEY.** A narrow, elongated north-south desert valley in Inyo Co., Cal., lying between the Panamint Range on the west and the Funeral, Black, and Grapevine mountains of the Amargosa Range on the east (Map: California, H 6). The Panamint Range rises to a maximum altitude of 10,937 feet in Telescope Peak, while the eastern ranges have altitudes of between 7000 and 8000 feet. Much of the valley is below sea level. The lowest point of dry land in the United States occurs here and is 276 feet below sea level. It is interesting to note that Mount Whitney, the highest point in the United States (14,501 feet above sea level), lies at a distance of less than 80 miles from the point of lowest depression. The valley has a length of 150 miles. It varies greatly in breadth, being in few places less than 10 miles wide, and in some places having twice that breadth, while the distance from summit to summit of the bordering ranges is 20 to 30 miles. The valley is the sink of the Amargosa River, a stream which is dry for the greater part of the time throughout much of its course. Water is exceedingly scarce throughout the Death Valley region. Places where ordinarily drinkable water can be obtained in the valley are Saratoga Springs in the southeastern part, Bennett Wells on the west side, and a point near the mouth of Furnace Creek at the north end of the Funeral Range.

Several watercourses enter the valley, among them the Amargosa River from the south and Furnace Creek from the east, but it is only after heavy rains, which are of very rare occurrence, that they contain any water. The valley was formerly the bed of a salt lake along the east side. There is a white salt deposit, with borax appearing in several places. In the western part a salt marsh still exists.

The salty bottom of the valley is destitute of vegetation, but on the west side is bordered by mesquite; the east and west slopes possess a sparse vegetation of cacti and desert shrubs and grasses. A growth of tall coarse grass is found in the salt marsh in the northern section. Animal life is confined to a few species of desert animals, chiefly reptilia, such as snakes, lizards, and horned toads; but flocks of blackbirds have been seen there. The meteorological conditions are very interesting, and during one summer the United States Weather Bureau instituted special observations here. The temperatures in the valley during the summer are excessive, a maximum of 125° F. in the shade having been observed on successive days. They rarely fall below 70°. The air is very dry, and dew never forms, the relative humidity averaging only about 23 per cent. During five summer months not quite an inch and a half of rainfall occurred, and on only nine days was the rainfall sufficient to permit its amount to be measured. The summer rains are of local character. It is probable that 4 or 5 inches of rainfall occur during the year. The prevailing wind is from the south in summer time; the average wind velocity for the season is about 10 miles per hour, which is high for that locality. Sand storms and dust whirlwinds of a few hours' duration are common.

**DEATH-WATCH.** Any of a family of small beetles, Ptinidae, which live on dead animal and vegetable matter. They are usually of a cinnamon-brown color, the trochanters are situated between the femora and the coxae, and their larvæ are short, have six legs, no eyes, short antennæ, and require one or more years for development. Both the beetles and the larvæ do much damage to furniture, house timbers, ships' stores, drugs, books, etc. A few, such as the often injurious apple-twig borer (*Amphicerus bicaudata*), bore into living, solid wood. Another form, of both Europe and America (*Lasioderma serricorne*), is a serious pest of capsicum and of dried tobacco. Still another species thrives on opium. The "deathwatch" whose rapid ticking is so frequently heard in the quiet of the night is a species (*Stodotropa panicea*) of world-wide distribution which not infrequently feeds on paper, paste, and leather bindings of books. The tapping is caused by a rapid hammering with the head on some suitable resounding material and is probably a sexual call. It may sometimes be found tapping with remarkable force and agility on furniture where its action is observable. In England the name is sometimes applied to the book lice of the family Psocidae. See BOOKWORM.

**DE AUGMENTIIS SCIENTIARUM,** dē ag-mēn'shī-is sī'en-shī-ā'rūm (Lat., on the advancement of learning). A treatise by Francis Bacon. It forms the opening chapter of his *Instauratio Magna* and is, after the *Novum Organum*, his most important treatise. A good edition is *The Advancement of Learning* (New York, 1904), ed. by A. S. Cook. See also the bibliography under BACON, FRANCIS.

**DE ÁVILA.** See DÁVILA.

**DÉBÂCLE,** dā'ba'kl'. A French word originally applied in that language to the breaking up of the ice in a harbor or river, but introduced into English by geologists to express any sudden flood of water which bears before it opposing obstacles and leaves its path marked with confused and scattered fragments of rocks or other débris.

*La Débâcle* is the title of an historical novel by Emile Zola—by many regarded as his greatest work—published in 1892 and describing the downfall of the Second Empire in 1870.

**DE BARY,** dā bā'rē, HEINRICH ANTON (1831-88). A German botanist. He was born at Frankfurt-on-the-Main and studied medicine and botany at Heidelberg, Marburg, and Berlin. After filling a professorship at Freiburg (1856-66) and Halle (1867-72), he was appointed rector of the newly established university at Strassburg. He was editor of the *Botanische Zeitung* from 1866 until his death. De Bary established the first botanical laboratory and introduced laboratory methods. His chief work was with the parasitic fungi, and in their study he began the method of securing all stages of development from spore to spore, a method which has extended to the study of the life histories of all plants. He was a notable teacher, and many of the most distinguished botanists are numbered among his students. He published a number of standard works on fungi and kindred subjects, such as *Die Mycetozoen* (1859; 1864); *Beiträge zur Morphologie und Physiologie der Pilze* (5 parts, 1864-82, partly in collaboration with Woronin); *Vergleichende Anatomie der Vegetationsorgane der Phanerogamen und Farne* (1872); *Vorlesungen über Bakterien* (1885; 1887).

**DEBATABLE LAND.** A tract of land situated between the Esk and the Sark, on the southwestern part of the border of England and Scotland, and at one time claimed by both kingdoms; hence its name. In 1542 commissioners appointed by the two crowns divided the land by a line drawn from east to west betwixt the two rivers. The upper half was adjudged to Scotland and the southern part to England. The Debatable Land continued long after to be the residence of freebooters and criminals, to whom its dubious state afforded a refuge. See BORDER.

**DEBAT-PONSAN**, de-bá'-pon'sán', EDOUARD BERNARD (1847-1913). A French historical, genre, and portrait painter, born in Toulouse. He was a pupil at the Beaux-Arts in Paris and then of Cabanel, and won the Prix de Rome in 1873. His pictures include historical subjects, such as the dramatic "Gate of the Louvre on St. Bartholomew's Day" (1880, Clemond-Ferrand Museum); allegorical works, such as the famous "Nec Mergitur" (1898), inspired by the Dreyfus case; and genre paintings, like "The Untamable Mare" (1911), and "Those who Watch" (1912). They are executed in a finished, academic style and show literary rather than pictorial imagination. He was particularly successful with portraits, such as those of Paul de Cassagnac (1882), General Boulanger (1888), and Constans—Minister of the Interior.

**DEBAY**, de-bá'. A family of French sculptors.—JEAN BAPTISTE JOSEPH the elder (1779-1863) was born at Malines and studied principally under Chaudet in Paris, where he settled permanently after living 15 years in Nantes. He was made an officer of the Legion of Honor in 1825 and conservator of the department of classical sculpture in the Louvre in 1846. Among his principal works are the marble statues of Charles Martel in the Versailles Museum, an equestrian statue of Louis XIV at Montpeller, two groups in marble of "Mercury and Argus," one in Montpeller and the other in Nantes, "Girl with a Shell" (Antwerp Museum); decorative figures for the hôtel de ville and the bourse at Nantes; two bas-reliefs for the Arc de Triomphe in Paris, and many portrait busts.—His son and pupil, JEAN BAPTISTE JOSEPH the younger (1802-62), usually called JEAN DEBAY, to distinguish him from his father, was born at Nantes and studied also under Bosio in Paris, where he won the Grand Prix de Rome in 1829. For his marble statue of a "Young Girl Slave" (1836, Museum at Valence) he received a first-class medal. Besides the statues of Charles VIII in the Versailles Museum, and of General Cambronne at Nantes, he made many decorative statues for public buildings and churches, but is best known for his portrait busts, which include those of Ampère (Palais de l'Institut, Paris), and Mustapha Ben Ismael and General Debilly, in the Versailles Gallery.—His brother, AUGUSTE HYACINTHE (1804-65), born at Nantes, was equally excellent as a sculptor and painter. He was a pupil of his father and, in painting, of Gros, in Paris, where he won the Grand Prix de Rome in 1823. His finest plastic work is "The First Cradle," which obtained a gold medal at the Universal Exposition of 1855. In the Louvre are his statues of the architect Perrault, and Mademoiselle Desbrosses. The figures of "Ocean" and "The Mediterranean," belonging to the south fountain of the Place de la Concorde in

Paris, and "Power" and "Moderation" before the Fontaine Saint-Michel, afford good examples of his style. His most remarkable painting is the so-called "Field of the Cloth of Gold" in the Versailles Museum, a composition on a gigantic scale, representing the meeting of Francis I and Henry VIII in 1520. "An Episode of 1793 at Nantes" and "Lucretia on the Collatine Hill" are in the Museum at Nantes.

**DE BAY**. See BAJUS, MICHAEL.

**DE BEAUCHAMP**, RICHARD. See WARWICK.  
**DE BEAUMONT**, de bó'món'. See EON DE BEAUMONT.

**DE BEAUMONT**. See ELIE DE BEAUMONT.

**DE BEAUMONT**, FRANÇOIS. See ADRETS.

**DE BEAUNE**, de bó'n'. FLORIMOND. See BEAUNE.

**DE BELLOY**. See BELLOY.

**DEBENTURE** (ME. *debutur*, from Lat. *debutur mihi*, there are owing to me, from *debere*, owe). In the most general sense, a written acknowledgment of indebtedness. The term has long been in use in England to describe various classes of government obligations, as soldier's debentures, exchequer debentures, and custom-house debentures, and it is employed in the same sense in the United States (U. S. Rev. Stat., §§ 3037-3040). Of late years the term "debenture" has come into common use, especially in England, to designate company securities of all sorts, including the corporate bonds, which in the United States comprehend the greater part of such obligations. They need not be bonds, however, though they are usually of that character; and neither is it necessary to give them the character of debentures, that they shall be issued by corporations, though most of them doubtless are. They may or may not be secured by mortgage or other charge on the property of the company issuing them. They differ from certificates of stock, in that they contain a promise, usually in the form of a covenant, to pay a principal sum, with periodical interest thereon, on a specified date in the future, and they are usually issued in series, and for the purpose of borrowing money thereon. They are commonly transferable and may be so drawn as to be negotiable.

When, as usually is the case, debentures are secured by a charge on the property of the company issuing them, the charge is in the form of a "floating security," as it is called, attaching at any given moment during the life of the debenture to all the property owned by the company at that time. The dissolution of the company causes the debentures to mature, even though the time for which they were given has not expired, and the floating security thereupon becomes fixed and definite, and the property may be reached by the debenture holders in an action for the appointment of a receiver and the enforcement of the security. From this it is evident that such debentures depend for their security upon the condition of the company from time to time.

The matter of issuing debentures and the nature of the security which they afford are largely regulated by general statutes providing for the incorporation of companies and sometimes by private acts for the government of individual corporations. Consult: Palmer, *Company Precedents* (8th ed., London, 1902); Manson, *The Debentures and Debenture Stock of Trading and Other Companies* (ib., 1894); Jones, *Treatise on the Law of Corporate Bonds and Mortgages*

(2d ed., Boston, 1894). See BOND; CORPORATION; SECURITY.

**DE BÉTHUNE, MAXIMILIEN.** See SULLY, DUKE OF.

**DEBIL.** A place in the south of Judah (Josh. x. 38). (See KIRJATH-SEPHER.) In Josh. xv. 7, where Debir has been supposed to be a name of a city, we should probably read *Midbarah*, 'to the wilderness,' and in Josh. xiii. 26 the correct reading seems to be *Lidebir* or *Lodebar* (q.v.).

**DEBIT AND CREDIT.** See SOLL UND HABEN.

**DE BLOIS.** See CHARLES DE BLOIS.

**DE BOOR FRAGMENT, THE.** Part of a manuscript of Philippus Sidetes published by De Boor (*Texte und Untersuchungen*, vol. 2, p. 170). The fragment contains a quotation from Papias, an Asiatic Church father writing about 150 A.D., in which the statement is made that "John and James, his brother, were put to death by the Jews." This quotation has caused much controversy, for, if accepted as true, it invalidates the tradition that John the Evangelist wrote the Fourth Gospel when an old man in Asia Minor. Those critics who believe that Christ's prophecy in reference to James and John, viz., "Ye shall indeed drink of my cup," was fulfilled, naturally accept the validity of Papias' statement. Against the truth of the statement, however, the claim is made that since, from the Epistle to the Galatians, we know that John outlived his brother, the author was incorrect in saying that the two met their death at the same time. On the other hand, it is not clear that the statement as to the death of the brothers is to be taken to mean that they died at the same time. It must nevertheless be admitted that the fragment has caused some confusion because of its use of the term "Theologus," which is usually not applied to John until the fourth or fifth century. In spite of this, however, Bacon contends that, "until some valid reason is advanced why the doubly attested statement of the martyrdom of James and John may not have stood on the pages of Papias writing c.150 A.D., it must be accepted as the simple historical fact."

Consult: *Texte und Untersuchungen zur Geschichte der altchristlichen Literatur*, vol. 2, p. 170 (1889); against the acceptance of the fragment, Drummond, *The Character and Authorship of the Fourth Gospel* (London, 1903); and, for the acceptance of the fragment, Bacon, *The Fourth Gospel in Research and Debate* (New York, 1910).

**DEBORAH** (Heb., bee). A heroine who helped to deliver the Israelites from the oppression of the Canaanites and who in tradition becomes a prophetess and a "judge." She was the wife of Lapidoth and dwelt in the hill country of Ephraim (Judg. iv. 4-5). For 20 years, the story goes, Israel had been oppressed by the Canaanites, when Deborah stirred up Barak, son of Abinoam of Kedesh in Naphtali, and the two with an army went against Sisera, leader of the force of the Canaanite King Jabin, descended upon him from Mount Tabor, and routed his army (ib., iv. 10-16). Sisera himself, in flight, was slain while asleep by a woman, Jael, wife of Heber the Kenite (ib., iv. 11-22). A forty years' peace followed this success (ib., v. 31), though it should be added that the number 40 is to be regarded as a general term for a genera-

tion. The Song of Deborah (ib., v. 2-31) celebrates this victory, but there are some striking discrepancies between the song and the prose narrative in chap. iv. That the song is a contemporary record may be inferred from the archaic language and its general character. It is universally regarded by scholars as one of the oldest bits of literature in the Old Testament, but it makes no mention of Jabin and commemorates the discomfiture of Sisera. The text is obscure in some places and corrupt in others, but there is enough left to give this composition a unique position in the history of ancient poetry among the Semites. There is no valid reason to doubt that the ode was composed and sung by Deborah. In the prose narrative, which is considerably later, many scholars suppose that there is a reference to another event in which Jabin is chiefly involved and that the two occurrences have been welded together by making Sisera the leader of Jabin's army. Consult: Cooke, *The History and Song of Deborah* (1892); G. F. Moore, *Judges* (1895); A. Segond, *Le cantique de Debora* (1900); A. Stephan, *Das Deborahlied* (1900); Lagrange, *Le livre des juges* (1903); N. Schmidt, *Messages of the Poets* (1911); G. A. Smith, *Early Poetry of Israel* (1912); H. T. Fowler, *A History of the Literature of Ancient Israel* (1912); E. L. Curtis, *Judges* (1913); E. G. King, *Early Religious Poetry of the Hebrews* (1913).

**DE BOUCHERVILLE**, de bō'shër-vil', SIR CHARLES EUGENE BOUCHER (1822-1915). A Canadian statesman. He was born at Boucherville, P. Q., and was educated at the College of St. Sulpice, Montreal. He graduated in medicine at Paris in 1843, and on his return to Canada practiced his profession for many years in his native district. He began his political career in 1861 and was a Conservative member of the Canada Legislative Assembly until 1867, in 1865 voting for confederation. In 1867-73 he was Speaker of the Legislative Council of the Province of Quebec, and he was Premier of that province from September, 1874, to Jan. 29, 1876, when his and his colleagues' dismissal by Lieutenant Governor Letellier de St. Just caused a political sensation. In 1879 he was appointed to the Dominion Senate, and in December, 1891, after the dismissal of Premier Honoré Mercier (q.v.) by Lieutenant Governor Angers, he again became Premier of Quebec, and retained that position until Dec. 16, 1892. In 1914 he was created K.C.M.G.

**DEBOUCHING**, dé-bōush'ing (Fr. déboucher, from *de*, from + *boucher*, to stop up, from *bouche*, mouth, from Lat. *bucca*, cheek). In military usage, the issuing of troops from out a narrow passage, wood, defile, or any other roadway which has compelled them to advance in column or other narrow formation.

**DE BOW, JAMES DUNWOODY BROWNSON** (1820-67). An American journalist and statistician, born at Charleston, S. C. He was editor of the *Southern Quarterly Review*, to which he contributed an article on the "Oregon Question," which attracted wide attention. In 1845 he left the *Southern Quarterly* and established *De Bow's Commercial Review* in New Orleans (1846), which was at once successful and was for many years an organ of ultrasectational opinion. In 1848 he became professor of political economy in the University of Louisiana and in 1860 head of the State Census Bureau, which he managed

with such distinction that he was appointed superintendent of the United States census (1853-55). He fostered, by lectures and pen, the material and intellectual interests of the South and later of the Confederacy, though he ultimately became a convert to the economy of free labor. He wrote *Industrial Resources of the Southern and Western States* (3 vols., 1853), and the greater part of *The Statistical View of the United States*, a compendium of the seventh census (1854), besides many statistical pamphlets.

**DEBRECZEN**, *dé-brét-sén*. A free Imperial city of Hungary, capital of the County of Hajdu, situated on a sandy but fertile plain, about 137 miles east of Budapest by rail (Map: Hungary, G 3). It is called "the Protestant Rome," being the chief Protestant centre in Hungary. The town, with its suburbs, is widely scattered. It possesses a number of handsome modern buildings, among which are the Rathaus, theatre, two old monasteries, and the Protestant church from the pulpit of which in 1849 Kossuth proclaimed the deposition of the Hapsburg dynasty. Its walls and fortifications have given place to broad promenades. Among its numerous educational institutions is the famous Protestant Collegium, with more than 2000 students, founded in 1531, with a library of 151,000 volumes. The manufactures of the town are clay pipes, cigars, machinery, brushes, bricks, vehicles, lumber, sugar, soap, and sausages. Its yearly cattle markets are of considerable importance. The city owns large cattle ranges in the surrounding territory. Pop. (commune), 1900, 75,006, 1910, 92,729, mostly Hungarian Protestants. Debreczen suffered severely during the Turkish War in the sixteenth century, and in the seventeenth century, when it had become a Protestant town, was attacked by the Imperialists. In 1849 the Hungarian Diet and government fled to Debreczen on the fall of Budapest. On July 3, 1849, it was taken by the Russians, and on August 3 it was the scene of a fierce battle between the Hungarians and the Russians.

**DEBRY**, *de-bré'*, or **DE BRY**, *Tafonore* (1528-88). A Flemish engraver, goldsmith, and printer, born at Liège. Forced to emigrate on account of religious persecution, he settled at Frankfort-on-the-Main about 1580, where he worked as printer, engraver, and book-seller until his death. He also visited England, where he engraved the "Procession of the Knights of the Garter under Queen Elizabeth," 12 plates, after Geerarts, and "The Funeral of Sir Philip Sidney," 34 plates, after Thomas Lent (1587). He executed a number of engravings, which are of great value, but rather on account of the invention and originality displayed in them, than as works of art, although many possess the technical perfection of the old Dutch and Flemish masters. His subjects are sometimes grotesque and fanciful, but more often processions or dances with numerous figures. Among his most celebrated plates are 48 for Boissard's *Icones Virorum Illustrum* (1597-99); and those which he engraved for the *Collectiones Peregrinationum in Indiam Orientalem et Occidentalem* (1590-1634), familiarly known to English readers as the "De Bry Collection of Voyages." There were many editions of this work in different languages. An excellent collection of his prints is in the New York Public Library. He was also a medalist and designer for jewelry and plate. —His sons, JOHN THÉODORE (1561-1621) and

JOHN ISRAEL (?-1611), assisted him in many of his works. John Théodore had less imagination than his father, but was the better artist.

**DEBS**, *EUGENE VICTOR* (1855- ). An American social agitator and candidate of the Socialist party for President of the United States. He was born Nov. 5, 1855, at Terre Haute, Ind. Between 1871 and 1883 he was a locomotive fireman on the Terre Haute and Indianapolis Railroad, a wholesale grocery salesman, and city clerk of Terre Haute. In 1885 he served as a member of the Indiana Legislature. He was grand secretary and treasurer of the Brotherhood of Locomotive Firemen from 1880 to 1893, when he resigned to organize and be president (for four years) of the American Railway Union. Under his leadership this Union won a large strike on the Great Northern Railway early in 1894, and then in the same year, having espoused the cause of the poorly paid Pullman workers, the Union brought about a great tie-up of the Western roads. This strike was ultimately broken by the interference of the Federal courts and by action of President Cleveland, based upon the right of the Federal government to maintain the uninterrupted transmission of the mails. Debs was arrested first upon a charge of conspiracy to murder, but the charge was never pressed, for want of foundation, although Debs was insistent in his demand that his name be cleared through trial on the charge in open court. In July, 1894, Debs, with the other officers of the Union, was arrested on the charge of violating an injunction issued by Judge Woods, and was sentenced to six months in jail for contempt of court.

Debs's introduction to Socialism began during his imprisonment in the Woodstock jail, where he was visited by Victor Berger and given Marx's *Capital* and other Socialistic works. In 1897-98 he was chairman of the National Council of the Social Democracy, and in 1900 he was the candidate of the Social Democratic party for President of the United States. Thereafter Debs spent most of his time as lecturer and organizer in the Socialist movement. He was the candidate of the Socialist party for President of the United States in 1904, 1908, and 1912. As one of the first "victims" of so-called "government by injunction," and because of his likable personality, Debs has commanded the respect of American unionists and radicals, even of those who do not accept his economic doctrines. Besides his articles published as contributing editor to the *Appeal to Reason* and also occasional magazine articles, his writings include a widely read speech on *Industrial Unionism* (1911). Consult S. M. Reynolds, *Debs: His Life, Writings, and Speeches* (Girard, Kans., 1908). In 1914 Debs became a member of the editorial staff of the *National Rip-Roar*.

**DEBT** (*OF. dette, dette, Lat. debitum*, that which is owed, from *debere*, to owe, from *de*, from + *habere*, to have). In law, strictly speaking, a sum of money due upon a certain and expressed agreement. This obligation may be founded on simple contract, may be contained in a sealed instrument, or may be established by the judgment of a court. In this meaning a debt is a definite sum due, not merely a claim for damages. In some applications, however, the word has been much more broadly used, and it is probable that most courts would not confine it to the strict definition above given, unless required so to do by the context of a law

or the special circumstances of the case. Thus, it has been held that a debt may be a certain sum of money promised to be paid in the future as well as a sum already actually due and payable; but if the sum be payable upon a contingency at a future time, it cannot properly be called a debt. In its more general sense debt is that due from one person to another, whether money, goods, or service. Under the United States legal-tender statutes the term embraces any obligation by contract, expressed or implied, which may be discharged by money through the voluntary action of the party bound. A bequest of "whatever debts" might be due the testator at the time of his death has been held to include money deposited with his bankers. A tax is not of the nature of a debt, not being founded on contract, but being rather an impost laid by a government.

Under the dual form of government which obtains in this country, an important question in regard to debts was raised as to the provision of the United States Constitution forbidding the several States to pass laws impairing the validity of contracts. It was questioned whether an insolvency law adopted by a single State did not violate this provision, where it allowed a debt already existing to be canceled upon the debtor's complying with the regulations of the Insolvency Act. It has been settled by the courts that the States have the right to legislate in this manner, but subject to the power of the United States to enact a uniform law of bankruptcy (q.v.). Of course a State's insolvency law cannot impair the obligation of a contract existing before its passage. But in all contracts implying a debt entered into after its passage, it will be presumed that the parties to the contract have in mind the provisions of the law.

Formerly the courts, both in England and America, employed the drastic and often inhuman process of imprisonment of the debtor to enforce the payment of debts. But this has generally been done away with by statute. The present tendency of legislation is to afford an easy and simple procedure for the enforcement of debts, so that undisputed debts may be collected quickly and as summarily as is consistent with the right of defense and of appeal. The action of debt, or the simpler substitutes provided thereby for the reformed procedure in England and this country, is a civil suit, resulting in a money judgment and an execution levied on the property of the debtor for its satisfaction. Where the element of fraud, false pretenses, or concealment of property enters into the question, the courts, both in England and the United States, may still restrain and under some conditions imprison the debtor. For a fuller exposition of these principles and of other matters relating to phases of the general subject, see ABSCONDING; ATTACHMENT; BANKRUPTCY; CESSIO BONORUM; CREDITOR; DEBTOR; GARNISHMENT; IMPRISONMENT; INSOLVENCY; SEQUESTRATION; TRUSTEE PROCESS. Consult the authorities referred to under the titles treating of specific subjects, such as CONTRACT; BOND; ATTACHMENT; BANKRUPTCY; ETC., and also Bell, *Commentaries on the Statutes Relative to Diligence, or Execution Against the Movable Estate; Imprisonment, etc.* (Edinburgh, 1890), where a history of imprisonment for debt will be found, and the general treatises such as the *Commentaries* of Kent, Blackstone, Stephen, Bell, Erskine, etc., referred to under LAW.

**DEBT, ACTION OF.** An old form of personal action in common-law pleading, employed to recover a sum certain, or capable of being ascertained by computation only. Formerly the declaration alleged the *debit et detinet*, on the theory that the defendant owed the money and was guilty of an unjust detention of the goods or whatever happened to be the consideration, but this fell into disuse and is no longer proper. Where the obligation is founded on a simple contract the declaration must allege the consideration, and if on a specialty or on a record it must be set out in full. Debt differs from assumpsit (q.v.), where a special promise is necessary. The action is still retained in some of the United States where common-law pleading is retained, but has been abolished by statute in England, where it originated, as well as in most of our States under the reformed-code procedure. See COMMON COUNTS; COMMON FORMS; FORMS OF ACTION; also PLEADING, and consult the authorities there referred to.

**DEBT, PUBLIC.** National debt has become a marked feature in the finances of modern states. In any strict sense the public debt designates all of the outstanding obligations of the government. These are of many kinds. Among them, e.g., in those states which conduct government savings banks must be included the sums due depositors. In countries which, like France, require the collectors of taxes to make payments at specified times, advancing if need be from their own resources the amount required, such advances must for the time being be regarded as part of the national debt. But it is not with these informal obligations, which correspond somewhat with the book debts of merchants, that the phrase "public debt" is generally concerned. It refers rather to the more formal obligations undertaken by governments and represented by formal instruments of indebtedness.

This formal debt may be divided into short-term and long-term obligations. To the former is frequently applied the expression "floating debt," and the analogy which this suggests with the transactions of corporations indicates the general nature of such indebtedness. These short-term obligations are normally used to anticipate revenues, and resemble the promissory notes issued by merchants in the course of their business transactions. As the latter frequently have a certain aggregate of outstanding notes, though individual notes be promptly paid when due, so the floating debt of the state may readily become a permanent feature in its finances by the creation of new debts running parallel to the payment of the old. When such debts become too numerous, and the obligation of repayment a source of embarrassment, it is not infrequent for them to be converted into funded or permanent debt.

The funded debt consists in obligations which mature at a more or less distant date or which are payable at the option of the government. Bonds maturing within a fixed period are familiar in American finance, e.g., the so-called ten-forties of the Act of March 3, 1863. But more commonly no time is set for the ultimate redemption of public obligations. In the national finance of European states it is usually understood that the government will not soon avail itself of the privilege of repayment. So much is this the case that on the continent of Europe the debts are spoken of as *rentes*, the emphasis being thereby wholly laid upon the

fact that the payment of interest alone is expected, while in England the greater part of the public debt is regarded as a series of perpetual annuities. A further form of public debt consists in irredeemable paper money. In essence it is a debt without interest, payable at the option of the government. See MONEY.

The public debt, in the sense in which it is known to-day, is essentially a creation of modern times. Emergencies in the mediæval state were met by enforced contributions from the people and in part by contraction of debt by the monarch. But the debt so contracted was a debt of the crown, and not of the state, and rested upon the personal credit of the ruler. With the growth of parliamentary power and the control of supplies by representatives of the people, state debts appeared. They were originally confined to states like Holland and England, where loanable capital was plentiful, and where the commercial classes were sufficiently influential with the government to insure against repudiation. Later they were extended even to states under despotic and irresponsible rule. In the beginning public debts frequently assumed the form of life annuities; but as these varied of necessity with the age of the persons who advanced money to the state, the complications of accounting were excessive; moreover, the amount of the advances which could be obtained in this way was necessarily limited. It was a simplification to issue so-called perpetual annuities with a definite annual payment, and the computation of life annuities gave way to the simple operations of interest. In Great Britain terminable annuities are still common, but they form a comparatively insignificant proportion of the total indebtedness of the government. The term "public debt" usually refers to the national debt alone. In its widest sense, however, it includes local indebtedness also. It is only within the past century that the municipalities have become debtors to any considerable extent; but at present the aggregate of municipal debts in the United States exceeds the national debt in magnitude. See FINANCE.

**Causes of Debt.** Public debt arises under three distinct sets of circumstances: 1. War expenditure. A modern war demands the expenditure of an enormous sum of money, and this sum is usually raised through loans. Debts of this class are naturally borne by the national government. 2. Public works. The increase in commercial intercourse and the rise in standards of national and civic life have required a great development of public improvements. The cost of these has been met partly by taxation, partly by the raising of loans. The debts incurred are borne sometimes by the national government, sometimes by the localities. Practice differs in the various states—a fact which must be taken into account in comparing the national debts of different countries. 3. The funding of floating indebtedness. The presence of a large volume of demand obligations embarrasses the workings of the treasury and impairs the credit of a government. When it is not convenient to pay them out of revenue, it is customary to change them into funded debt.

**Theory of Public Debts.** In the eighteenth century it was held by many writers on finance that a public debt increased a nation's wealth. Public bonds were regarded as a net addition to capital. The claim was also advanced that a public debt was a matter of indifference to the

state, since it merely represented money owed by one set of citizens to another. Adam Smith and his followers, on the other hand, were inclined to regard public debt as an unqualified evil. Modern opinion recognizes that the debts of a state, like those of an individual, are necessary or unnecessary, wise or foolish, according to the circumstances under which they are contracted. The expenses of a state are incapable of sudden contraction; its revenues, however, fluctuate to a considerable extent. Unless a large surplus is put by in favorable times, a deficit is inevitable at times when revenues fall off. Since the accumulation of a surplus seriously disturbs commerce and industry, the creation of floating indebtedness is frequently expedient. In time of war, when the honor and possibly the very existence of a nation are at stake, it is imperative that immense sums of money should be raised to meet the expenditures attendant upon mobilizing and equipping armies, building fleets, and preparing defenses. At such a time the ordinary sources of revenue fail; taxation sufficient to cover the abnormal expenditures would amount to a virtual confiscation of property and would so derange industry as to impair the capacity of a state to withstand a long-continued struggle. The raising of a loan shifts the burden to a period when industry will be better prepared to endure it. In the peaceful competition for commercial ascendancy great advantages are gained by those states or communities which are first to develop their resources. It is, therefore, often expedient to undertake public improvements which would be too costly to be paid for out of increased taxation. Such improvements, moreover, create new sources of revenue, and therefore may impose merely a nominal burden upon posterity. Certain classes of public works, e.g., state railways and telegraphs, yield a direct revenue which may be sufficient to cover depreciation and interest on the capital invested in them. It would be manifestly unreasonable to pay for such works out of taxation. To do so would unjustly burden the present taxpayer for the advantage of future generations.

While there are circumstances, then, under which the creation of public debt is abundantly justified, it remains true that in practice debts are often contracted to national detriment. The ease with which money is raised by loans leads often to reckless financing. Useless wars are undertaken, premature and unproductive public works are entered upon. The expediency of particular loans, however, is a matter to be decided by practical politics, not by financial theory.

The effect upon industry of the creation of a public debt has received thorough discussion from economists. When the government enters the market as a bidder for money, capital is drawn away from productive enterprises, and industry is in so far hampered. It may, however, happen that the demand for more capital will encourage saving, so that the loss to industry will not be measured by the whole extent of the public loan. If the loan is for productive purposes which would otherwise be undertaken by private enterprise, industry is not necessarily deranged. It makes some difference whether the loan is made at home or abroad. Owing to friction in the international flow of capital, a foreign loan may have far less effect upon national industry than a domestic loan.

Important political consequences frequently

result from the creation of a public debt. When the creditors of a state are its own citizens, a party vitally interested in the stability of the government is created. When a weak state incurs a large debt to foreigners, it may endanger its own autonomy. Egypt is a classical example of a state which has fallen under foreign control in this way.

**Conversion or Refunding of Public Debt.** Public debts are frequently created at a time of low national credit. To attract investors, it is necessary to issue bonds paying a high rate of interest. When national credit improves, it is possible to exchange high-interest obligations which are payable at the option of the government for others bearing a lower rate of interest. The exchange may be a direct one, in which case the government retains its former creditors; or a new loan may be issued to pay off the old obligations.

Almost every country which has a public debt has refunded it at various times. The refunding operations of the British Treasury extend through two centuries. Conversion has been frequent in the United States in both national and local finance.

The investor in public funds is naturally opposed to conversion. Part of the inducement for investing in bonds consists in the expectation that they will continue to bear a high rate of interest and so rise above par value after normal conditions return. In the United States the investor is usually insured against early conversion by the provisions of the loan, in other countries the same end is reached by the adoption of a settled policy of converting only after a considerable lapse of time. One method of insuring the investor against conversion is to issue low-interest bonds below par. Redemption of such obligations entails a heavy cost. This practice is generally regarded, however, as bad finance, and is not resorted to in the United States.

**Repayment of Public Debt.** Some parts of the public debt are so constituted as to be automatically extinguished. Such are the terminable annuities of British finance. Each payment includes, besides interest, a partial repayment of the principal. It would obviously be inconvenient to pay a large part of the public debt in this way, since payments would have to be made whether revenues were plentiful or not. Most frequently debt is paid by redeeming obligations which are due, or which are payable at the option of government, or by purchasing bonds in the open market and canceling them.

The policy of repaying public debts has often been called into question. In order to redeem a debt, a sum equal to the principal of the debt must be taken from the people by taxation; and it is the last portion of the taxes which is hardest to collect and which causes the greatest distress. Almost all modern states are growing in wealth and population; consequently it is to be expected that a debt which at present would be very difficult to pay will in the future be relatively insignificant. So long as gold depreciates in value, the burden of debt automatically grows less.

When a state is insufficiently provided with capital, its bonds are likely to be held by foreign capitalists. In repaying the debt the state may diminish the scanty supply of capital and so injure its own industries.

There are, however, cogent reasons for the redemption of public debts. A future generation

may indeed be more able to pay a given sum than the present generation; but the future will doubtless have correspondingly heavy obligations of its own. Gold may indeed depreciate, but it may also appreciate. The payment of debt may derange industry, but it unquestionably strengthens the credit of a nation and places it in a condition to meet emergencies. On these grounds the weight of modern authority favors the gradual redemption of public debts.

**Debts of Leading Nations.** The national debt of England is dated generally from the year 1693, with the loan to the government of the entire capital of the Bank of England, amounting to £1,200,000. In return for this loan the Bank received its charter and privileges. The needs of the government were pressing, and the debt, once started, grew rapidly, as the result of the vigorous foreign policy of William III. At the accession of the house of Hanover, in 1714, it had reached £50,000,000, and it grew throughout the following century, as a result of the several wars in which England found herself engaged. When, in 1793, the great struggle with France began, the debt was £260,000,000, and when it terminated with the Treaty of Vienna, in 1815, it had reached the sum of £885,000,000. The example set by England was followed by the other European countries, although before the closing years of the eighteenth century few of the states had contracted debts upon any considerable scale. The Napoleonic struggle, which involved all Europe, inaugurated an era of debt for modern states, and the nineteenth century witnessed a rapid growth of national indebtedness. The following table compiled from the reports of the Bureau of Statistics of the Department of Commerce and Labor gives the indebtedness of some of the principal nations, and of all the nations of the world combined, since 1800. The table shows that the progress of debt in most countries has been constantly forward, and that, with the exception of the United Kingdom and the United States, there has been no conspicuous reduction of the debt. The debt of the United Kingdom reached its maximum in 1815, when it amounted to £902,000,000.

**American National Debt.** The public debt of the United States was first reported, 1791, two years after the organization of the government, as \$75,463,476.52. In 1812, at the commencement of the second war with England, it had fallen to \$45,209,737.90. That war brought it up to a total of \$127,334,933.74. After peace was restored, the reduction was from \$3,000,000 to \$10,000,000 per year, until in 1835 it reached its lowest point, being only \$37,513.05. Thenceforward it increased, with fluctuations, until in 1860—the year before the Civil War—it was \$64,842,287.88 and the annual interest was \$3,443,687. This was a rate per capita on the whole population of \$1.91 debt and 11 cents interest. The outbreak of the Civil War made the raising of enormous sums of money imperative. Two small loans had been made just before—in 1858, \$20,000,000 in 5 per cents, and in 1860, \$21,000,000 in 6 per cents—the first to run 15 and the last 20 years.—Of the last loan only \$7,022,000 was issued. Of the loans made necessary by the Civil War, the first was Feb. 8, 1861, \$25,000,000 at 6 per cent, to run 20 years, of which \$18,415,000 was reissued. On March 2, 1861, 6 per cent treasury notes were authorized

and \$35,364,450 issued. On the same date, \$1,095,850 was reissued to pay the Oregon war debt. On July 17, 1861, \$250,000,000 was authorized at 7 per cent, to run 20 years, with authority to issue any part in the form of treasury notes running three years at 7.3 per cent interest, or in notes not bearing interest, but payable on demand, or in treasury certificates for one year bearing 3.65 per cent interest; the whole amount of demand notes not to exceed \$50,000,000. An Act of Aug. 5, 1861, authorized the issue of 6 per cent bonds, running 20 years, to exchange for the one and three year notes just mentioned, with accumulated interest, at any time before their maturity; and the demand notes were made receivable for all dues to the government. Before the close of the year the demand notes, at first rejected by the banks,

claims, running one year at 6 per cent. There were \$561,753,241 issued, all redeemed before 1866. In July, 1862, postage stamps were issued for currency and made a legal tender for sums less than \$5. In March, 1863, fractional currency was authorized in place of postage stamps, the amount limited to \$50,000,000. In March, 1863, a loan of \$900,000,000 was authorized, principal and interest payable in coin; but only \$75,000,000 was issued. The same act authorized \$400,000,000, in one, two, and three year treasury notes, interest not over 6 per cent, payable in ordinary money, and to be a legal tender for their face value. The actual issues were: of one-year notes, at 5 per cent, \$44,520,000. two-year notes, at 5 per cent, \$166,480,000. three-year notes, at 6 per cent, \$266,595,440; making the whole issue \$477,595,400; all canceled or exchanged before

<sup>1</sup> Prussia prior to 1870, figures for 1900 are exclusive of state debts, which in 1890-1900 amounted to \$2,015,958,000. <sup>2</sup> 1789 <sup>1</sup> 1810 <sup>1</sup> 1812 <sup>1</sup> 1817 <sup>1</sup> 1819 <sup>1</sup> 1830 <sup>1</sup> 1814 <sup>1</sup> 1815 <sup>1</sup> 1845 <sup>1</sup> 1852 <sup>1</sup> 1847 (figures for Sardinia). <sup>1</sup> 1851 <sup>1</sup> 1853. <sup>1</sup> 1857 <sup>1</sup> 1868 <sup>1</sup> 1869 <sup>1</sup> 1869 <sup>1</sup> Chiefly former debt of North German Confederation. <sup>1</sup> Total debt less cash in the Treasury. <sup>1</sup> 1872 <sup>1</sup> 1879 <sup>1</sup> 1883 <sup>1</sup> 1885 <sup>1</sup> 1876 <sup>1</sup> 1882 <sup>1</sup> 1899 <sup>1</sup> 1903 <sup>1</sup> 1902 <sup>1</sup> 1911. <sup>1</sup> The figures of aggregate national debts of the world are subject to slight revision by reason of the fact that for certain of the minor countries the latest available figures represent a year earlier than that represented by the chief countries included in the aggregate. There are also a few minor countries for which no satisfactory debt statement can be had.

were at a premium, and the interest-bearing notes were readily convertible into permanent 6 per cent bonds. On Feb. 12, 1862, \$10,000,000 more of demand notes were issued. In the same month a great war loan was authorized—\$500,000,000 of 6 per cent bonds, redeemable after 5 and payable after 20 years. The loan was readily taken, and the full amount was issued. In 1864-65, \$15,000,000 more was authorized of the same loan. In February, 1862, \$150,000,000 of legal-tender notes were authorized, of which \$50,000,000 were to take the place of demand notes. In July, 1862, \$150,000,000 more were authorized, and an equal amount in addition in March, 1863, making \$450,000,000 in all. These issues formed the currency known as "greenbacks," from the color of the paper. An Act in February, 1862, authorized the acceptance of \$25,000,000 of deposits, increased in March to \$100,000,000, on which 5 per cent interest was paid. In June, 1864, \$50,000,000 more was authorized at 6 per cent. This was a temporary loan, to be repaid on 10 days' notice, and was all redeemed before the close of 1866. In March, 1862, Congress authorized the issue of certificates of indebtedness to public creditors in the adjustment of

May 15, 1868. In March, 1864, a loan of \$200,000,000 was authorized at 5 or 6 per cent, principal and interest payable in coin: \$196,117,300 were issued at 5 per cent, to run 40 years (the 10-40s of 1864), and \$3,882,500 at 6 per cent. Most of the 5 per cents brought premiums from 1 to 7 per cent. In June, 1864, a loan of \$400,000,000 was authorized at 6 per cent (the 5-20s of 1864), of which \$121,561,300 was issued. In June, 1864, Congress authorized the issue of \$200,000,000 in 7-30 treasury notes, and in March, 1865, the sum was increased by \$600,000,000 more. The whole issue was \$829,992,500 of 7-30 interest-bearing notes, and the whole loan was redeemed by the middle of July, 1868. In March, 1865, a loan was authorized of \$600,000,000 in 6 per cent 5-20 bonds, to be used only for the payment of treasury notes or other obligations of the nation. Two issues were made: July 1, \$322,988,950 and \$379,616,050, and in July, 1868, \$42,539,350; all to redeem treasury notes and other obligations, but in no case to increase the public debt. In March, 1867, and July, 1868, there were issued \$85,150,000 of temporary loan certificates of deposit, bearing interest at 3 per cent, to redeem com-

pond-interest notes. In July, 1870, the great Refunding Act was passed. The Secretary of the Treasury was authorized to issue \$200,000,000 at 5 per cent, \$300,000,000 at 4½ per cent, and \$1,000,000,000 at 4 per cent, of 30-year bonds, principal and interest payable in coin, to be used only to redeem the 6 per cent or other early bonds. Besides these issues, there were guarantee bonds issued to the Pacific and other railroads, secured by mortgage on the roads. In January, 1871, the 5 per cent bonds were increased to \$500,000,000.

These enormous financial transactions have no parallel for extent in the world's history. Yet for a time there was much fear that such loans could not be floated; but when they were proved possible without recourse to the capitalists of foreign countries, the loyal people of the Union had abundant cause for congratulation. The loan of 1862 (\$515,000,000) was the greatest in amount and the most successful thus far attempted. Afterward, however, loans were not easily made, and the government was compelled to resort to currency and treasury notes and also compound-interest notes and certificates of indebtedness. The greatest test of the financial strength of the nation fiercely struggling to maintain its political existence was in 1864. On July 11, in that year, gold touched its highest point, \$2.85, and a paper dollar was worth in gold only about 38 cents.

From the period of the Civil War the surplus of revenue was applied to the public debt. As the bonds bearing the higher rates of interest were first extinguished, the interest burden diminished even more rapidly than the principal. Thus, while in 1865 the total interest-bearing debt amounted to \$2,381,000,000, and the annual interest charge to \$151,000,000, at its lowest point, in 1892, of \$585,000,000 principal, the interest charge was, in round numbers, but \$23,000,000. As the population had increased rapidly during the interval, the interest per capita had declined from 4.39 to 39 cents. After 1893 the amount of public debt was increased by the issue of bonds for the purpose of securing the Treasury against the drain upon its gold reserve. This issue of 5 per cent bonds was followed in 1898 by a further issue of 3 per cent bonds for the purpose of meeting the expenses of the Spanish War. By the Act of March 14, 1900, the 3, 4, and 5 per cent bonds were made convertible into 2 per cent bonds, which resulted in a considerable diminution of the annual interest charge. The interest-bearing debt of the United States on July 1, 1912, was made up of the following:

2% Bonds	730,882,130
2½% "	459,280

<b>Total</b>	<b>\$963,776,770</b>

The following table presents the principal data relating to the development of the interest-bearing debt of the United States from 1791 to 1912:

#### TOTAL INTEREST BEARING DEBT

1791, Jan. 1	\$75,463,476.52
1800, July 1	82,976,294.35
1810	53,173,217.52
1820	91,015,565.15
1830	48,565,406.50
1840	3,873,344.00
1850	63,452,773.55

1860 July 1	\$64,842,287.88
1861	90,580,873.95
1862	365,304,826.92
1863	707,581,634.47
1864	1,359,930,763.50
1865	2,221,311,918.29
1866	2,332,331,208.00
1870	2,046,455,722.39
1880	1,723,993,100.00
1890	725,313,110.00
1898	847,867,470.00
1900	1,023,478,860.00
1910	913,317,490.00
1912	963,776,770.00
1913	965,706,610.00

**DEBTOR.** One who owes a debt or obligation to another. Strictly speaking, the relation of debtor and creditor arises only out of voluntary transactions between the parties and not as the result of a duty or obligation imposed by law. The position of the debtor and the rights of the creditor over him have varied greatly in the various stages of human, and especially of commercial, development. In primitive society the arrangements for borrowing and lending are rarely such as to enable the citizen to avail himself with security of his resources, or to assign such limits to the powers of the creditor as either the claims of humanity or his own true interests demand. On the one hand, lending is confounded with almsgiving, and the exaction of interest, and even of capital, is regarded as an act of inhumanity towards the poor. On the other hand, no sooner do the creditor's rights come to be recognized in anything like a legal sense than there seem to be no logical grounds on which any limits can be set to them. If he is entitled to exact the debt at all, he is entitled to seize the goods of the debtor; and if the debtor has no goods, he is entitled to his services, which also implies the possession of his person and even of power over his life. Moreover, from the theories of the domestic relations which usually prevail in early times, the person of the individual, where he is the father of a family, brings with it his wife, his children, and his slaves. The creditor thus becomes the master of the life and liberty of his debtor, and of all those who are dependent upon him. The provisions of the Mosaic law are an illustration of the manner in which, in the ruder forms of society, the laws of debt combine a degree of lenity with a severity which is equally alien to modern views. In this as in many other respects they are typical of the state of society to which they belong rather than a system peculiar to the Jews. If an Israelite became poor, it was a duty to lend to him, and no interest was to be exacted either in money or in produce. When the sabbatical year arrived, i.e., at the end of every seven years, there was a general remission of debts as between Israelites, and the near approach of the year of remission was not recognized as an excuse for declining to lend to an indigent brother (Deut. xv. 1-11). Pledges, it is true, might be taken, but even here the same humane principles prevailed. The upper millstone was sacred, for to take it would be to deprive the debtor of the means of subsistence. If raiment was the pledge, it must be returned before nightfall, when it might be required for a

covering; and the widow's garment could not be taken in pledge (Ex. xxii. 26, 27). In strange contrast to this is the provision (Lev. xxv. 39) that a poor Israelite may be sold to one possessed of substance, even when modified by the special provision that he shall serve as a hired servant, not as a bond servant, and shall be set at liberty when the year of jubilee arrives. Children were often given in pledge (Job xxiv. 9), and ultimately into slavery, in payment of debt (2 Kings iv. 1).

Both in Greece and in Rome the creditor had a claim to the person of the debtor. Previous to the time of Solon this arrangement had produced consequences at Athens closely analogous to those which afterward led to the struggles between the patricians and plebeians at Rome; and his abolition of it forms one of Solon's many claims to the character of an enlightened legislator. By the Twelve Tables it was enacted at Rome that if the debtor admitted the debt, or had had judgment pronounced against him for it, 30 days should be allowed him for payment. At the expiration of that period he was liable to be given into the hands of his creditor, who kept him 60 days in chains, exposing him from time to time publicly and proclaiming his debt. If no one stepped in to release him, the debtor at the end of that time might be sold as a slave or put to death. If there were several creditors, the letter of the law permitted them to cut their debtor in pieces, sharing him in proportion to their claims; but Gellius tells us that no Shylock ever was found in Rome. To treat him as a slave, however, and make him work out the debt, was the common practice; and his children followed his condition. The *Lex Poetelia* (326 B.C.) alleviated the condition of debtors to the extent, at least, of preventing summary imprisonment and of relieving all debtors for the future from being put in chains. There do not seem to have been any public prisons for debtors at Rome, and each creditor consequently was the jailer of his own debtor. In this circumstance we probably see the reason of the prominence which was given by the plebeians to a change in the laws of debtor and creditor, on the occasion of their first secession, in 494 B.C., and subsequently during the whole course of the struggles between the two orders.

During the feudal period the person in general was not attachable for debt, imprisonment being inconsistent with the duties of warlike service, to which every man was bound; and it was for the encouragement of commerce and in consideration of the merchant having to deal with strangers and foreigners that it was first introduced in the mercantile communities of Europe. By the Statute of Merchants it was enacted by the English Parliament, in 1282, that in lending money a merchant might bring the borrower before the Lord Mayor of London, or the chief warden of another good town, and cause him to acknowledge his debt and the day of payment. A recognizance (q.v.) was then enrolled, and an obligation written by the clerk and sealed with the King's seal and the debtor's. Failing payment, the creditor was entitled to produce this obligation and to demand a warrant to seize the person of his debtor and to commit him to the Tower. This barbarous practice of punishing misfortune as a crime flourished in England for 600 years, until the humanitarian sentiment of our own time, stirred into action by the efforts of Samuel Romilly and

other reformers, forced the abandonment of the practice. An impression of the extent of the hardship which it involved may be gained from the fact that, in the 18 months subsequent to the commercial panic of 1825, 101,000 writs for debt were issued from the English courts. In the year ending Jan. 5, 1830, there were 7114 debtors sent to prison in London, and on that day 1545 of these were still in confinement. In general it may be said that, up to the time of the reform legislation referred to, the prisons of England were crowded with debtors. The first statute affording partial relief to these unfortunates was passed in 1838, but it was not until 1868 that the system was finally abolished (Statutes 32 and 33 Vict., c. 62).

The practice of imprisonment for debt has also prevailed, though to a much more limited extent, in the United States. It was abolished in New York in 1831 and shortly after that date by the other States in which it had been permitted. In many of the States it has never been recognized. Both in England and the United States, however, a limited right of coercing a dishonest debtor by arrest in civil process is permitted by statute. It is generally allowed in actions for injury to the person or character, or for injury to or the wrongful taking of property, embezzlement by public officers or persons acting in a private fiduciary capacity as trustees; for misconduct in office or in any professional employment; in actions to recover possession of personal property, where it is concealed or kept out of the reach of the sheriff; and where the defendant has been guilty of fraud in contracting the debt or in avoiding payment. Women are generally exempt from arrest in all cases except actions for willful injury to person, character, or property.

As to the manner in which the position of the debtor has been mitigated by the general adoption of the principle of the bankruptcy and insolvency laws, see those titles. See also *DEBT*, and the titles there referred to.

DE BUEIL, HONORAT. See RACAN.

DEBUSSY, de-by'sé', CLAUDE ACHILLE (1862- ). A prominent French composer, the acknowledged leader of the new French school. He was born Aug. 22, 1862, at Saint-Germain-en-Laye. When only 11 years of age he entered the Paris Conservatory, where his teachers were Lavignac in solfège, Marmontel in piano, and Guiraud in composition. After having carried off several prizes, he won the Grand Prix de Rome in 1884 with his cantata *L'Enfant prodigue*, a work of striking beauty and originality of expression (produced as an opera in Boston in 1910). The result of the first year of his sojourn in Italy was a symphonic suite, *Printemps*, which the Academy pronounced too advanced and unduly modern. Nothing daunted by this verdict, Debussy continued in his own characteristic style, and as the fruit of the second year sent the still more advanced *La Demoiselle élue* for female voices and orchestra on a text by Gabriel Sarrazin after Rossetti's "Blessed Damozel." This was followed by the exquisite *Petite Suite* for piano (four hands), *Suite Bergamesque*, three nocturnes for orchestra (*Nuages, Fêtes, Sérènes*), a string quartet. In 1902 he attracted wide attention with the symphonic poem *L'Après-midi d'un faune*, which elicited much critical discussion and many conflicting opinions, but also gained many friends for the new master. The same year witnessed

the first production, on April 30, in Paris, of Debussy's first dramatic work *Pelléas et Mélisande*. This immediately placed its author at the head of the new French school. In 1907 it was brought out in Germany and Belgium, in 1908 in Italy and the United States (New York, February 19), in 1909 in England. Since the death of Wagner no other musicodramatic work, with the exception of Strauss's *Salome* and *Elektra*, has caused such animated discussion as *Pelléas et Mélisande*. Even its detractors must admit its importance in the history of dramatic music. The next important work, three symphonic sketches, *La Mer*, appeared in 1905. The list of larger works is completed by the enumeration of a rhapsody for clarinet and orchestra (1911), a ballet, *Jeux* (1913); a second ballet, *Crimen Amoris* (1914). In 1913 Debussy published an expanded orchestral version of his earlier suite, *Printemps*. Four other dramatic works—*Chmène*, *Histoire de Tristan*, *Le diable au Beffroi*, *La chute de la maison Usher*—are still in manuscript. Debussy has also written a number of exquisitely graceful pieces for piano and songs of striking originality. His texts are selected chiefly from the works of Baudelaire, Bourget, Louy, Mallarmé, and Verlaine; and he favors such poems as are eminently suited to be wedded to his vague, intangible, and elusive musical strains.

Debussy's originality consists in the conscious employment of the higher overtones, by means of which the field of harmony has been considerably widened and enriched. By a skillful combination of this principle with the older church modes and the whole-tone scale—which latter is rather unduly favored—many new and interesting effects are obtained. The themes rarely assume a well-defined shape; they generally defy searching analysis because of their vagueness. The instrumentation is always fascinating, discreet, and exquisitely refined. In all Debussy's music not a bar can be found that even remotely suggests the commonplace. His whole art, in fact, is sublimated refinement. And for this very reason it never strikes deep, never grips the soul with that elemental force which is the peculiar attribute of the highest genius. Yet, in spite of all limitations, Debussy has exerted a marked and widespread influence not only upon contemporary French composers, but upon the younger composers of Spain, England, and the United States. Consult: F. Liebig, *Claude-Achille Debussy* (London, 1908); C. Caillard and J. de Bérus, *Le cas Debussy* (Paris, 1910); G. Setaccioli, *Debussy è un innovatore?* (Rome, 1910); J. Rivière, *Études* (Paris, 1911); C. Paglia, *Strauss, Debussy e compagnia bella* (Bologna, 1913).

**DÉBUT**, dā-bu' (Fr.). A word which signifies generally a "beginning" or "entrance," but especially applied to the first appearance of an actor or actress on the stage or to a first appearance in a particular theatre. In these circumstances the actor is called a *débutant*; the actress, a *débutante*. The word is used also for "entry into society."

**DECA** (Gk. *deka*, *deka*, ten). A common prefix or combining form meaning "ten," as in *decapolis*, a union of 10 cities; *decatalogue*, the Ten Commandments. *décamètre*, a measure of 10 meters, etc. From *deca* is formed:

**Decade**. A collection or group of ten. In its most common application it signifies a period of 10 years. The word was used in the calendar

of the French Republic to designate the week of 10 days. Each month of 30 days was divided into three decades. The days of each decade were named *primidi*, *duodi*, *tridi*, *quartidi*, *quintidi*, *sextidi*, *septidi*, *octidi*, *nonidi*, and *decadi*. The tenth, or *decadi*, was the day of rest, which, as the Republic subscribed to no definite religion, was devoted to the practice of and exhortation to virtue. The Republican year numbered 36 decades. The remaining five (in leap years, six) days were not numbered and were set apart as holidays at the end of the year.

**DECACHORD** (Gk. *dekachordos*, *dekachordos*, ten-stringed, from *deka*, *deka*, Lat. *decem*, Eng. *ten* + *chordē*, *chordē*, string, chord). A kind of guitar with 10 strings, similar to the common guitar, but larger in the body, and provided with a broader finger board. The lower strings have no frets, being used only as open notes.

**DECADENCE** (Fr. *décadence*, through ML. *decadentia*, from *de*, from + *cadere*, to fall). A term used with reference to works of art belonging to a school, nation, or race artistically in decline. In Greece art in all its forms reached its acme in c.450 B.C.; and though there are many exquisite works which were produced at a later period, they all belong, more or less conspicuously, to the decadence of Greek art. The century and a half beginning with Augustus (until about 150 A.D.) was the golden age of Roman art; after which there is a decadence which soon becomes very obvious and rapid. The art of the Italian Renaissance attained its highest development in the early sixteenth century, in the work of such masters as Michelangelo, Raphael, Leonardo, Titian, Correggio, after whom (except in Venice) came its decadence, to which even such artists as the Carracci and Caravaggio belong.

**DECADENTS**, dā'kā'dān' (It., Sp., Portug. *decadente*, from Lat. *de*, from + *cadere*, to fall). See SYMBOLISTS.

**DECAEN**, de-kān', CHARLES MATTHIEU ISIDORE, COUNT (1769-1832). A French general, who, having risen to the rank of general of division because of his services in the Rhemish campaigns of the war of the Revolution, won fame because of his share in the victory of Hohenlinden in 1800. In 1802 he was sent to India as captain general of the French possessions there, in connection with Napoleon's schemes for building up a new French colonial empire. Finding conditions in India hopeless for such plans, he made Mauritius the centre for some eight years of the destructive warfare which with the aid of Admiral Sinois he waged against British trade in the East. However, he was obliged to surrender to the English in 1810 and, having returned in 1811, was placed in command of the army in Catalonia. He compelled the English to raise the siege of Tarragona and was created Count in 1812. When Napoleon abdicated, Decaen entered the service of Louis XVIII, but on the Emperor's return from Elba again accepted a command under him. After the battle of Waterloo he lived in retirement. Consult M. L. E. Gautier, *Biographie du général Decaen* (Caen, 1850).

**DECAGON** (Gk. *deka*, *deka*, ten + *gōnia*, *gōnia*, angle). A geometric plane figure of 10 sides and 10 angles. When the sides are equal and the angles are equal, the figure is called a regular decagon. This figure is obtained from a regular pentagon (q.v.) by describing a circle around the latter, bisecting the arcs between its

vertices, and drawing lines from these vertices to the points of section. See POLYGON.

**DECAISNE**, de-kān', JOSEPH (1807-82). A French botanist, born in Brussels. He studied medicine and natural science in Paris and in 1830 became connected with the Museum of Natural History, in which he was made professor of botany in 1848. Three years later he was appointed to a similar post at the Jardin des Plantes. His published works include the following: *Herbarii Timoriensis Descriptio* (1835); *Plantes de l'Arabie heureuse recueillies par Botta* (1841); *Histoire de la maladie des pommes de terre* (1845); *Recherches anatomiques et physiologiques sur la garance* (1847); *Flore élémentaire des jardins et des champs*, jointly with Lemaout (1855; 1865); *Traité général de botanique descriptive et analytique*, jointly with Lemaout (1867); *Le jardin fruitier du Muséum* (9 vols., 1858-78); *Manuel de l'amateur des jardins*, jointly with Naudin (4 vols., 1862-72).

**DECALOGUE** (Gk. *dekálogos*, *dekalogos*, ten sayings, from *deka*, *deka*, ten + *lógos*, *logos*, word). The term usually applied by the Greek fathers to the law of the two "tables of testimony" given, according to the Book of Exodus, by Yahwe to Moses on Mount Sinai (Ex. xx. 1-17). According to the narrative, these tables were made of stone, and the commandments inscribed thereon were "written with the finger of God" (Ex. xxxi. 18). Afterward, when the tables were broken by Moses (Ex. xxxii. 19), he was commanded to hew others, on which Yahwe again wrote the words of the covenant (Ex. xxxiv. 28). These are said to be "the 10 words" (verse 28 h). The commandments are not numerically divided in the Pentateuch, and it has been supposed by some that the number 10 was chosen because 10 was considered the most perfect number. As, however, there are 10 distinct injunctions, it is superfluous to allege any other reason for the division than the simple fact that this is the correct enumeration. Philo divides them into two pentads, the first ending with "honor thy father and thy mother," etc., but the general opinion among Christians is that the first table contained those commandments which enjoin upon us our duty to God (comprising the first four), and the second those which enjoin upon us our duty to our fellow creatures (comprising the last six). The Talmudists make the introductory words, "I am the Lord thy God, which have brought thee out of the land of Egypt, out of the house of bondage," to be the first commandment, and, in consequence, to keep the number 10, they make the next two (verses 3-6) into one. But the words quoted obviously contain no command at all, and merely express the general reason why the Israelites should yield implicit obedience to the injunctions which follow. Hence Origen commences the Decalogue with, "Thou shalt have no other gods before me." His division is that in use in the Greek, and in all the Protestant churches except the Lutheran; while from the writings of Philo and Josephus it appears that such was also the division received in the Jewish synagogue. The Roman Catholic and Lutheran churches also make verses 3-6 one commandment. To preserve the number 10 they divide verse 17 into two commandments, the first being "Thou shalt not covet thy neighbor's house," and the second, "Thou shalt not covet thy neighbor's wife, nor his manservant," etc.,

to the end. The two tables are said to have been placed in the ark of the tabernacle as a testimony of Yahwe's revelation (Ex. xxv. 16).

Modern scholars have called attention to the fact that there are two texts of the Decalogue—(1) Ex. xx. 2-17, and (2) Deut. v. 6-21—which present some striking differences. The commands in both are the same, viz., (1) prohibition of any worship besides that of Yahwe; (2) prohibition of graven images; (3) prohibition of the use of the name Yahwe for vain purposes; (4) the Sabbath command; (5) command to honor father and mother; (6) prohibition of murder; (7) prohibition of adultery; (8) prohibition of stealing; (9) prohibition of bearing false witness; (10) prohibition of coveting one's neighbor's property. But the text in Deuteronomy is believed to contain various amplifications, notably in the case of the fourth, fifth, and tenth commandments; and, moreover, while in Exodus the reason for hallowing every seventh day is as a memorial of the creation of the world in six days and of God's resting on the seventh, in Deuteronomy the observance of the Sabbath is enjoined as a reminiscence of the Exodus from Egypt. Of the two versions that in Exodus is regarded as the older form, though even in this amplification are supposed to have been introduced which did not belong to it in its original form. In regard to the age of the Decalogue in its earliest form scholars differ. Many regard the moral rather than ritual tone, the prohibition of images, the Sabbath commandment, and the condemnation of the evil desire as evidences of a date later than the appearance of the great prophets. On the other hand, it has been urged that neither monotheism nor monolatry may have been originally intended, but only abstinence from worship of other gods and from placing their images in the presence of Yahwe, i.e., near him, that the Sabbath contemplated may have been the full moon, and that, in the tenth commandment, appropriation of that which has no owner is meant by the word translated 'coveting.' Traces of another Decalogue were discovered in Ex. xxxiv. already by Goethe. Here we find (verses 10-26) chiefly ritualistic ordinances: (1) not to worship any other god but Yahwe; (2) not to make any molten images; (3) to keep the feast of unleavened bread; (4) to give the firstlings to Yahwe; (5) to observe the feast of weeks; (6) to keep the feast of ingathering; (7) not to mix the blood of the sacrifice with leaven; (8) not to leave the fat of the paschal sacrifice till morning; (9) to bring the first fruits to Yahwe; (10) not to seethe the kid in the mother's milk. This decalogue, to which the phrase "the 10 words" in Ex. xxxiv. 28, if they are a genuine part of the text, would seem to refer, puts the emphasis upon the religious ceremonies. It has therefore been regarded by many scholars as older than the other. If the latter, with its stress upon moral duties, was earlier and enjoyed Mosaic authority, they find it difficult to understand how the former could have claimed to take its place, while the reverse can be more readily comprehended.

Consult: Procksch, *Die Elohimquellen* (1906); Volz, *Mose* (1907); Eerdmans, "The Covenant Code and the Decalogue," in *The Expositor* (1909); Sellin, *Einleitung ins Alte Testament* (1910); Gressmann, *Mose und seine Zeit* (Leipzig, 1912); Bade, *The Decalogue: A Problem in Ethical Development* (1914).

**DECAMERON** (It. *Il Decamerone*, from Gk. *deka*, *deka*, ten + *hēmera*, *hēmera*, day). A famous collection of stories by Boccaccio (q.v.). See GALEOTTO, PRINCEPE.

**DE CAMPE, JOHN** (1812-75). An American naval officer, born in New Jersey. He entered the service in 1827, became commander in 1855, and commanded the *Iroquois* at the capture of New Orleans in 1862. Afterward he played a gallant part in various actions on the Mississippi, especially under Farragut at Vicksburg. He was raised to the rank of commodore in 1866 and retired in 1870 as rear admiral.

**DECAMP, JOSEPH RODEFEE** (1858- ). An American figure and landscape painter. He was born in Cincinnati, Ohio; studied there under Duvencek, and at the Munich Academy. He established himself in Boston in 1893, and became an instructor in the school of the Boston Museum of Fine Arts. He was elected to the Society of American Artists in 1888. Impressionism, modified by a realistic treatment and sureness and solidity of execution characterizes his paintings. He received the Temple gold medal from the Pennsylvania Academy of Fine Arts in 1899, honorable mention at the Paris Exposition of 1900 for a "Woman Drying her Hair" (now in the Cincinnati Museum), and a gold medal at the St. Louis Exposition in 1904. He aroused great enthusiasm in Berlin in 1910 with "An Interior" and a "Lady Playing a Lute." Other fine paintings by him are: "The New Gown" (Wiltach Gallery, Philadelphia); "Sally" (Worcester Museum); a portrait of Dr. Horace Howard Furness and "Little Hotel" (Pennsylvania Academy, Philadelphia).

**DECAMPS, de-kāmp', ALEXANDRE-GABRIEL** (1803-60). A French genre and landscape painter. He was born in Paris, March 3, 1803, and studied with Abel de Pujol, but was in no way restricted by the traditions of the conventional and classic in art. Of early instruction he had received little, regarding lessons "monotonous." He preferred to grope his way alone, but in later years acknowledged himself handicapped for lack of early training. Once, visiting the studio of Millet, he exclaimed, "Ah! you are a lucky fellow; you can do all you wish to do." "The sting of his artistic conscience" was always with him, making him discontented and restless even over his best work. Decamps's genius finally expressed itself in landscape and genre, and in Oriental subjects which introduced both. His subjects were chiefly found in the streets, on the quays, and in the fields. He reveled in color and in effects of atmosphere and light, and he managed these qualities in his pictures in a fascinating manner. Before he visited the East, in 1827, he had painted suggestions of the Orient, and five years before Delacroix he laid the foundation of the French school of Orientalism. His first paintings of genre subjects, exhibited in 1831, were so popular that it was difficult for him to depart from that style of work, yet he aspired to the historical in his nine sketches of the history of Samson (*Musée des Arts Decoratifs*, Paris) and made various unsuccessful attempts at monumental compositions. As a landscape painter, he sympathized with Constable and was lofty and dignified in his interpretation of nature. Light and atmosphere dominated his works—the modern note that was handed on to the school of impressionists. Decamps liked to indulge in satirical work, and "The Monkey Ex-

perts" and his travesties of Charles X display his skill in that direction. He touched the high-water mark of his popularity in 1839, in his exhibits at the Salon, where his "Café in Asia," "Street of a Roman Village," "Children Playing Near a Fountain," and other examples of his figure subjects and landscapes made him chevalier of the Legion of Honor. But the authority of the classic school and lack of official recognition made Decamps uncertain of himself and discouraged with his profession. In this mood, and suffering besides from a nervous illness, he burned many of his works and retired to the country, neglecting art for many years. He lost his life, Aug. 22, 1860, as the result of an accident while riding to the hunt. Decamps has been worthily represented in the Louvre since 1903; the Wallace collection, London, possesses 28 of his pictures, and others are in the Metropolitan Museum, New York, the Brooklyn Institute, and many other European and American galleries. He left about 100 lithographs and 20 etchings. Consult the monographs by Chaumelin (Marseilles, 1861); Moreau (Paris, 1869); Clément, in *Les artistes célèbres* (ib., 1886); Hédiard, in *Les maîtres de la lithographie* (Le Mans, 1892); Im-Thurn, *Scheffer et Decamps* (Nîmes, 1876); Chesneau, *Mouvement moderne en peinture: Decamps* (Paris, 1861); Stranahan, *Modern French Painters* (New York, 1888).

**DE CANDOLLE, de känd'öl', ALPHONSE LOUIS PIERRE PYRAME** (1806-93). A celebrated botanist, son of Augustin Pyrame de Candolle. He was born in Paris. His early education, like that of his father, was obtained in Geneva, where the greater part of his life was spent. Besides making botanical investigations of his own, he continued his father's monumental work, the *Prodromus Systematis Regni Vegetabilis*. His most important botanical writings are: *Introduction à l'étude de la botanique* (Paris, 1835); *Géographie botanique* (ib., 1855); *Lois de la nomenclature botanique* (ib., 1867); *La phytographie ou l'art de décrire les végétaux* (ib., 1880); *Origine des plantes cultivées* (ib., 1883). Besides these works he wrote a history of the sciences and scientists of the last two centuries (Geneva, 1872) and edited the memoirs and souvenirs of his father (ib., 1862).

**DE CANDOLLE, AUGUSTIN PYRAME** (1778-1841). A celebrated Swiss botanist. He was born in Geneva, Switzerland, where he obtained his early education. While still a youth, his ability to study and his attainments in literature were in marked contrast to his weak constitution. The gracefulness of his verse led Florian to predict a future for him as a poet. Law and medicine at first attracted him, but his love of plants, which had been aroused in 1792, while he was living with his mother in a village during the siege of Geneva, and which had been growing, through the influence of Saussure and especially of Vaucher, led him to adopt the study of botany as his life work. In 1796 he removed to Paris, where his first works, *Historia Plantarum Succulentarum* (Paris, 1799) and *Astragalologia* (ib., 1802), attracted the attention and gained him the friendship of scientists, among whom were Cuvier, to whose chair in the Collège de France he was elected in 1802; and Lamarck, who intrusted to him the publication of *Flore Française* (ib., 1803-15), in the introduction of which work he elaborates

and enforces Jussieu's natural system of plant classification as opposed to the Linnæan or artificial system. In 1804 the medical faculty of Paris awarded him the degree of M.D. Beginning with 1806, he spent six summers in the service of the government making a botanical and agricultural survey of the entire country, a report of which appeared in 1813. In 1807 he became botanist and director of the botanical garden in the medical faculty of the University of Montpellier, and three years later was transferred to the newly created chair of botany in the science faculty. During this incumbency he published *Théorie élémentaire de la botanique* (Montpellier, 1813; 2d ed., 1819; reprint, 1844)—a work that greatly extended his reputation and the popularity of the natural method of plant classification. In 1816 he accepted the newly founded chair of natural science and, conjointly with his son, the directorship of the botanical garden at Geneva, which offices he held until 1834, when his son succeeded him. He spent the remainder of his life in Geneva. In 1824 he commenced the *Prodromus Systematis Regni Vegetabilis* (Paris, 1824-74), based upon a former work (*Regni Vegetabilis Systema Naturale*), which had been planned upon too prodigious a scale for one man to complete, and of which only two volumes were published, in 1819 and 1821 respectively. Even of this more condensed work he was able to complete only seven volumes; the remaining 14 are the work of his son. He published other books and pamphlets, whose value, though considerable, is eclipsed by the works already mentioned. As a lecturer he exerted a wide influence and as a citizen was highly esteemed. Among the numerous honors awarded him was the cross of the Legion of Honor, which he received from Louis Philippe.

**DECAP'ODA** (Neo-Lat. nom. pl., from Gk. δεκάπους, *dekapous*, from *deka*, *deka*, ten + *πούς*, *pous*, foot) 1. The largest and most important order of malacostracan crustaceans, distinguished by the fact that the carapace is firmly grown to the dorsal side of all the thoracic segments, and that the last five pairs of thoracic appendages serve as walking feet, while the first three pairs are mouth organs. All of the crustaceans ordinarily used for food (crabs, lobsters, shrimps, and prawns) are decapods. Many hundred species are known, and they are found in all parts of the world, on land and in fresh water, but chiefly in the sea. The decapods contain three groups—the long-tailed (*Macrura*), the short-tailed (*Brachyura*), and the peculiar-tailed (*Anomura*). The first has the abdomen long and covered by a hard shell, and the lobster, crayfish, prawn, etc., are good illustrations; the second suborder has the abdomen very short and weak (this group is made up of the crabs); while the third includes the hermit crabs, which seem to be intermediate between the others. See CRAB; CRUSTACEA, LOBSTER.

2. A suborder of dibranchiate cephalopods, having 10 arms, the squids. See CEPHALOPODA. SQUID; and Colored Plate of OCTOPODS AND DECAPODS.

**DECAP'OLIS** (Lat., from Gk. Δεκάπολις, *De-kapolis* = *deka*, ten, *polis*, a city). A geographical term used in Josephus (e.g., *Wars*, iii, ix, 7), the New Testament (Matt. iv. 25; Mark v. 20; vii. 31), and other ancient writings to designate certain districts in and near Pales-

tine, situated mainly east of the Jordan. The Decapoli was a confederacy, or league, originally of 10 cities, though the number was not constant, apparently having been increased in the second century. The details of the history of the confederation are somewhat obscure. Its outlines can be recovered, however, with a good degree of certainty.

When Alexander the Great conquered the East (331 B.C.), the ancient Semitic world was at once opened to the influences of Greek civilization. Many of Alexander's veterans either settled in cities already founded or established new ones for themselves. Palestine, outside of Judæa proper, was not exempt from this movement, and soon here and there throughout the ancient Hebrew territory numerous Greek cities came into existence. These cities, all constituted after the same general idea of the Greek *polis*, were centres of Greek culture. During the Maccabean War of Independence (167-141 B.C.), waged by the Jews against the Greek-Syrian Kingdom, the sympathies of these cities were with Syria. Consequently, with the triumph of the Jews, and especially during the reigns of the Asmonean princes, John Hyrcanus (135-105 B.C.) and Alexander Jannæus (104-78 B.C.), they suffered great hardship, in many cases being deprived of their independence. In 63 B.C., when Pompey took charge of affairs in Syria and Palestine in the name of Rome, he freed them from the Jewish yoke. It was probably at this time that 10 of these cities formed the league known as the Decapolis. The charter members seem to have been Scythopolis (*Beisân*, the only one west of the Jordan), Dion, Pella (*Pahil*), Gadara (*I'mm Kays*), Hippos (*Susneh*), Gerasa (*Jerdach*), Philadelphia (*'Amman*), Damascus, Raphana, and Kanatha (*Kana'adit*). Such, at least, is the list given by our earliest authority, Pliny the Elder (*Hist. Nat.* v, 18), in the first century; though it must be remembered that this list represents only the cities which belonged to the confederation in Pliny's time. There is strong reason to believe that Damascus was not one of the original group, lying too far to the north, but that in its place was Abila, generally reckoned as a later addition. It is also debated whether Raphana or Samaria is to be considered as one of the primary number. (Consult Hölcher, pp. 97 f.) The geographer Ptolemy, in the second century, omits Raphana, but adds nine other names, most of them of cities belonging to the district just south of Damascus, making 18 in all constituting the league in his time. The purpose of the confederation was in part to secure better protection against enemies, such as the Jews and the Arabian tribes, who were naturally hostile to Roman and Greek influences. Another equally powerful motive was the desire to obtain better trade advantages. The members of the league were all situated on trade routes, and the influence they exerted is seen in the passing over from Greek into Hebrew of many commercial terms and names. Each one of these cities covered with its jurisdiction a large adjacent district. Yet the Decapolis was not one solid territory, but between the districts belonging to the respective cities were large tracts governed by the various tetrarchies, or other forms of government permitted by Rome to exist under her general supervision. The most compact part of the Decapolis lay just south and east of the Sea of

Galilee. Here the regions of Scythopolis, west of the Jordan and on the main line of communication with the East-Jordan territory, of Hippos, east of the Sea of Galilee, and of Gadara, south of Hippos, on the Hieromax (the ancient *Yarmūk*), were contiguous, each possessing a section of the shore of the lake. South of Gadara, bordering on the Jordan valley, were Pella and Dion, which, from their Macedonian names, were both probably founded by Alexander's veterans. East of these were the districts belonging to Abila, on the Hieromax; Jerasa, farther south and very extensive; and Philadelphia, the ancient *Rabbah-Ammon* (Deut. ii. 11), the most southern member of the league. To the northeast were the cities Kanatha, the ancient *Kenath* (Num. xxxii. 42), both on the western slope of the Haurān Hills, and Damascus. Other members, such as Edrei and Bosra, though old cities, were late additions and carried the influence of the league eastward, south of the Haurān.

As to their political constitution, it seems to have been of an uncertain character. The independence to which they were restored by Pompey gave them the right to elect communal councils, to coin money, to offer asylum, to hold and administer property in the surrounding territory, and to associate together for defense and trade. At the same time the administration of their affairs was subject to review by the Governor of Syria, their coins bore the Imperial image; they were subject to taxation by Rome and to service in her military system; and even their political connections were determinable by the Emperor, as when, in 30 B.C., Augustus transferred some of them from the Province of Syria to the direct control of Herod.

From the organization of the league until the third century—a period of nearly 300 years—the Decapollitan country was exceedingly prosperous. When Trajan organized the Province of Arabia (106 B.C.), the security of the region was assured, commerce expanded, literature and art flourished, and in all conditions this was one of the most favored regions of the Empire. Of the cities making up the league, some were of more than ordinary size and importance. The ruins of Jerasa are very extensive; the amphitheatre of Philadelphia had a seating capacity of more than 7000; Jerasa had a *naumachia*. Greater than any of these, in Josephus' day, was Scythopolis, the ancient *Bethshean* (Josh. xvii. 11), west of the Jordan, famous for its linen manufactures. The confederation seems to have dissolved gradually. Some of the cities became incorporated with the Province of Arabia; others maintained their independent position until the break-up of the Roman Empire.

Smith, *The Historical Geography of the Holy Land* (11th ed., 1904); Hülscher, *Palästina in der persischen und hellenistischen Zeit* (Berlin, 1903); Schumacher, *Across the Jordan* (London, 1899).

**DE CASSAGNAC**, de ka-sā'nyāk', PAUL GRANIER. See GRANIER.

**DECATUR**. A city and the county seat of Morgan Co., Ala., on the south bank of the Tennessee River, about 18 miles above the Muscle Shoals, and on the Louisville and Nashville and the Southern railroads (Map: Alabama, B 1).

It has repair shops of the Louisville and Nashville, car works, engine works, tannery, bottling plants, and manufactures of lumber, sashes and blinds, fertilizers, cigars, flour, cottonseed oil, and various other products. There are two infirmaries, a hospital, and a Federal building. Pop., 1890, 2765; 1900, 3114; 1910, 4228.

**DECATUR**. A town and the county seat of De Kalb Co., Ga., 6 miles east-northeast of Atlanta, on the Georgia Railroad (Map: Georgia, B 2). It is a popular residential place and contains the Agnes Scott College (Presbyterian) for women, the Donald Frazer (Presbyterian) High School for boys, and a Carnegie library. Here, on July 20, 1864, the battle of Peachtree Creek (q.v.) was fought, the Confederates, under General Hood, attacking unsuccessfully part of Sherman's army under Generals Thomas and Schofield. Decatur, named after Commodore Stephen Decatur, was settled and incorporated in 1823. The water works are owned by the town. Pop., 1900, 1418; 1910, 2466.

**DECATUR**. A city and the county seat of Macon Co., Ill., 38 miles east of Springfield and 173 southwest of Chicago, on the Sangamon River, and on the Illinois Central, the Wabash, the Cincinnati, Hamilton, and Dayton, and the Vandalia railroads (Map: Illinois, D 4). It contains a Carnegie library, Fairview, Lincoln, Nelson, and Torrence parks, a hospital, a home for aged and orphans, and James Millikin University, founded in 1901. The city is in a fertile agricultural region and, owing to its exceptional railroad facilities, has large trade and shipping interests, particularly in grain. It is also an important industrial centre, manufacturing iron, soda fountains, corn shellers, starch, corn flour, meal, hominy, plumbing, water-works equipment, electric-light fixtures, coffins, etc. Decatur adopted the commission form of government in 1911, consisting of a mayor and four commissioners elected every four years. The water works and electric-light plant are owned and operated by the municipality. Decatur was settled in 1830 and incorporated six years later. Lincoln received his first indorsement as presidential candidate at the Illinois Republican Convention, held here on May 6, 1860. Decatur is also the birthplace of the Grand Army of the Republic, Post 1 having been organized here on April 6, 1866. Pop., 1900, 20,754; 1910, 31,140, 1914 (est.), 37,525.

**DECATUR**. A city and the county seat of Adams Co., Ind., 21 miles southeast of Fort Wayne, on St. Mary's River, and on the Toledo, St. Louis, and Western, the Erie, and the Grand Rapids and Indiana railroads (Map: Indiana, E 2). It has several fine stone quarries, heading, handle, and hoop factories, and manufactures of lumber in various products, machinery, tiles, sugar, saddlery, fences, furnaces, and gloves. There is a Carnegie library and a Knights of Pythias home. Decatur was settled in 1840 and incorporated in 1882. The government is administered by a mayor, elected every four years, and a city council. The city owns and operates its water works and electric-light plant. Pop., 1900, 4142; 1910, 4471.

**DECATUR**. A city and the county seat of Wise Co., Tex., 40 miles north by west of Fort Worth, on the Fort Worth and Denver City

Railroad (Map: Texas, D 3). It is the seat of the Decatur Baptist College and contains a park and fine courthouse. The city is the centre of a corn and cotton-growing region and has cotton gins, a cottonseed-oil mill, a rolling mill, a canning factory, a flour mill, and an ice plant. Limestone is extensively quarried in the vicinity. Decatur owns its water works and electric-light plant. Pop., 1900, 1562; 1910, 1651.

**DECATUR, STEPHEN** (1751-1808). An American naval officer, born in Newport, R. I., of French ancestry. He early went to sea on a merchantman and during the Revolution commanded privateers. In 1798 he became a captain and was put in charge of the *Delaware*, 20 guns, with which he captured two French privateers. In 1801 he left the navy and went into business in Philadelphia. His son Stephen attained great distinction in the navy.

**DECATUR, STEPHEN** (1779-1820). An American naval officer, born in Sinnepuxent, Md., Jan. 5, 1779. He entered the navy as midshipman on board the *United States* in 1798. In November, 1803, he had command of the *Norfolk* and afterward of the *Enterprise*. On Feb. 16, 1804, at the head of a small party, he made a dash into the harbor of Tripoli and burned the frigate *Philadelphia*, which had fallen into the hands of the Tripolitans. In recognition of this act, which Admiral Nelson pronounced "the most daring of the age," he was made captain and was presented with a sword. Decatur had much more hard fighting in the harbor and neighborhood of Tripoli and in all cases showed the utmost daring and bravery. In 1812 he was in command, as commodore, of a squadron off the Atlantic coast and on October 25, in the *United States*, captured the English frigate *Macedonian*. From 1813 till the summer of 1814 he was forced by a British blockading squadron much superior to his own to remain in the harbor of New London. In January, 1815, he attempted to get to sea from New York with a small squadron. His flagship, the *President*, was injured by striking on the bar at Sandy Hook. He had not proceeded far when he was pursued and forced to engage in an unequal fight. He was finally overpowered and compelled to surrender and was taken to Bermuda with his frigate. He was soon paroled and in May, 1815, sailed from New York as commander of three frigates, one sloop, and six brigs and schooners, to operate against Algiers. He captured two important vessels; but the war was soon concluded by a treaty abolishing the demand upon the United States for tribute and giving up all prisoners. He made similar arrangements with the rulers of Tunis and Tripoli and thus put an end to the enslaving of the Americans by the corsairs of those countries. In November, 1815, he was made navy commissioner, with Commodore Rodgers and Porter, holding the office until his death, March 22, 1820, in a duel at Bladensburg, near Washington, with Commodore James Barron (q.v.). Consult the *Life* by Mackenzie (Boston, 1846), and Brady, *Stephen Decatur* (ib., 1900). His nephew, **STEPHEN** (1815-76), was commodore in the United States navy.

**DECAZES, de-káz', ELIE, DUC** (1780-1860). A French statesman. He began his career as a lawyer, became a judge in Paris, and in 1806 was called to Holland by King Louis, who

esteemed him highly as his trusted counselor. Afterward he became secretary to Napoleon's mother, Letizia Bonaparte, and the same year Counsel to the Court of Appeals. He joined the Bourbons after the restoration and won the favor of Louis XVIII, who made him Prefect of Police, Minister of Police, and in 1818 Prime Minister. He carried out a number of liberal measures, but did not succeed in pleasing the radicals, and at the same time incurred the enmity of the ultraroyalists, who availed themselves of the murder of the Duc de Berry in 1820 to accuse Decazes of complicity in the crime, alleging that his revolutionary policy had instigated the assassin to his deed. The King accepted his minister's resignation with great reluctance, made him a duke, and sent him as Ambassador to England. Having returned in 1821, Decazes took part in all important debates in the Chamber of Peers, opposing the government, and after the revolution of 1830 supported the Orléans dynasty. He retired from public life in 1848 and thereafter devoted himself to the administration of his estates. Consult E. Daudet, *Louis XVIII et le duc Decazes* (Paris, 1899).

**DECAZES, LOUIS CHARLES ELIE AMANIEU, DUC DE GLUCKSBERG** (1819-86). A French diplomat, born in Paris. His father was the statesman Elie Decazes, and through his influence Decazes became Secretary to the Embassy in London, and afterward Minister Plenipotentiary to Spain and Portugal. The revolution of 1848 forced him to retire to private life, but he remained a devoted Orleanist and always hoped for a restoration of the dynasty. In 1871 he was elected a deputy to the Assembly, and in 1873, after being for a short time Ambassador at London, he was given the portfolio of Foreign Affairs. He was retired in 1877 and failed in subsequent efforts to return to political life.

**DEC'AN** (Hind. *dakhan*, Prak. *dakkhana*, Skt. *dakṣiṇa*, southern, pertaining to the right hand, from *dakṣa*, right hand, connected with Gk. *δεξιός*, *dezios*, Lat. *dexter*, right). A term sometimes applied to the peninsula of India (Map: Asia, J 7), south of the river Nerbudda, but now generally restricted to the portion bounded on the north by the Nerbudda and on the south by the river Kistna or Krishna. The name is also applied to the entire triangular plateau which forms the larger part of the Asiatic peninsula of India and is the official designation of a division of the Bombay Province.

**DECCAN HEMP.** See **HIBISCUS**.

**DECEASED WIFE'S SISTER.** See **AFFINITY**; **CONSANGUINITY**; **MARRIAGE**.

**DECEBALUS, de-séb'á-lús** (Lat., from Gk. *Δεκβάλος*, *Dekebalos*; perhaps a title of honor, equivalent to *king*). A king of Dacia, a military leader of much ability, for years a formidable enemy of Rome. He crossed the Danube during Domitian's reign, overran Mesia, and defeated the Imperial army under Cornelius Fuscus. Later he forced Domitian to conclude a treaty by which Domitian was to pay an annual tribute. He was completely overthrown by Trajan in 105 A.D., and his territories were reduced to a Roman province. He committed suicide to escape capture by the conquerors, about 106. See **DACIA**; **TRAJAN**.

**DECEDENT** (Lat. *decedens*, from *decedere*, to depart, die). Strictly, a dying person; in

English and American law, a deceased person—the term being employed only in connection with the passing of the estate of such person, or the administration thereof. When the estate in question is disposed of by will, the decedent is properly described as “testator,” or “devisor,” and thus the term “decedent” has come to be commonly appropriated to a person dying intestate. As thus restricted, decedents’ estates come under the operation of two distinct sets of rules, which, though now usually embodied in statute form, do not depart in essential particulars from the common-law doctrines in which they originated. These rules are, first, that the real estate of a decedent shall descend to his heir, and, second, that his personal property shall pass to his personal representative for purposes of administration and distribution. This personal representative may or may not be a person entitled to share in the ultimate distribution of the property, and under some circumstances the duty of administration is undertaken by the state. In the early history of the law in England it devolved upon the church, the right of administering upon the estate of a decedent being vested in the bishop of the diocese in which he died, such administration, together with the probate of wills, constituting an important part of the ordinary jurisdiction of the ecclesiastical courts. This jurisdiction has now been assumed by the High Court of Justice in England. In the United States it is commonly exercised by local tribunals of the rank of county courts, known, variously, as surrogate’s courts, probate courts, orphans’ courts, and the like. See those titles; also DESCENT; DISTRIBUTION; HEIR, PERSONAL REPRESENTATIVE; EXECUTOR, ADMINISTRATION.

**DECEIT.** In law, a misrepresentation or other device or contrivance by which one man intentionally deceives another to the legal injury or damage of the latter. The deceit need not be accomplished by any spoken or written words or by any positive statement or representation; but the concealment of any fact or circumstance which the deceiver is under a legal obligation to disclose, or his mere silence concerning it when the circumstances are such as to put upon him an obligation to speak, amount to deceit as fully as if positive misrepresentation was made. But mere silence concerning matter which there is no obligation to disclose is not generally deceit, even though the party misled may be known to be acting upon a false idea as to those facts. Deceit involves as a necessary element the *intention* to deceive in a matter in which the deceived party has a right to know the truth and rely upon it. Without this intent a misrepresentation might amount to a legal mistake, but would not be a basis for an allegation of the tort of fraud.

If the party deceived be in a position such that by the exercise of due caution or diligence, or by duly taking advantage of matters open to his knowledge, he would not have been deceived, there is no legal deceit, even though his reason for failing to take reasonable care was due to his confidence in the honesty of the party by whom he is deceived. If, however, he is dissuaded from the exercise of his caution by the actions of the other party intended so to dissuade him, there is deceit. The misrepresentation or misleading must be in respect of matters material to the transaction concerned, and must

be relied upon to the deceived party’s prejudice in the same transaction in order to lay a basis for an action. Misrepresentations as to matters of law are not generally sufficient to lay a basis for an action, although the circumstances may be such as to make them so. Reckless statements, made without any regard to whether they are true or not, or false statements, made in the belief that they are true when the party making them is legally bound to know and state the true facts, are legally deceitful. But mere expressions of opinion, or of anticipation as to what will happen in the future, is not deceit.

Deceit is a necessary element of a fraud, and no exact or absolute definition or statement can be given of what is deceit, except in a general way, as above. See FRAUD.

**DE CELLES**, de sèl', ALFRED DUCLOS (1843–). A Canadian author. He was born at St. Laurent, P. Q., and was educated at Quebec Seminary and Laval University, where he graduated in 1867. He was called to the bar in 1873, but left law for journalism and successively edited three conservative newspapers, *Le Journal de Québec*, *La Minerve*, and *L'Opinion Publique*. In 1880–85 he was assistant librarian, and after 1885 librarian, of the Dominion Parliament. He was elected a fellow of the Royal Society of Canada, was appointed by the French government an officer of Public Instruction (1896), and a chevalier of the Legion of Honor (1903), and in 1907 was created C.M.G. His principal publications are: *La crise du régime parlementaire* (1888), *La conquête de la liberté en France et au Canada* (1890), *Les constitutions du Canada* (1890); *Les Etats Unis. origine, institutions, développement* (1896), crowned by the French Academy of Political and Moral Sciences; *Papineau, Cartier* (1905); *Cartier et son temps* (1907); *Lafontaine et son temps* (1907).

**DECEMBER.** See MONTH.

**DECEMVIRI** (Lat., board of ten men, from *decem*, ten + *vir*, man). The most famous body with this title were the 10 persons appointed at Rome (451 B.C.) to draw up a code of laws. The basis of their work was the information collected by three commissioners who were sent for that purpose to Greece (455–452). On the return of the commissioners a violent dispute arose between the patricians and the plebeians as to which of the orders should be intrusted with the revision of the laws. The dispute ended in favor of the patricians, and 10 patrician lawgivers were consequently appointed, to whom, moreover, the whole government of the state was intrusted during the year for which they were to hold office (451). The work of legislation was carried on with zeal and success, and the state was governed with prudence and moderation. Ten “Tables” of laws were adopted in 451. Their labors not being quite finished, a new body of decemviri was appointed, only one of whom, the notorious Appius Claudius Crassus (q.v.), had belonged to the previous commission. Two more “Tables” were adopted. In their magisterial and executive capacities, however, the new decemviri acted in the most tyrannical manner. In place of the fasces (q.v.) without the axe being carried only before the decemvir who presided for the day, as in the previous year, each decemvir was now attended by 12 lictors, who carried not only the rods, but the axe, which was the emblem of power over

life and death. When the term of their appointment expired, the decemviri refused either to resign or to allow successors to be appointed to them. At length the action of Appius Claudius in the matter of Virginia brought affairs to a climax. A popular insurrection broke forth, the decemviri were driven from their office, and the tribunes and other ordinary magistrates of the Republic were reappointed. The "Twelve Tables," however, remained in force. (See TWELVE TABLES, LAW OF THE.) Consult Mommsen, *History of Rome*, Eng. trans. by Dickson (New York, 1883), and Greenidge, *Roman Public Life* (London, 1901).

The *Decemviri Sacris Faciundis*, 'Commissioners for the Performance of Sacred Rites,' first appointed in 367 B.C., had the charge of the Sibylline Books (see SIBYL) and of the celebration of certain games in honor of Apollo and of the Secular Games (q.v.), which Augustus did most to make famous.

**DECENNALIA.** See DECENNIAL GAMES.

**DECENNIAL GAMES** (Lat. *Decennia* or *Decennalia*, nom. pl., from *decem*, ten + *annus*, year). The games celebrated in ancient Rome, every 10 years, to commemorate the nominal refusal of Augustus to be Emperor for life and his preference for reelection once in 10 years. They were maintained as a popular amusement until the last days of the Empire.

**DECEPTION.** See FRAUD; DECEIT.

**DECEPTION ISLAND.** One of the South Shetland Islands in the Antarctic Ocean, situated in lat. 62° 55' S. and long. 60° 35' W. It was formed from a volcano whose cone rises about 1800 feet above sea level. On the southeast side the cone wall is broken by an opening about 600 feet wide, through which the sea has flooded the crater, forming a lake harbor (called Port Foster) which is approximately circular, about 5 miles in diameter, and about 95 fathoms deep.

**DE CESARE, dà chà'zà-rà, CARLO** (1824- ). An Italian political economist and legislator. He was born at Spinnazola, Province of Bari, and studied at Naples. He became Secretary General of the Neapolitan Finances in 1860 and of Agriculture, Industry, and Commerce in 1868. His works include: *Il mondo civile ed industriale nel XIX secolo* (1857); *Del potere temporale del Papa* (2d ed., 1861); *Il primo unitario italiano* (2d ed., 1861); *La Germania moderna* (2d ed., 1874).

**DECHAMPS, de-shàn', ADOLPHE** (1807-75). A Belgian statesman, born at Melle, East Flanders. He became Governor of the Province of Luxembourg in 1842, Minister of Public Works in 1843, and Minister of Foreign Affairs in 1845. He was the foremost promoter of railroad communication in Belgium and, in association with De Decker, was the founder of the *Revue de Bruxelles*, a Catholic organ which exerted a marked influence from 1837 to 1850. From 1847 to 1864 he was leader of the Catholic minority, when, after an attempt to organize a Liberal ministry, he retired from politics. He had considerable ability as a writer, and a thorough familiarity with the political conditions of his time, as evidenced by his works, which include: *La Second Empire* (1859); *L'Empire et l'Angleterre* (1860); *La France et l'Allemagne* (1865); *Le Prince de Bismarck et l'entrevue des trois empereurs* (1873).

**DE CHAVANNES, PUVIS.** See PUVIS DE CHAVANNES.

**DECHEN, dà'ken, HEINRICH VON** (1800-89). A German geologist and engineer, born in Berlin. He studied for some time at the university of that city, but soon devoted himself to practical mining, and subsequently held a number of important government offices. In 1834 he was made professor of mining engineering in Berlin and in 1841 director of mines at Bonn. Besides a number of valuable geological maps, Dechen's published works include: *Geognostische Umriss der Rheinlande zwischen Basel und Mainz* (2 vols., 1825); *Geognostische Beschreibung des Siebengebirges* (1852); *Die nutzbaren Mineralien und Gebirgsarten im Deutschen Reich, nebst einer physiographischen und geognostischen Uebersicht des Gebietes* (1873). He was also for many years editor of the *Archiv für Mineralogie, Geognosie, Bergbau- und Hüttenkunde*, and he published a geological map of Rhenish Prussia and Westphalia in 1855-82. His investigations of the geological structure of these regions formed his chief contribution to science.

**DECHY, dà'k't, MORITZ VON** (1851- ). A Hungarian explorer. He was born in Budapest and was educated there and in Vienna, where he studied law, but he devoted himself to geography and mountaineering. In 1875 he was Hungarian commissioner to the International Geographical Congress in Paris. In 1878 with a Swiss guide he made an attempt to get to Tibet. In 1884, with Swiss and Tirol guides and a party of geologists and botanists, he made a remarkable tour of the Caucasus, which was followed by several other journeys in which his party made a thorough study of the mountains and climbed many high peaks. He wrote an elaborate book on the Caucasus in three volumes, which was published in German and in Hungarian (1905-07).

**DECIDUOUS PLANTS** (Lat. *deciduus*, falling down or off, from *de*, away + *cadere*, to fall). Plants which have organs that are shed periodically. The term "deciduous" is applied in particular to those trees and shrubs that shed their leaves at the approach of a season of cold or drought. See DURATION; FOREST; TREE.

**DECIDUOUS TEETH.** See TEETH.

**DECIMA.** See DESHIMA.

**DECIMAL FRACTION.** See FRACTION.

**DECIMAL NOTATION.** See NOTATION.

**DECIMALS, REPEATING.** See CIRCULATING DECIMALS.

**DECIMAL SYSTEM** (from Lat. *decimus*, tenth). A name applied to a system of numeration or to a system of measures such as weights, money, etc., in which the standard unit is divided into tenths, hundredths, etc., for the denominations below it, and multiplied by 10, 100, etc., for those above it. An excellent example is that of the international metric system of measures. The meter (approximately 39.37 inches in length) is the unit of linear measure and serves as a foundation for the measures of length, surface, volume, capacity, and weight. For the higher denominations the Greek *deka*, *hekto*, *kilo*, *myria*, are prefixed to signify the multiples 10, 100, 1000, 10,000, respectively. Thus, 1 dekameter = 10 meters; 1 hektometer = 100 meters, and so on. On the other hand, the Latin prefixes *deci*, *centi*, *milli*, are used to express divisions by 10, 100, etc., and thus furnish names for the lower denom-

inations; e.g., 1 decimeter =  $\frac{1}{10}$  of a meter; 1 centimeter =  $\frac{1}{100}$  of a meter. Similarly with money; the franc being the unit, a decime is the tenth part of a franc, and a centime the hundredth part. The monetary system of the United States of America, like that of nearly every civilized country except England, is decimal. Indeed, the numerical system in general use the world over is the most notable example of a decimal arrangement. It is based upon the 10 fingers used in primitive counting. See METRIC SYSTEM; NUMERALS; NOTATION; FRACTION.

**DECIMATION** (Fr. *décimation*, Lat. *decimatio*, from *decimare*, to decimate, from *decem*, ten). A punishment sometimes inflicted in the armies of ancient Rome. In instances where a crime had been committed by soldiers en masse, which would merit death in the individual, one-tenth of the whole number would be put to death. The individuals were selected by lot.

**DE CISNEROS**, de sis-ná-ròs, ELEONORA, COUNTESS (1878- ). An American prima donna, born in New York City. She studied singing under Mme. Murio Celli in New York, and made her début at the Metropolitan Opera House in 1899. In the following year she was married to Count François G. de Cisneros. Between 1900 and 1906 she sang in more than 40 operatic rôles in Rome, Milan, Madrid, Lisbon, Vienna, St. Petersburg, London, and Rio de Janeiro. In 1907 she was Oscar Hammerstein's leading mezzo soprano at the Manhattan Opera House, New York.

**DECIVS**, dé-siv'l-ús, GAIUS MESSIVS QVINTVS TRAIANVS. A Roman Emperor (201-251 A.D.). He was a native of Pannonia, of Illyrian stock. He commanded the troops of the Emperor Philippus on the Danube. In 249, his soldiers in Mesia revolted and forced him, against his will, to proclaim himself Emperor and lead them into Italy. Philippus marched against him, but was slain in battle near Verona. In 250 Decius ordered all Christians to renounce their faith, and a cruel persecution ensued, notably at Rome, Carthage, Alexandria, Jerusalem, and Antioch. Fabianus, Bishop of Rome, was martyred on January 20, Cyprian, Bishop of Carthage, was forced to leave his see, and the bishops of Alexandria and Antioch perished in prison. The great Origen also was cast into prison and tortured in Cæsarea. In the following year (251) Decius was called to Thrace to check a great invasion of the Goths, but was abandoned by his general, Trebonianus Gallus, who sought the throne for himself, and Decius, together with his son, perished in battle. Consult Gibbon, *Decline and Fall of the Roman Empire*, chap. x.

**DECIUS MVS**, PVBIVS. Father, son, and grandson, famous consuls and generals of the Roman Republic. The first commanded the Roman army in the Latin War (340 B.C.). Just before a battle was fought at Veseris, near Veuvivus, he was told in a vision that the army of one side and the general of the other were devoted to the gods of the dead. Accordingly Decius exposed himself to the attack of the enemy and lost his own life that the hostile army might be destroyed. The son found himself in a similar position at the battle of Sentinum (295 B.C.), when his heroic death gave the victory to the Romans over the Gauls, the Samnites, and the Etruscans. The grand-

son is said by Cicero, *Tusculanæ Disputationes*, i. 89, to have sacrificed himself similarly at the battle of Asculum (279 B.C.), in the war with Pyrrhus, but the statement is challenged on good grounds.

**DE CIVITATE DEI**, de siv't-tâ-té dê'i. See AUGUSTINE, SAINT.

**DECK**. The flooring or platform formed by covering the deck beams with steel or planking. The term is sometimes used to express the space above a deck to the under side of the next higher deck. In old-type-rigged men-of-war the upper deck was called the *spar deck*; the next deck, the *gun deck*—if guns were carried on it—if not, it was called the *berth deck*; the next deck below the berth deck was the *orlop deck*. In old three-deckers (i.e., wooden line-of-battle ships carrying guns on three covered decks) these were called the *main*, *middle*, and *lower decks*. The *half deck*, in vessels having one or more covered gun decks, was that portion of the next deck below the spar deck extending from the mainmast to the cabin bulkheads. The *quarter-deck* was the part of the upper deck which was abaft the mainmast. These terms, *quarter* and *half*, were derived from the character of the decks in the days of high castle-like poops and forecastles. The *half deck* then extended half the length of the ship or less, the quarter-deck being still shorter. The after partial decks were connected with similar partial ones forward by gangways or narrow walks inside the ship's rail. As time went on, the forecastle and poop were reduced in height, and the partial decks became fewer in number, but the quarter-deck was only a partial one until after the beginning of the nineteenth century. For a long time the only partial decks above the upper, or spar, deck were those of the poop and topgallant forecastle, but the advent of the modern ship with its high central superstructure changed this together with the entire deck nomenclature. In ships of the United States navy the highest deck which extends the full length of the ship is called the *main deck*; a partial deck above this is called the *upper deck*; above this are the *bridge decks*, *bridges*, etc. The first deck below the main is called the *gun deck* if any of the main battery guns are mounted on it, the next deck below the gun deck is the *berth deck*; if there is no gun deck, it is the next one below the main deck; the *orlop deck* is the next below the berth deck; and then the *platform decks*. The *topgallant forecastle deck* is the deck over a raised, or topgallant, forecastle; the *poop deck* is the deck over the poop. The deck over superstructures is called the *superstructure deck*, *hurricane deck*, *boat deck*, *teezas*, etc., according to the character of the vessel. In passenger steamers the deck below the *boat deck* is frequently called the *shelter deck*. A *flush deck* is one that extends from bow to stern without a break, or a superstructure rising above it. A *protective deck* (fitted in men-of-war only) is one designed to protect the vitals of a ship from being struck by a shell or injured by fragments of one which bursts on board. If flat and laid over the upper edges of an armor belt, it is frequently called the *armor deck*. The ordinary type of protective decks consists of a flat portion amidships and sloping parts at the sides. The side slope may be a curve, a straight slope, or two short straight slopes; the inclination downward is at an angle

of 30° to 45° from the horizontal, and the lower edge of the deck where it meets the ship's side is several feet under water, in order that a projectile shall not get underneath it when the ship is rolling. Behind the belt armor of battleships sloping protective decks are now usually fitted to deflect any shell which may get through the belt. Both the flat and sloping parts of protective decks are armored, the latter much more heavily, reaching a thickness of six inches in large protected and armored cruisers.

**DECK, THÉODORE** (1823-91). A French ceramist, born at Gebweiler, Alsace. After three years' apprenticeship in a porcelain stove factory at Strassburg, he made an extensive tour through central Europe and subsequently became director of a factory of faience ware in Paris, where he conducted independent experiments in ceramics. His specialty was faience wainscoting and decorative architectural ceramics, but he also succeeded in reproducing not only some of the famous faience of the Renaissance but also imitations of Persian and Chinese ware, and created several colors for porcelain, such as the pale green, called *céladon*, and the turquoise blue, or *bleu de Deck*. During the last three years of his life he was director of the factory at Sèvres. He is the author of *La faïence* (Paris, 1887). Consult his biography by Gerspach (ib., 1883).

**DECKEN, AUGUSTE VON DER** (1828-1908). A German novelist, known under the pen name of Auguste von der Elbe. She was born at Bleckede. Her novels, several of which enjoy great popularity, include: *Chronika eines fahrenden Schülers* (a continuation of Klemens Brentano's works of the same name), which has passed through seven editions, *Onkel Wilhelms Gäste* (1899); *Seckings Tochter* (1900); *Ehrgeiz* (1903); *Ein frisches Reis* (1905); *In Banden* (1907); *Eiken von Eikenheede* (1908).

**DECKEN, KARL KLAUS VON DER** (1833-65). A German African explorer, born at Kotzen, Brandenburg. He was for a time in the military service of Hanover and in 1861, in company with Thornton, an English geologist, undertook a journey of African exploration from Mombasa to the volcanic mountain of Kilimanjaro. In 1862 he ascended the mountain to a height of more than 14,000 feet and in the following year made an extended voyage about the African coast. His final explorations were begun in February, 1865. With a large and well-equipped expedition he attempted the ascent of the Juba River, but by reason of unnavigable rapids was forced to take the land, and on October 2 was murdered by the Somali at Berbera. Despite the hostility of the natives, most of his companions succeeded in reaching Zanzibar. The scientific collections of the expedition were presented to the University of Berlin, and its results were described by Kersten and others in *Karl Klaus von der Deckens Reisen in Ostafrika 1859-65* (4 vols., 1869-79).

**DECKER, KARL VON** (1784-1844). A Prussian general and author, born in Berlin. He took a leading part in the campaigns of 1813-15. He was a director in the Prussian Topographical Bureau and for many years a lecturer at the General Military Academy. By his incessant activity and his works he greatly stimulated the interest in, and the extension of, a scientific military education, and this he accomplished in the face of serious opposition.

His theories on artillery were attacked by his countrymen, but the principle of the offensive which he strongly advocated found effective illustration in the campaign of 1870-71. His works include *Der kleine Krieg* (1822; 4th ed., 1844) and *Taktik der drei Waffen* (2 parts, 1833-34; 3d ed., 1851-54).

**DECKER, SIR MATTHEW** (1679-1749). A political economist and free trader, born in Amsterdam, Holland. He went to London in 1702, was naturalized as an English subject in the following year, and having embarked in commerce attained the greatest success; received a baronetcy in 1716, and three years afterward took his seat in Parliament as member for Bishop's Castle. He sat in the House, however, only four years. His death took place March 18, 1749; the baronetcy then became extinct, and his daughters succeeded to his estates.

Decker was the reputed author of two pamphlets which appeared anonymously during his lifetime, and which ran through several editions and provoked much acrimonious controversy. In one he proposed to raise all the public supplies from one single tax, viz., a tax upon houses. According to Decker's calculation, there were then in England, exclusive of Wales, 1,200,000 houses, of these he meant to tax only one-half, counting off 500,000 as inhabited by the working classes and 100,000 as being uninhabited. By this means he proposed to raise an annual revenue of £6,000,000, which sum was £1,000,000 more than the expenses of the government of that day required. The surplus was to be applied as a sinking fund for the purpose of discharging debt. The same idea is found in the second essay, which discussed England's foreign trade and the means of improving it.

**DECLAMATION** (Fr. *déclamation*, Lat. *declamatio*, declamation, from *declamare*, to declaim, from *de*, down + *clamare*, to shout). The art of speaking according to rules, whereby the sense of the words, as well as the feeling and sentiment, is naturally and characteristically represented. Recitation, therefore, whether spoken or sung, is subject to the laws of declamation, from which it derives its value and significance. Perfect declamation implies correctness of speech, distinctness and clearness of enunciation, and a well-toned voice. Declamation is therefore clearly of a musical nature. Declamation in music, however, differs from the declamation of speaking in that the singer must adhere to what the composer has written. The composer fixes the whole of the intonation, modulation, and phrasing, and also the *tempi* and expression, and not infrequently sacrifices the correctness of the declamation to the charm of some peculiar melodic phrase or pleasing rhythm or a vocal musical embellishment. The truth and beauty of correct musical declamation are always endangered by a translation of the original words into another language—a work which, with the greatest care and ability, it is in many cases almost impossible to accomplish word for word, or syllable for syllable, so as to fit accurately to the accent of the music. The masterworks of many great composers thus suffer much from careless translation. In earlier times attempts were made to establish declamation as a science. The ancients had a kind of note, or sign of intonation, which they placed over or under the words, possibly to decide whether the accent should be given by a high or by a low tone and thus to regulate the modula-

tion of the voice. That the theatrical declamation of the ancients resembled the musical recitative of the present day is generally admitted.

**DE CLAPIERS, Luc.** See VAUVENARGUES, MARQUIS DE.

**DECLARATION (OF),** *Lat.* *declaratio*, from *declarare*, to make clear, from *de* + *clarus*, clear). Under the common-law practice of England and the United States, the first pleading in an action corresponding to the bill in equity in chancery practice and the libel in admiralty. It must consist of a sufficient statement, in legal form, of all the material facts constituting the plaintiff's cause of action, together with a demand for relief. The facts alleged must be sufficient to give the plaintiff a right to recover if he establishes them; otherwise the defendant may demur and have the declaration dismissed. Originally, in England, the term was used only of the first pleading in a personal action, the first pleading in actions for the recovery of real property being called a *count*; but this distinction is no longer maintained either in England or in the United States.

The declaration is made up of the following general parts, viz., the *title*, being the name of the court; the *venue*, or county in which the cause of action is brought; the *commencement*, containing the names of the parties and the capacities in which they are joined in the action, together with a statement that the defendant has been summoned; the *body*, a statement of the facts constituting the cause of action; and a *conclusion*, or formal demand for relief at the end. The *body* must conform to the particular common form which is adapted to the nature of the action, but the other characteristics remain the same in all forms of action. The declaration is still in use in most of the United States, where the common-law system of pleading obtains, but under the reformed procedure in England it has been superseded by a pleading known as the *statement of claim* and in the "code States" of America (i.e., those which have adopted codes of civil procedure) by the *complaint* (q.v.). See BILL IN EQUITY; CODE; COMMON FORMS; FORMS OF ACTION; ORIGINAL WRIT; PLEADING.

In the criminal law of Scotland the statement made by the prisoner on the preliminary examination before the examining magistrates is known as the *declaration* of the accused. It is the duty of the magistrate to take this declaration immediately on the prisoner being brought before him. The magistrate must previously inform him that it is entirely at his own option to declare or not, but that, if he chooses to do so, the declaration may be used in evidence against him on his trial. The declaration ought to contain the name, age, and designation of the prisoner, the parish and county in which the crime was committed, and all similar particulars. When completed, it must be read over to the prisoner, who, if he is able to write, signs every page of it along with the magistrate. This practice of the Scottish committing magistrates is identical with that which obtains in England and America, the term "statement" being here employed for the prisoner's declaration. See ARRAIGNMENT; CONFESSION; and consult the statutes of the various States regulating the examination of persons under arrest for crime.

**DECLARATION, DYING.** A statement as to the cause of his death, made by a person who has been physically injured at the hands of

another, and who has given up all hope of recovery and who subsequently dies of such injury. Such statements are in English and American law permitted to be given in evidence as an exception to the rule excluding hearsay evidence from the consideration of the jury. The exception is based on the assumption that statements made by a dying person in the apprehension of death are as trustworthy as those made in open court under the sanction of an oath. To be admissible, however, dying declarations must have been made by the victim of the homicide and must relate to the circumstances of the crime; they can be used only on the trial of the person charged with the death of the declarant and are equally admissible whether favorable or unfavorable to the accused. As appears from the foregoing statement, dying declarations made by others than the victim of a homicide are inadmissible, either in civil or in criminal cases. Thus, a confession of guilt made by a person *in articulo mortis* will not be received in favor of a person accused of the crime. This narrow scope of the rule has been much criticized, but is almost universally maintained. Only such of the statements of the deceased as he could have testified to if he had lived to go on the witness stand are allowable. The substance of what was said by the dying person may be given by a witness if he cannot remember the exact words. As these statements must be repeated by one who was present and heard them, the character of the testifying witness enters into the weight of the evidence, and it is for the jury to determine whether he repeats what was said accurately. The jury may also give such credence to the deceased's story as in their judgment it deserves. It is for the court to rule in the first instance on the question whether the statement is admissible as a dying declaration. See EVIDENCE; HEARSAY RULE.

**DECLARATION IN LIEU OF AN OATH.** A solemn statement in court or before a judicial or legislative body, by a witness, that he will tell the whole truth in such testimony as he may be called upon to give in the matter pending. Any one who objects to taking an oath, for religious or other reasons, may, in nearly all jurisdictions to-day, thus declare or affirm that he will tell the truth, but usually an oath is administered unless the witness objects. This practice was adopted generally because at common law no witness who did not believe in a Supreme Being and who, therefore, had no sense of the obligation of an oath from that standpoint, was allowed to testify, which rule excluded much valuable testimony. Violation of such declaration or affirmation is legal perjury, and the witness may be punished as if he had taken an oath. See AFFIRMATION; OATH.

**DECLARATION OF INDEPENDENCE, AMERICAN.** A document proclaiming the independence of the 13 English Colonies in America, and finally agreed upon by the Continental Congress, July 4, 1776. Early in 1776 several delegates in Congress were directed by their constituencies to vote for independence. Such a vote would be, in some particulars, no more than a recognition of the existing state of affairs, for already there existed in several provinces a complete independence of England so far as the administrative system was concerned. As a result of advice given by the Continental Congress, Massachusetts, New Hampshire, and South Carolina had early established commonwealth

organizations entirely regardless of any connection with England. This organization of commonwealth governments on a permanent basis was strongly urged by John Adams, largely as a result of whose work the Continental Congress passed the resolutions of May 10 and 15, 1776, recommending to all the Colonies the formation of independent governments. This action was generally indorsed; and gradually the various States placed themselves on record as favoring the step which had now indeed become virtually inevitable—the declaration of their absolute independence. On June 7, 1776, Richard Henry Lee moved in Congress that “these united Colonies are and of right ought to be free and independent States, that they are absolved from all allegiance to the British Crown, and that all political connection between them and the State of Great Britain is and ought to be totally dissolved.” This motion was seconded by John Adams, but action thereon was deferred until July 1, and the resolution was passed on the following day. Two committees were appointed (on June 10)—one to prepare a declaration, and the other to draw up a plan of confederation. On the Declaration committee were Jefferson, Franklin, John Adams, Roger Sherman, and R. R. Livingston. They reported June 28, but action was delayed for several days. When the Declaration finally came up for consideration, it was passed unanimously on July 4, by the delegates of 12 Colonies, those representing New York not voting, since they had not as yet been authorized to support the movement for independence. The document was signed on the same day by John Hancock as President of the Congress. On July 9, however, a New York convention formally pledged that State to support the Declaration. The document was engrossed on parchment in accordance with a resolution passed by Congress on July 19, and on August 2 was signed by the 53 members then present. Congress directed that copies be sent “to the Assemblies, Conventions, and Committees or Councils of Safety, and to the several commanding officers of the continental troops; that it be proclaimed in each of the United States and at the head of the army.” Subsequently Matthew Thornton, Elbridge Gerry, and Thomas McKean also affixed their signatures. The Declaration of Independence was drafted by Thomas Jefferson and was but very slightly changed from his copy. The document itself was assigned for safekeeping to the Department of State upon the organization of the national government. It was deposited in the Patent Office in 1841, when that office was a bureau in the Department of State; was returned to the Department of State in 1877; and in 1894, owing to the rapid fading of the text and the deterioration of the parchment, was withdrawn from exhibition and was carefully put away out of the light and air. A facsimile was made in 1823, by order of John Quincy Adams, then Secretary of State, for the original signers and their families, and it is from a copy struck from the copperplate then made that the reproduction here given was obtained.

The text of the Declaration is as follows:

**THE UNANIMOUS DECLARATION OF THE THIRTEEN  
UNITED STATES OF AMERICA**

When, in the course of human events, it becomes necessary for one people to dissolve the

political bands which have connected them with another, and to assume, among the powers of the earth, the separate and equal station to which the laws of nature and of nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.

We hold these truths to be self-evident—that all men are created equal; that they are endowed by their Creator with certain unalienable rights; that among these are life, liberty, and the pursuit of happiness. That to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed; that whenever any form of government becomes destructive of these ends, it is the right of the people to alter or to abolish it, and to institute a new government, laying its foundation on such principles, and organizing its powers in such form, as to them shall seem most likely to effect their safety and happiness. Prudence, indeed, will dictate that governments long established should not be changed for light and transient causes; and, accordingly, all experience hath shown, that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same object, evinces a design to reduce them under absolute despotism, it is their right, it is their duty, to throw off such government, and to provide new guards for their future security. Such has been the patient sufferance of these Colonies, and such is now the necessity which constrains them to alter their former systems of government. The history of the present King of Great Britain is a history of repeated injuries and usurpations, all having, in direct object, the establishment of an absolute tyranny over these States. To prove this, let facts be submitted to a candid world:

He has refused his assent to laws the most wholesome and necessary for the public good.

He has forbidden his Governors to pass laws of immediate and pressing importance, unless suspended in their operation till his assent should be obtained; and, when so suspended, he has utterly neglected to attend to them.

He has refused to pass other laws for the accommodation of large districts of people, unless those people would relinquish the right of representation in the Legislature; a right inestimable to them, and formidable to tyrants only.

He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public records, for the sole purpose of fatiguing them into compliance with his measures.

He has dissolved Representative Houses repeatedly for opposing with manly firmness his invasions on the rights of the people.

He has refused, for a long time after such dissolutions, to cause others to be elected; whereby the legislative powers, incapable of annihilation, have returned to the people at large for their exercise; the State remaining, in the meantime, exposed to all the danger of invasion from without and convulsions within.

He has endeavored to prevent the population of these States; for that purpose obstructing the laws for the naturalization of foreigners; refusing to pass others to encourage their migration hither, and raising the conditions of new appropriations of lands.

He has obstructed the administration of justice by refusing his assent to laws for establishing judiciary powers.

He has made judges dependent on his will alone, for the tenure of their offices, and the amount and payment of their salaries.

He has erected a multitude of new offices, and sent hither swarms of officers to harass our people and eat out their substance.

He has kept among us, in times of peace, standing armies, without the consent of our legislatures.

He has affected to render the military independent of, and superior to, the civil power.

He has combined, with others, to subject us to a jurisdiction foreign to our constitution, and unacknowledged by our laws, giving his assent to their acts of pretended legislation:

For quartering large bodies of armed troops among us:

For protecting them, by a mock trial, from punishment, for any murders which they should commit on the inhabitants of these States.

For cutting off our trade with all parts of the world:

For imposing taxes on us without our consent.

For depriving us, in many cases, of the benefits of trial by jury:

For transporting us beyond seas to be tried for pretended offenses:

For abolishing the free system of English laws in a neighboring province, establishing therein an arbitrary government, and enlarging its boundaries, so as to render it at once an example and fit instrument for introducing the same absolute rule into these Colonies.

For taking away our charters, abolishing our most valuable laws, and altering, fundamentally, the powers of our governments:

For suspending our own legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever.

He has abdicated government here, by declaring us out of his protection, and waging war against us.

He has plundered our seas, ravaged our coasts, burnt our towns, and destroyed the lives of our people.

He is, at this time, transporting large armies of foreign mercenaries to complete the works of death, desolation, and tyranny, already begun, with circumstances of cruelty and perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the head of a civilized nation.

He has constrained our fellow-citizens, taken captive on the high seas, to bear arms against their country, to become the executioners of their friends and brethren, or to fall themselves by their hands.

He has excited domestic insurrections among us, and has endeavored to bring on the inhabitants of our frontiers, the merciless Indian savages, whose known rule of warfare is an undistinguished destruction of all ages, sexes, and conditions.

In every stage of these oppressions we have petitioned for redress in the most humble terms; our repeated petitions have been answered only by repeated injury. A prince whose character is thus marked by every act which may define a tyrant, is unfit to be the ruler of a free people.

Nor have we been wanting in attention to our British brethren. We have warned them from time to time of attempts made by their legis-

lature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them, by the ties of our common kindred, to disavow these usurpations, which would inevitably interrupt our connection and correspondence. They, too, have been deaf to the voice of justice and consanguinity. We must, therefore, acquiesce in the necessity which denounces our separation, and hold them, as we hold the rest of mankind, enemies in war, in peace, friends.

We, therefore, the Representatives of the United States of America, in General Congress assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do, in the name and by the authority of the good people of these Colonies, solemnly publish and declare, That these United Colonies are, and of right ought to be, *free and independent States*; that they are absolved from all allegiance to the British Crown, and that all political connection between them and the State of Great Britain is, and ought to be, totally dissolved, and that, as *free and independent States*, they have full power to levy war, conclude peace, contract alliances, establish commerce, and to do all other acts and things which *independent States* may of right do. And, for the support of this Declaration, with a firm reliance on the protection of Divine Providence, we mutually pledge to each other, our lives, our fortunes, and our sacred honor.

The 56 signers of the Declaration were as follows: Roger Sherman, Samuel Huntington, William Williams, and Oliver Wolcott, of Connecticut; Caesar Rodney, George Read, and Thomas McKean, of Delaware; Button Gwinnett, Lyman Hall, and George Walton, of Georgia; Samuel Chase, William Paca, Thomas Stone, and Charles Carroll of Carrollton, of Maryland; John Hancock, Samuel Adams, John Adams, Robert Treat Paine, and Elbridge Gerry, of Massachusetts; Josiah Bartlett, William Whipple, and Matthew Thornton, of New Hampshire; Richard Stockton, John Witherspoon, Francis Hopkinson, John Hart, and Abraham Clark, of New Jersey; William Floyd, Philip Livingston, Francis Lewis, and Lewis Morris, of New York; William Hooper, Joseph Hewes, and John Penn, of North Carolina; Robert Morris, Benjamin Rush, Benjamin Franklin, John Morton, George Clymer, James Smith, George Taylor, James Wilson, and George Ross, of Pennsylvania; Stephen Hopkins and William Ellery, of Rhode Island; Edward Rutledge, Thomas Heyward, Jr., Thomas Lynch, Jr., and Arthur Middleton, of South Carolina, and George Wythe, Richard Henry Lee, Thomas Jefferson, Benjamin Harrison, Thomas Nelson, Jr., Francis Lightfoot Lee, and Carter Braxton, of Virginia.

**Bibliography.** Much useful material may be found in Emmet, *History of the Inception and Drafting of the Declaration of Independence; with a Collection of Autographs of the Signers, and Other Documents* (New York, 1876), which, however, is not generally accessible. See also the biographical notices of the individual signers.

**DECLARATION OF INDEPENDENCE, MECKLENBURG.** See MECKLENBURG DECLARATION OF INDEPENDENCE.

**DECLARATION OF INDULGENCE.** This name is applied to several acts of the last two Stuart kings, but particularly to the proclamation of James II, in 1687, suspending the operation of the penal statutes directed against the Roman Catholics and the Protestant Nonconformists, and of all acts imposing a test as a qualification for holding lay or ecclesiastical office. In this way James hoped to gain, in favor of his Catholic policy, the adherence of the Protestant dissenters, many of whom were suffering severe persecution under those laws. Several hundred addresses of thanks were presented to the King, but the majority of the dissenting clergy would not accept toleration on such terms. The great leaders, Baxter, Howe, and Bunyan, declined the indulgence at the price of a breach of the law and the encouragement of Romanism.

The clergy generally refused to read the proclamation in their churches, as commanded by a royal order of May, 1688. The seven bishops, with Archbishop Sancroft at their head, signed a firm but moderate petition to the King, refusing to publish a declaration which they knew to be illegal. James commanded the ecclesiastical commissioners to deprive these bishops of their sees, but this was going too far, even for that body; and on the suggestion of Jeffreys, a prosecution before the King's Bench for seditious libel was substituted. So threatening was the popular indignation that the accused prelates were acquitted, although the jury was packed and the judges were mere tools of the crown. The declaration cost James the allegiance of the Anglican church and precipitated the revolution of 1688. Consult: Howell, *State Trials*, vol. xii (London, 1809-28); D'Oyly, *Life of William Sancroft* (ib., 1840); Macaulay, *History of England*, vol. ii (ib., 1849). See SANCROFT.

**DECLARATION OF LONDON.** See LONDON, DECLARATION OF.

**DECLARATION OF PARIS.** An agree-

ment defining the rules of maritime law, to be applied in time of war, signed by the plenipotentiaries of Great Britain, Austria, France, Prussia, Russia, Sardinia, and Turkey, at Paris, April 16, 1856, where they had met in convention to settle the questions involved in the Crimean War, just closed. England had always claimed and had exercised the right to seize an enemy's goods on the high seas, though conveyed in a neutral vessel, which included the right to stop and search neutral merchant vessels for this purpose. The exercise of this right had aroused against England the Northern Maritime League of 1800 and was condemned generally by the civilized world. Nothing short of absolute command of the seas made it safe for a single power to maintain a practice which threatened in moments of danger to turn the whole body of neutral states into enemies. Besides, while it was profitable for England to seize an enemy's goods in neutral ships when she was at war, it reacted upon England when she remained at peace during hostilities between other states. Likewise, while her privateers might inflict severe injuries upon an enemy's commerce, her own commerce in time of war offered a rich field for hostile privateers. So, in return for the abolition of privateering, Great Britain consented to a rule permitting the products of a belligerent state to find a market in time of war.

The following rules were adopted by the convention: 1. Privateering is, and remains, abolished. 2. The neutral flag covers enemy's goods, with the exception of contraband of war. 3. Neutral goods, with the exception of contraband of war, are not liable to capture under the enemy's flag. 4. Blockades, in order to be binding, must be effective, i.e., maintained by a force sufficient really to prevent access to the coast of the enemy. This declaration was subsequently accepted by the civilized nations, with the exception of the United States, Spain, Mexico, and several South American republics. The United States urged the substitution of a more advanced provision, excepting from capture all private property, even of citizens of belligerents, either by privateers or national vessels. This was the situation at the opening of the Civil War. On the issuance by the Confederate President, Jefferson Davis, of letters to privateers, Secretary of State Seward addressed a note to the Powers, requesting to be allowed to accede to the Declaration of Paris without modification. Great Britain and France, who had recognized the South as belligerents and were anxious not to invalidate the letters of marque issued by the Confederate government, stipulated that the accession of the United States should not "have any bearing, direct or indirect, on the internal differences now prevailing." As this placed no restriction upon Confederate privateers, the negotiations were dropped. In the war between the United States and Spain, in 1898, both belligerents formally announced their intention to adhere to the principles of the Declaration. It may be said that the second, third, and fourth principles are a recognized part of the body of international law. The question of privateering has thus far been regarded rather as one of national policy. With the development of modern navies, however, it has become of minor significance. Consult the authorities referred to under MARITIME LAW; INTERNATIONAL LAW.

**DECLARATION OF RIGHTS.** See RIGHTS, DECLARATION AND BILL OF.

**DECLARATION OF ST. PETERSBURG.** See ST. PETERSBURG, DECLARATION OF.

**DECLARATION OF WAR.** A formal announcement of hostile intentions by one state to another. It is a survival of the feudal custom of sending heralds to give the enemy warning of impending hostilities. The doctrine that notice must be given an enemy before entering upon war has never grown into an obligation, and since the middle of the eighteenth century the practice has so largely decreased that it may be concluded that a formal declaration is not required by morality or international law. The later custom of publication by a belligerent in its own territory, at the outbreak of war, of a manifesto discussing the questions at issue and justifying its position, which should be communicated to neutrals, never has assumed the weight of an obligation, though useful both to subjects of the state and to those of neutrals.

Under conditions of modern intercourse a state can never be taken by surprise. A period of negotiation is followed by an ultimatum in the form of a demand, refusal of which involves war. Thus, the United States demanded of Spain her withdrawal from Cuba in April, 1898, on condition of war. A later act of declaration was passed by Congress on April 25, fixing the date of hostilities as April 21. This was important, as determining the date for legal purposes. On Jan. 13, 1904, the Japanese minister delivered to the Russian government a note containing proposals relative to the matters in dispute between the two Powers, a prompt reply to which was requested, the implication being that, in the event of unreasonable delay, Japan would take hostile action. Formal declarations of war were issued by both governments on February 10, two days after the commencement of hostilities. When not fixed by direct notice, war is held to date from the first act of hostilities by either party. The United States began the War of 1812 by invading Canada and seizing British vessels in port, and in 1854 the British fleet entered the Black Sea to compel the Russian fleet to return to Sebastopol before the ambassadors had withdrawn. On the other hand, the French chargé d'affaires handed a formal notice to Bismarck in 1870, and Russia declared war upon Turkey in 1877 by a formal dispatch.

**DECLARATOR, ACTION OF.** A form of action peculiar to the law of Scotland, the object of which is judicially to ascertain a fact, leaving its legal consequences to follow as a matter of course. The declaratory conclusions of such actions are generally followed by petitory or possessory actions, for the purpose of giving effect to the right declared. A substantial interest on the part of the pursuer, or plaintiff, must be shown in all cases, as it is not competent to ask the court to declare a mere abstract fact or right. The existence of this special form of action has contributed to diffuse in Scotland a false view as to the nature of actions and judicial proceedings generally.

**DECLÉ, da'kl', LIONEL** (1859-1907). A French explorer, born in Saint-Quentin, France. Between 1881 and 1885 he traveled through most of Asia and in America, in 1891-94 he crossed Africa from the Cape to Zanzibar by the way of Uganda, and he then served as Russian correspondent for the *Pall Mall Gazette*, the editor of which, H. J. C. Cust, he accompanied (1896-

97) through East and South Africa. He organized the native transports in the Madagascar expedition in 1895, and during the Spanish-American War was correspondent for the London *Daily Telegraph*. For that paper also he headed an expedition from Cape Town to Cairo (1899-1901). He wrote: *Three Years in Savage Africa* (1898), with an introduction by Henry M. Stanley; *Trooper 3809* (1899), an attack upon French army management; *The New Russia* (1906).

**DECLENSION** (Fr. *déclinaison*, Lat. *declinatio*, from *declinare*, to bend, from *de*, down + *\*clinare*, Gk. *κλίνειν*, *klínein*, to bend, Lith. *szlyti*, to incline, Skt. *śrī*, to lean). A grammatical term applied to the system of modifications called *cases*, which nouns, pronouns, and adjectives undergo in many languages. How the word "declension" (Lat. *declinatio*, a declining, or leaning away) and "case" (Lat. *casus*, a fall) came to be applied to this species of inflection has never been made altogether clear. The relations in which one thing stands to other things may be expressed in either of two ways. Some languages make use of separate words, called prepositions, or postpositions; in others the relations are expressed by changes in the termination of the name of the thing. Thus, in Latin, *reg* being the root or crude form of the word for "king," *regis*, or *rex*, is the word in the nominative case, signifying "a king" as subject or agent; *regis*, in the genitive case, "of a king"; *regi*, in the dative, "to a king"; etc. An adjective joined to a noun usually takes a corresponding change. The number of cases is very different in different languages. The further we go back in the history of the Indo-European languages, the richer do we generally find them in these modifications. Sanskrit had eight cases, old Slavonic seven, Latin six, and Greek five. The names of the Latin cases, which are often used also in regard to the English language, are the nominative, which names the subject or actor; the genitive, expressing the source whence something proceeds, or to which it belongs—it is sometimes called the adjective case; the dative, that to which something is given, or for which it is done; the accusative, the object towards which an action is directed—it completes the meaning of a transitive verb; the vocative, the person addressed or called; and the ablative, that from which something is taken. The Greek has no ablative case. The Sanskrit, in addition to the Latin cases, has an instrumental and a locative case. The grammar of the inflective languages is complicated by the circumstance that all nouns do not form their cases in the same way. This makes it necessary to distribute nouns into various classes, called *declensions*. In Latin, as many as five declensions are usually given. (See INFLECTION.) As we descend, the case endings become rubbed off, as it were, and prepositions are used in their stead. The languages descended from the Latin (French, Italian, etc.) have lost all the cases of nouns and adjectives. The Teutonic languages in their early periods had cases almost as numerous and perplexing as those of the Latin. German is still to a great extent incumbered with them. Modern English has only one case in nouns different from the nominative, viz., the genitive, or possessive. (See NOUN.) The declension of pronouns (q.v.) has been more persistent than that of nouns and adjectives. Languages of the agglutinative

The use of the tables may best be explained by a few examples. (1) What was the change in declination at Mobile, Ala., between Aug. 25, 1805, and June 15, 1911? In the table for Alabama the values for 1800 and 1810 are 5° 24' E. and 5° 39' E., showing an average annual increase of 1.5. Hence the value for Aug. 25, 1805, would be 5° 24' E. + (1/5 × 5.6) = 5° 32' E. Similarly the table gives for 1910 the value 2° 45' E. with an annual decrease of 0.7. Hence the value for June 15, 1911, would be 2° 45' E. - (0.7 × 1.5) = 2° 44' E. Therefore the north end of the compass needle pointed 2° 49' less to the east on June 15, 1911, than it did on Aug. 25, 1805. (2) A resection of a piece of land at Santa Barbara, Cal., was surveyed by compass in May, 1822, and the bearings recorded as follows: N. 20° 15' W., N. 75° 30' E., S. 18° 45' E., and S. 78° 00' W. What bearings should be used in order to retrace the lines in March, 1912? From the table for southern California the value for May 1822, is 13° 10' E. and for March, 1912, 15° 46' E., showing a change of 2° 30' in the interval. The desired bearings are, therefore, N. 22° 45' W., N. 73° 00' E., S. 21° 15' E., and S. 75° 30' W.

order have, in general, a great abundance of cases. In Finnish nouns have 15 cases, if by case is understood an inflectional form produced by joining on a suffix which takes the place of a preposition. Thus, *karhu*, a bear; *karhun*, of a bear; *karhuna*, as a bear; *karhutta*, without bear; *karhussa*, in the bear; *karhusta*, out of the bear; etc. In the Magyar 20 cases may be reckoned; and the languages of the North American Indians are richer still—perhaps we should say more embarrassed. Semitic speech originally had at least four cases, but only a few traces of them remain in the modern Semitic tongues. In Basque each noun may belong to two different declensions—*definite* and *indefinite*—each of which has 13 different case forms. What case endings and other inflectional terminations were in their origin, as well as the comparative merits of the highly inflected and the analytic languages, will be considered under INFLECTION.

**DECLINATION** (Lat. *declinatio*, a bending aside, from *de*, away, from + *\*clinare*, to incline, bend), in astronomy. If a great circle be drawn through the pole of the heavens and any star, the declination of the star is its angular distance from the celestial equator, measured along this circle. The declination is positive or negative according as the star is to the north or south of the equator, or the position of the star relative to the equator may be indicated by the letter N. or S., as the case may be. The place of a point in the heavens is determined by its right ascension (see ASCENSION, RIGHT) and declination, just as a point in the earth's surface is determined by its latitude and longitude, the right ascension corresponding to the longitude, and the declination to the latitude.

**DECLINATION.** In magnetism, the angle which the direction pointed out by a compass needle makes with the true meridian or astronomical north-and-south line; the marines and the surveyor call this angle the "variation of the compass." The declination, which may be either to the east or west of the true north and south, varies from time to time and from point to point on the earth's surface, as do the other magnetic phenomena which are discussed under TERRESTRIAL MAGNETISM, and under COMPASS. At some places the magnetic and astronomical meridians may coincide, while at others the difference is most marked. The table on page 587, compiled from a report on *The Distribution of the Magnetic Declination in the United States for January 1, 1910*, of the United States Coast and Geodetic Survey, gives the declination or variation for January, 1910, with the amount of annual change at that date, for a number of points throughout the United States:

See COMPASS; DIP CIRCLE. TERRESTRIAL MAGNETISM. Under the latter will be found charts showing the isogonic, the isoclinic, and other lines. Consult the Reports, Bulletins, and Charts published from time to time by the United States Coast and Geodetic Survey and the Division of Terrestrial Magnetism of the Carnegie Institution of Washington.

**DECLINATION NEEDLE.** See DECLINOMETER.

**DECLINE AND FALL OF THE ROMAN EMPIRE.** A celebrated work by Edward Gibbon (1776-88), the first real attempt at scientific history in English. It contains an account of the growth of Christianity and subjected the

author to fierce attacks by the leading churchmen of his day.

**DECLINOMETER.** An instrument for determining the magnetic declination. Two things are essential—the means of ascertaining the astronomical meridian and a magnetic needle to show the magnetic meridian. The most accurate method of determining declination is with the magnetometer (q.v.) and theodolite. This instrument is employed by the Division of Terrestrial Magnetism of the United States Coast and Geodetic Survey, and the apparatus and results are described in its reports. Various types of magnetic instruments have received thorough test and application both on land and sea by the Division of Terrestrial Magnetism of the Carnegie Institution of Washington, to whose various publications reference may be made. The declination of the needle may be also ascertained approximately by the dipping needle. The ordinary surveyor's compass, which may be used by making allowance for declination, is a declination compass. See COMPASS; ENGINEERING INSTRUMENTS; TERRESTRIAL MAGNETISM; MAGNETOMETER.

**DECOCTION** (Lat. *decoctio*, a boiling down, decoction, from *de*, down + *coquere*, to cook, boil). The term applied in pharmacy to a solution procured by boiling an organic drug in water. One hundred cubic centimeters of a decoction usually contain five grams of drug.

**DECOMPOSITION** (Fr. *décomposition*, from Lat. *de*, down, away + *componere*, to put together, join, unite). A term employed to signify the breaking up of compounds into simpler compounds or altogether into their chemical elements. The number of substances that are being decomposed is, as a rule, smaller, of course, than the number of substances produced by the decomposition. However, in the class of chemical transformations known as "double decompositions," the number remains unchanged. Thus, AB and CD, two compounds, made up each of two elements, may, on being brought into contact, undergo decomposition, the result of which would be again only two compounds, AC and BD. Examples of this class of reactions are very numerous in chemistry. But the term "decomposition," unqualified, is generally applied, as stated above, to transformations involving an increase in the number of substances. Such decompositions are usually caused by the influence of some physical factor, such as heat, electricity, etc. Heat is one of the most common of decomposing agents: mercuric oxide (HgO), when heated, breaks up into the invisible gas oxygen (O<sub>2</sub>) and the liquid metal mercury (Hg). Limestone (CaCO<sub>3</sub>) decomposes into quicklime (oxide of calcium, CaO) and carbon dioxide (CO<sub>2</sub>): coal and wood decompose into a great variety of useful materials, including coke or charcoal, illuminating gas, and tar. Electricity (the galvanic current) is a potent decomposing agent, under its influence water (H<sub>2</sub>O) is broken up into oxygen (O<sub>2</sub>) and hydrogen (H<sub>2</sub>), and metallic salts are broken up into their constituent metals and acids, electrolytic processes being consequently much used both for scientific and industrial purposes. Light effects many decompositions, as of the silver salts used in photography, of nitric acid, of hydrogen peroxide, and a number of other substances. Percussion explodes nitroglycerin, and even a touch causes iodide of nitrogen to decompose violently. Ferments (minute vege-

table and animal organisms) cause many decompositions, such as the breaking up of dextrose ( $C_6H_{12}O_6$ ), in the presence of yeast, into alcohol ( $C_2H_5OH$ ) and carbon dioxide ( $CO_2$ ), and the common decompositions known as putrefaction and decay.

It has been customary to class a number of decompositions separately as *dissociations*. For example, when sal ammoniac (ammonium chloride) containing at least a trace of moisture is heated in a closed vessel, it partly breaks up into ammonia gas and hydrochloric acid and partly remains unchanged. On the other hand, if equal volumes of ammonia gas and hydrochloric acid (with a trace of moisture again) were confined in a closed vessel at the same temperature as in the first experiment, the two substances would partly combine chemically into ammonium chloride and partly remain in a state of mechanical mixture. Quantitative investigation would show that the ratio of the combined to the uncombined products is the same in both experiments, i.e., the final state is the same, whether we start with sal ammoniac or with ammonia and hydrochloric acid. The decomposition of sal ammoniac is classed as a chemical *dissociation*, because, as we have just seen, it is *reversible*. Dissociation might thus be defined as reversible decomposition. It must, however, be borne in mind that the principles of thermodynamics—scientific principles of the most indubitable reliability—teach that reversibility is by no means an attribute of certain reactions only; that *all* reactions must be reversible, or else perpetual motion would result. In other words, while a given reaction may proceed almost to completion and therefore appear to be nonreversible, in reality no reaction can proceed *entirely* to completion. But then the customary distinction between dissociation and decomposition proper can have but little real significance. An excellent illustration of this conclusion is presented by the case of ammonia. At high temperatures, and especially under the influence of electric sparks, ammonia rapidly breaks up into its elements, hydrogen and nitrogen. The process appears to be complete and until a few years ago was often mentioned as a typical case of decomposition proper as distinguished from dissociation. Then Haber and his collaborators, encouraged by the thermodynamic principle that no reaction can be entirely complete or nonreversible, succeeded in showing experimentally that hydrogen and nitrogen do recombine to form ammonia, that the decomposition of ammonia is as much a dissociation as, e.g., the dissociation of sal ammoniac, and at the present time ammonia is actually made on an industrial scale by the direct synthesis of hydrogen and nitrogen. See AMMONIA.

Nevertheless, the term "dissociation" is a convenient one and may well be retained in the current language of chemistry, with the understanding that it denotes decomposition that is obviously or readily reversible. See DISSOCIATION; REACTION.

**DE CONSOLATIONE PHILOSOPHIÆ**, de kōn'sō-lā'shī-ō'nē fīl'ō-sō'fī-ē (Lat., on the consolation of philosophy). A philosophical work interspersed with verse by Boëthius, written about 525, in prison. Alfred the Great translated it into Anglo-Saxon, and Chaucer translated it into English before 1382. Caxton printed it in 1480. Its influence in spreading

Platonic thought in the Middle Ages is almost incalculable. It was one of Dante's great thought sources.

**DECORAH.** A city and the county seat of Winneshiek Co., Iowa, 110 miles northwest of Dubuque, on the upper Iowa River, and on the Chicago, Milwaukee, and St. Paul and the Chicago, Rock Island, and Pacific railroads (Map: Iowa, F 1). It is the seat of Luther College and Valder College and contains a hospital. The city has stock-raising, farming, and milling interests and manufactures of valves, wagons, patent medicines, toilet preparations, metal boats, etc. Settled in 1849, Decorah was incorporated as a town in 1857 and was chartered as a city in 1871. Its government is administered under a general law by a mayor elected biennially and a city council. The city owns and operates its water works. Pop., 1900, 3246, 1910, 3592.

**DECORATED STYLE OF GOTHIC ARCHITECTURE.** The second of the three period styles into which the history of English Gothic architecture is usually divided. This system of style division and nomenclature was invented by Thomas Rickman and has been in use ever since his time; but it is unscientific,

GEOMETRIC TRACERY.

for style development cannot be sliced into precise period styles. The name designates the style of the century approximately covered by the reigns of the first three Edwards (1280-1380), during which the vigorous simplicity and Norman elements of the Early English style developed into the more elaborate and ornate architecture which characterizes the churches and cathedrals of the fourteenth century, although exemplified also in some of the chapter houses of the end of the thirteenth. It is distinguished primarily by its bar tracery of geometric patterns with cusping, by the fineness and overrichness of its moldings and shaft clusterings, by its naturalistic carving and the progressively increasing richness and complexity of its vault ribbing. Sharpe divides the style and period into two, the Geometric and the Curvilinear, named from their tracery forms. The interior of Lichfield Cathedral, the presbytery and octagon of Ely, the choir of Wells, are among the prominent examples of the Decorated style, which passed into the Perpendicular (q.v.), the most distinctively English phase of Gothic architecture. See ARCHITECTURE, EARLY ENGLISH; GOTHIC ARCHITECTURE.

POMPEIAN MURAL DECORATION

# POMPEIAN MURAL DECORATION

Pierpont Morgan. Of the objects displayed in the three rooms devoted to American Colonial, a majority came from the Bolles collection, presented to the museum by Mrs. Russell Sage.

Of what decorative art is, these four museums form an excellent definition. They illustrate not only the arts that are primarily decorative, but also the arts of painting and sculpture as employed decoratively.

The classification of the collections of the Musée des Arts Décoratifs is particularly worthy of attention for its simplicity and clarity. The two main divisions are the Decoration of Man and the Decoration of Building. The Decoration of Man is subdivided into (1) costume; (2) arms and armor; (3) instruments and tools; (4) means of instruction (books, engravings, photographs, etc.).

The Decoration of Buildings is divided into Exterior Decoration and Interior Decoration. Exterior Decoration is subdivided into (1) architecture; (2) sculpture applied to architecture; (3) painting applied to architecture, including mosaic and stained glass.

Of Interior Decoration the main subdivisions are (1) painting; (2) woodwork; (3) furniture; (4) textiles; (5) pottery; (6) metal work; (7) miscellaneous objects.

Of painting, stained glass, mosaic, sculpture, and tapestry, etc., as used in the decoration of buildings, there are two main types: (1) pictorial; (2) ornamental.

To the first class belongs mural painting (q.v.), that not only decorates the surface of walls, ceilings, and vaults, but also presents allegorical, historical, religious, or other scenes. In ancient Egypt walls and columns, internal and external, were covered with pictures deeply incised by the chisel and richly painted. The Romans covered the walls of their chambers, courts, and banquet rooms with painted decorations in which pictures of mythological beings and of familiar scenes were mingled with landscape and fantastic architecture. (See POMPEII.) The Byzantine artists adorned the walls and apses of their churches with highly decorative pictures on a gold ground, executed often in glass mosaic; in these the drawing and coloring, forsaking the pursuit of natural realism, were controlled by purely decorative considerations. The greatest schools of decorative painting were those which grew up in Italy in the fourteenth and sixteenth centuries—the earlier having its chief centre in Florence, with Giotto as its greatest master; the second reaching its highest development in Rome under Raphael and Michelangelo, and a little later in Venice, where Titian, Tintoretto, and Paolo Veronese attained an extraordinary pitch of sensuous splendor of color. But no decorative painter of any age ever equaled the sublimity of conception and grandeur of execution of Michelangelo's compositions for the vault of the Sistine Chapel in the Vatican at Rome.

The work of the sculptor has in all ages been considered an essential adjunct to noble architecture. In Egypt he cooperated with the painter in producing the pictures mentioned above and carved the effigies of the King and the god Osiris against the pylons and piers of the temples. It was, however, the Greeks who lifted decorative sculpture out of the trammels of sacerdotal tradition and exalted it into one of the highest and noblest of all forms of expression of religious and national aspirations.

The friezes, metopes, and pediment groups of their temples were not merely unequaled as sculpture, but superb as decorations for the architecture to which they were affixed. In creating them the sculptor, while he sought to embody the poetic and patriotic ideals of the Greek mythology which inspired him, was at the same time solicitous so to dispose the masses of light and shade, so to combine and arrange every outline and detail of the composition, that they should harmonize with the dominant lines of the architecture and produce that pleasing effect of harmony, rhythm, balance, and contrast which is the chief source of an enjoyment of all decorative design. The Romans made far less use of pictorial sculpture in architecture than the Greeks, but developed a remarkable system of ornamental carving in relief, in which symbolic figures, grotesque, and conventional foliage were blended in a manner to enrich with a wonderful play of light and shade the friezes, pilasters, and panels to which they were applied. In the Middle Ages the builders of abbeys and cathedrals in Europe, especially in France, adorned their buildings with sculpture, both of serious figures and of gargoyles, everywhere pervaded with religious meaning, but marvelously adapted to the exigencies of the architecture.

Beautiful as are many of the French fourteenth-century statues of saints, martyrs, and apostles, and the ranges of seated angel choirs in the cathedral porches, considered as pictorial sculpture, they are perfect only when seen in the architectural setting for which they were designed, whose lines they emphasize and whose beauty they enhance. The French and Italians may be said to vie with each other for the supremacy in sculpture during the Renaissance: but while the French produced no one to equal Michelangelo in pure sculpture, the Italians never equaled Jean Goujon in the perfect mastery of decorative effect in figure sculpture applied to architecture.

However, the decoration of architecture and furniture with nonpictorial painting and sculpture is quite as important and vastly more necessary. The capitals and moldings of ancient Greek temples are reproduced over and over again in our modern buildings. The painting of the average house is apt to interest the owner more than any other part of the decoration except perhaps the wall paper. Of furniture, carving is the most usual ornament.

Magazines in English that print many interesting articles about the different decorative arts are the *Burlington Magazine* (London); *International Studio* (New York); *Arts and Decoration* (ib.); *Connoisseur* (London). There are also important decorative magazines in France and Germany. But on the history of decorative art, as a whole, there is no adequate book, and most of the histories of the individual decorative arts are unsatisfactory. Consult: Ward, *Historic Ornament: A Treatise on Decorative Art and Architectural Ornament* (London, 1897); Speltz, *Styles of Ornament* (trans., Berlin, 1906); Molinier, *Les arts appliqués à l'industrie* (6 vols., Paris, 1896-1902); the guide books and descriptive pamphlets of the four decorative art museums mentioned above. See ORNAMENT; ARCHITECTURE; INTERIOR DECORATION; FURNITURE; TAPESTRY; STAINED GLASS; PAINTING; MURAL DECORATION; SCULPTURE; POTTERY; JEWELRY; LIGHT-

ING; MUSICAL INSTRUMENTS; COSTUME; ARMOR; TEXTILE; CARPETS AND RUGS.

**DECORATIVE NEEDLEWORK.** See EMBROIDERY.

**DE CORONA** (Lat., On the Crown). The most famous speech of Demosthenes and the most perfect specimen of the world's oratory. It was delivered in 330 B.C. as a reply to the famous speech of Eschines against Ctesiphon, who had secured the passage of a law authorizing the crowning of Demosthenes for his services to the state.

**DECORT, FRANS.** See COET, FRANS DE.

**DE COSTA, BENJAMIN FRANKLIN** (1831-1904). An American clergyman and historian. He was born in Charlestown, Mass., graduated at the Concord (N. H.) Biblical Institute in 1856, and was rector at North Adams, Mass., from 1857 to 1858, and at Newton Lower Falls from 1858 to 1860. He was chaplain in the Federal army from 1861 to 1863, when he settled in New York. Here he was editor successively of the *Christian Times*, the *Episcopalian*, and the *Magazine of American History*. In 1884 he founded the American White Cross Society, of which he was president until 1899, and afterward helped organize the Church Temperance Society. He was rector of the church of St. John the Evangelist in New York from 1863 to 1890, when he became a Roman Catholic. He contributed to Winsor's *Narrative and Critical History* and published valuable monographs and essays on early American history and on local history, including: *The Pre-Columbian Discovery of America by the Northmen* (1868); *Narrative of Events at Lake George* (1868); *The Northmen in Maine* (1870); *Columbus and the Geographers of the North* (1872); *The Fight at Diamond Island* (1872); *Huaveatha: The Story of the Iroquois Sage in Prose and Verse* (1873); *The Lost City of New England* (1877); *Verrazano the Explorer* (1880); *Cabo de Barros, or the Place of Cape Cod in the Old Cartology* (1891); *Cabo de Arenas, or the Place of Sandy Hook in the Old Cartology* (1885); *Whither Goest Thou?* (1902). He wrote a novel, *The Rector of Roxburgh* (1873), under the pseudonym of William Hickling; and he edited White's *Memoirs of the Protestant Episcopal Church* (1881).

**DE COSTER, CHARLES THÉODORE HENRI** (1827-79). A Belgian author, born in Munich. For many years he occupied the chair of French literature at the military academy in Brussels. His work has been compared to that of Rabelais and Montaigne. His prose epic, *La légende de Tiel Uylenspiegel* (1867), is a masterly description of Flemish life during the reign of Philip II and the days of the Inquisition. His works also include: *Légendes flamandes* (1857; 2d ed., 1861); *Contes brabançons* (1861); *Voyage de nocce* (1872). Consult Potvin, *Histoire de lettres en Belgique* (1882).

**DE COVERLEY, SIR ROGER.** See COVERLEY.

**DECOY** (from *de*, Fr., Lat. *de*, down + *cog*, OF. *cog*, quiet, from Lat. *quietus*, still, from *quies*, repose). A contrivance for luring game into a snare or within the range of a weapon. In England for centuries decoys have been contrivances for capturing as well as alluring ducks, by driving them into tunnel nets, or by catching them in a cage built on a platform on the water, into which they were enticed by feeding. To-day both these especial methods are

obsolete; but the principle of the tunnel net remains in the decoys built in the fresh-water pools near the coast, which attract the birds on their arrival from over sea. At the corners of the pool curved ditches are cut and covered with wide arched hoop nets, gradually diminishing in size. The wild ducks are enticed to the mouth of the tunnel by live, tame ducks, which retreat up the tunnel, the wild birds following to the end of the pipe, which by this time is on land, after which they are all easily caught.

In America the decoys are painted wooden, cork, or canvas imitations of ducks (or other birds, as the case may be) anchored on the water in a lifelike way, within range of a blind or boat concealed in the reeds. Waterfowl and shore birds often stoof well to such decoys.

Consult: Grinnell, *American Duck Shooting* (New York, 1901); Folkard, *Wild Fowling* (London, 1859-64-75-97); Payne-Gallwey, *The Book of Duck Decoys* (ib., 1886).

**DECREE** (Lat. *decretum*, judgment, from *decernere*, to separate one thing from another, to decide). In the civil law, an Imperial judgment in causes brought before the Emperor on appeal, or otherwise. These judgments were promulgated as law, and the principles enunciated in them were binding on all the courts of the Empire. See CIVIL LAW; CORPUS JURIS; DECRETAL.

In English and American law, the judgment, or order, of a court of equity, the term "judgment" being properly restricted to the adjudication of a matter by the courts of common law. The difference between a judgment and a decree is fundamental and springs out of the radical difference in the character of the jurisdiction exercised by the two classes of tribunals. The function of the law court is merely to decide the bare question in controversy between the litigating parties, awarding an unconditional judgment to one or the other of them. The court of equity, on the other hand, undertakes to do substantial justice between the parties as to the whole matter submitted by them, and it may make such decree, or order, as justice may require, without being confined to the award or denial of the particular remedy sought by the complainant. Accordingly it may, before the final adjudication of the case, grant an "interlocutory" decree, which may or may not become the "final" decree of the court, or it may issue a conditional order, which shall become absolute or void, according as the condition is or is not complied with.

A decree nisi ('unless') is a conditional order, to become absolute unless, before the date fixed therein, good cause shall be shown to the court for vacating it. A decree for a temporary injunction, if drawn to become permanent, unless cause to the contrary be shown, is of this character. The phrase is not in common use in the United States, however, and in England it has come to be appropriated to a particular case in which a decree nisi is commonly employed, viz., in decrees for divorce not to take effect for a probationary period of six months or more, during which time any person may show cause why the decree should be vacated, and the parties reinstated in their conjugal rights.

In jurisdictions in which the law and equity systems have been merged, or in which they are administered by the same tribunals, the

term "judgment" is often employed in a comprehensive sense to include decree; and when the law permits both legal and equitable remedies to be afforded in the same action, the judgment rendered may be both a judgment and a decree. See DIVORCE; CHANCERY; EQUITY; JUDGMENT; and the authorities there referred to.

**DECRESCENDO**, *Ital. pron. dā'krā-shēn'dō* (It., decreasing). In music, the reverse of crescendo (q.v.), viz., a gradual diminishing of the sound. Like the crescendo, it is also sometimes combined with a slight ritardando, especially in descending passages. It is frequently marked thus,  $\text{—}$ .

**DECRETAL** (ML. *decretalis*, from Lat. *decretum*, a decree, from *decernere*, to decide). Generally, an authoritative order or decree; more specifically in ecclesiology, a letter or decision of the popes, determining some question of ecclesiastical law referred to them. For detailed classification of various collections of these decretals, see CANON LAW; and for a famous collection, now universally admitted to be largely forged, PSEUDO-ISIDORIAN DECRETALS.

**DECRETALISTS**. Commentators on the *Decretum*, or the Decretals. See CANON LAW.

**DECRETUM OF GRATIAN**. See CANON LAW.

**DECUMATES AGRI**, *dēk'ō-mā'tēz ā'grī* (Lat., tithe lands). A term applied by the Romans to their possessions north of the upper Danube and east of the Rhine, corresponding in large part to modern Baden and Württemberg. This district was guarded by the famous *limes*, or line of fortifications, which was begun by Domitian and finished by his successors and served as a bulwark against the Germans. The name would seem to signify tithe lands and to imply that at some time settlers had been allowed to occupy these lands in return for the payment of a tenth of all produce won from them, but we have no evidence to show that this was actually the case. Another view derives the name from that of a hypothetical town, *Decuma* or *Ad Decuman* (*Lapidem*). Consult Furneaux, in his edition of Tacitus' *Germania*, note on chap. xxix (Oxford, 1894).

**DECURION** (Lat. *decurio*, from *decuria*, company of ten, from *decem*, ten). The chief of a body of 10 men. This name was applied especially, in the Roman cavalry service, to the commander of a troop of 10 (afterward more) horsemen. In the free municipalities of Italy and in the provinces the chief citizens were often called *decuriones*; they corresponded to the senators at Rome. They had extensive powers of control over the magistrates, sometimes heard appeals from judicial sentences passed by the magistrates, and enjoyed certain special privileges. Consult: Greenidge, *Roman Public Life* (London, 1901); Friedländer-Waters, *Town Life in Ancient Italy* (Boston, 1902); Reid, *The Municipalities of the Roman Empire* (Cambridge, 1913).

**DECUSSATION** (Lat. *decussatio*, an intersecting of two lines crosswise, from *decussis*, the number 10, X, on account of its shape). In anatomy, the crossing of nervous filaments. Certain fibres of the anterior pyramids and lateral columns of the medulla oblongata are thus crossed freely from side to side, so that disease on one side of the brain often leads to paralysis on the other side of the body.

**DEDEAGATCH**, *dā'dā-ā-gāch'*. A seaport

town of Bulgaria, on the Aegean Sea, northwest of the mouth of the Maritza. Its harbor is small, but its trade is considerable (Map: Balkan Peninsula, E 4). Dedeagatch has supplanted Enos (q.v.) as the port for the Maritza valley. It is connected by rail with Constantinople, Burgas, and Saloniki, and has steam communication with Greece. Pop., about 9000. For over four centuries the town belonged to Turkey, but in 1913, as a result of the Balkan War (q.v.), it was ceded to Bulgaria.

**DEDHAM**, *dēd'ām*. A town, including three villages, and the county seat of Norfolk Co., Mass., 10 miles southwest of Boston, on the Charles River, and on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, E 3). It is principally a residential suburb of Boston, but has manufactures of cotton and woolen goods, carpets, handkerchiefs, and pottery. The town contains the county courthouse, jail, and house of correction, a memorial hall, public library, and an Historical Society building. Water power is obtained from Mother Brook, a canal connecting the Charles and Neponset Rivers, built in 1641. The government is administered by town meetings. Dedham was settled in 1636 and was called Contentment. It was incorporated as a town under its present name on September 10 of that year. The first free school in America supported by a general tax of the people was established here in 1645. Dedham is the mother town of a large number of other towns in Norfolk County. Pop., 1900, 7457; 1910, 9284; 1914 (est.), 10,063. Consult Mann, *Historical Annals of Dedham from 1635 to 1877* (Dedham, 1847), and Erastus Worthington, *History of Dedham from September, 1635, to May, 1827* (1827). Eight volumes of town records (1635-1890) have been published (Dedham, 1886-94).

**DEDICATION** (Lat. *dedicatio*, from *dedicare*, to dedicate, from *de*, down + *dicare*, to say). In literature, the address of a book, or any literary work, to a particular person; *vide* Shakespeare's note to the Right Honorable Henry Wriothesley prefaced to *Venus and Adonis*. The custom, practiced by the ancients—*vide* Horace and Vergil—was adopted by the modern nations. In the seventeenth and eighteenth centuries books were usually dedicated to a patron, whose influence was sought by the author. They are now dedicated to relatives and friends, or, if learned, to scholars to whom the authors are indebted. An elaborately laudatory dedication is Tennyson's poem to the memory of Prince Albert, prefixed to the *Idylls of the King*. For models of the lighter forms, see the volumes of the *Spectator*. Stevenson was particularly graceful in his inscriptions. The fulsome epistle of former times has been cut down to a brief formula, and many books are without dedications.

**DEDICATION FEAST** (Heb. *chanukkah*, Gk. *τὰ ἐγκαίνια*, *ta enkaínia*, from *ἐν*, *en*, in + *καίνος*, *kainos*, new, Lat. *encenia*). An annual festival among the Jews, which originated in the Maccabean period. On the 25th of December, 168 B.C., the Yahwe temple in Jerusalem was dedicated to the worship of Zeus Olympius by order of Antiochus IV Epiphanes, the ruler of the land. An altar to Zeus was set up on the altar of burnt offerings. This smaller altar is called an "abomination of desolation" in 1 Mace. i. 54, 59, which is a translation of *shikkus shomem* in Dan. xi. 31; xii. 11. Originally the "Baal of Heaven" may have been intended by

this phrase. According to 2 Macc. vi. 2, the sanctuary was called after Zeus Olympius; and it has been thought that a statue of this god was placed upon the altar. When Judas Maccabeus recovered Jerusalem in 165 B.C., he purged the temple, removed the pagan altar, and put up a new one. The temple was then rededicated to Yahwe with festivities that lasted eight days. According to 1 Macc. iv. 52-54, it was on the 25th of Chislev (December) that the dedication took place, on "the same day the heathen had profaned it"; the Greek manuscripts in 1 Macc. i. 54 give the 15th of Chislev as the day when the pagan altar was set up, but here also the Syriac Codex Ambrosianus has the 25th, which seems to have been the original text. It is indeed highly probable that both events took place on the 25th, a day that may have been kept by both nations as a celebration of the winter solstice. This is further suggested by the manner in which the dedication feast has since been kept. Josephus (*Ant.*, xii, 7, 7) calls it "the feast of lights," and the custom of placing lights at the entrance of synagogues and private houses is mentioned in Talmudic literature. The observation of the feast in memory of the deliverance of Jerusalem is enjoined upon the Egyptian Jews in the letters prefixed to 2 Maccabees. Psalm xxx was the dedication hymn. Consult: Marti, *Das Buch Daniel* (1901); Benzinger, *Hebraische Archæologie* (2d ed., 1907); Bouché-Leclercq, *Histoire des Séleucides* (1913). Oesterley, "1 Maccabees," in Charles, *O. T. Apocrypha and Pseudepigrapha* (1913); Wellhausen, *Israelitische und jüdische Geschichte* (7th ed., 1914).

**DED'LOCK, LADY.** The mother of Esther Summerson in Dickens's *Bleak House*.

**DEDUCTION** (Lat. *deducere*, to draw out). A process of reasoning from the general to a particular subsumed under it; its counterpart is induction (q.v.). Formal logic regards deduction and induction as opposed operations. Deduction is the application of a principle, assumed to be accepted, to some specific case, and a judgment, on this case, controlled by this accepted principle. For instance, when heat is recognized as a mode of motion, the judgment that therefore the laws of motion prevail in the phenomena of heat is a deduction. Induction is the recognition of a group of phenomena as involving a general principle. For instance, when the study of the phenomena of heat leads to the recognition and judgment that they are regulated by the laws of motion, an induction is made. The difference is one of point of departure in the reasoning process. If we begin with the knowledge of the law and apply this law to a particular instance, we deduce; if we begin with particular instances and from them arrive at a knowledge of the law, we induce. The explicit analysis and statement of the presuppositions implied in a process of deduction is a syllogism (q.v.), whose major premise is the assertion of the law or principle; the minor premise is the assertion that the case in point comes under the law; the conclusion is the judgment on this case in accordance with the law. But our thought movements are usually very elliptical, when compared with the expression that formal logic gives to them in syllogisms, and it is pedantry to demand that in our ordinary thinking we should cultivate the syllogistic habit. The value of the syllogism is found in the fact that we have therein

in explicit detail the various interrelated judgments to which we commit ourselves in the deduction and can thus examine and criticize them in the open. The syllogism is an instrument of criticism and is not to be regarded as "good form" in reasoning which is to be adopted on all occasions.

*Transcendental deduction* is a technical term in Kant's (q.v.) philosophy, designating the justification which a theory of knowledge gives to a claim a priori conceptions make of being applicable to any possible object of knowledge.

See **LOGIC** (where a bibliography is given); **SYLLOGISM**.

**DEE** (Lat. *Deva*, OWelsh, *Dubr-Duin*, water of the goddess, Ir. *dé*, goddess, Corn. *duy*, Bret. *doe*; connected with Lat. *deus*, Lith. *devas*, OPruss. *deuvas*, Skt. *dēva*, god). A river in England and Wales, draining parts of the counties of Merioneth, Denbigh, Flint, and Shropshire, and the west of Chester (Map: Wales, C 3). It ends in a tidal estuary of the Irish Sea, 13 miles long, and 3 to 6 miles broad. From the city of Chester, which it almost encircles, the river flows to the estuary in a straight artificial channel which is the only navigable portion. Its course is 80 miles long, and among its chief tributaries are the Treveryn and Alwyn. Canals connect the Dee with the rivers of central England. The ancient Britons held its waters sacred.

**DEE.** The name of two rivers in Scotland. The larger rises in five wells, 4000 feet above sea level, in the neighborhood of Ben Macdhui (Map: Scotland, F 2). After flowing 12 miles south-southeast, it is joined by the Geauley, 1294 feet above sea level, tumbles through a narrow chasm, called the Linn of Dee, runs east-northeast through Aberdeenshire and a small part of Kincardineshire, and ends in the North Sea at the harbor of Aberdeen. The river is not navigable except near the mouth, where it has been altered in order to increase the dockage at Aberdeen. In its course of 90 miles it receives the Lun, Muck, Fugh, etc. On its banks is Balmoral Castle. The river is remarkable for the clearness of its waters and is noted for its salmon. The smaller Dee rises near the northern boundary of Kirkeudbrightshire (Map: Scotland, D 5). For the first 40 miles it flows southeasterly, then westerly, falling into the Solway Firth at Kirkeudbright Bay. It is about 50 miles long and navigable for the last 7 miles.

**DEE, JOHN** (1527-1608). An English astrologer and mathematician. He was born in London, was educated at St. John's College, Cambridge, lived for some time at the University of Louvain, and in 1550 he lectured at the College of Rheims on the *Elements* of Euclid with great success. In 1551 he returned to England, was introduced to Edward VI, and was pensioned: but during the next reign he was falsely accused of attempting Queen Mary's life and came very near being executed. Queen Elizabeth received him kindly and promised him an appointment. This promise was not fulfilled, and Dee again set out for the Continent in 1564, ostensibly for the purpose of presenting to Emperor Maximilian a book, *Monas Hieroglyphica*, which he had previously dedicated to him. Lilly, however, in his *Memoirs*, affirms that he acted as Queen Elizabeth's "intelligencer," or spy. In 1594 he was made chancellor of St. Paul's Cathedral and in the next

year warden of Manchester College. He died very poor. Dee's writings, mostly on the occult sciences, were published in London in 1659.

**DEED** (an act, *Lat. factum*, something done). A written instrument, sealed and delivered, whereby a legal right is created or transferred. Though the term is popularly employed only in connection with instruments for the conveyance of land, it is not, in the legal sense, thus restricted, being equally applicable to a considerable variety of other legal transactions effected by the same solemn form. A contract, an appointment to office, the surrender of a right of action, may be effected by deed, as well as the transfer of title to land or goods. In other words, it is not the event, or transaction, but the manner in which it is performed, which constitutes the deed. So, too, it is in a popular rather than a strictly legal sense that a sealed writing, in and by itself considered, is described as a deed. Until delivered to the party who is to have the benefit of it, it is still a mere writing, an escrow (*écrit, scriptum*), an inchoate deed. The perfected deed is compounded of three distinct things—the writing, the act of sealing, and the act of delivery.

The superior validity of a transaction effected by deed, as compared with one consummated by spoken words or by ordinary writings, is a matter of history. Blackstone declares that a deed derives its name (*deed, factum*) from the circumstance that "it is the most solemn and authentic act that a man can possibly perform with relation to the disposal of his property; and therefore a man shall always be estopped by his own deed, or not permitted to aver or prove anything in contradiction to what he has once so solemnly and deliberately avowed" (2 Bl. Com. 295). In fact, the deed is the one form in which the formal or ceremonial mode of incurring an obligation or transferring a legal right survives among us, corresponding in that respect to the *mancipatio* and the *stipulatio* of the Roman law, the latter of which still appears in the usual ceremony of marriage. Recent investigations into early legal procedure show conclusively that in primitive society a peculiar importance and validity attaches to legal transactions of the formal sort, and, though the tendency of advancing civilization is to reduce or eliminate the distinction between formal and informal obligations, this has never been completely accomplished. The conclusive effect of a deed is probably due to the fact that it originated at a time when writing was a rare accomplishment, confined to those who had taken holy orders, and that its character, as a solemn form of engagement, had become established before the art of writing became more general. Its superior validity still consists in the fact mentioned by Blackstone, in the passage quoted above, that he who makes a deed is conclusively bound by the statements which it contains, and that, in contracts and other transactions which ordinarily require a consideration to support them, no consideration is necessary if the transaction be consummated by deed. Technically a contract in the form of a deed is known as a specialty.

Deeds are of two kinds, deeds poll and indentures—the former being of only one part, i.e., binding only one person or group of persons, in the same way and to the same effect; and the latter having two or more parties, who become bound to one another. Thus, the ordinary deed

of conveyance, whereby A, or A and B, convey land to C, the latter entering into no engagement with reference to the transaction, and the grantor or grantors, only, executing it, is a deed poll; whereas articles of association or of partnership, or any other bilateral contract, under seal, whereby several parties become mutually bound to one another, is an indenture. The names are derived from the circumstance that deeds of the latter sort were formerly written in duplicate, etc., on the same piece of parchment, which was then cut so as to separate them by an indented and irregular line, whereby their identity could afterward be established. The deed poll, on the other hand, only one copy being required, was polled, i.e., shaved or cut off smooth. This difference in the form of deeds having disappeared, the term "indenture" is often carelessly employed in deeds which are really deeds poll. The distinction between them has not, however, been obliterated by their assimilation in form, and a deed purporting to bind only one party, or, whatever it may purport, executed by only one, is still a deed poll and binds only the giver thereof and not the person to whom it is delivered.

Deeds have from an early period been employed for the transfer of certain interests in land, but their general and almost exclusive use for this purpose is quite modern. Formerly, at common law, freehold interests in land were created or conveyed by the formal ceremony known as livery of seisin, while all estates less than freehold were subject to alienation by parol, deeds being required only to convey the class of interests known as incorporeal, such as easements, profits, future interests in land, and the like. But deeds have now, under the technical description of grants, almost entirely superseded other modes of conveyance of interests in land. Only estates for years or tenancies at will are still capable of arising by parol or by writing not under seal, and in England even leaseholds, for three years and upward, can be created or transferred only by deed. In Great Britain and most of the United States the general use of deeds for purposes of conveyance is a matter of regulation by statute.

In form, however, the deed remains substantially the same as at common law. The writing must still be on paper or parchment, though it may to-day be done by the typewriting machine or the printing press. The old requirement of a seal is also generally adhered to, though in a few of the Western States it has been abolished, and in most others a scroll, or similar mark made with the pen, may be substituted for the more usual wafer or sealing wax. But, whatever its form, the important thing is not the adhesion to the paper of something called a seal, but the sealing of the instrument by the party to be bound by it. It must be "his own act and seal." At the present time, also, it is generally considered that the instrument must contain the name of the maker in his own handwriting, although prior to the Statute of Frauds, in 1648, signing was not necessary to the validity of deeds, and it is not clear that the statute contemplated any addition to the formalities with which they were already surrounded.

Delivery is properly accomplished by the obligated party handing over the sealed writing

in person to the party to be benefited thereby. Either party may, however, be represented by an agent, and a delivery to an unauthorized third person is good if subsequently ratified by the benefited party. Indeed, it has been held that any unequivocal act on the part of the obligated party, showing an intention to vest the possession of the document in the benefited party, is sufficient to constitute a delivery, even without a manual transfer of possession to any one—as where the former, at or after the time of sealing, utters the words “I deliver this as my act and deed,” or where he incloses the sealed writing in an envelope, addressed to the benefited party, though retaining it in his own possession. There is some conflict of authority, however, as to whether a delivery of the latter sort, or to a third person, which, in fact, never comes to the knowledge of the party intended to be benefited, will be sustained by the courts. There may also be a conditional delivery, which is made to a third person, as an escrow, or mere writing, to be delivered over to the benefited party on the performance of some act or the happening of some event. An escrow does not take effect as a deed until the delivery over, when it takes effect, by relation back, as of the time of its first delivery. See ESCROW, and the titles of the various kinds of deeds, as COVENANT; GRANT; LEASE AND RELEASE. Consult: Coke on *Littleton*; Blackstone, *Commentaries on the Laws of England*; Kent, *Commentaries on American Law*; Pollock and Maitland, *History of English Law* (2d ed., Cambridge and Boston, 1899); Holmes, *The Common Law* (Boston, 1881); and the authorities referred to under REAL PROPERTY.

**DEEMS, CHARLES FORCE** (1820-93). An American clergyman. He was born in Baltimore, graduated at Dickinson College in 1839, and was agent in North Carolina for the American Bible Society. He was professor of logic and rhetoric in the University of North Carolina from 1842 to 1847, and of natural sciences in Randolph Macon College (then in Boydton, Va.) in 1847-48. He then became a Methodist preacher at Newbern, N. C., and in 1850-54 was principal of the Greensboro (N. C.) Female College. In 1865, after holding several charges in North Carolina, he went to New York, where he helped found (1868) the Church of the Strangers (undenominational), of which he was pastor until his death. The Mercer Street Presbyterian Church building was given to this church by Cornelius Vanderbilt, whose gifts for Vanderbilt University, Nashville, Tenn., were secured through Dr. Deems. In 1881 he founded the American Institute of Christian Philosophy, and he edited for several years its organ, *Christian Thought*. The Institute founded in his honor a lectureship in philosophy (1905) at New York University. Among his many publications are: *Life of Dr. Adam Clarke* (1840); *The Home Altar* (1850); *Annals of Southern Methodism* (1856); *Life of Jesus* (1872); *A Scotch Verdict in Evolution* (1886); *The Gospel of Common Sense as Contained in the Canonical Epistle of James* (1889); *The Gospel of Spiritual Insight, and Studies in the Gospel of John* (1891). He edited several hymnals. Consult his *Autobiography* (New York, 1897), with memoir for the years after 1847 by his sons.

**DEEMSTER, DEMPSTER, or DOOMSTER** (AS. *dōm, doom, judgment*, as in *Domesday Book*;

hence *doomster* or *deemster*, a judge). The name of an officer formerly attached to the High Court of Justiciary in Scotland, who pronounced the doom or sentence of condemned persons. The office was held along with that of executioner. At the conclusion of a trial this dread official was produced in open court, in presence of the criminal, as is graphically described by Scott in his tale of *Old Mortality*. See notes to that work and also notes to *Heart of Midlothian*. The office of deemster has been long abolished.

In the Isle of Man and in Jersey deemsters are judges, the office as well as the title being of great antiquity and dignity. The highest judicial authority in the Isle of Man is divided between two deemsters, one for the northern and the other for the southern half of the island.

**DEEP'ING, (GEORGE) WARWICK** (1877- ). An English novelist, born in South-end, Essex. He was educated at Merchant Taylors' School and at Trinity College, Cambridge (B.A., 1898), studied medicine at Middlesex Hospital, practiced for a year, and then adopted literature as a profession. His popular romances, not unlike Maurice Hewlett's in manner and subject, include: *Uther and Igraine* (1904), *Slanderers* (1905), *Bess of the Woods* (1906), *A Woman's War* (1907), *Bertrand of Brittany* (1908), *Mad Barbara* (1909), *The Rust of Rome* (1910), *The Lame Englishman* (1911), *Joan of the Tower* (1911), *Strong Hand* (1912), *House of Spies* (1913), and *The White Gate* (1914), a story of contemporary England.

**DEEP RIVER.** A river rising in Guilford Co., N. C. (Map: North Carolina, C 2). It flows southeast and then east, joining the Haw River (q.v.) in Chatham County, forms the Cape Fear River (q.v.). About 120 miles long, the stream drains an area of 1350 square miles. Large coal and copper deposits are found in its valley. It furnishes considerable water power at Lockville and is navigable to Carbondon.

**DEEP-SEA EXPLORATION.** The depths of the sea have been explored with precision only during comparatively recent years. Deep-sea investigations began in the necessity for accurate soundings for submarine cables, and this is still the main reason for sounding, but much more has been accomplished in this field by dredging for purely scientific purposes.

The most important part of our knowledge of deep-sea conditions has been gained since 1870. The *Challenger* expedition sent out by the British government from 1873 to 1876 (see CHALLENGER) engaged in pelagic investigations for nearly four years, sounding and dredging in the oceanic basins at more than 350 different places. This vessel was well equipped and carried a scientific staff under the direction of Sir Wyville Thomson. A great amount of deep-sea work was accomplished, and the large series of *Reports* form the most important contribution ever made to the literature of this subject. Other extensive deep-sea investigations have been conducted at various times by most of the European governments, while vessels of the United States Coast Survey or of the Fish Commission have been engaged in them more or less regularly since 1870. The Prince of Monaco has made very important contributions to this department of knowledge, as

he has for many years employed his yachts almost entirely in deep-sea work, and has devoted much time to the improvement of the appliances for investigation.

The methods employed by the earlier investigators for measuring the depths were slow and uncertain, for their soundings were made with hemp rope, which was greatly drifted by currents and gave inaccurate depths. The soundings and dredgings conducted on the *Challenger* were so made and often under great difficulties. At the present time such investigations are made by means of wire, the first successful employment of which was by Sir William Thomson in 1872. Wire sinks rapidly, presents the least frictional surface, and is but little affected by currents; and the machinery is now so perfect that soundings may be made with accuracy in the greatest depths. The improved methods show that the early soundings by the *Herald*, *Congress*, and other vessels with rope, supposed to have reached over 7000 fathoms, were erroneous, and that there are probably no such depths in the ocean.

The greatest depth known was discovered by the United States cable-survey ship *Nero* in 1900, near the island of Guam, where a sounding was made of 5269 fathoms, or nearly 6 statute miles, a depth sufficient to submerge the highest mountains. It is probable that future soundings will reveal slightly greater depths. For four years prior to the voyage of the *Nero* the deepest water known was north of New Zealand, where the British ship *Penguin* sounded in 5155 fathoms. Off the coast of Japan, in 1874, the United States ship *Tuscarora* found a depth of 4635 fathoms; and in 1900 the United States Fish Commission steamship *Albatross* made a sounding in the western Pacific of 4813 fathoms. Many great depths have been discovered in the Atlantic, the deepest (4561 fathoms) off Porto Rico, by the United States Coast Survey steamer *Blake*. More than 40 "deeps," or depressions ranging from 3000 to 5200 fathoms, are now known, some of them mere holes, others of vast extent. The deeps are well distributed over the seas, but none have been found north of the fifty-fifth degree of latitude. The average depth of the sea is probably not less than 2200 fathoms.

**Method of Sounding.** In the operation of sounding several instruments are sent down with the wire. A thermometer takes the temperature at the bottom; a closing cylinder brings up a specimen of the bottom water for analysis, and the sounding cylinder at the end of the line brings up a specimen of the bottom mud or ooze, for examination as to the character of the bottom. These instruments are all self-acting at the bottom and are not affected in rising to the surface.

To the sounding cylinder is attached the sinker—a 60-pound iron shot—which detaches itself on striking the bottom. An indicator attached to the reel on deck shows the number of fathoms of wire that have run out. After sounding the wire is reeled in by steam. It takes about one hour to make a sounding 3 miles deep and get the instruments back on board.

**Deep-Sea Dredging.** The methods employed on board the United States Fish Commission steamship *Albatross*, doubtless the best-equipped deep-sea dredger in existence, may be taken as

illustrative. The *Albatross* has brought together larger deep-sea collections than have been made on any other vessel. She has made nearly 6000 hydrographic soundings and nearly 2000 hauls of the dredge or beam trawl. The investigations of this vessel cover areas extending from the Banks of Newfoundland along both coasts of North and South America to Bering Sea, and also limited areas in the tropical Pacific, and in the regions between Japan and Kamchatka. Her work has carried dredging into deeper waters than ever before, animal life having been obtained near the Tonga Islands at a depth of 4173 fathoms, while the dredge on one occasion in Bering Sea brought up from a depth of 1771 fathoms more than 800 deep-sea fishes at a single haul.

The creatures of the deep sea are brought up by means of a dredge or beam trawl towed by a wire rope, operated by a powerful engine on deck. The first operation in dredging is to ascertain the depth by sounding, after which the trawl is put overboard and allowed to sink to the bottom as the dredge rope is let out. The dredge, or beam trawl, is simply an iron frame to which is attached a strong bag-shaped net about 20 feet long. The mouth of the dredge, as formed by the iron frame, is about 11 feet wide and 2 feet high. Dragged along the bottom, it quickly fills with animals. Sometimes it settles into mud or ooze and is very hard to lift. The dredge rope is connected with a large spring, or accumulator, attached to the foremast, which often shows the dredge to be pulling thousands of pounds. Before the dredge reaches the surface, most of the oozy mud washes away, so that the dredge haul is usually light enough to be hoisted from the water and landed on deck with safety. Sometimes it is filled with fishes; sometimes with sea urchins, starfishes, crinoids or corals; sometimes with squids and devilfish. It often brings up a varied collection, in which many classes of marine animals are represented. The time required by the *Albatross* in making her deepest dredge haul—that from 4173 fathoms—was 10 hours, the engine reeling in the great weight of line very slowly. In depths of 1000 to 1500 fathoms hauls can be made in three or four hours, according to conditions.

In addition to the dredge, another collecting machine, very useful on rough bottom, is the "tangle." This consists of bunches of shredded rope attached to iron bars, and when dragged over the bottom it frequently brings up sea urchins, starfish, and crinoids in abundance. A deep-sea fishtrap has been devised by the Prince of Monaco, in which fishes have been taken as deep as 2 miles. The *Albatross*, in 1897, succeeded in setting ordinary gill nets a mile deep and catching *Macrurus* and other deep-water fishes. Deep-water exploration by means of gill nets, traps, and trawl lines promises to yield interesting results.

**Deep-Sea Life.** The surface of the sea nearly everywhere bears an abundance of minute animal and plant life. In this surface life, or "plankton," as it is called collectively, many groups of invertebrates are represented. The phosphorescence often seen upon the surface of the sea is due entirely to their presence. These almost microscopic creatures are constantly dying and falling to the bottom. They constitute the principal food of the smaller animals dwelling there; and their remains form

a large part of the deep-sea oozes. The most important forms among them, considered with reference to abyssal deposits, are the Globigerinidae and the radiolarians, which are enormously abundant.

The marine deposits on the ocean floor are generally referred to three groups. Those of the continental slopes are called Terrigenous Deposits, derived from the land through the wearing action of rivers, tides, and currents. These coastwise deposits are the blue, green, coral, or volcanic muds, and are characteristic of the adjacent land slopes from which they are derived. Farther off shore, generally about 200 miles, occur the Pelagic Deposits, made up of dead marine organisms from the surface—the minute surface life already referred to. Here we find oozes, such as diatom, radiolarian, or globigerina oozes which depend respectively upon the character of the surface life prevailing above them. Beyond these, in the deeper parts of the ocean, are the Red Clay Deposits, which cover about half the ocean floor. This region is not affected by matter from the land and receives little pelagic matter from the surface. It lies so deep that the shells of surface organisms falling down are removed through the solvent action of the deep water. The red clay is believed to have formed very slowly, not more than a few feet of matter having accumulated since the Tertiary period.

**Intermediate Depths.** The question as to the existence of life at intermediate depths has been given general reconsideration since the perfecting of closing townets for the exploration of such depths. The experience gained with the various intermediate nets used on board the *Albatross* has shown no mingling of surface and bottom forms. The latter occur, of course, at all depths along the continental slopes. See DISTRIBUTION OF ANIMALS.

From the evidence now at hand with respect to light in the sea, it seems certain that the sunlight does not extend below a couple of hundred fathoms and even there becomes very dim. Below this the vast body of the ocean is absolutely dark, being illuminated only where phosphorescent creatures may shed a certain amount of steady or intermittent radiance (see below).

**Conditions and Life at Great Depths.** It is always cold at the bottom of the sea, the influence of the warm surface waters not extending below a few hundred feet. In the great depths the temperature is always close to the freezing point. In warm equatorial seas, where the depths exceed 400 fathoms, the difference between surface and bottom temperatures usually ranges from 40° to 49° F. It has been found that from 100 fathoms down, or throughout the waters beyond the influence of the sun, temperatures remain practically constant. At the surface of the sea the lines of equal temperatures are parallel with the equator, although subject to deflections by currents, while at the bottom they follow the general trend of the continents. The cold water of the depths comes from regions far to the north and south of the tropics, the coldness being due to the water in polar or subpolar regions sinking and gradually spreading itself over the ocean floor. If for any reason the cold polar waters should cease to flow downward towards the deep tropical basins, the deep-sea water would rise in temperature, and deep-sea life would perish

from lack of the air which the polar currents absorb at the surface and carry down with them. So far as is known, the bottom currents are extremely slow, and, as the water is not affected by storms, it is likely that the lower part of the deep sea is a place of calm repose.

There is a tremendous pressure of water in the depths—so great, in fact, that it will crush all objects that are not constructed to resist it. All deep-sea instruments are made to withstand a pressure increasing about a ton to the square inch with each 1000 fathoms of depth. At the greatest depth known there would therefore be a pressure of nearly six tons to each square inch of surface. The tissues of deep-sea animals are so permeated by fluids, however, that a balance is maintained, and at the bottom they may be as firm as animals of the shallow waters. Most of these creatures are so soft that, when withdrawn from the pressure which keeps them in a firm condition at the bottom and brought to the surface, they must be treated carefully to prevent their going to pieces. The bones of abyssal fishes are especially cartilaginous. When deep-sea creatures are dragged to the surface from deep water, they are always dead, and doubtless die during an early stage of their upward journey.

**Phosphorescence and Color.** It has been mentioned that no light reaches the abyssal regions, which are absolutely dark so far as sunlight is concerned; hence plant life is unknown there, and all the animals of the depths are carnivorous.

Deep-sea dredging, however, has brought up so many phosphorescent animals that there can be little doubt of considerable phosphorescent light in the depths. The amount of such light given off at the surface is no measure of that produced under normal conditions at the bottom. Phosphorescent organs take many forms in the depths and occur in both fishes and invertebrates.

The colors of deep-sea animals are usually as brilliant as those of animals living under the influence of light, although not so varied. The reds, yellows, purples, and greens predominate, and the colors, when they occur at all, are apt to be in solid masses, in striking contrast, or the whole animal is of a uniform brilliant coloration. There is a conspicuous absence of blue. The fishes, as a rule, are dark-colored, but many of the crustaceans, holothurians, and starfish are brilliant.

Some of the deep-sea animals are blind. Those that have eyes probably capture their prey by the phosphorescent light shed from their own bodies and the bodies of the vast number of other creatures that are constantly flashing their faint lamps over the ocean floor. Fishes of the greatest depths have the smallest eyes, while those of moderate depths have very large eyes, as, for instance, those of the *Macrurus* type.

#### EXPLANATION OF PLATE

1. Method and theory of deep-sea dredging, as practiced on the U. S. S. *Albatross*. 2. The deep-sea dredge and its derrick. 3. Gathering the surface life, by hand nets, and by a towing net rigged to the port boom. 4. The tangles, showing its rigging. 5. The Townsend intermediate net, open and closed. Having been sunk to the depth desired, it is towed for a time, and then a sliding weight is allowed to run down the line, striking the ring which holds upright the iron arm hooked to the towrope, it dislodges the ring and releases the arm, which falls, permitting a weight beneath it to slide down and pinch together the folding rim of the netting bag, which may then be drawn up without loss of contents.

# DEEP-SEA EXPLORATION

1. U.S.S. ALBATROSS dredging.
2. THE DREDGE AND ITS RIGGING.
3. SURFACE NETTING
4. TANGLES.
5. INTERMEDIATE SELF-CLOSING TOW-NET.

Many of them have highly developed organs of touch. Some of the fishes have enormous jaws, much larger proportionately than are found among shallow-water forms. Their teeth also are more formidable. See *MACRURUS*, and *PLATE OF CODFISH AND ALLIES*.

**Size.** All the animals that have so far been brought up from deep water have been taken in dredges of moderate size—so small, in fact, that they are only capable of taking small animals, the largest specimens of fishes seldom exceeding 4 or 5 feet in length. It is quite possible that by using larger dredges larger animals could be taken.

**Conclusion and Bibliography.** It will be seen from the foregoing that the fauna of the depths lives under such extraordinary conditions as temperature close to the freezing point, pressure amounting to a ton to the square inch for each 1000 fathoms of depth, and darkness except for light due to phosphorescence.

**DEER.** (AS. *dēor*, wild beast, animal, Ger. *Thier*, animal, Goth. *dīus*, wild beast; cf. AS. *dēor*, bold, OHG. *tiorih*, wild). The popular name for even-toed, hoofed mammals of the family Cervidæ and subfamily Cervinæ. The musk (q.v.), usually called musk deer, forms a distinct subfamily, which is sometimes accorded full family rank. More than 50 species of deer are known, occurring in all parts of the world except Australia and southern Africa. South-eastern Asia especially abounds with them, some of the largest as well as many of the smallest living there. Only two species of deer dwell in the whole continent of Africa, and both of these are near relatives of European species and occur only in the northern parts of the continent. In North America there are perhaps 8 or 10 species of deer, while Central and South America possess a much larger number.

Deer are characterized by the absence of a gall bladder and the possession of upper canines, lateral digits on both fore and hind feet, a remarkable suborbital sinus or tear pit below each eye, and antlers. Antlers are the most noticeable of these characters, though they are usually present only in the male. The female reindeer has antlers, and individual females of other species sometimes have small ones. Antlers (q.v.) are outgrowths of bone, which are covered with a thin, highly vascular hairy skin during their growth, but when this is completed the blood supply is cut off, and the skin, or "velvet,"

as it is called, dries up and is peeled off, leaving the bone bare. Antlers are renewed annually, the fully formed pair becoming detached from the "pedicels" on which they were developed, and a new pair arising at the same place. Antlers are usually shed soon after the close of the breeding season. An antler may be straight and unbranched, but usually there are branches, called *times* or *enags*. The number of these increase with age, so that the most handsomely developed antlers are found only on fully matured males. The antler and its branches are generally more or less cylindrical or terete, but in some cases they are very much expanded and flattened, and the antler is then called "palmated."

Deer are animals of very graceful form, combining compactness and strength with slenderness of limb and fleetness. They have for many centuries been renowned as objects of the chase, and the flesh of many species is highly esteemed for food, under the name "venison." The best-known species, which may serve as an example of the group, is the European red deer (*Cervus elaphus*), the adult male of which is the "stag," and the female is the "hind." The former is sometimes nearly 7 feet long and over 4 feet in height, but the hind is much smaller. The body is covered by a double coat of fine wool and longer, coarse hairs, the latter longest on throat and chest. The wool is brownish gray, and as it is longest and most abundant in winter, the summer coat is brighter-colored and smoother. The young are spotted with white. The antlers are at first unbranched and show only the number of times characteristic of the adult in the fifth year, and it is not until then that the young male is dignified with the name "stag." An old stag is called a "hart." The hinds and young stags are usually found together in large herds, but the older stags occur in smaller groups, while harts are generally found alone. The feeding time is during the evening and at night. The food varies with the season; in winter it is chiefly lichens, moss, bark, and buds, while in summer leaves and herbs form most of the diet. Stags are said to eat only fungi during the breeding season. The red deer occurs in all parts of Europe and in northern and western Asia. It is exterminated as a wild animal in populous districts, but is preserved as an object of the chase, or as a semi-domesticated pet, in all parts of western Europe, though not so common in Great Britain as the fallow deer. It is exceptionally swift of foot and an excellent swimmer, and all of the senses are marvelously acute. The hinds and fawns are gentle and can be tamed as pets, but the stags are untrustworthy and become quite dangerous during the breeding season.

The American deer (*Cariacus* or *Odocoileus virginianus*) is considerably smaller than the stag, but resembles it in many of its habits. It is found throughout the eastern United States, ranging northward into southern Canada, west to the Missouri, and south to Florida and Texas. West of the Missouri it is replaced by the very similar white-tailed deer (*Cariacus leucurus*), and south of the United States by the Mexican deer (*Cariacus mexicanus*). The American deer are very fond of water, especially in the summer, and at that season feed very largely on water lilies, in seeking which they often go far out into shallow ponds and lakes. They are fine swimmers, and often enter the water during the

day to escape from flies and other insects, but they feed chiefly at night. Owing to this habit, a method of hunting known as "jacking" is often practiced, by means of boats. A brilliant light, known as a "jack light," is placed at the bow, while the hunter is stationed in the shadow behind. The boat is then pushed quietly through the lily pads until a deer is heard or seen; attracted by the bright light, the animal turns full towards it, and the hunter, seeing the reflection of the light in the deer's eyes, can make his aim sure. Under similar circumstances George Shiras, 3d, of Pittsburgh, Pa., secured a series of fine photographs of deer beside lakes in northern Wisconsin, by using a flash-light apparatus, operated by a trigger and instantaneous plates. In color the American deer is somewhat variable, there being a marked seasonal change as well as much individual and geographical diversity. In summer the upper parts are more or less chestnut red, and become more cinnamon-colored along the sides; the under parts are white. In winter the upper parts become more gray, so that there is a general slaty-blue cast, and the deer is then said to be "in the blue." Deer no longer occur commonly south of Vermont, New York, and Michigan, except in some of the less-settled portions of the Southern States. Protective legislation has led to a marked increase in the number of deer in Vermont and some other States, but excessive hunting during the open season is reducing the numbers elsewhere.

Besides the North American deer above mentioned, the Western mule deer (*Cervacus macrotis*) demands a word, on account of its remarkable ears. These are 8 inches long and well covered with hair.

**Classification.** The classification of deer is now based largely upon the structure of the feet and the antlers. There are two main groups of deer, the Plesiometacarpalia and the Telemetacarpalia. The former are all Old World deer, except the wapiti (q.v.), and have the proximal portions of the lateral metacarpals present, and the vomer never divides the posterior osseous nares into two distinct passages. This group comprises the genera *Cervulus*, the muntjacs (q.v.); *Elaphodus*, with a single small Chinese species and *Cervus*. This last genus includes many species and is subdivided, chiefly according to the form of the antlers, into seven groups, as follows: (1) Rusine, in which the antlers have no tine (known as the bez) just above the lowest or brown tine, the beam is upright and simply forked at the tip, the brow tine rises close to the base, and the angle formed with the beam is acute; (2) Reevesine, beam somewhat flattened, and bifurcates into two branches, which again divide, and the brow tine is given off at an obtuse angle and curves upward; (3) Elaphurine, beam straight, erect, with a long, straight back tine; (4) Axine, antlers rusine, but body of adult marked with rows of white spots; (5) Pseudaxine, similar to axine, but the antlers have a forked beam, of which the posterior tine is the smaller; (6) Elaphine, a bez tine is present, and the rounded beam splits up into a number of small tines often arranged in a cup-like manner; (7) Damine, the antlers are palmated near the tip. See ANTLES, where illustrations of various forms are given.

Of these seven groups the Elaphine is the most important, including the red deer and wapiti, but the well-known sambar (*Cervus*

*aristotelis*) of India is rusine, the swamp deer (*Cervus duvaucelli*) of the same country is reevesine, the axis is axine, the Japanese deer (*Cervus sika*) is pseudaxine, while the fallow deer (*Cervus dama*) is damine.

The Telemetacarpalia include all the American deer except the wapiti, and several Old World species also. The distal extremities of the lateral metacarpals are present, and the vomer usually divides the posterior nares into two distinct orifices. The genus *Rangifer* contains the reindeer and caribou; *Alces*, the elk, or moose; and *Capreolus* includes the roe deer of Europe and Asia. The Chinese water deer is a remarkable little species without antlers and is the sole representative of the genus *Hydropotes*. The genus *Cariacus* includes, besides the three species already mentioned, a number of others found in the western United States and in Central and South America. They may be grouped in four sections, known as the Cariacine, Blastocerine, Furciferine, and Coassine. The North American deer all belong in the first section, while the last one includes the small South American deer known as brockets. The genus *Pudu* includes only a single diminutive species, the pudu, which is less than 18 inches high and lives in the Andes of Chile.

**Fossil Deer.** The earliest fossil remains of deer are found in the Middle Miocene strata, where the group is represented by several species of *Palamertyr*, at least one of which had antlers. Remains of other genera occur in the Pliocene and Pleistocene. *Cervus* proper appears in the Pliocene. The notable giant deer, or "Irish elk" (*Cervus giganteus*), possessed enormous palmated antlers, 11 feet from tip to tip. It represents a distinct section of the genus, called megacerotine. The remains are found in Pleistocene deposits over a large part of Europe, but are especially common in the peat bogs of Ireland, where they were first discovered. See ELK.

C., 1908); id., "Raising Deer and Other Large Game Animals in the United States," in *United States Biological Survey, Bulletin* 36 (Washington, D. C., 1910). Consult also the authorities mentioned under STILL-HUNTING.

**DEERFIELD.** A town including four villages, in Franklin Co., Mass., 33 miles north of Springfield, on the Connecticut River, and on the Boston and Maine and the New York, New Haven, and Hartford railroads (Map: Massachusetts, B 2). It has agricultural interests and manufactures of pocket books and art novelties. The town contains a public library, Dickinson High School, and Deerfield Academy. The government is administered by annual town meetings. The water works are owned by the municipality. Pop., 1900, 1969; 1910, 2209. A

DEER OF NORTH AMERICA

1. MOOSE OR EUROPEAN ELK.  
2. ELK-LIKE ANTLERS OF EXTINCT IRISH DEER.  
3. WOODLAND CARIBOU OR AMERICAN REINDEER.

4. WAPITI, the "elk" of the Western United States.  
5. EASTERN CARIBOU OR BLACKTAIL.  
6. EASTERN, VIRGINIAN, OR WHITE-TAILED DEER.

FALLOW DEER, MUSK, ETC.

part of the town was annexed to Greenfield in 1890.

Deerfield was founded in 1671 and incorporated in 1673. Near here, on Sept. 19, 1675, the Indians caught Captain Lothrop and 84 men in an ambush. The latter were reinforced, and the Indians driven off, but the colonists had suffered a loss of 63 killed and 7 wounded. On Feb. 29, 1704, the French and Indians surprised the place, killing 49 and capturing 100 of the inhabitants, while many of the buildings were destroyed. The captives were taken to Canada, a number being murdered on the way. Some of the survivors were liberated in 1706. Consult Sheldon, *A History of Deerfield, Mass.* (Deerfield, 1895-96), and Powell, *Historic Towns of New England* (New York, 1898).

**DEERFIELD RIVER.** A river rising in Windham Co., southern Vermont (Map: Vermont, C 8). It flows south into Massachusetts, where, after forming the boundary between Franklin County and the northeast corner of Berkshire County, it flows in a generally southeasterly direction nearly across Franklin County and empties into the Connecticut River near Deerfield. It is about 60 miles long in a general direction and drains an area of 650 square miles. The stream has a fall of 1023 feet from Readsboro, Vt., and furnishes extensive water power there and at Hoosac Tunnel and Shelburne Falls. Its valley is famed for its beauty.

**DEER FLY.** A gadfly which attacks deer; especially, in North America, the small green or yellow tabanids of the genus *Chrysops*.

**DEERHOUND.** See GREYHOUND.

**DEERING, CHARLES** (1852- ). An American manufacturer, born at Paris, Me. He graduated from the United States Naval Academy in 1873 and served as an officer in the navy until 1881, when he resigned to become secretary of the Deering Harvester Company. After this firm was merged with others in the International Harvester Company he became chairman of the latter's board of directors.

**DEERING, WILLIAM** (1826-1913). An American manufacturer, father of Charles Deering, born at Paris, Me. He was educated at the Readfield Seminary. Engaging in the woolen mill and dry-goods business, he became a member of the commission and wholesale dry-goods firm of Deering, Milliken & Co., of Portland, Me., and New York City. In 1873 he established, at Plano, Ill., the harvester business which bears his name, and until his retirement he was president of the Deering Harvester Company and of the William Deering & Co.

**DEER LODGE.** A city and the county seat of Powell Co., Mont., 40 miles north of Butte, on the Northern Pacific and the Chicago, Milwaukee, and St. Paul railroads, and on the Deer Lodge River (Map: Montana, D 3). It contains the State penitentiary, the College of Montana (Presbyterian), St. Mary's Academy, St. Joseph's Hospital, and a public library. Farming and cattle and sheep raising are the principal industries, and there are railroad repair shops and creameries. Gold mining is also carried on. Pop., 1900, 1324; 1910, 2570.

**DEER MOUSE.** Any of several wild mice, which resemble a deer in colors and movement. The name is most properly applied in North America to the jumping mouse (*Zapus hudsonius*), but is also given to the white-footed mouse (*Peromyscus leucopus*). See MOUSE, and accompanying Plate of MICE and JERBOAS.

**DEER'S HAIR.** See SCURFUS.

**DEER-SLAYER, THE.** One of Cooper's *Leatherstocking Tales*, the first of the series written, but the last published (1841). The title is the sobriquet of the leading character, Natty Bumppo.

**DEERSTALKING.** See STILL-HUNTING.

**DEER-STEALING.** In English law, the statutory offense of hunting, killing, or carrying off any deer in any forest, chase, or park, whether private and inclosed or public and uninclosed. By the common law deer at large are *feræ naturæ* ('wild animals'), but the penchant of the Norman kings and their immediate followers for the hunting of deer caused that animal to be invested with a peculiar sacredness, and led at a very early period to the enactment of stringent forest and game laws for their protection. The matter is now regulated by a series of game laws, beginning with 16 Geo. III, c. 30. See FOREST; GAME LAWS; POACHING.

**DÉS MAGYAROS.** See DÉS MAGYAROS.

**DE FACTO** (Lat.). A legal phrase, signifying "actual, based on fact": as distinguished from "de jure," which means "based on law." It is commonly employed of the occupancy of public office or the exercise of political or other authority without legal warrant or by one whose legal title thereto is defective. Under a government of law a merely de facto authority may always be impeached, the proper legal remedy in England and in the United States being by the common-law writ of quo warranto, issued by a court of competent jurisdiction, to bring the offender into court and inquire "by what warrant" he has presumed to exercise the office or authority in question.

Used in this general sense, as opposed to a de jure, or lawful, authority, the exercise of de facto authority is always a usurpation, and it maintains this character so long as it continues, or until it is legalized by proper legislative or other authority. Any public office, administrative, legislative, or judicial, may be usurped and its powers exercised by de facto authority; but the phrase has no application to the case of an excessive or other illegal exercise of power by a duly constituted authority, which does not amount to an assumption of any other office than that which it possesses. Nor does mere usurpation of an office without the actual exercise of its functions constitute the usurper an officer de facto. The authority claimed must be effective and actually exercised in order to give it the de facto character.

It is in this general sense of a power actually exercised, but without legal authority, that the term "de facto" is employed in international and constitutional law. It is thus applied to a revolutionary government, as the Continental Congress—whose acts gained legal sanction through the success of the Colonies and the recognition of their independence by Great Britain—or the President and Congress of the Confederate States—whose de facto exercise of authority gained for them a certain measure of international recognition, but remained to the end, in point of law, an illegal usurpation. Acts performed by such an authority are wholly void and may be impeached in any proceeding, direct or collateral.

In administrative law, however, the term "de facto" is commonly used in a narrower sense, to describe the exercise of illegal authority, but with apparent right and under color of legal

authority. The acts of an officer thus acting have a certain validity, so far as the interests of the public and of third persons are concerned, and cannot be questioned in any collateral proceeding. But they may be directly impeached—as by a refusal to recognize the *de facto* authority, or by instituting proceedings to test the usurper's title to the office exercised by him, or, at the common law, by a civil suit for the wrongful intrusion into office or for the profits thereof taken by the usurping official. But the mere possession of an office is *prima facie* evidence of a valid title thereto, and *de facto* authority is presumed to be *de jure* also, until the contrary is made to appear in an appropriate proceeding instituted for that purpose. Where an office has been exercised *de facto* in good faith, as by one believing himself to be rightfully entitled to it, or where in cases of public danger an official commits unwarranted acts of authority, it is usual for the legislature by a subsequent act of indemnity (q.v.) to legalize the unlawful acts so committed. See ADMINISTRATIVE LAW; OFFICE; and consult the authorities there referred to.

**DEFAMATION** (Lat. *diffamare*, from *dis*, priv. + *fama*, report). The infringement of the right of reputation; specifically, the publishing of any matter concerning an individual which is untrue in fact, and which has a tendency to impair his public reputation. The right of every man to the good name which he has earned by a long course of good conduct is recognized by every developed system of law. It is regarded as a species of property, a valuable asset, of which no one can deprive him with impunity. Its violation is a legal wrong, or tort, and it may under some circumstances be a public wrong, or crime.

As reputation is the estimation in which a man is held by the community in which he lives, the gist of the injury lies in the publication of the imputation upon his character. If communicated to him privately or written out for the purpose of publication, but not actually communicated to a third party, it is no violation of the right of reputation, no matter how unjust it may be. Furthermore, the law will protect reputation only in so far as it is fairly earned. A truthful imputation upon character is no violation of the right. But even the publication of derogatory matter which is in fact untrue may not amount to defamation in the legal sense. The imputation may be too vague and general, or too trivial to be regarded, or, although definite and harmful, it may be uttered under such circumstances of privilege as to justify and excuse it.

In general it may be said that an action will lie for defamation in those cases, and in those cases only, (1) in which the charge or accusation is shown to have caused special pecuniary damage to the plaintiff; (2) in which the plaintiff is charged with the commission of a crime; (3) in which the present existence of an offensive contagious disease is imputed to him; (4) in which the conduct of his profession or trade, or of an office of public trust held by him, or his fitness therefor, is impugned; (5) in which unchastity is imputed to a woman. In all these cases but the first, the words or acts charged are defamatory *per se*, and are actionable without proof of special damage resulting therefrom, and in all of them the action will lie whether the derogatory words were spoken or

written. In the case of a written imputation, however, which is technically called a libel, special damage need never be shown, but it is enough to satisfy the jury that the words complained of were such as to bring the plaintiff into ridicule, odium, or contempt.

The most important and comprehensive ground of justification for imputations upon character is the privilege of fair criticism and comment on public men and affairs. This exists only in communities, like England and the United States, in which the government is of a free and popular character, and the liberty of the press and of public discussion has reached a high point. This privilege does not cover mere abuse, nor the malicious imputation of dishonesty and incapacity, nor the invasion of the private and domestic life of the person accused, unless this has some bearing on public affairs. But every citizen is protected in the honest expression of opinion, however severe and unjust it may be, concerning matters of public interest and general concern, whether political or not, so long as the limits of fair criticism are not exceeded. Privilege may also exist in matters of private concern, under special circumstances, as in comments on character made by a judge, advocate, or witness in the course of a judicial proceeding, such statements being privileged unless made maliciously or recklessly.

Reference has been made to the fact that the publication of defamatory matter may, under some circumstances, be a violation of the criminal law. This is never true of mere slander, or spoken defamation, but only of libel; and it is theoretically justified on the ground that written or printed attacks on character are likely to lead to breaches of the peace or to prove subversive of the good order and morals of the community. It seems more probable, however, that the criminal proceedings in libel cases are a survival of the primitive right of private vengeance for injuries of this character, which has, in process of time, been taken over by the state. See TORT; LIBEL; SLANDER, PRIVILEGED COMMUNICATION; and consult the authorities there referred to.

**DEFARGE**, *de-färzh'*, THÉRESE. The wife of the keeper of the wine shop in Dickens's *Tale of Two Cities*; a type of the remorseless virago of the French Revolution.

**DEFAULT** (OF. *defaulte*, It. *diffalta*, from Lat. *de*, away + *fallere*, to fail). In law, the failure of a party to a suit to take the next step in the process of litigation incumbent upon him, within the time limited by the practice of the court. Originally the term was limited to the nonappearance of a party in court on the day assigned in the writ or summons, but it is now employed of a similar failure at any stage of the cause. In general, the effect of a default on the part of the plaintiff is to entitle the opposing party to a nonsuit, and the default of the defendant renders him liable to a judgment in accordance with the demand of the declaration or complaint. Formerly, in suits at law, these results were final, but the procedure of the equity tribunals permitted the opening of defaults for cause shown, and this is now the general practice, at law as well as in equity, in the courts of England and the United States. Usually, however, the default can be reopened and the cause reinstated on the calendar of the court only on the payment of moderate costs by the party in default. See PROCEDURE.

**DEFEASANCE** (OF. *defoisance*, from *de-faire*, Fr. *défaire*, to make void). A proviso annexed to a conveyance of land or goods, whereby the latter shall become void in some specified event. At common law the term was confined to such a proviso contained in a separate instrument from the act or deed of conveyance, the term "condition" being proper to describe a similar term or provision contained in or forming a part of the conveyance itself. At the present time, however, the latter is often referred to as a clause of defeasance. It is commonly employed to effect a mortgage, which is, properly speaking, a conveyance of property with a defeasance reinstating the title of the mortgagor upon the payment of the mortgage debt. In the United States the defeasance is usually incorporated in the mortgage deed, but in England a mortgage often takes on the form of an absolute deed with a separate deed of defeasance, made by the mortgagee to the mortgagor, specifying the condition on which the conveyance of the property is to become void. Ordinarily a separate instrument of defeasance must be delivered at the same time as the deed of conveyance which it is intended to affect, so as to form part of the same transaction. If given subsequently, it may have the effect of a covenant, enforceable in a separate action by the grantor of the property, but it will not in that event convert the grant into a mortgage.

At common law it is also necessary that a separate defeasance, in order to have the intended operation, should be "of as high a nature" as the conveyance itself, i. e., should also be in the form of a deed. But the courts of equity have always admitted parol evidence of the agreement, understanding, and purpose with which a conveyance was made, and have given effect to such a proviso, even though it was not embodied in a deed or other written form. Accordingly an absolute deed conveying a parcel of land for the real purpose of securing the payment of a debt is, in practical effect, a mortgage and may be redeemed as such. See **CONDITION; MORTGAGE**, and consult the authorities there referred to.

**DEFENDANT**. The person who is sued in an action at law or in equity. Blackstone says: "In every court there must be at least three constituent parts—the actor, or plaintiff, who complains of an injury done; the reus, or defendant, who is called upon to make satisfaction for it; and the judge, or judicial power, which is to examine the truth of the fact, to determine the law arising upon that fact, and, if any injury appears to have been done, to a-certain, and, by its officer, to apply the remedy" (3 Bl. Com. 25).

The term was originally limited to the person sued in a *personal* action at common law, the one against whom a *real* action was brought being described as "the tenant," the complaining party in that case being known as "the demandant," and these expressions are still employed to distinguish the contending claimants to real property in several of the United States. But in most States, as well as in England, the term "defendant" has come to designate the party used in any form of action and in any court. See **PARTIES**.

**DEFENDER OF THE FAITH** (trans. of the Latin, *Fidei Defensor*). A title conferred on Henry VIII by Pope Leo X in recognition of his treatise, *Assertio Septem Sacramentorum*, directed against Martin Luther in 1521. When

Henry suppressed the religious houses at the Reformation, Pope Clement VII recalled the title and deposed him. In 1544 Parliament confirmed the title, which has ever since been used by the sovereigns of Great Britain.

**DEFENDER OF THE MARRIAGE TIE** (*Defensor Matrimonii*). An office created by Pope Benedict XIV in the year 1741. Its object is, in all cases of actions for the annulment of marriage, to defend the marriage bond in its integrity. Marriage, being a sacrament in the Catholic church, is, like the other sacraments, most jealously guarded. The "defender" is clothed by ecclesiastical authority with the same or similar powers that the prosecuting attorney in civil law, in criminal procedure, is endowed with. He usually acts as a referee in civil-court proceedings. The office was instituted in America by the Third Plenary Council of Baltimore in 1884, and is now extended until each Catholic diocese has its "defender" ecclesiastically appointed, ready to defend the integrity of the marriage agreement before any court of proper jurisdiction, and to carry an appeal to a higher court, if needed. Consult Taunton, *The Law of the Church* (London, 1906).

**DEFENSE** (Lat. *defendere*, to ward off). In criminal law, the right of forcible resistance to an attack by force on person or property. The exercise of this right may be a justification of the charge of assault or homicide. It is restricted to the employment of so much force as is reasonably necessary for the protection of one's self, his wife, children, and other members of his household, his personal property, and, where a felony is threatened, as burglary or arson, his real property. He may also resist by force a violent attempt to commit a trespass, even without felonious intent, upon the premises constituting his dwelling. For the limitations upon the exercise of the right of defense, see **ASSAULT; HOMICIDE**.

In the law of civil and criminal procedure, the answer of the defendant in a suit to the cause of action set up by the plaintiff. As commonly employed under the reformed procedure in England and many of the United States, the defense includes the *demurrer*, in which the facts alleged by the plaintiff are admitted, but their legal effect is denied, and the justification by the defendant of the acts of which the plaintiff complains, as well as the bare denial of the allegations of the complaint or statement of claim. It does not, however, cover a counterclaim (q.v.), or separate cause of action, set up by the defendant.

Under the highly technical procedure of the common law, defense (from French *defender*, to deny) was only the first step in the defendant's answer to the plaintiff's cause of action, and was limited to a denial of the truth or validity of the complaint. This was followed by the *plea*, under which the jurisdiction of the court and the legal validity of the facts alleged in the complaint might be questioned, and the justification of the defendant set forth. This system of pleading still obtains in several of the American States, but the term "defense" has generally come to have the wider meaning assigned to it above, which includes the plea and demurrer of the defendant as well as his technical defense. Formerly, also, the term had no reference to the answer interposed by a defendant to the charges contained in a bill or information filed in an equity proceeding, being restricted to

actions at law. Under the reformed procedure, however, this distinction no longer obtains, and the term "defense" may be employed in either forum.

In general, it may be said that the defense must contain a specific denial or justification of each and every allegation of the complaint, together with a statement of any facts relied upon by the defendant to relieve him from the plaintiff's claim of liability. It must usually be verified by the defendant or his solicitor or attorney and served upon the plaintiff or his legal representative within a limited time—usually 20 days—after the service of the complaint. The defense once made, the cause is at issue and may usually proceed to trial without further pleading. See ANSWER; DEMURRER; PLEA; PLEADING; and consult the authorities there referred to.

**DEFENSE OF POESIE, THE.** The name under which Sir Philip Sidney's *Apologie for Poesie* was reprinted in 1598, with the third edition of the *Arcadia*.

**DEFERENT** (Lat. part. *deferens*, bearing away). An old term in astronomy, signifying a circle on which the centre of another circle moves, while a body is supposed to be moving on the latter itself. If we suppose the sun to be moving round a centre in space, while the earth moves, say, in a circle round the sun, then the sun is moving in the deferent. The term originated in the Ptolemaic system (q.v.).

**DEFFAND, da'fan', MARIE ANNE DE VICHY-CHAMBRON, MARQUISE DU** (1697-1780). A Frenchwoman, celebrated in her day for her caustic wit and remarkable beauty, and still so to-day for the soundness of her judgment. The style of her letters is ranked by Sainte-Beuve with that of Voltaire, the model of French prose writers. She was a conspicuous figure in the brilliant salons and gay suppers of the period. Later on, her own aristocratic salon at the Convent of St. Joseph was frequented by Voltaire, Montesquieu, D'Alembert, the famous *encyclopédistes*; D'Alembert, however, abandoned her for the young Mademoiselle de Lespinasse, her protégée and former reader. At 68 the now blind Marquise conceived a violent passion, in spite of her cynical nature, for Horace Walpole, the famous English Premier, who would have more openly reciprocated her love had he not feared the ridicule of his contemporaries. Among her clever sayings the following bon mot furnishes the best keynote to her character: "I was bored, which accounts for all my follies." Her works exist as *Correspondance complète publiée par de Lescure (excepté lettres à la duchesse de Choiseul)* (1865); several *Letters to Horace Walpole* were collected by Miss Berry (London, 1810). Consult Sainte-Beuve, *Causeries du Lundi*, vols. i. xiv, and De Ségur, *Esquisses et récits: Mme. du Deffand d'après des documents inédits* (Paris, 1908).

**DEFIANCE.** A city and the county seat of Defiance Co., Ohio, 51 miles west by south of Toledo, on the Maumee River, at the junction of the Auglaize, on the Miami and Erie Canal, and on the Wabash, the Baltimore and Ohio, and the Ohio Electric railroads (Map: Ohio. B 3). It is the seat of Defiance College, opened in 1885, and contains a Carnegie library and Fort Defiance. There are several flour mills, extensive machine shops, wagon works, pressed-steel factories, etc., and the city has a large trade in agricultural products and live stock. Pop., 1900, 7579; 1910, 7327.

**DEFIANCE COLLEGE.** An institution for higher education, organized under its present name in 1902 at Defiance, Ohio. It is the successor to the Defiance Female Academy, chartered in 1850 and opened for students in 1885. The college is under the control of the Christians. The grounds consist of 28 acres, on which are four large, modern, fully equipped buildings and a residence for the president. Connected with the college is the Christian Biblical Institute, which has a separate board of trustees but the same president. The college includes a college department, a department of music, a normal department, and a commercial department. The total enrollment in all departments in 1912-13 was 456, of whom 186 were in the college department. The total number of instructors was 28. The total assets of the institution at the end of the year 1913 amounted to \$520,480; of this \$312,358 was endowment. The total income from all sources for the year 1912-13 was \$41,398. The library contains about 7000 volumes. The president of the college since its foundation has been P. W. McReynolds, D.D.

**DEFICIENT NUMBER.** An integer whose divisors added together make a sum less than the number itself; e.g., 16 is a deficient number, since the sum of its divisors,  $1 + 2 + 4 + 8 = 15$ , is less than 16. The term goes back to the Greek theory of numbers. See PERFECT NUMBER.

**DEFILADING.** Determining the direction and height of a parapet which will give protection from hostile fire; or, selecting a natural screen which affords concealment from hostile observation. In the latter sense positions for field-artillery batteries are designated as follows: if the guns are posted so that through the sights the hostile position can just be seen over the mask or screen, the battery has *sight defilade*; if a dismounted man can just see the hostile position, the guns have *dismounted defilade*; if mounted, *mounted defilade*; if the flashes of the guns are concealed, *flash defilade*. Consult *Field Artillery Drill Regulations, U. S. A.* (1911). See FORTIFICATION.

**DEFILE'** (noun, Fr. *défilé*, pass). Any passage which compels troops to advance in column formation. DEFILE, verb intransitive, not in common use, means "to march with narrow fronts," as in column of files, i.e., one behind the other, as in *Indian file*. See DEBOUCHING.

**DE FILIPPI, FILIPPO.** See FILIPPI, FILIPPO DE.

**DE FINIBUS BONO'RUM ET MALO'RUM** (Lat., On the Limits of Good and Evil). A philosophical treatise by Cicero.

**DEFINITION** (Lat. *definitio*, from *definire*, to bound, from *de* + *finire*, to fix a limit). The act of making clear one's meaning in the use of a term. This may be accomplished by giving a synonym whose meaning is beyond doubt, as is often done in dictionaries. But traditional logic calls for something more explicit than this. It demands that the *definiendum* (i.e., the term to be defined) shall be assigned to a class including other terms with the same general meaning. This class is called the *genus*, and the term that names this class is called a generic term. There is a second requirement which is met by stating the attribute or combination of attributes which marks off the objects denoted by the *definiendum* from the other objects within the same genus. This differentiating attribute or combination of attributes is

called the specific difference, or the *differentia*. A logic definition is thus the designation of genus and specific difference.

But there are many terms which cannot be defined in accordance with the above requirements. Formal logic recognized one such term in the *summun genus*, the class to which all things belong, and which therefore does not itself belong to a higher class, from which it may be differentiated by some specific attribute. This class is usually identified as "being." But logical definition presupposes the possession of a number of terms whose meanings are already known, and it gives a meaning to a definiendum by correlating it generically and specifically with these other terms. When, however, we come to define these other terms, we enter upon a movement which is either circular or which ends in something which can be defined only by identification, i.e., by directing attention to it in some manner, such as pointing. Such terms as space, time, similarity, and relation cannot be defined logically without what is technically known as a *circulus in definiendo*. Here, as elsewhere, the requirements of formal logic should not be regarded as absolute, but as subserving the purpose of criticism.

#### DEFLECTION OF THE PLUMB LINE.

If the materials which compose the earth had the same density throughout, and if the materials were perfectly plastic, at least to long-continued stresses, then the visible surface of the earth would define a geometrical figure represented by an ellipsoid of revolution with the shorter axis joining the poles. This condition would also obtain if the earth were composed of concentric (or nearly concentric) layers of material with each layer having the same density throughout. Under the ideal condition the plumb line would always be normal to the surface of the ellipsoid. But the earth's surface shows materials of very different densities, and the recent investigations carried on by the United States Coast and Geodetic Survey prove that the materials in the earth's crust to a depth of about 76 miles below the surface have different densities under different places. They show that the material under the sea is heavier than that under the mountains. They also indicate that the earth's crust has only a small effective rigidity, and therefore the mountain range is floated by the lighter material under it, and the sea bottom is depressed by reason of the denser material in the crust below. The water surface over the oceans and along canals projected, in imagination, through the continents would define an irregular surface called the geoid, which deviates somewhat from the ideal ellipsoid of revolution. This deviation is due to the variations in the direction and force of gravity resulting from depressed ocean beds and projecting mountains and to the heterogeneous densities in the earth's crust. The plumb line will be, at each point, perpendicular to the geoid surface rather than to the mean surface of the earth, the ellipsoid of revolution. The angle between the normals to the geoid and the ellipsoid at any point is called the deflection of the plumb line or of the vertical. The deflection is given in two components—one in the plane of the meridian and the other in that of the prime vertical. Usually the deflections of the vertical are spoken of as the differences between the geographic positions, as computed on the ellip-

soid of revolution, and the astronomic positions, as determined from observations on the stars. This is not strictly true, because of inaccuracies in the dimensions of the adopted ellipsoid of revolution, also to some error (possibly only slight) in the assumed longitude and latitude of the initial station from which all the other geographic positions are computed.

No. 12* (ib., 1912).

**DEFOE, DANIEL** (c.1660-1731). An English journalist, novelist, and miscellaneous writer, author of *Robinson Crusoe*. He was born in London late in 1659 or early in 1660, the son of James Foe, a dissenting butcher of Northamptonshire stock, and he retained the family name Foe until after he was 40 years old. Comparatively little is known of his life until he reached middle age. He was educated for the Presbyterian ministry, but abandoned it, probably going to Spain as apprentice in a commission business and then doing some traveling. Before January, 1684, when he married Mary Tufley, who bore him several children and survived him, he had become a wholesale hosier in Cornhill. He took an obscure part in Monmouth's Rebellion; supported William of Orange heartily in 1688-89, having at that time a good standing in the city, engaged in speculative commerce, and failed about 1692 for a rather large sum. Meanwhile he had done some studying and writing, his earliest identified publication being a verse satire, *A New Discovery of an Old Intreague* (1691). Friends helped him to his feet, and in a few years he had established a manufacture of bricks and pantiles and was paying off his debts. In 1697 he became a prolific pamphleteer in political and ecclesiastical controversies and issued the most important of his early books, *An Essay upon Projects*, in which he put forward many plans for social betterment, his discussion of banking, insurance, road making, and the education of women being surprisingly modern in tone. In 1701 he gained a national reputation through his poem "The True-Born Englishman," which defended King William from attacks made on him as a foreigner, and through his bold "Legion's Address," which demanded from the Commons the release of certain political prisoners known as the Kentish Petitioners. He was now at the zenith of his career so far as regards popularity with his contemporaries. He was introduced to the King and served him politically in some unascertained way, and he was recognized as one of the ablest exponents of Whig views. In the latter capacity he is seen at his best in the tract entitled *The Original Power of the Collective Body of the People of England* (1701).

The death of William in 1702 marked a great

change in Defoe's fortunes. Queen Anne was a strong churchwoman, and the High-Churchmen were encouraged to attack the dissenters in violent sermons, to which Defoe replied in far from mild pamphlets, such as *A New Test of the Church of England's Loyalty and The Shortest Way with the Dissenters* (1702). The second of these, a monologue hoax, which represented a high-flyer as advocating a drastic rooting out of dissent, was taken seriously by all parties and construed as a libel by the government. On the appearance of an advertisement for his arrest Defoe went into hiding and escaped detection for nearly five months, until the end of May, 1703. He was tried in July, found guilty, and given a very severe sentence, which included three exposures in the pillory. When he underwent this punishment, the fickle mob treated him like a hero, and his spirited "Hymn to the Pillory" (1703) was hawked about the crowd. But his business was ruined, he felt himself to be forever disgraced, the injustice rankled, and his character steadily deteriorated. He might, while in prison, collect his Whiggish tracts and poems and issue new ones, but he was soon to become an unscrupulous journalist, a wily political agent, a pamphleteer capable of writing on any or all sides of any cause.

Defoe's stay in Newgate was much shorter than his early biographers believed. He was released in October or November, 1703, through the good offices of Robert Harley (q.v.), who wished to utilize his serviceable pen. With Harley's approbation he not only wrote many tracts and made journeys as an election agent in the interest of the Whigs, but he established his famous newspaper, *The Review*, as an organ of political moderation and of liberal commercial views. This journal—which was not first issued from Newgate, as is often stated—ran, mainly as a triweekly, through eight yearly volumes and a supplementary ninth (1704-13) and marked an important stage in the evolution of British journalism. It was written by Defoe single-handed, and it appeared with surprising regularity despite his protracted absences from London. Between 1706 and 1710 these absences were mainly due to his services in Scotland as a secret agent. Under Harley's directions he was indefatigable in urging by pen and voice the union of England and Scotland, and later (1708-10), under Godolphin, he labored to allay Scottish discontent and to thwart Jacobite intrigues. His success was striking and his reward inadequate, hence he rapidly became less trustworthy. Meanwhile he displayed remarkable fecundity as a writer, issuing, besides his newspaper and many tracts, his prose political allegory, *The Consolidator* (1705), his mammoth political satire in verse, *Jure Durno* (1706), and his dull but accurate and valuable *History of the Union* (1709). Probably his only important contribution to literature proper during these years is his extraordinarily realistic *True Relation of the Apparition of one Mrs. Veal* (1706).

From the fall of 1710 to the fall of 1714 Defoe was once more in the employ of Harley (Lord Oxford) and was in consequence forced to do much of his writing as a semi-Tory. During the Sacheverell agitation he had been pronouncedly Whig, but late in 1711 he adroitly shifted the policy of the *Review* in order to sup-

port peace with France, he wrote many tracts with the same end in view, and he secretly attacked Marlborough and the Dutch. There is strong evidence, however, that he also wrote on the Whig side, and it is clear that in two particulars he remained staunch to his old principles. He opposed all measures against the dissenters—e.g., the Schism Bill (1714)—and he did not waver in supporting the Hanoverian succession. Perhaps his most important writings of this period belong to political economy, a subject in which he had already displayed competence, as in his famous *Giving Alms No Charity* (1704). Numerous tracts on the South Sea Scheme, *An Essay upon Publick Credit* (1710), *A General History of Trade* (1713), and the important journal, *Mercator* (1713-14), issued to support Bolingbroke's abortive plans for freer trade with France, made up a body of economic literature well worth study. His political pamphlets, however, have attracted most attention, since some of them, notably the ironical *Reasons against the Succession of the House of Hanover* (1713), almost led, through the intrigues of Whigs angry at his deserting them, to his trial for high treason. In this connection he reflected in the *Review* on Chief Justice Parker, and in May, 1713, he was imprisoned a few days for contempt.

The fall of Oxford and the death of Queen Anne (1714) led to another crisis in Defoe's affairs. He lost the pension the Prime Minister had paid him, on which he had managed to establish his family comfortably at Stoke Newington. He lost also Oxford's favor through indiscreet revelations in *The Secret History of the White Staff* (3 parts, 1714-15), written in support of that statesman. An article reflecting on Lord Anglesey led furthermore to a prosecution for criminal libel. To crown all, he seems somewhat to have broken down in health in the fall of 1714. The story of how he extricated himself from his difficulties and at the age of 55 entered upon the most important stage of his career is too complicated to be told here. He began to display redoubled energy as a writer, composing histories, popular manuals such as *The Family Instructor* (1715-18) and the like, and issuing numerous pamphlets in support of King George, particularly at the time of the rebellion of 1715. He was convicted of the libel on Lord Anglesey, but he escaped punishment by working on the feelings of Chief Justice Parker, and by showing that worthy and the Secretary of State, Lord Townshend, that he would be very useful to the Whig interest as a spy and journalist. The public still regarded him as a Tory; so it was arranged that he should edit mildly Tory journals and secure employment on Jacobite papers like the weekly published by Nathaniel Mist, toning down disaffected articles and reporting to the governments facts about disloyal writers. This disgraceful employment may have lasted 10 years, but it dates mainly from 1716 to 1720, and is chiefly connected with *Mist's Weekly* and a monthly political compilation, *Mercurius Politicus*. Defoe kept his labors so secret that for nearly a century and a half it was generally supposed that after the death of Queen Anne he had touched politics only in an occasional tract, such as his plausible account of his own career, *An Appeal to Honour and Justice* (1715). The effect of such conduct on

his standing as a man needs no comment: but it should be noted that his "Letters Introductory" in *Mist's* were important precursors of the "leading editorial" in modern journalism.

Need of a large income for an expensive family, which included several marriageable daughters, now led Defoe to increase his output of books, but he remained no less active as pamphleteer and journalist. Such volumes as *Memoirs of the Church of Scotland* (1717), the forged *Minutes of the French diplomat Mesnager* (1717), and the *Continuation of the Letters of a Turkish Spy* (1718) gave him needed practice in the art of narration, and led, more naturally than critics have noted, to his masterpiece based on the experiences of Selkirk (q.v.), *The Life and Strange Surprising Adventures of Robinson Crusoe of York, Mariner* (April 25, 1719). The unexampled success of this story—at least eight genuine and pirated printings of 1719 are known—not only led to a new era in the fiction of adventure, but stimulated Defoe's genius to the utmost. The *Further Adventures of Crusoe* immediately followed, his *Serious Reflections* in 1720, and for about five years, despite the fact that he founded new newspapers and wrote many pamphlets on the South Sea Bubble and other topics, Defoe supplied readers with a mass of fiction extraordinary for quantity and for realistic power. *The Life of the deaf-and-dumb fortune teller Duncan Campbell* (1720), *Memoirs of a Cavalier* (1720), *Captain Singleton* (1720), *Moll Flanders* (1722), *Due Preparations for the Plague* (1722), the better-known and masterly *Journal of the Plague Year* (1722), *Colonel Jack* (1722), *The Fortunate Mistress* ("Roxana," 1724)—these abbreviated titles and their dates constitute a remarkable record. The fiction also includes *A New Voyage Round the World* (1724), and Defoe later had at least a share in such books as *The Four Years' Voyages of Capt. George Roberts* (1726), *Memoirs of Capt. George Carleton* (1728), and *Madagascar; or Robert Drury's Journal* (1729). He was writing, with a slight intermission, almost to the day of his death, in London, April 26, 1731, and, remarkable to relate, when his vein of fiction began to dry up, he developed, although nearing 70, new resources as a miscellaneous writer. He wrote numerous lives of criminals—Jack Sheppard, Jonathan Wild, etc.—manuals of conduct and instruction, such as *Religious Courtship* and the equally popular and more interesting *Complete English Tradesman* (1725-27), contributions to topography, economics, and sociology, such as his valuable *Tour Thro' the Whole Island of Great Britain* (3 vols., 1724-27), *A Plan of the English Commerce* (1728), *Augusta Triumphans* (1728), and, last but not least, a series of works on occult subjects, the often reprinted *Political History of the Devil* (1726), *A System of Magic* (1726), etc. He may fairly be designated "The Old Man Marvelous," and there is the evidence of lawsuits and letters to show that he was still trying to make his fortune by manufacturing bricks, and that he was canny in negotiations with regard to the marriage portion of one of his daughters. There is also proof that he was philanthropical and that he had lived down much of his bad reputation as a bankrupt and a political turncoat and hireling. The notion of the early biographers that, after leaving unfinished in the

autumn of 1729 his *Compleat English Gentleman* (first published, 1890), he went into a state of mental decline, can be shown, through unimpeachable proof of his literary activity at the time, to be almost without foundation. In the last year of his life (1730) he was apparently connected in an important capacity with that well-known periodical, *The Political State*, founded by Abel Boyer. Much in his varied career and puzzling character remains obscure, but it is becoming clear that in versatility and copiousness of genius, though not in quality, he has very few rivals. In fiction no one has surpassed him in the use of minute details in order to produce the effect of lifelikeness, and he is a master of the homely vernacular.

As most of Defoe's writing was anonymous, no complete list of his works is obtainable. The latest (W. P. Trent, 1912) includes more than 375 titles; the addition of plausible attributions would swell it to 500. No edition contains a twentieth part of the ascertained writings. The fullest is that printed at Oxford in 20 vols. (1840-41); the best for the fiction is G. A. Aitken's in 16 vols. (1895-96). The chief biographers are Walter Wilson (3 vols., London, 1830), William Lee (3 vols.—two of newly discovered writings—London, 1869), William Minto (London, 1870, *English Men of Letters*), and Thomas Wright (London, 1894). The latest research is represented in vol. ix, chap. i of *The Cambridge History of English Literature*, contributed by Professor Trent.

**DEFORCEMENT** (OF, from *deforcer*, from ML. *disforcare*, to deprive by force). In English law, an ouster or deprivation of the freehold (q.v.). In the more general sense, in which the term is often employed, it includes any means by which the rightful owner of the freehold estate is put or kept out of possession, such as the wrongs of abatement, intrusion, disclaim, or discontinuance. But in its strict sense it is only a detainer of the freehold from him that has the right of property, but never had any possession under that right. The party thus wrongfully retaining possession was called the *deforcant* and was deemed to have an apparent right of possession. There was this difference between a party retaining possession of the freehold by means of *deforcement* and one who occupied by any of the other modes of ouster, that in the former case the party ousted had no right of entry (q.v.). This, previous to the reign of William IV, was a matter of some importance, inasmuch as the claimant was thereby debarred from recovering possession by means of entry or ejectment, and was driven to the more tedious process of asserting his right by a real action (q.v.). But by 3 and 4 Wm. IV. c. 27, all real actions, except four, having been abolished, this distinction between *deforcement* and the other means of ouster has ceased to have any practical importance. See **DISSEISIN**; **SEISIN**.

**DEFOREST**, JOHN WILLIAM (1826-1906). An American author and soldier, born at Humphreysville (now Seymour), Conn. He was educated in Europe and spent some years in the Levant. Before the Civil War he wrote *Oriental Acquaintance* (1856); *European Acquaintance* (1858); and *Sealiff* (1859), a novel. He served throughout the Civil War and emerged with the brevet of major. After the

war he took up the life of a voluminous writer and frequent traveler. Between 1870 and 1880 he published no fewer than nine novels, among them: *The Wetherell Affair* (1873); *Honest John Vane* (1875); *Justine's Lovers* (1878). He wrote also *The DeForests of Avesnes and of New Netherlands* (1900) and *Poems: Medley and Palestrina* (1902).

**DE FOREST, LEE** (1873- ). An American inventor, born at Council Bluffs, Iowa. He graduated at Sheffield Scientific School (Yale) in 1896 and spent three years in postgraduate work at Yale. He became known as one of the pioneers in the development of wireless telegraphy in the United States. In 1902-06 he was vice president of the American De Forest Wireless Telegraph Company (now the United Wireless Telegraph Company), and in 1907 he became vice president of the Radio Telephone Company and also of the De Forest Radio Telephone Company. In 1904 he was awarded a gold medal at the St. Louis Exposition for his achievements in wireless telegraphy.

**DE FOREST, ROBERT WEEKS** (1848- ). An American lawyer and publicist. He was born in New York City and was educated at Yale (A.B., 1870), Columbia (LL.B., 1872), and Bonn. When first admitted to the bar, he joined his father and uncle; later the firm included his brother and sons. After 1874 he was general counsel, and after 1902 vice president, of the Central Railroad of New Jersey, and he came to hold offices or directorships in a number of other corporations. Actively identifying himself with a variety of public interests, he served as president of the Charity Organization Society (New York City) after 1888; trustee after 1889, and president beginning in 1913, of the Metropolitan Museum of Art; president of the Municipal Art Commission (1905); chairman of the State Tenement House Commission (1900), and New York City's first tenement house commissioner; president of the National Conference of Charities and Correction (1903); vice president of the American Red Cross, and vice president of the Russell Sage Foundation. From 1905 to 1912 he was a vice president of the American Academy of Political and Social Science.

**DEFORMED/ TRANSFORMED, THE.** A drama by Lord Byron (1824), based partly on an old story, *The Three Brothers*, and partly on Goethe's *Faust*.

**DEFORMITIES** (Lat. *deformitas*, ugliness, deformity, from *de*, away, off + *forma*, form, shape). Varieties of form which mar the external appearance. Deformities may be divided into congenital and acquired, according as they occur before or after birth. The former class were considered by the ancients to carry some important meaning in their mysterious shapes and to show the anger of the gods; hence they termed them monsters, from *monstrare*, to show; and even in later times they were popularly believed to be the result of the most hideously unnatural combinations. Modern scientific writers have, however, made them a subject of special study under the name "teratology" (Gk. *teras*, monster, and *lógos*, *logos*, science), and their researches have shown that deformities generally depend on some arrest of development of the fetus, or some accidental position it has assumed, or some inflammatory disease which has caused unnatural adhesion of parts.

It has been found that in Paris one monster occurs in about 3000 births. Deformities are more common among domestic than wild animals, among mammalia than birds, and are very rare among fishes and the invertebrata.
